Glossary 117

Index 125
About This Book

Replication Server Options extend the capabilities of Replication Server® to support replication to and from the following primary data servers in a Sybase replication system:

- IBM DB2 Universal Database (for UNIX and Microsoft Windows)
- Microsoft SQL Server
- Oracle Database Server

The Replication Server Options consist of the following components:

- Replication Agent™
- Enterprise Connect Data Access™ (ECDA)

---

**Note** Although this guide describes homogeneous replication scenarios, the appropriate combination of Replication Agent and ECDA can be used for replication between different types of primary and replicate data servers.

---

**Audience**

This book is for anyone who needs to manage or administer a Sybase replication system with non-Sybase databases, or administer non-Sybase databases in a Sybase replication system. This may include:

- Database administrators
- Network administrators
- System administrators

**How to use this book**

Use the product documentation to look up detailed information about Replication Server, Replication Agent, and ECDA commands and configuration parameters.

This book is organized as follows:

Chapter 1, “Setting Up Replication for Microsoft SQL Server,” describes the quick-start procedure to install and configure a sample replication environment for Microsoft SQL Server.
Chapter 2, “Setting Up Replication for Oracle,” describes the quick-start procedure to install and configure a sample replication environment for Oracle.

Chapter 3, “Setting Up Replication for IBM DB2 Universal Database,” describes the quick-start procedure to install and configure a sample replication environment for IBM DB2 Universal Database.

**Related documents**

**Replication Server, Replication Agent, and ECDA**  See the product documentation for details on how to install and use Replication Server and the Replication Server Options components.

**Primary data server**  Make sure that you have appropriate documentation for the primary data server that you use with the Sybase replication system.

**Java environment**  The Replication Agent requires a Java Runtime Environment (JRE) on the Replication Agent host machine.

- The *Replication Agent Release Bulletin* contains the most up-to-date information about Java and JRE requirements.

- Java documentation available from your operating system vendor describes how to set up and manage the Java environment on your platform.

**Other sources of information**

Use the Sybase Getting Started CD, the SyBooks™ CD, and the Sybase Product Manuals Web site to learn more about your product:

- The Getting Started CD contains release bulletins and installation guides in PDF format, and may also contain other documents or updated information not included on the SyBooks CD. It is included with your software. To read or print documents on the Getting Started CD, you need Adobe Acrobat Reader, which you can download at no charge from the Adobe Web site using a link provided on the CD.

- The SyBooks CD contains product manuals and is included with your software. The Eclipse-based SyBooks browser allows you to access the manuals in an easy-to-use, HTML-based format.

Some documentation may be provided in PDF format, which you can access through the PDF directory on the SyBooks CD. To read or print the PDF files, you need Adobe Acrobat Reader.

See the *SyBooks Installation Guide* on the Getting Started CD, or the *README.txt* file on the SyBooks CD for instructions on installing and starting SyBooks.
• The Sybase Product Manuals Web site is an online version of the SyBooks CD that you can access using a standard Web browser. In addition to product manuals, you will find links to EBFs/Maintenance, Technical Documents, Case Management, Solved Cases, newsgroups, and the Sybase Developer Network.

To access the Sybase Product Manuals Web site, go to Product Manuals at http://www.sybase.com/support/manuals/.

Sybase certification on the Web

Technical documentation at the Sybase Web site is updated frequently.

❖ Finding the latest information on product certifications

2. Click Certification Report.
3. In the Certification Report filter select a product, platform, and timeframe and then click Go.
4. Click a Certification Report title to display the report.

❖ Finding the latest information on component certifications

2. Either select the product family and product under Search by Base Product; or select the platform and product under Search by Platform.
3. Select Search to display the availability and certification report for the selection.

❖ Creating a personalized view of the Sybase Web site (including support pages)

Set up a MySybase profile. MySybase is a free service that allows you to create a personalized view of Sybase Web pages.

2. Click MySybase and create a MySybase profile.
Finding the latest information on EBFs and software maintenance

2. Select EBFs/Maintenance. If prompted, enter your MySybase user name and password.

3. Select a product.

4. Specify a time frame, and click Go. A list of EBF/Maintenance releases appears.

   Padlock icons indicate that you do not have download authorization for certain EBF/Maintenance releases because you are not registered as a Technical Support Contact. If you have not registered, but have valid information provided by your Sybase representative or through your support contract, click Edit Roles to add the “Technical Support Contact” role to your MySybase profile.

5. Click the Info icon to display the EBF/Maintenance report, or click the product description to download the software.

Style conventions

The following style conventions are used in this book:

- In a sample screen display, commands that you should enter exactly as shown appear like this:
  
  ra_init

- In the regular text of this document, variables or user-supplied words appear like this:
  
  Specify the value option to change the setting of the configuration parameter.

- In a sample screen display, variables or words that you should replace with the appropriate value for your site appear like this:
  
  resume connection to pds.pdb

  Here, pds and pdb are the variables you should replace.

- In the regular text of this document, names of programs, utilities, procedures, and commands appear like this:

  Use the pdb_init command to initialize the primary database.
• In the regular text of this document, names of database objects (tables, columns, stored procedures, and so on) appear like this:

Select the price column in the widgets table.

• In the regular text of this document, names of datatypes appear like this:

Use the date or datetime datatype.

• In the regular text of this document, names of files and directories appear like this:

Log files are located in the $SYBASE/RAX-15_2/inst_name/log directory.

### Syntax conventions

Table 1 shows the syntax conventions used in this book:

<table>
<thead>
<tr>
<th>Key</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>{}</td>
<td>Curly braces indicate that you must choose at least one of the enclosed options. Do not type the braces when you enter the command.</td>
</tr>
<tr>
<td>[]</td>
<td>Brackets mean that choosing one or more of the enclosed options is optional. Do not type the brackets when you enter the command.</td>
</tr>
<tr>
<td>()</td>
<td>Type parentheses as part of the command.</td>
</tr>
<tr>
<td></td>
<td>The vertical bar means you can select only one of the options shown.</td>
</tr>
<tr>
<td>,</td>
<td>The comma means you can choose as many of the options shown as you like, separating your choices with commas that you type as part of the command.</td>
</tr>
</tbody>
</table>

In reference sections of this document, statements that show the syntax of commands appear like this:

```
ra_config [param [, value]]
```

The words `param` and `value` in the syntax are variables or user-supplied words.

### Character-case conventions

The following character-case conventions are used in this book:

• All command syntax and command examples are shown in lowercase. However, command names are not case-sensitive. For example, `RA_CONFIG`, `Ra_Config`, and `ra_config` are equivalent.

• Names of configuration parameters are case-sensitive. For example, `Scan_Sleep_Max` is not the same as `scan_sleep_max`, and the former would be interpreted as an invalid parameter name.

• Database object names are not case-sensitive in commands. However, to use a mixed-case object name in a command (to match a mixed-case object name in the primary database), delimit the object name with quote characters. For example:
This document is available in an HTML version that is specialized for accessibility. You can navigate the HTML with an adaptive technology such as a screen reader, or view it with a screen enlarger.

Replication Server Options 15.2 and the HTML documentation have been tested for compliance with U.S. government Section 508 Accessibility requirements. Documents that comply with Section 508 generally also meet non-U.S. accessibility guidelines, such as the World Wide Web Consortium (W3C) guidelines for Web sites.

The online help for this product is also provided in HTML, which you can navigate using a screen reader.

**Note** You might need to configure your accessibility tool for optimal use. Some screen readers pronounce text based on its case; for example, they pronounce ALL UPPERCASE TEXT as initials, and MixedCase Text as words. You might find it helpful to configure your tool to announce syntax conventions. Consult the documentation for your tool.

For information about how Sybase supports accessibility, see Sybase Accessibility at http://www.sybase.com/accessibility. The Sybase Accessibility site includes links to information on Section 508 and W3C standards.

Each Sybase installation that has purchased a support contract has one or more designated people who are authorized to contact Sybase Technical Support. If you cannot resolve a problem using the manuals or online help, please have the designated person contact Sybase Technical Support or the Sybase subsidiary in your area.
CHAPTER 1

Setting Up Replication for Microsoft SQL Server

This chapter identifies the components that are required to implement a Sybase replication system for Microsoft SQL Server, as well as an overview of the tasks and instructions for installing and configuring a sample replication environment for Microsoft SQL Server.

<table>
<thead>
<tr>
<th>Topic</th>

Note: Use the procedures in this chapter only for proof-of-concept (POC) or testing, not for production.

Sybase replication system

These components are required to implement a Sybase replication system for Microsoft SQL Server:

- A primary Microsoft SQL Server database
- A replicate Microsoft SQL Server database
- A Replication Server
- The Replication Server Options components:
  - Replication Agent
  - ECDA Option for ODBC
Prerequisites

Figure 1-1 illustrates a Sybase replication system with Microsoft SQL Server databases. It shows the flow of data between the databases and the Replication Agent, Replication Server, and ECDA database gateway.

**Figure 1-1: Sybase replication system for Microsoft SQL Server**

---

**Prerequisites**

Before you begin setting up the replication system, be familiar with the Microsoft SQL Server data server and have an understanding of Sybase replication. In addition:

- ECDA for ODBC must be installed on the same host as your replicate Microsoft SQL Server database.
- Replication Agent must be installed on the same host as your primary Microsoft SQL Server database.
- You have obtained the licenses for the Replication Server and Replication Server Options.
- Microsoft SQL Server 2005 SP2, with database compatibility set to 2005(90), must be installed and configured to serve as the source (primary) database and as the target (replicate) database from which Replication Agent replicates transactions.
- Microsoft SQL Server JDBC driver 1.2 must be installed.
• TCP/IP connectivity must be available.

During this procedure:
• Because Replication Agent for Microsoft SQL Server is limited to the Microsoft Windows platform, all examples shown are for Windows.

**Note** On Windows Vista and Windows Server 2008, you must be logged in as an Administrator.

• Sybase recommends that you do not use Replication Server reserved words for object names and connection names. A complete list of reserved words is in the *Replication Server Reference Manual*.

### System requirements

The target Windows computer on which you are installing the replication components must meet the following minimum memory and disk space requirements:

**Table 1-1: Memory and disk requirements**

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>380MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>512MB</td>
<td>440MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

To improve performance by avoiding multiple network hops, Sybase recommends that Replication Server, ECDA for ODBC, and the target database reside on the same machine.

### Installing replication components

Sybase recommends that you install all replication components on the same host where a Microsoft SQL Server has already been installed and is running with both the primary and replicate databases. This simplifies the quick-start process and avoids the step of separately installing a Microsoft SQL Server ODBC driver for ECDA Option for ODBC.
Identifying the Sybase installation directory

Replication Agent, Replication Server, and ECDA are installed in the same base directory, which is identified by the SYBASE environment variable. Select a path on a host drive to be the recipient of the Sybase installation and configuration activities.

Accessing products from the SPDC

If you are not using installation CDs, go to the Sybase Product Download Center (SPCD) Web site to obtain replication software.

❖ Downloading the replication software

Note This procedure requires you repeat steps to download two products: Replication Server and Replication Server Options.

You must have a login ID and password to download software from the SPDC.

1 Go to SPDC at https://sybase.subscribenet.com/control/sybs/login and enter your login ID and password.

The Product List page appears.

2 Select Replication Server.

The high-level Product Information page appears.

3 Select Replication Server again.

The detailed Product Information page appears.

4 Select the Replication Server software you need by primary database, version, and platform (return later to this detailed Product Information page to select Replication Server Options software).

The Software Terms and Conditions page appears, listing countries and regions.

5 Either:
   • Select I Agree to accept the terms without reading them, go to the Product Download Page, and continue with step 6, or
   • Select your country or region to read the terms.
The software licence agreement for the software appears. Read the terms and either:

- Select I Agree to accept the terms, go to the Product Download Page, and continue with step 6, or
- Select Cancel to return to the high-level Product Information page.

6 The Product Download Page lists the software and documentation for the product. Select FTP Download or Advanced Download Options for the Replication Server software to download and save the compressed files to your local drive.

**Note** For each product, the documentation download contains installation-related documents, and the SyBooks download contains the rest of the documentation set.

7 Return to the detailed Product Information page that you accessed in step 3 and select the Replication Server Options software by primary database, version, and platform.

The Software Terms and Conditions page appears, listing countries and regions.

8 Navigate the Software Terms and Conditions pages as you did in step 5.

9 At the Product Download Page, select FTP Download or Advanced Download Options for the components of Replication Server Options to download, and save the compressed files to your local drive:

- Replication Agent 15.2
- ECDA Options 15.0
- DirectConnect Client 15.0

10 Uncompress and extract all the installation images to your local drive.

11 Download the ECDA 15.0 ESD #3:

b Select EBFs/Maintenance. If prompted, enter your MySybase user name and password.

c Select EnterpriseConnect Data Access. A list of EBFs and maintenance releases appears.
Installing replication components

d Find the EBF containing the ECDA 15.0 ESD #3 for your platform, for example:

EBF xxxxx: 15.0 ESD #3

Here, xxxxx is the number of the EBF containing the ECDA 15.0 ESD #3 for your platform.

e Click the Info icon to display the EBF/Maintenance report, and click the product description to download the software.

Installing Replication Agent

If Replication Agent is already installed, go to “Installing Replication Server” on page 8.

Install Replication Agent on a server where it can directly access the Microsoft SQL Server online transaction logs.

Installing the Replication Agent creates a directory structure containing the Replication Agent binaries, scripts, JRE, and associated files. There are no configuration steps during installation.

Installing Replication Agent software

1 Use one of the following methods to install the software.

   • After following the download instructions in “Accessing products from the SPDC” on page 4, go to the location where you extracted the Replication Agent 15.2 for Windows installation image, or
   • Insert the Mirror Replication Agent CD into your CD drive.

2 Execute the setup routine for Windows:

   setup

3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:

   setup -is:tempdir someDirectory

Here, someDirectory is a directory with at least 100MB of disk space that the installation program can use.

4 On the Welcome window, click Next.

5 Select a geographic location that displays the license agreement. Select I Agree, and click Next.
6 Enter the directory where you want to install Replication Agent:
   • If the directory does not exist, the installation program prompts you to create it. Click Yes.
   • If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Typical for the installation setup type, and click Next.

8 The installation program displays a summary of what is to be installed. Click Next.

9 The installation program starts to install Replication Agent, displaying the progress status. If you see the following message;
   There are newer files already installed and do you want to replace them?
Click No to All.

10 When you receive a message that the installation was successful, click Next.

11 The SySAM License Server window opens and displays this prompt:
   Will licenses be obtained from the License Server?
Respond based on how you set up your environment and use the license obtained from the Software Product Download Center (SPDC) Web site for Replication Server Options, and click Next

12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. At the SySAM notification window, do one of the following:
   • Select Yes and either accept the default values that are supplied, or enter values for the following:
     • SMTP server host name
     • SMTP server port number
     • Sender e-mail address
     • Recipient e-mail address
     • Message severity level of an event that triggers an e-mail message. Your choices are:
       • Informational
Installing replication components

- Warning
- Error
- If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 When you receive a message indicating that Replication Agent was successfully installed, click Finish.

See the Replication Agent Installation Guide.

❖ Verifying the installation

1 In a command window, change to the directory where you installed Replication Agent.

2 Change to \%SYBASE\%RAX-15_2\bin.

3 Obtain the Replication Agent version string:

   ra -v

   If the Replication Agent installation completed successfully, you see the Sybase copyright and the Replication Agent version string.

Installing Replication Server

If Replication Server is already installed, go to “Installing ECDA Option for ODBC” on page 11.

While installing Replication Server:

- Allocate a disk partition of at least 20MB for each Replication Server you are installing. You can add more partitions later, if necessary. Check each partition to make sure it is available and has write permissions.

   Allocate the entire partition to the Replication Server. If you allocate only a portion of the partition to Replication Server, you cannot use the remainder for any other purpose.

❖ Installing Replication Server

1 Use one of the following methods to download Replication Server software.
• After following the download instructions in “Accessing products from the SPDC” on page 4, go to the location where you extracted the Replication Server 15.2 for Windows installation image, or
• Insert the Replication Server CD in your CD drive.

2 Execute the setup routine (GUI mode):
   
   ```
   setup
   ```

3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:
   
   ```
   setup -is:tempdir someDirectory
   ```

   Here, `someDirectory` is a directory with at least 100MB of disk space that the installation program can use.

4 On the Welcome window, click Next.

5 Select a geographic location that displays the license agreement. Select I Agree, and click Next.

6 Enter the directory where you want to install Replication Server:
   • If the directory does not exist, the installation program prompts you to create it. Click Yes.
   • If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Typical for the installation setup type, and click Next.

8 The installation program displays a summary of what is to be installed. Click Next.

9 The installation program starts to install Replication Server, displaying the progress status. You may see the following message:
   
   ```
   There are newer files already installed and do you want to replace them?
   ```

   Click No to All.

10 When you receive a message indicating that Replication Server software has successfully installed, click Next.

   **Note** This procedure uses the SAMPLE_RS Replication Server.

11 The SySAM License Server window opens and displays this prompt:
   
   ```
   Will licenses be obtained from the License Server?
   ```
Installing replication components

Respond based on how you set up your environment and use the license obtained from the Software Product Download (SPDC) Web site for Replication Server.

Click Next.

12 The SySam notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. Select Yes, and either accept the default values that are supplied, or enter values for the following:

- SMTP server host name
- SMTP server port number
- Sender e-mail address
- Recipient e-mail address
- Message severity level of an event that triggers an e-mail message. Your choices are:
  - Informational
  - Warning
  - Error

If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 To start a sample Replication Server, select Yes, and click Next.

14 This information appears and should be recorded:

   This page contains detailed information regarding the sample Replication Server. Please record this information.

   The sample Replication Server will be called SAMPLE_RS and will run on port 11752. It will be configured with a user of sa and no password.

   The sample Replication Server will use an embedded RSSD called SAMPLE_RS_ERSSD that runs on port 11751. It will be configured with a user of SAMPLE_RS_RSSD_prim and a password of SAMPLE_RS_RSSD_prim_ps.
The installer has updated the appropriate interfaces file or sql.ini file.

All files and logs associated with the sample Replication Server will be located in the directory <samp_repserver>.

The sample Replication Server will be configured using the file <SAMPLE_RS.res>.

Here, <samp_repserver> and <SAMPLE_RS.res> are paths to the sample Replication Server and sample Replication Server configuration file, respectively.

Click Next.

15 When the sample Replication Server is running and an “Installation was successful” message appears, click Finish.

- Verifying the installation
  1 In a command window, change to the directory where you installed Replication Server.
  2 Log in to Replication Server:
     isql -Usa -P -SSAMPLE_RS
  3 Verify the Replication Server version:
     admin version
     go
  4 Exit the isql session with the quit command.

- Installing ECDA Option for ODBC
  If ECDA Option for ODBC is already installed, go to “Configuring replication components” on page 14.

  When installing ECDA for ODBC, install ECDA on the same server as the replicate database. This eliminates a network hop and improves performance.

- Installing ECDA for ODBC in GUI mode

  Note To install using the console mode or a response file, see the ECDA Installation Guide for Microsoft Windows.
Installing replication components

1. Use one of the following methods to download the software:
   - After following the download instructions in “Accessing products from the SPDC” on page 4, go to the location where you extracted the ECDA Option for ODBC 15.0 installation image.
   - Insert the CD labeled “ECDA 15.0 Option for ODBC for Windows.”

2. Launch InstallShield by executing the setup routine:

   `setup`

3. If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:

   `setup -is:tempdir someDirectory`

   Here, `someDirectory` is a directory with at least 100MB of disk space that the installation program can use.

4. On the Welcome window, click Next.

5. Select a geographic location that displays the license agreement. Select I Agree, and click Next.

6. Enter the directory where you want to install ECDA:
   - In the destination directory, enter the base directory identified by the SYBASE environment variable. Click Yes to install over an existing directory.
   - If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7. Select Custom setup, and click Next.

8. Unselect ECDA Option for Oracle, and click Next.

9. Verify the modules to install. Click Next.

   You may receive this message:

   ```
   There are newer files already installed and do you want to replace them
   ```

   Click No to All.

10. When you receive a message that the installation was successful, click Next.

11. The SySAM License Server window opens and displays this prompt:

    ```
    Will licenses be obtained from the License Server?
    ```
Respond based on how you set up your environment and use the license obtained from the Software Product Download Center (SPDC) Web site for Replication Server Options.

Click Next.

12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. Select Yes and either accept the default values that are supplied, or enter values for the following:

- SMTP server host name
- SMTP server port number
- Sender e-mail address
- Recipient e-mail address
- Message severity level of an event that triggers an e-mail message. Your choices are:
  - Informational
  - Warning
  - Error

If you choose not to have e-mail alerts or severity messages logged, select No. Click Next.

13 When you receive a message indicating that ECDA was successfully installed, click Finish.

ECDA for ODBC, including the DirectConnect server, is now installed.

14 Apply the ECDA 15.0 ESD #3:

a Extract the zip file for the ECDA 15.0 ESD #3 that you downloaded in “Downloading the replication software” on page 4.

b Go to the directory into which you extracted the zip file.

c Install the ECDA 15.0 ESD #3 in the same way that you installed ECDA earlier in this procedure.
Configuring replication components

This section describes the tasks you must perform to configure each of the components in the replication system.

Configuring ECDA Option for ODBC

Configuring the ECDA Option for ODBC involves:
1. Configuring the Microsoft SQL Server ODBC driver
2. Configuring and starting the DirectConnect server
3. Creating a maintenance user for replication

Configuring the Microsoft SQL Server ODBC driver

If you already have a data source configured for your replicate database, skip to “Configuring and starting the DirectConnect server” on page 15.

When you installed Microsoft SQL Server, an ODBC driver was also installed. Configure this driver to connect to the replicate database.

❖ Configuring the Microsoft SQL Server ODBC driver

1. Open the ODBC Driver Manager by navigating to Control Panel | Administrative Tools and double-clicking the Data Sources (ODBC) icon.

2. Click the Drivers tab, and verify that the Microsoft SQL Server driver is version 2000.86.1830.00. If it is an earlier version, go to the Microsoft Web site to download and install the correct version.

3. Click the System DSN tab, click Add, and select the Microsoft SQL Server driver. Click Finish.

4. In the Name field, enter a name that identifies your replicate data server and database, for example, my_mssql_datasource_name. Use this name later when you configure the ECDA access service. Select the replicate Microsoft SQL Server in the Server drop-down list. Click Next.

5. Be sure that Microsoft SQL Server authentication is selected, and the Connect to Microsoft SQL Server check box is checked. Enter a valid Microsoft SQL Server login ID and password, and click Next.

6. Select Change the Default Database To, and select the replicate database from the drop-down list. Click Next.
7 Click Finish.

8 Verify ODBC connectivity to the replicate database by clicking Test Data Source. If connectivity is not successful, verify that you have configured the ODBC driver correctly.

9 Click OK.

10 You should now see your Microsoft SQL Server data source in the list of System Data Sources. Click OK.

Configuring and starting the DirectConnect server

Before you begin to create and configure the DirectConnect server, make sure that:

- The name for a valid Microsoft SQL Server account is available. This name is used as the administrator for the DirectConnect server.
- The number of the unused port to be used by the DirectConnect server is available.

❖ Creating and configuring a DirectConnect server

1 Start the Create Server wizard by navigating to the %SYBASE%\DC-15_0\DCWizard directory and executing the DCWizard script. The Welcome Create Server wizard appears. Click Next.

2 Select ECDA Option for ODBC. Click Next.

3 Enter the server name for the new DirectConnect server and the port number that you want the server to listen on. Click Next.

4 Enter the ECDA access service name that you want to use for the replicate Microsoft SQL Server database, for example, my_mssql_access_service. Click Next.

5 Verify the DirectConnect server information. If correct, select Create Server. Otherwise, click Back to return to the previous window and provide the correct information.

6 Open the %SYBASE%\DC-15_0\servers\servername\cfg\dcany.cfg file, where servername is the name of the server you created using the DCWizard.

7 In the file, locate the name of the Microsoft SQL Server access service that you created in step 4 using the DCWizard. Under that, set the ConnectionSpec1 parameter to the name of the Microsoft SQL Server ODBC data source you created. For example:
Configuring replication components

[Service Library]
{Client Interaction}
SvclibDescription=Access Service Library for ODBC
{Logging}
LogSvcLibStatistics=0
[my_mssql_access_service]
{ACS Required}
ConnectionSpec1=my_mssql_datasource_name
{Client Interaction}
EnableAtStartup=yes
TransactionMode=long

8 Start the DirectConnect server:
   a Open a command window, and navigate to the DirectConnect installation directory. For example:
      cd c:\sybase\DC-15_0
   b Execute the DC_SYBASE.bat script to set the DirectConnect environment variables.
   c Navigate to the DirectConnect bin directory:
      cd bin
   d Start the DirectConnect server. This also starts all of the configured access services:
      DCStart -S servername
      Here, servername is the name of the DirectConnect server.

9 Click Finish.

❖ Verifying that you can connect to Microsoft SQL Server

1 Open a command window in the %SYBASE% directory of your ECDA installation.

2 Change to the %SYBASE%\DC-15_0 directory.

3 Set the environment variables by sourcing the %SYBASE%\DC_SYBASE.bat file.

4 Log in to Microsoft SQL Server through the DirectConnect service:
   isql -U validuser -P password -
   S my_mssql_access_service
   Here, validuser and password are any valid user and password, and
   my_mssql_access_service is the DirectConnect service name.
5 Verify the connection to the replicate Microsoft SQL Server database by obtaining the DBMS name and version number:

```
select @@sqldbmsname
GO
```

<table>
<thead>
<tr>
<th>SQLDbmsName</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft SQL Server</td>
</tr>
</tbody>
</table>

```
select @@sqldbmsver
GO
```

<table>
<thead>
<tr>
<th>SQLDbmsVer</th>
</tr>
</thead>
<tbody>
<tr>
<td>09.00.1399</td>
</tr>
</tbody>
</table>

6 Exit the `isql` session with the `quit` command.

---

Creating a maintenance user for replication

The maintenance user is a valid Microsoft SQL Server user that the Replication Server uses to apply commands to the replicate Microsoft SQL Server database. Replication Server requires one maintenance user to be defined for each connection.

❖ Creating a maintenance user in Microsoft SQL Server

1 Connect to the replicate database, and enter the following command to create the maintenance user login:

```
CREATE LOGIN maintuser WITH PASSWORD='password',
DEFAULT_DATABASE=replicate_db_name;
```

Here, `password` is the maintenance user login password, and `replicate_db_name` is the replicate database name.

2 At the replicate database, enter the following command to create a maintenance user:

```
CREATE USER maintuser FOR LOGIN maintuser;
```

3 Grant database owner permission to the maintenance user:

```
EXEC sp_addrolemember 'db_owner', 'maintuser';
```
Configuring Replication Server

Configuring Replication Server includes the following tasks:

- Configuring Replication Server for replication to the target database
- Configuring Replication Server for replication from the primary database

Configuring Replication Server for replication to the target database

❖ Creating a Replication Server connection

1. Navigate to the `%SYBASE%\RAX-15_2\scripts\mssql` directory.

2. Make a copy of the `mssql_create_rs152_standby_connection.sql` script named `my_mssql_create_rs152_standby_connection.sql`.

3. Before executing the `my_mssql_create_rs152_standby_connection.sql` script against your Replication Server, change the `{rds\rdb}` to the name of the connection that Replication Server uses to connect to the DirectConnect access service, where:
   - `rds` is the DirectConnect access service name.
   - `rdb` is any valid identifier. Sybase recommends that you use the Microsoft SQL Server replicate database name.
   - `maintuser` and `password` are the maintenance user and password created in ECDA Option for ODBC in step 1 of “Creating a maintenance user for replication” on page 17. For example:

   ```sql
   create connection to rds.rdb
   using profile rs_msss_to_msss;standard
   set username maintuser
   set password "password"
   go
   ```

   Note In the previous example, `password` is a Replication Server reserved word and therefore, must be enclosed in double quotes.

4. Create the connection to the replicate database:

   ```cmd
   isql -Uusa -P -SSAMPLE_RS -i my_mssql_create_rs152_standby_connection.sql
   ```

5. Log in to SAMPLE_RS and verify the Replication Server connection to the replicate database:

   ```cmd
   isql -Uusa -P -SSAMPLE_RS
   admin who
   ```

   ```sql
   ```
CHAPTER 1  Setting Up Replication for Microsoft SQL Server

You should see a message returned for the DSI connection msss_dco.dbname. Verify that the status is “Awaiting Message” or “Awaiting Command.”

6 Exit the isql session with the quit command.

Configuring Replication Server for replication from the primary database

This section describes the configuration steps required for replication from the primary database. It includes:

• Creating a Replication Server connection to the primary database
• Creating a database replication definition
• Creating a database replication subscription

❖ Creating a Replication Server connection to the primary database
1 Go to the %SYBASE%\RAX-15_2\scripts\sybase directory.

2 Make a copy of the rs_create_test_primary_connection.sql script named my_mssql_rs_create_primary_connection.sql.

3 Before executing the my_mssql_rs_create_primary_connection.sql script against your Replication Server, change {rax.test} to the name of the connection between Replication Agent and Replication Server, where:
   • rax is the name of the Microsoft SQL Server data server.
   • test is the name of the Microsoft SQL Server database.

   For example, NY.NYmss5.

   Note  Save these values to be used later for the rs_source_ds and rs_source_db parameters in the Replication Agent mssql.rs file.

4 Execute the script in Replication Server:

   isql -Usa -P -SSAMPLE_RS -i my_mssql_rs_create_primary_connection.sql

   A message appears that indicates the Replication Server connection to the primary database has been created.

❖ Creating a database replication definition
1 Navigate to the %SYBASE%\RAX_15-2\scripts\sybase directory.
Configuring replication components

2 Make a copy of the rs_create_test_db_repdef.sql script named
my_mssql_rs_create_test_db_repdef.sql.

3 Before executing the my_mssql_rs_create_test_db_repdef.sql script,
change the value of {pds}.{pdb} to the name of the connection string you
defined for the primary database, where:

- pds is the name of the Microsoft SQL Server data server.
- pdb is the name of the Microsoft SQL Server database.

For example, NY.NYmss5.

Note Save these values to be used later for the rs_source_ds and
rs_source_db parameters in the Replication Agent mssql.rs file.

This is a database replication definition example:

```
create database replication definition NY_repdef1
with primary at NY.NYmss5
go
```

4 Connect to the Replication Server and enter:

```
isql -Usa -P –SSAMPLE_RS -i my_mssql_rs_create_test_db_repdef.sql
```

A message appears that indicates the database replication definition has
been created.

❖ Creating a database replication subscription

1 Make a copy of the rs_create_test_db_sub.sql script named
my_mssql_rs_create_test_db_sub.sql.

2 Before executing the my_mssql_rs_create_test_db_sub.sql script, change
{pds}.{pdb} and {rds}.{rdb} to the appropriate connection name, where:

- pds is the name of the Microsoft SQL Server data server.
- pdb is the name of the Microsoft SQL Server database.
- rds is the DirectConnect access service name.
- rdb is the name of the replicate database.

Note Save these values to be used later in the Replication Agent mssql.rs
file.

Here is an example of create database replication subscription:
create subscription NY_sub1
for database replication definition NY_repdef1
with primary at NY.NYmss5
with replicate at my_mssql_access_service.my_repl_db
without materialization

3 Connect to Replication Server and execute:

isql -Usa -P -SSAMPLE_RS -i my_mssql_rs_create_test_db_sub.sql

A message appears that indicates the subscription is being created.

Configuring Replication Agent

Configuring Replication Agent involves:

1 Configuring and verifying the primary Microsoft SQL Server
2 Configuring and validating the Replication Agent resource file
3 First-time initialization
4 Subsequent initialization
5 Verifying the Replication Agent replicating state

On Windows Vista, you must be logged in as an Administrator.

Configuring and verifying the primary Microsoft SQL Server

Before you configure Replication Agent and configure the primary Microsoft SQL Server database for replication, complete these procedures:

• Verify the compatibility level of Microsoft SQL Server.
• Disable Microsoft SQL Server replication.
• Create a Microsoft SQL Server user and grant Microsoft SQL Server permissions.
• Enable remote DAC.
• Obtain the Microsoft SQL Server DAC port number.
• Verify the supplemental logging of primary key data.
• Make the primary transaction log files readable for Replication Agent.
• Stop the Analysis Service.
Configuring replication components

- Enable TCP/IP.

❖ Verifying the compatibility level of Microsoft SQL Server

Replication Agent supports only Microsoft SQL Server 2005 Service Pack 2 and later. Verify that the database compatibility level is set to Microsoft SQL Server 2005 (90):

1. In the Microsoft SQL Server Management Studio, right-click your primary database and select Properties.
2. In Database Properties, click Options, and verify that the Compatibility level is “Microsoft SQL Server 2005 (90).” If it is not, select that compatibility from the drop-down list, and click OK.

❖ Disabling Microsoft SQL Server replication

- A Microsoft SQL Server publication cannot be created in the primary database used by Replication Agent for Microsoft SQL Server, and you cannot simultaneously use Microsoft replication and Replication Agent on the same Microsoft SQL Server database. If a Microsoft SQL Server publication already exists, remove the publication before using Replication Agent for Microsoft SQL Server.

❖ Creating a Microsoft SQL Server user and granting permissions

- Log in to the primary Microsoft SQL Server as a system administrator, and run the following commands to create a Microsoft SQL Server user named “ra_user” with the password “sybase,” and grant permissions to the user:

```sql
use master;
create login ra_user;
use <primary_database>;
create user ra_user for login ra_user;
EXEC sp_addsrvrolemember 'ra_user','sysadmin';
```

❖ Enabling remote DAC

1. From the Windows Start menu, choose Microsoft SQL Server | Configuration Tools | Surface Area Configuration | Surface Area Configuration for Features.
2. In the Surface Area Configuration for Features window, choose DAC under the MSSQLSERVER/Database Engine tree, and make sure the Enable Remote DAC check box is selected.
❖ Obtaining the Microsoft SQL Server DAC port number
1 Open the ERRORLOG file in a text editor. This file is located in the log directory of your Microsoft SQL Server. For example:
C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\LOG\ERRORLOG
2 Search for the string “Dedicated admin” to find an entry similar to the following:
2007-11-09 13:40:02.40 Server Dedicated admin connection support was established for listening locally on port 1348.
3 Record the port number specified in this entry for use in a later step.

❖ Verifying the version of the Microsoft Filer Manager Library
To make the primary transaction log files readable for Replication Agent, the Microsoft Filter Manager Library must be version 5.1.2600.2978 or later.
1 To determine the version of the library, in Windows Explorer, right-click c:\windows\system32\fltlib.dll, select Properties, and click the Version tab in the Properties dialog box.
2 If the version is earlier than 5.1.2600.2978, go to the Microsoft Web site at http://windowsupdate.microsoft.com, and update your Windows system.

❖ Making the primary transaction log files readable for Replication Agent
Install and set up the sybfilter driver so that Replication Agent can read the primary transaction log files.
1 In Windows Explorer, navigate to the sybfilter driver installation directory. This directory is located at %SYBASE%\RAX-15_2\system\<platform>, were <platform> is winx86, winx64, or winvistax64.
2 Right-click the sybfilter.inf file to install the sybfilter driver.

Note There can be only one installation of the sybfilter driver on a Windows machine. After the driver is installed, it works for all Replication Agent for Microsoft SQL Server instances running on the same machine.

3 Under any directory, create a configuration file to store all log file paths for primary databases. The configuration file must have a .cfg suffix. For example, under the directory %SYBASE%\RAX-15_2\system\<platform>, create a file named LogPath.cfg.
Configuring replication components

4 Add a system environment variable named RACFGFilePath, and set its value to the path of the configuration file.
   a Open the Control Panel, click System, click the Advanced tab, and choose Environment Variables.
   b Click New to add a new system variable.
   c Name the variable RACFGFilePath, and set its value to the location of your configuration file.

5 In Windows Explorer, navigate to %SYBASE%\RAX-15_2\bin, and double-click the sybfiltermgr.exe file to start the sybfilter driver management console.

6 To start the sybfilter driver, enter start at the management console.

7 Add the log file path to the sybfilter driver with the user manager or by modifying the configuration file:
   • User manager – use the add command in the management console. The syntax for this command is as follows:
     
     `add serverName dbName logFilePath`

     For example, to add the log file named pdb2_log.ldf at C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Data\ to the dbName database on the serverName data server, use the following:

     `add myserverName dbName C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Data\pdb2_log.ldf`

     **Note** If you add the log file path with the user manager, the user manager refreshes all log paths in the sybfilter driver automatically after adding the log path into the configuration file.

   • Configuration file – to add the log file path directly to the configuration file, open and manually edit the configuration file. This an example of log file path entries:

     ```
     [myserver, pdb1]
     log_file_path=C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Data\pdb11_log.ldf
     log_file_path=C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Data\pdb12_log.ldf
     [myserver, pdb2]
     log_file_path=C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Data\pdb2_log.ldf
     ```
Note After you have added the log file paths to the configuration file, use the refresh command in the management console.

8 If you added a log file for your primary database before adding the log file path to the sybfilter driver, restart Microsoft SQL Server to make the log file readable.

9 At the management console, verify that log files are readable. If some log files are unreadable, make sure the files have been created and that Microsoft SQL Server has been restarted, if necessary.

See the Replication Agent Primary Database Guide.

❖ Stopping the Analysis Service

1 From the Windows Control Panel, select Administrative Tools | Services.

2 In the listed services, find the service named Microsoft SQL Server Analysis Service (SERVER), where SERVER is the name of your Microsoft SQL Server data server.

3 Stop this service.

❖ Enabling TCP/IP

1 From the Windows Start menu, choose Microsoft SQL Server | Surface Area Configuration | Surface Area Configuration for Services and Connections.

2 Under the Database Engine tree, click Remote Connections.

3 Select “Local and remote connections,” and “Using both TCP/IP and Named Pipes protocols.”

❖ Installing the Microsoft SQL Server JDBC driver

1 Go to the Microsoft download site (http://www.microsoft.com/downloads) and search for the following string:

Microsoft SQL Server 2005 JDBC driver

2 Click the link for the 1.2 driver, and follow the instructions to download and install the driver.

3 Open Control Panel | System, click the Advanced tab, and click Environment Variables.
Configuring replication components

4 In the System Variables window, if the CLASSPATH variable is not listed, click New. Otherwise, select it, and click Edit.

5 Enter the full path of the JDBC driver, using a semicolon (;) to separate it from any other drivers.

6 Click OK three times.

Configuring and validating the Replication Agent resource file

A single installation of the Replication Agent can support replication from multiple databases. However, one Replication Agent instance is needed for each Microsoft SQL Server database that is to be replicated.

Configuring and validating the Replication Agent parameters in a resource file

1 Locate the resource file template.

The majority of configuration values required to create and initialize a Replication Agent can be recorded and stored in a resource file. Using a resource file provides a means to record or retain the configuration information for a Replication Agent instance, allowing an instance to be removed and re-created.

The Microsoft SQL Server resource file template is at %SYBASE%\RAX-15_2\init\mssql.rs.

2 Create an instance resource file:

Copy the resource file template %SYBASE%\RAX-15_2\init\mssql.rs to another file, for example, myra.rs.

Change the values assigned to properties in the resource file so they match the values required for your environment. The majority of these values are host, port, user, and password information for the Microsoft SQL Server, Replication Server, and RSSD connections.

- Set the value of rs_source_ds to the value you chose for rax and pds in previous procedures.
- Set the value of rs_source_db to the value you chose for test and pdb in previous procedures.
The resource file is self-documenting, with each parameter described. See the Replication Agent Administration Guide.

**Warning!** The combined values of rs_source_ds and rs_source_db must match the \( \{pds.pdb\} \) values of the Replication Server primary connection name.

### Table 1-2: Resource file parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example values</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance name</td>
<td>Any valid name.</td>
<td>myra</td>
</tr>
<tr>
<td>admin_port</td>
<td>Port number that Replication Agent uses.</td>
<td>20500 (if in use, select a different port number)</td>
</tr>
<tr>
<td>pds_server_name</td>
<td>Name of the primary Microsoft SQL Server.</td>
<td>TEAMSTER</td>
</tr>
<tr>
<td>pds_port_number</td>
<td>Port number for the primary Microsoft SQL Server.</td>
<td>1433</td>
</tr>
<tr>
<td>pds_dac_port_number</td>
<td>Microsoft SQL Server Dedicated Administration connection port number.</td>
<td>1348</td>
</tr>
<tr>
<td>pds_database_name</td>
<td>Name of the primary database.</td>
<td>test_db</td>
</tr>
<tr>
<td>pds_username</td>
<td>User ID that Replication Agent uses to access the primary data server.</td>
<td>ra_user</td>
</tr>
<tr>
<td>pds_password</td>
<td>Password for pds_username.</td>
<td>sybase</td>
</tr>
<tr>
<td>rs_host_name</td>
<td>Machine where Replication Server is installed.</td>
<td>teamster</td>
</tr>
<tr>
<td>rs_port_number</td>
<td>Port where Replication Server is installed.</td>
<td>11752</td>
</tr>
<tr>
<td>rs_username</td>
<td>Replication Server user with CONNECT SOURCE and CREATE OBJECT capabilities.</td>
<td>SAMPLE_RS_ra</td>
</tr>
<tr>
<td>rs_password</td>
<td>Password for rs_username.</td>
<td>SAMPLE_RS_ra_ps</td>
</tr>
<tr>
<td>rs_source_ds</td>
<td>Valid name representing data server of primary Microsoft SQL Server database.</td>
<td>NY</td>
</tr>
<tr>
<td>rs_source_db</td>
<td>Valid name representing primary Microsoft SQL Server database.</td>
<td>NYmss5</td>
</tr>
<tr>
<td>rs_charset</td>
<td>Character set that Replication Server is using.</td>
<td>cp850</td>
</tr>
</tbody>
</table>

**Note** The value defined for the rs_charset configuration parameter must match the RS_charset value in the Replication Server configuration file, \%SYBASE\%REP-15_2\install\<server>.cfg.

| rssd_host_name    | Machine where RSSD resides.                                                 | teamster                              |
| rssd_port_number  | Port number where RSSD resides.                                              | 11751                                 |
| rssd_database_name | Database name for RSSD.                                                     | SAMPLE_RS_ERSSD                       |
Be sure your CLASSPATH environment variable points to the Microsoft SQL Server JDBC driver, and use the Replication Agent ra_admin utility to validate the settings in the new instance resource file using the -vr parameter. For example:

%SYBASE%\RAX-15_2\bin\ra_admin -vr myra.rs

Validation results are returned as one of the following:

- Response-file processing completed
- Response-file processing completed with errors

If any validation fails, the ra_admin utility returns an error message and information about the failure. You can repeat the validation process as many times as necessary until it executes without error. No entities are changed or created.

### First-time initialization

To initialize the primary data server, Replication Agent for Microsoft SQL Server installs objects at the data-server level and at the database level. Data-server level modifications are required only once. Use this procedure if you are initializing the primary data server and a Replication Agent instance for the first time.

If you have previously initialized the primary data server and a Replication Agent instance and want to initialize another Replication Agent instance, skip to “Subsequent initialization” on page 30.

#### Configuring the primary data server and a Replication Agent instance for the first time

1. Stop the Microsoft SQL Server service.
   
   a. In Control Panel | Administrative Tools | Services, find the service named Microsoft SQL Server (SERVER), where SERVER is the name of your Microsoft SQL Server data server. For example:

   Microsoft SQL Server(TEAMSTER)
b Stop the service.

2 Open a command window, and restart Microsoft SQL Server in single-user mode:

```
"C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Binn\sqlservr.exe" -m -s instanceName
```

Here, `instanceName` is the name of the Microsoft SQL Server instance.

3 Execute the resource file to create the Replication Agent instance. In your resource file, if you set `start_instance` to `yes`, this step also starts the Replication Agent instance. In your resource file, if you also configured `initialize_instance` to `yes`, this step also initializes the Microsoft SQL Server and the Replication Agent instance.

After the resource file has been validated, use the `ra_admin` utility to create the Replication Agent instance using the `-r` parameter. For example:

```
%SYBASE%\RAX-15_2\bin\ra_admin -r myra.rs
```

Execution results are returned as one of the following:

- Response-file processing completed
- Response-file processing completed with errors

See the `Replication Agent Administration Guide`.

4 If your resource file set `start_instance` to `no`, change to the `SYBASE` directory and start the Replication Agent instance:

```
cd %SYBASE%\RAX-15_2\myra
```

Execute the `RUN` file, for example:

```
RUN_myra
```

5 Use the `dse` utility to update the Replication Server `sql.ini` file with the Replication Agent location, and verify the connection to the Replication Agent:

a Open a command window in the `SYBASE` directory of your Replication Agent installation.

b Set the environment variables by executing the `SYBASE.bat` file.

c Log in to Replication Agent:

```
isql -Usa -P -Smyra
```

Here, `myra` is the name of Replication Agent.
Configuring replication components

6 If your resource file set initialize_instance to no, initialize the primary data server and the Replication Agent instance:
   a Open a command window, and log in to the Replication Agent instance.
   b Issue the following command:
      pdb_xlog init

7 Stop the Microsoft SQL Server in single-user mode:
   a Log in to the server:
      "C:\Program Files\Microsoft SQL Server\90\Tools\Binn\SQLCMD.EXE" -U username -P password -S serverName
      Here, username, password, and serverName are your user ID, password, and Microsoft SQL Server name.
   b Issue the shutdown command.

8 Restart Microsoft SQL Server in multiuser mode (normal start):
   a In Control Panel | Administrative Tools | Services, find the service named Microsoft SQL Server (SERVER) where SERVER is the name of your Microsoft SQL Server data server. For example:
      Microsoft SQL Server (TEAMSTER)
   b Start the service.

The Replication Agent instance is now running, and the primary data server and the Replication Agent instance have been initialized. Continue with “Verifying the Replication Agent replicating state” on page 32.

Subsequent initialization

Use the following procedure only if you have already initialized the primary data server, as described in “First-time initialization” on page 28, and you want to create another Replication Agent instance. This procedure creates and initializes only the Replication Agent instance, not the primary data server.

❖ Creating and initializing a Replication Agent instance

1 Execute the resource file to create the Replication Agent instance.
After the resource file has been validated as described in “Configuring and validating the Replication Agent resource file” on page 26, use the ra_admin utility to create the Replication Agent instance using the -r parameter, for example:

```
%SYBASE%\RAX-15_2\bin\ra_admin -r myra.rs
```

Execution results are returned as one of the following:

- Response-file processing completed
- Response-file processing completed with errors

See the Replication Agent Administration Guide.

2 If your resource file set initialize_instance to no, start the Replication Agent instance.
   a Change to the directory containing your Replication Agent instance RUN file, for example:
   b To start the Replication Agent instance, execute the RUN file, for example:

```
RUN_myra
```

3 Use the dsedit utility to update the Replication Server sql.ini file with the Replication Agent location, and verify the connection to the Replication Agent.
   a Open a command window in the SYBASE directory of your Replication Agent installation.
   b Set the environment variables by executing the SYBASE.bat file.
   c Log in to Replication Agent:

```
isql -Usa -P -Smyra
```

Here, myra is the name of Replication Agent.

4 If your resource file set initialize_instance to no, open a new command window, log in to the Replication Agent instance, and initialize the Replication Agent instance and the primary Microsoft SQL Server database using the following Replication Agent command:

```
pdb_xlog init
```

Your Replication Agent instance is now running and has been initialized. Continue with “Verifying the Replication Agent replicating state” on page 32.
Verifying the Replication Agent replicating state

1. Enter:
   ```
   resume
   go
   ```

   If the Replication Agent successfully transfers to a replicating state, the following result is returned:

   ```
   State Action
   -----------------------------
   REPlicating Ready to replicate data.
   ```

   A returned state of `Admin` indicates that an error prevented the replicating state from being achieved. To determine the error, review the contents of the Replication Agent system log.

2. The `ra_status` command returns the state of the Replication Agent. It is good practice to verify that the Replication Agent remains in replicating state, even after the resume command executes successfully.

   To detect an error that occurred after replication start-up, execute:
   ```
   ra_status
   go
   ```

   If the Replication Agent is in replicating state, `ra_status` returns:

   ```
   State Action
   -----------------------------
   REPlicating Ready to replicate data.
   ```

   A returned state of `Admin` indicates that an error prevented the replicating state from being achieved. To determine the error, review the contents of the Replication Agent system log.

3. Validate that both primary and replicate connections are active:

   ```
   isql -Usa -P -SSAMPLE_RS
   admin who
   ```
CHAPTER 1 Setting Up Replication for Microsoft SQL Server

Note Be aware that:

- The DSI connection for the primary database connection is usually down because you are not replicating data back to the primary database.
- The Replication Agent connection, if established for the replicate database connection, is usually down, because you are not replicating data from the replicate database.

Do not proceed until admin who has similar status for threads to the following:

```
admin who
go
```

The following appears:

<table>
<thead>
<tr>
<th>Spid</th>
<th>Name</th>
<th>State</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>
<td>DSI EXEC</td>
<td>Awaiting</td>
<td>Command 101(1) SAMPLE_RS_ERSSD.SAMPLE_RS_ERSSD</td>
</tr>
<tr>
<td>9</td>
<td>DSI</td>
<td>Awaiting</td>

</tbody>
</table>
Testing replication

After you finish setting up the replication system, you can test replication.

❖ Testing replication

1. Connect to the primary Microsoft SQL Server database as a regular user, not the maintenance user. Make sure the regular user also exists in the replicate database.

2. Create a test table to replicate in the primary database:
   
   ```
   create table T1( a int, b char(10) ),
   go
   ```

3. Grant permissions to any new or existing object to be replicated in the primary database:
   
   ```
   grant all on T1 to public
   go
   ```

4. Connect to the replicate Microsoft SQL Server database as a regular user, not the maintenance user.

5. Create a test table in the replicate database:
   
   ```
   create table T1 (a int b char(10))
   go
   ```

6. Grant permissions to any new or existing object to be replicated in the replication database so that the Replication Server maintenance user can update this table:
   
   ```
   grant all on T1 to public
   go
   ```

7. Connect to the Replication Agent and run the following command to mark the table:
   
   ```
   pdb_setreptable T1, mark
   ```
After the table is marked and the Replication Agent is in a replicating state, insert test data into the test table and commit it.

By default, the work performed by the maintenance user of the primary connection is not replicated. The user ID used to insert transactions cannot be the same as the maintenance user defined in the primary connection. See “Configuring Replication Server for replication from the primary database” on page 19.

Replication Agent applies only committed transactions to a replicate database.

```
insert into T1 values (42, 'foo')
go
```

Use your preferred Microsoft SQL Server query tool to examine the replicate site for results, and compare the contents of your test table from both the primary and replicate sites.

---

**Resetting the primary Microsoft SQL Server database for replication**

In a test environment, you may occasionally need to reset the replication environment. Instead of deleting and re-creating a new Replication Agent instance, use this procedure to facilitate resetting the environment.

❖ **Resetting the primary database for replication**

1. Protect your new environment from old log information by using the following command in the Replication Agent to archive all current redo log data:

   ```
pdb_xlog move_truncpt
   ```

2. To retain marking and log device information, reinitialize the Replication Agent using `pdb_xlog init` with the `force` option, which forces the Replication Agent repository to be refreshed instead of overwritten:

   ```
pdb_xlog init, force
   ```

   **Note** If you prefer to delete and replace all the information in the Replication Agent repository, issue the `pdb_xlog remove` command followed by a normal `pdb_xlog init` command (without the `force` option).

3. Reset the locator stored in Replication Server:

   ```
isql -USAMPLE_RS_RSSD прим -PSAMPLE_RS_RSSD prim_ps
   ```
Testing replication

-SSAMPLE_RS_ERSSD -DSAMPLE_RS_ERSSD

rss_zeroitm NY, NYms5
go

The following appears:

Locator has been reset to zero.
(return status = 0)
CHAPTER 2

Setting Up Replication for Oracle

This chapter identifies the components that are required to implement a Sybase replication system for Oracle, as well as an overview of the tasks and instructions for installing and configuring a sample replication environment for Oracle.

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sybase replication system</td>
<td>37</td>
</tr>
<tr>
<td>Prerequisites</td>
<td>38</td>
</tr>
<tr>
<td>Installing replication</td>
<td>40</td>
</tr>
<tr>
<td>Configuring replication</td>
<td>51</td>
</tr>
<tr>
<td>Testing replication</td>
<td>71</td>
</tr>
</tbody>
</table>

**Note** Use the procedures in this chapter only for proof-of-concept (POC) or testing, not for production. Only basic Oracle features are addressed in the following scenario. In particular, Oracle Automatic Storage Management (ASM) and Real Application Clusters (RAC) are not addressed here. However, Replication Agent does support these features. See the *Replication Agent Primary Database Guide*.

**Sybase replication system**

These components are required to implement a Sybase replication system for Oracle:

- A primary Oracle data server
- A replicate Oracle data server
- A Replication Server
- The Replication Server Options components:
  - Replication Agent
Prerequisites

Before you begin setting up the replication system, be familiar with Oracle data servers and have an understanding of Sybase replication. In addition:

- You must have a valid license for Replication Server and Replication Server Options.
- Oracle Database 10g or 11g Enterprise Edition must be installed and configured to serve as the source (primary) database and as the target (replicate) database from which Replication Agent replicates transactions.
- Oracle JDBC thin driver for Oracle 10g for JDK 1.4 and 1.5, or for Oracle 11g for JDK 1.5 must be installed.
- TCP/IP connectivity must be available.
- Any OS patches required for Java 6.0 have been installed.
• The Replication Agent must have direct access to the Oracle online and archived redo logs.

During this procedure, Sybase recommends that you do not use Replication Server reserved words for object names and connection names. A complete list of reserved words is in the Replication Server Reference Manual.

System requirements

The target computer on which you are installing the replication components must meet the following memory and disk space requirements:

For Windows

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>380MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>512MB</td>
<td>440MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

For UNIX

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>520MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>256MB</td>
<td>700MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

For Linux

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>400MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>256MB</td>
<td>590MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

To improve performance by avoiding multiple network hops, Sybase recommends that Replication Server, ECDA for Oracle, and the target database reside on the same machine.
Installing replication components

The replication of sequences is not covered in this document. To set up sequence replication, see the Replication Agent Installation Guide and the Replication Agent Primary Database Guide.

Identifying the Sybase installation directory

Replication Agent, Replication Server, and ECDA are installed in the same base directory, which is identified by the SYBASE environment variable. Select a path on a host drive to be the recipient of the Sybase installation and configuration activities.

Accessing products from the SPDC

If you are not using installation CDs, go to the Sybase Product Download Center (SPDC) Web site to obtain replication software.

❖ Downloading the replication software

Note This procedure requires you repeat steps to download two products: Replication Server and Replication Server Options.

You must have a login ID and password to download software from the SPDC.

1. Go to SPDC at https://sybase.subscribenet.com/control/sybs/login and enter your login ID and password.
   The Product List page appears.
2. Select Replication Server.
   The high-level Product Information page appears.
3. Select Replication Server again.
   The detailed Product Information page appears.
4. Select the Replication Server software you need by primary database, version, and platform (return later to this detailed Product Information page to select Replication Server Options software).
   The Software Terms and Conditions page appears, listing countries and regions.
Either:

- Select I Agree to accept the terms without reading them, go to the Product Download Page, and continue with step 6, or
- Select your country or region to read the terms.

The software licence agreement for the software appears. Read the terms and either:

- Select I Agree to accept the terms, go to the Product Download Page, and continue with step 6, or
- Select Cancel to return to the high-level Product Information page.

The Product Download Page lists the software and documentation for the product. Select FTP Download or Advanced Download Options for the Replication Server software to download and save the compressed files to your local drive.

Note For each product, the documentation download contains installation-related documents, and the SyBooks download contains the rest of the documentation set.

Return to the detailed Product Information page that you accessed in step 3 and select the Replication Server Options software by primary database, version, and platform.

The Software Terms and Conditions page appears, listing countries and regions.

Navigate the Software Terms and Conditions pages as you did in step 5.

At the Product Download Page, select FTP Download or Advanced Download Options for the components of Replication Server Options to download and save the compressed files to your local drive:

- Replication Agent 15.2
- ECDA Options 15.0
- DirectConnect Client 15.0

Uncompress and extract all the installation images to your local drive.

Download the ECDA 15.0 ESD #3:

Installing replication components

b Select EBFs/Maintenance. If prompted, enter your MySybase user name and password.

c Select EnterpriseConnect Data Access. A list of EBFs and maintenance releases appears.

d Find the EBF containing the ECDA 15.0 ESD #3 for your platform, for example:

   EBF xxxxx: 15.0 ESD #3

Here, xxxxx is the number of the EBF containing the ECDA 15.0 ESD #3 for your platform.

e Click the Info icon to display the EBF/Maintenance report, and click the product description to download the software.

Installing Replication Agent

If Replication Agent is already installed, go to “Installing Replication Server” on page 45.

Install Replication Agent for Oracle on a server where it can directly access the Oracle online redo logs and the archived redo logs.

Installing the Replication Agent creates a directory structure containing the Replication Agent binaries, scripts, JRE, and associated files. There are no configuration steps during installation.

❖ Installing Replication Agent software

1 Use one of the following methods to install the software.
   • After following the download instructions in “Accessing products from the SPDC” on page 40, go to the location where you extracted the Replication Agent 15.2 installation image, or
   • Insert the Replication Agent CD into your CD drive.

2 Execute the setup routine.
   • For UNIX or Linux (GUI mode):
     
     ./setup

   • For Windows:
     
     setup
3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:

- For UNIX or Linux:
  
  \[./\text{setup} -\text{is:tempdir} \text{someDirectory}\]

- For Windows:
  
  \[\text{setup} -\text{is:tempdir} \text{someDirectory}\]

Here, \text{someDirectory} is a directory with at least 100MB of disk space that the installation program can use.

\textbf{Note} If you are installing from a remote machine and do not have an X-Windows client, execute \text{./setup} –\text{console}, to run in console mode.

4 On the Welcome window, click Next.

5 Select a geographic location that displays the license agreement. Select I Agree, and click Next.

6 Enter the directory where you want to install Replication Agent:

- If the directory does not exist, the installation program prompts you to create it. Click Yes.

- If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Typical for the installation setup type, and click Next.

8 The installation program displays a summary of what is to be installed. Click Next.

9 The installation program starts to install Replication Agent, displaying the progress status. If you see the following message;

\[\text{There are newer files already installed and do you want to replace them?}\]

Click No to All.

10 When you receive a message that the installation was successful, click Next.

11 The SySAM License Server window opens and displays this prompt:

\[\text{Will licenses be obtained from the License Server?}\]
Respond based on how you set up your environment and use the license obtained from the Software Product Download Center (SPDC) Web site for Replication Server Options, and click Next.

12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. At the SySAM notification window, do one of the following:

- Select Yes and either accept the default values that are supplied, or enter values for the following:
  - SMTP server host name
  - SMTP server port number
  - Sender e-mail address
  - Recipient e-mail address
  - Message severity level of an event that triggers an e-mail message. Your choices are:
    - Informational
    - Warning
    - Error
- If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 When you receive a message indicating that Replication Agent was successfully installed, click Finish.

See the Replication Agent Installation Guide.

- **Verifying the installation**
  1. Change to the directory where you installed Replication Agent.
  2. Set the environment variables by sourcing the SYBASE.csh file (UNIX or Linux) or by executing the SYBASE.bat file (Windows).
  3. Change to $SYBASE/RAX-15_2/bin (UNIX or Linux) or %SYBASE%\RAX-15_2\bin (Windows).
  4. Obtain the Replication Agent version string.
     - For UNIX or Linux:
CHAPTER 2 Setting Up Replication for Oracle

Quick Start Guide

.../ra.sh -v

• For Windows:
  ra -v

If Replication Agent installs successfully, you see the Sybase copyright and the Replication Agent version string.

Installing Replication Server

If Replication Server is already installed, go to “Installing ECDA Option for Oracle” on page 48.

While installing Replication Server:

• Allocate a disk partition of at least 20MB for each Replication Server you are installing. You can add more partitions later, if necessary. Check each partition to make sure it is available and has write permissions.

• Allocate the entire partition to the Replication Server. If you allocate only a portion of the partition to Replication Server, you cannot use the remainder for any other purpose.

❖ Installing Replication Server

1 Use one of the following methods to download Replication Server software.

  • After following the download instructions in “Accessing products from the SPDC” on page 40, go to the location where you extracted the Replication Server 15.2 installation image, or

  • Insert the Replication Server CD in your CD drive.

2 Execute the setup routine.

  • For UNIX or Linux (GUI mode):
    ./setup

  • For Windows:
    setup

3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:

  • For UNIX or Linux:
Installing replication components

```
./setup -is:tempdir someDirectory
```

- For Windows:
  ```
  setup -is:tempdir someDirectory
  ```

Here, `someDirectory` is a directory with at least 100MB of disk space that the installation program can use.

4 On the Welcome window, click Next.

5 Select a geographic location that displays the license agreement. Select I agree, and click Next.

6 Enter the directory where you want to install Replication Server:
   - If the directory does not exist, the installation program prompts you to create it. Click Yes.
   - If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Typical for the installation setup type, and click Next.

8 The installation program displays a summary of what is to be installed. Click Next.

9 The installation program starts to install Replication Server, displaying the progress status. You may see the following message,

   There are newer files already installed and do you want to replace them?

Click No to All.

10 When you receive a message indicating that Replication Server software has successfully installed, click Next.

**Note** This procedure uses the SAMPLE_RS Replication Server.

11 The SySAM License Server window opens and displays this prompt:

   Will licenses be obtained from the License Server?

Respond based on how you set up your environment and use the license obtained from the Software Product Download (SPDC) Web site for Replication Server.

Click Next.
12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. Select Yes, and either accept the default values that are supplied, or enter values for the following:

- SMTP server host name
- SMTP server port number
- Sender e-mail address
- Recipient e-mail address
- Message severity level of an event that triggers an e-mail message. Your choices are:
  - Informational
  - Warning
  - Error

If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 To start a sample Replication Server, select Yes, and click Next.

14 This information appears and should be recorded:

This page contains detailed information regarding the sample Replication Server. Please record this information.

The sample Replication Server will be called SAMPLE_RS and will run on port 11752. It will be configured with a user of sa and no password.

The sample Replication Server will use an embedded RSSD called SAMPLE_RS_ERSSD that runs on port 11751. It will be configured with a user of SAMPLE_RS_RSSD_prim and a password of SAMPLE_RS_RSSD_prim_ps.

The installer has updated the appropriate interfaces file or sql.ini file.

All files and logs associated with the sample Replication Server will be located in the directory <samp_repserver>.
The sample Replication Server will be configured using the file `<SAMPLE_RS.res>`.

Here, `<samp_repserver>` and `<SAMPLE_RS.res>` are paths to the sample Replication Server and sample Replication Server configuration file, respectively.

Click Next.

15 When the sample Replication Server is running and an “Installation was successful” message appears, click Finish.

**Verifying the installation**

1 Change to the directory where you installed Replication Server.

2 Set the environment variables by sourcing the `SYBASE.csh` file (UNIX or Linux) or by executing the `SYBASE.bat` file (Windows).

3 Log in to Replication Server:

   `isql -Usa -P -SSAMPLE_RS`

4 Verify the Replication Server version:

   `admin version go`

5 Exit the `isql` session with the `quit` command.

**Installing ECDA Option for Oracle**

If ECDA Option for Oracle is already installed, go to “Configuring replication components” on page 51.

When installing ECDA for Oracle, install ECDA on the same server as the replicate database. This eliminates a network hop and improves performance.

**Installing ECDA for Oracle in GUI mode**

**Note** To install using the console mode or a response file, see the *ECDA Installation Guide* for Linux and UNIX.

1 Use one of the following methods to download the software:

   - After following the download instructions in “Accessing products from the SPDC” on page 40, go to the location where you extracted the ECDA Option for Oracle 15.0 installation image.
2 Launch InstallShield by executing the setup routine.
   • For UNIX or Linux:
     /setup
   • For Windows:
     setup

3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:
   • For UNIX or Linux:
     ./setup -is:tempdir someDirectory
   • For Windows:
     setup -is:tempdir someDirectory

   Here, _someDirectory_ is a directory with at least 100MB of disk space that the installation program can use.

4 On the Welcome window, click Next.

5 Select a geographic location that displays the license agreement. Select I agree, and click Next.

6 Enter the directory where you want to install ECDA:
   • In the destination directory, enter the base directory identified by the SYBASE environment variable. Click Yes to install over an existing directory.
   • If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Custom setup, and click Next.

8 Unselect ECDA Option for ODBC, and click Next.

9 Verify the modules to install. Click Next.

   You may receive a message:

   "There are newer files already installed and do you want to replace them"

   Click No to All.
10 When you receive a message that the installation was successful, click Next.

11 The SySAM License Server window opens and displays this prompt:

Will licenses be obtained from the License Server?

Respond based on how you set up your environment, and use the license obtained from the Software Product Download Center (SPDC) Web site for Replication Server Options.

Click Next.

12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. Select Yes and either accept the default values that are supplied, or enter values for the following:

- SMTP server host name
- SMTP server port number
- Sender e-mail address
- Recipient e-mail address
- Message severity level of an event that triggers an e-mail message.

Your choices are:

- Informational
- Warning
- Error

If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 When you receive a message indicating that ECDA was successfully installed, click Finish.

ECDA, including the DirectConnect server, is installed.

14 Apply the ECDA 15.0 ESD #3:

a Extract the tgz or zip file for the ECDA 15.0 ESD #3 that you downloaded in “Downloading the replication software” on page 40.

b Go to the directory into which you extracted the zip file.
c Install the ECDA 15.0 ESD #3 in the same way that you installed ECDA earlier in this procedure.

Configuring replication components

This section describes the tasks you must perform to configure each of the replication component in the replication system.

Configuring ECDA Option for Oracle

Configuring ECDA Option for Oracle involves:

1 Configuring and starting the DirectConnect server
2 Creating a maintenance user for replication

Configuring and starting the DirectConnect server

Before you begin to create and configure the DirectConnect server, make sure that:

- You have made a copy of the existing tnsnames.ora file, currently being used to connect to Oracle, and have placed it in a temporary file location.

Note You can connect to an Oracle data server without using the tnsnames.ora configuration file. However, the ECDA Option for Oracle requires the tnsnames.ora file to contain connection information.

- The Oracle connect string is available.
- The name for a valid Oracle account, which is used as the administrator for the DirectConnect server, is available. This account must not be one used for Oracle administration (the login must not require the as SYSDBA clause at login).
- The number of the unused port to be used by the DirectConnect server is available.
Configuring and starting the DirectConnect Server

1. Start the Create Server wizard, navigate to the 
   $SYBASE/DCO-15_0/DCWizard (UNIX or Linux) or 
   %SYBASE%\DCO-15_0\DCWizard (Windows) directory, and execute the 
   DCWizard script.

   The Welcome Create Server wizard appears. Click Next.

2. Select ECDA Option for Oracle. Click Next.

3. Enter the replicate Oracle server name for the new DirectConnect server 
   and the port number that you want the server to listen on. Click Next.

4. Enter a valid Admin Account name. Click Next.

5. Enter the replicate Oracle connection string as previously defined in the 
   tnsnames.ora file, and the path (including the file name) to the previously 
   defined temporary location of the tnsnames.ora file. Click Next.

6. Verify the DirectConnect server information. If correct, select Create 
   Server otherwise, click Back to return to the previous window and provide 
   the correct information.

7. Verify that the DirectConnect configuration is successful. If yes, click 
   Next otherwise, click Back to return to the previous window, provide the 
   correct information, and re-create the server.

8. In the Start DirectConnect Server window, click Start ecda_servername to 
   start the newly configured DirectConnect server, where ecda_servername 
   is the server name you indicated for the new DirectConnect server.

9. Verify that the DirectConnect server has started successfully, and click 
   Finish.

Verifying that you can connect to Oracle

1. Open a command window in the $SYBASE (UNIX or Linux) or 
   %SYBASE% (Windows) directory of your ECDA installation.

2. Change to the $SYBASE/DCO-15_0 (UNIX or Linux) or 
   %SYBASE%\DCO-15_0 (Windows) directory.

3. Set the environment variables by sourcing the 
   $SYBASE/DCO_SYBASE.csh file (UNIX or Linux) by or executing the 
   %SYBASE%\DCO_SYBASE.bat file (Windows).

4. Log in to the replicate Oracle server through the DirectConnect server:

   ```
   isql -U validuser -P password -S DCOServer
   ```
Here, validuser and password are any valid user and password, and DCOServer is the DirectConnect for Oracle server name.

5 Verify the connection to the replicate Oracle database:

```sql
select banner from v$version
```

```
go
```

```
BANNER
-----------------------------------------------
Oracle Database 10g Enterprise Edition Release 10.2.0.1.0 - Prod
PL/SQL Release 10.2.0.1.0 - Production
CORE 10.2.0.1.0 Production
TNS for Solaris Version 10.2.0.1.0 - Production
NLSRTL Version 10.2.0.1.0 - Production
(5 rows affected)
```

6 Exit the isql session with the quit command.

Creating a maintenance user for replication

The maintenance user is a valid Oracle user that the Replication Server uses to apply commands to the replicate Oracle database. Replication Server requires one maintenance user to be defined for each connection. Do not use the same name as the DCO Admin Account Name used in configuring the DirectConnect server.

❖ Creating a maintenance user in Oracle

1 Use SQLPLUS to connect to the replicate database, and enter:

```sql
create user maintuser identified by password;
```

2 Grant dba and create session permissions to the maintenance user, who must have permission to issue SQL commands against any table to be replicated:

```sql
grant dba to maintuser;
grant create session to maintuser;
exit SQLPLUS;
```

Configuring Replication Server

Configuring Replication Server includes:

1 Configuring Replication Server for replication to the target data server
2 Configuring Replication Server for replication from the primary database

Configuring Replication Server for replication to the target data server

❖ Creating a Replication Server connection

1 Navigate to the $SYBASE/RAX-15_2/scripts/oracle (UNIX or Linux) or %SYBASE%/RAX-15_2/scripts/oracle (Windows) directory.

2 Make a copy of the oracle_create_rs152_standby_connection.sql script named my_oracle_create_rs152_standby_connection.sql.

3 Before executing the my_oracle_create_rs152_standby_connection.sql script against your Replication Server, change all occurrences of value \{rds\}.\{rdb\} to the name of the connection that Replication Server uses to connect to DirectConnect server, where:

   •  \textit{rds} is the DirectConnect server name.

   •  \textit{rdb} is any valid identifier. Sybase recommends that you use the Oracle SID name.

   •  \textit{rs\_maint\_user} and \textit{rs\_maint\_user\_pwd} are the maintenance user and password created in ECDA Option for Oracle, in step 2 of “Configuring ECDA Option for Oracle” on page 51.

   •  \textit{maintuser} and \textit{password} are the user name and password created in ECDA Option for Oracle.

   For example:

   
   ```sql
   create connection to DCOServer.oratest2
   using profile rs_oracle_to_oracle;standard
   set username to maintuser
   set password to "password"
   go
   ```

   \textbf{Note}  In the above example, \textit{password} is a RepServer reserved word and therefore, must be enclosed in double quotes.

4 Create the connection to the replicate database:

   ```sql
   isql -Usa -P -SSAMPLE_RS -i
   my_oracle_create_rs152_standby_connection.sql
   ```

5 Log in to SAMPLE_RS and verify the Replication Server connection to the replicate database:
isql -Usa -P -SSAMPLE_RS
admin who
go

You should see a message returned for the DSI connection \{rds\}.\{rdb\}. Verify that the status is “Awaiting Message” or “Awaiting Command.”

Exit the isql session with the quit command.

**Configuring Replication Server for replication from the primary database**

This section describes the configuration steps required for replication from the primary database. It includes:

- Creating a Replication Server connection to the primary database
- Creating a database replication definition
- Creating the database replication subscription

❖ **Creating a Replication Server connection to the primary database**

1. Go to the $SYBASE/RAX-15_2/scripts/oracle (UNIX or Linux) or %SYBASE%\RAX-15_2\scripts/oracle directory (Windows).

2. Make a copy of the oracle_create_rs_primary_connection.sql script named my_oracle_create_rs_primary_connection.sql.

3. Before executing the my_oracle_create_rs_primary_connection.sql script against your Replication Server, change all occurrences of value \{pds\}.\{pdb\} to the name of the Replication Server connection used for the connection from Replication Agent for Oracle, where:
   - \pds\ is the name of the Oracle server.
   - \pdb\ is the Oracle System ID (SID).

   For example, NY.NYora92.

   **Note** Save these values to be used later for the rs_source_ds and rs_source_db parameters in the Replication Agent oracle.rs file.

4. Change \sys\ and \sys_pwd\ to the user ID and password of the Oracle user who must have permission to apply DML operations against all user tables to be replicated, where:
   - \sys\ is the user ID of the Oracle user (sys).
Configuring replication components

- `sys_pwd` is the password of the Oracle user (change_on_install).

**Note** This user must be a valid user in the Oracle database.

The following example creates a Replication Server connection to the primary database:

```sql
create connection to NY.NYora92
set error class rs_sqlserver_error_class
set function string class rs_oracle_function_class
set username sys
set password change_on_install
with log transfer on, dsi_suspended
go
```

5 Execute the script in Replication Server:

```
isql -Usa -P -SSAMPLE_RS -i my_oracle_create_rs_primary_connection.sql
```

A message appears that indicates the Replication Server connection to the primary database has been created.

❖ Creating the database replication definition

1 Navigate to the `$SYBASE/RAX-15_2/scripts/sybase` (UNIX or Linux) or `%SYBASE%\RAX-15_2\scripts\sybase` (Windows) directory.

2 Make a copy of the `rs_create_db_repdef.sql` script named `my_rs_create_db_repdef.sql`.

3 Before executing the `my_rs_create_db_repdef.sql` script, change all occurrences of value `{pds}.{pdb}` to the name of the connection string you defined for the primary database, where:

- `pds` is the name of the Oracle server.
- `pdb` is the Oracle System ID (SID).

For example, `NY.NYora92`.

**Note** Save these values to be used later for the `rs_source_ds` and `rs_source_db` parameters in the Replication Agent `oracle.rs` file.

This is a database replication definition example:

```sql
create database replication definition NY_replef1
with primary at NY.NYora92
replicate DDL
go
```
4 Connect to the Replication Server and enter:

```sql
isql -Usa -P -SSAMPLE_RS -i my_rs_create_db_repdef.sql
```

A message appears that indicates the database replication definition has been created.

❖ **Creating the database replication subscription**

1 Make a copy of the `rs_create_db_sub.sql` script named `my_rs_create_db_sub.sql`.

2 Before executing the `my_rs_create_db_sub.sql` script, change all occurrences of value `{pds}.{pdb}` and `{rds}.{rdb}` to the appropriate connection name, where:
   - `pds` is the name of the Oracle server.
   - `pdb` is the Oracle System ID (SID).
   - `rds` is the DirectConnect server name
   - `rdb` is any valid identifier. Sybase recommends that you use the Oracle SID.

   Note: Save the values of `pds` and `pdb` to be used later for the `rs_source_ds` and `rs_source_db` parameters in the Replication Agent `oracle.rs` file.

Here is an example of create database replication subscription:

```sql
create subscription NY_sub1
for database replication definition NY_repdef1
with primary at NY.NYora92
with replicate at DCOServer.oratest2
without materialization
```

3 Connect to Replication Server and execute:

```sql
isql -Usa -P -SSAMPLE_RS -i my_rs_create_db_sub.sql
```

A message appears that indicates the subscription is being created.

**Configuring Replication Agent**

Configuring Replication Agent involves:

1 Configuring and verifying the primary Oracle database for replication
Configuring and verifying the primary Oracle database for replication

Before you install Replication Agent, configure the primary Oracle database for replication.

To ensure that the Oracle redo log data is not overwritten before it is read by the Replication Agent:

- Verify the current archive setting of the redo logs.
- Verify the supplemental logging of primary key data.
- For Oracle 10g and 11g, verify that the flashback feature is disabled.
- Create an Oracle user and grant Oracle permissions.

Verifying the current archive setting of the redo logs

Redo logs are used by Oracle to maintain a log infrastructure. The steps described below verify that the feature is turned on and, if not, indicate how to switch on the redo logging. Turn this feature on only in the primary database.

1. Use SQLPLUS to connect to Oracle as a system administrator.
2. From SQLPLUS, run this command:

   ```sql
   select log_mode from v$database;
   ```

   - If the archive log is on, the result should be:

     ```
     LOG_MODE
     -------
     ARCHIVELOG
     ```

3. To turn on log archiving:

   ```
   shutdown;
   startup mount;
   alter database archivelog;
   alter database open;
   ```

See the Replication Agent Primary Database Guide.
Verifying the supplemental logging of primary key data

By default, Oracle does not log primary keys and unique indexes to its logging infrastructure. For successful replication of all table values, you must log these values. To verify whether this information is currently being recorded in the logging system:

1. Use SQLPLUS to connect to Oracle as a system administrator by running the following command from SQLPLUS:

   ```sql
   SELECT SUPPLEMENTAL_LOG_DATA_MIN,
          SUPPLEMENTAL_LOG_DATA_PK,
          SUPPLEMENTAL_LOG_DATA_UI
   FROM V$DATABASE;
   ```

   If logging of primary key and unique index values is enabled, the return values are:

   ```
   SUP SUP SUP
   --- --- ---
   YES YES YES
   ```

2. If the result is different, turn on supplemental logging by executing these commands:

   ```sql
   ALTER DATABASE ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY, UNIQUE INDEX) COLUMNS;
   ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
   ```

Verifying that the Oracle 10g flashback feature is disabled

1. Use SQLPLUS to connect to Oracle as a system administrator with sysdba privileges.

2. View the current recycle bin configuration:

   ```sql
   select value from v$parameter
   where name = 'recyclebin';
   ```

3. View the contents of the recycle bin:

   ```sql
   select * from dba_recyclebin;
   ```

4. Disable the recycle bin:

   ```sql
   PURGE dba_recyclebin;
   ALTER SYSTEM SET recyclebin = OFF;
   ```

Note: If you are using Oracle RAC, disable the recycle bin for each instance in the cluster. For information about Replication Agent support for Oracle RAC, see the Replication Agent Primary Database Guide.
Creating an Oracle user and grant permissions

An Oracle database user must be created for use by Replication Agent when connected to the primary database.

Note Permission to grant access to objects owned by “SYS” may require the command to be executed by an Oracle user with sysdba privileges.

1 Use SQLPLUS to connect to the primary database as a system administrator and run the following commands to create an Oracle user named “RA_USER” with the password “sybase,” and grant permissions to the user:

```sql
CREATE USER RA_USER PROFILE "DEFAULT" IDENTIFIED BY "sybase" DEFAULT TABLESPACE "USERS" ACCOUNT UNLOCK;
GRANT "CONNECT" TO RA_USER;
GRANT "RESOURCE" TO RA_USER;
GRANT "SELECT_CATALOG_ROLE" TO RA_USER;
GRANT ALTER SESSION TO RA_USER;
GRANT ALTER SYSTEM TO RA_USER;
GRANT EXECUTE ON "SYS"."DBMS_FLASHBACK" TO RA_USER;
GRANT ALTER ANY PROCEDURE TO RA_USER;
GRANT CREATE SESSION TO RA_USER;
GRANT CREATE TABLE TO RA_USER;
GRANT ALTER ANY TABLE TO RA_USER;
GRANT DROP ANY TABLE TO RA_USER;
GRANT CREATE PROCEDURE TO RA_USER;
GRANT DROP ANY PROCEDURE TO RA_USER;
GRANT CREATE PUBLIC SYNONYM TO RA_USER;
GRANT DROP PUBLIC SYNONYM TO RA_USER;
GRANT SELECT ON SYS.OBJ$ TO RA_USER;
GRANT SELECT ON SYS.LOB$ TO RA_USER;
GRANT SELECT ON SYS.COLLECTION$ TO RA_USER;
GRANT SELECT ON SYS.CONS$ TO RA_USER;
GRANT SELECT ON SYS.COLTYPES$ TO RA_USER;
GRANT SELECT ON SYS.COLS$ TO RA_USER;
GRANT SELECT ON SYS.CDEFS$ TO RA_USER;
GRANT SELECT ON SYS.NAPS$ TO RA_USER;
GRANT SELECT ON SYS.TSS$ TO RA_USER;
GRANT SELECT ON SYS.USER$ TO RA_USER;
GRANT SELECT ON SYS.SEQS$ TO RA_USER;
GRANT SELECT ON SYS.INDS$ TO RA_USER;
GRANT SELECT ON SYS.TABS$ TO RA_USER;
GRANT SELECT ON SYS.TABPART$ TO RA_USER;
```
2 If you intend to replicate Oracle partitioned tables or partitioned large objects (LOBs), grant select privileges to the user ID specified by `pds_username` on certain system tables. See the Replication Agent Primary Database Guide.

❖ Verifying the Oracle user roles created by the Replication Agent

- As described in the previous section, the following Oracle commands can be issued to validate the required Oracle settings.

  Use SQLPLUS to run the following command as the new Oracle user:

  ```sql
  select GRANTED_ROLE from USER_ROLE_PRIVS;
  GRANTED_ROLE
  ---------------------
  CONNECT
  RESOURCE
  SELECT_CATALOG_ROLE
  ```

  In addition, the user who starts the Replication Agent instance must have read access to the Oracle redo log files and the Oracle archive directory that contains the archive log files to be accessed for replication. If the Replication Agent is configured to remove old archive files, the user must have update authority to the directory and the archive log files.

Creating the Replication Agent instance

A single installation of the Replication Agent can support replication from multiple databases, however, one Replication Agent instance is needed for each Oracle database that is to be replicated.
Preparing the Replication Agent instance

1. Obtain the Oracle JDBC driver from Oracle and update the CLASSPATH environment variable.

   To find the JDBC connection that communicates with the primary Oracle instance, locate the JDBC driver that was available when the Oracle release was originally created, usually found at:

   `$ORACLE_HOME/jdbc/lib/ojdbc14.jar`

   Replication Agent may require a newer version of the JDBC driver, which you can obtain from at http://technet.oracle.com/software/tech/java/sqlj_jdbc/content.html.

2. Add the JDBC driver to the CLASSPATH environment variable. For example, you can append the existing CLASSPATH to the new JDBC driver and add the following command to the .login script of a UNIX and Linux user:

   ```sh
   setenv CLASSPATH /path_name/ojdbc14.jar:$CLASSPATH
   ```

   For a Windows user, add the following to the CLASSPATH environment variable:

   ```sh
   set CLASSPATH=path_name\jdbc\lib\ojdbc14.jar;%CLASSPATH%
   ```

3. Record the location of the `tnsnames.ora` file and record the connection name from that file for the Replication Agent to use to connect to the Oracle primary database. You can find these values from any machine where an Oracle SQLPLUS session can be used to connect to the desired Oracle instance. The ORACLE_SID is from the environment variable, `$ORACLE_SID`.

   Obtain host and port information from the file called `tnsnames.ora`, available at `SORACLE_HOME/network/admin` (UNIX or Linux) or `%ORACLE_HOME%\network\admin` (Windows).

   Record the following:

   - Host name of the Oracle database on which the TNS listener is operating
   - Port number the TNS listener is monitoring
   - ORACLE_SID value for the instance you want to connect to
4 (Optional) If your operating system has a Java 6.0.x-compatible JRE or JDK installed, you can use the Oracle iSQL (the browser-based interface to SQL*PLUS) demo items to connect to Oracle using the JDBC driver and to verify the connection information.

To perform this validation, see “Verifying a JDBC Client Installation” in the Oracle JDBC Developer's Guide and Reference Guide.

5 Obtain a local copy of the Oracle timezone file, so Replication Agent can correctly process the Oracle timestamp with the timezone datatype.

**Note** This step is required only if the Replication Agent is on a machine (host) other than the Oracle host and does not have access to the Oracle timezone file.

There are two timezone files in the $ORACLE_HOME/oracore/zoneinfo (UNIX or Linux) or %ORACLE_HOME%/oracore\zoneinfo (Windows) directory:

- The timezone.dat binary file is the default file that contains the most commonly used time zones.
- The timezlr.dat binary file contains a larger set of defined time zones.

The Oracle instance uses the timezone file from the ORA_TZFILE environment variable. If ORA_TZFILE is not set, use the default timezone file.

Determine which timezone file is used by the primary Oracle instance and make a copy of that file available on the machine hosting the Replication Agent.

**Note** These files are Oracle version- and platform-dependent. You cannot use a timezone file from a little-endian platform on a big-endian platform, nor can you use a timezone file from a version of Oracle that is different than the version of the primary Oracle.

6 Locate the Replication Agent for Oracle resource file template.

The majority of configuration values required to create and initialize a Replication Agent can be recorded and stored in a resource file. Using a resource file provides a means to record or retain the configuration information for a Replication Agent instance, allowing an instance to be removed and re-created.
Configuring replication components

The resource file template (oracle.rs) is in the Replication Agent directory $SYBASE/RAX-15_2/init (UNIX or Linux) or %SYBASE%/RAX-15_2/init (Windows).

7 Create an instance resource file:

Copy the resource file template $SYBASE/RAX-15_2/init/oracle.rs (UNIX or Linux) or %SYBASE%/RAX-15_2/init/oracle.rs (Windows) to another file that contains the configuration information for a new instance, for example, myra.rs.

Change the values assigned to properties in the resource file so they match the values required for your environment. The majority of these values are tnsname location, user, and password information for the Oracle, Replication Server, and RSSD connections.

- Set the value of rs_source_ds to the value you chose for pds in previous procedures.
- Set the value of rs_source_db to the value you chose for pdb in previous procedures.

The resource file is self-documenting, with each parameter described. See the Replication Agent Administration Guide. For a complete list of configuration parameters, see the Replication Agent Reference Manual.

**Warning!** The rs_source_ds and the rs_source_db values must match the {pds,pdb} values of your Replication Server primary connection name that you configured in step 3, in “Creating a Replication Server connection to the primary database” on page 55.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example values</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance name</td>
<td>Any valid name.</td>
<td>myra</td>
</tr>
<tr>
<td>admin_port</td>
<td>Port number that Replication Agent uses.</td>
<td>9030 (if in use, select a different port number)</td>
</tr>
<tr>
<td>pds_tns_connection</td>
<td>Connection name found in the tnsnames.ora file which identifies the connection information for the primary database.</td>
<td>ORA102.JDOE_HOST.COM</td>
</tr>
</tbody>
</table>

**Note** To be used with pds_tns_filename, only if you have not set pds_host_name and pds_port_number.
### Parameter Description Example values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example values</th>
</tr>
</thead>
<tbody>
<tr>
<td>pds_tns_filename</td>
<td>File name identifying the Oracle tnsnames.ora file to be used to identify the connection information for the primary database.</td>
<td>A valid Oracle tnsnames.ora file. For example: <code>/opt/oracle/network/admin/tnsnames.ora</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> To be used with pds_tns_connection, only if you have not set pds_host_name and pds_port_number.</td>
<td></td>
</tr>
<tr>
<td>pds_username</td>
<td>User ID that Replication Agent uses to access primary data server.</td>
<td>RA_USER</td>
</tr>
<tr>
<td>pds_password</td>
<td>Password for pds_username.</td>
<td>sybase</td>
</tr>
<tr>
<td>rs_host_name</td>
<td>Machine where Replication Server is installed.</td>
<td>jdoe_host1</td>
</tr>
<tr>
<td>rs_port_number</td>
<td>Port where Replication Server is installed.</td>
<td>11752</td>
</tr>
<tr>
<td>rs_username</td>
<td>Replication Server user with CONNECT SOURCE and CREATE OBJECT capabilities.</td>
<td>SAMPLE_RS_ra</td>
</tr>
<tr>
<td>rs_password</td>
<td>Password for rs_username.</td>
<td>SAMPLE_RS_ra_ps</td>
</tr>
<tr>
<td>rs_charset</td>
<td>Character set that Replication Server is using.</td>
<td>• Windows: cp850&lt;br&gt;• UNIX: iso_1</td>
</tr>
<tr>
<td>rs_source_ds</td>
<td>Valid name representing data server of Oracle primary database.</td>
<td>NY</td>
</tr>
<tr>
<td>rs_source_db</td>
<td>Valid name representing Oracle primary database.</td>
<td>NYora92</td>
</tr>
<tr>
<td>rssd_host_name</td>
<td>Machine where RSSD resides.</td>
<td>jdoe_host1</td>
</tr>
<tr>
<td>rssd_port_number</td>
<td>Port number where RSSD resides.</td>
<td>11751</td>
</tr>
<tr>
<td>rssd_database_name</td>
<td>Database name for RSSD.</td>
<td>SAMPLE_RS_ERSSD</td>
</tr>
<tr>
<td>rssd_username</td>
<td>Valid user for RSSD.</td>
<td>SAMPLE_RS_RSSD_maint</td>
</tr>
<tr>
<td>rssd_password</td>
<td>Password for rssd_username.</td>
<td>SAMPLE_RS_RSSD_maint_ps</td>
</tr>
<tr>
<td>pdb_timezone_file</td>
<td>Path to the pdb_timezone_file directory that contains the archive redo log files.</td>
<td><code>/software/oracle/Ora10g/oracore/zoneinfo/timezone.dat</code></td>
</tr>
<tr>
<td>start_instance</td>
<td>Start the instance that was created.</td>
<td>yes</td>
</tr>
<tr>
<td>initialize_instance</td>
<td>Initialize the Replication Agent instance.</td>
<td>yes</td>
</tr>
</tbody>
</table>

---

**Quick Start Guide**

65
## Configuring replication components

### Create and execute the new instance resource file:

- **Note**: Be sure your CLASSPATH environment variable points to the correct Oracle JDBC driver before proceeding.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example values</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdb_include_archives</td>
<td>Enables or disables the use of Oracle archive log files.</td>
<td>USE_DEFAULT</td>
</tr>
<tr>
<td>pdb_archive_path</td>
<td>Identifies directory path where Replication Agent expects to find archived Oracle redo log files.</td>
<td>A valid directory path on the machine hosting Replication Agent that points to a location where Oracle puts the archived redo log files</td>
</tr>
</tbody>
</table>

8. Create and execute the new instance resource file:

- **Note**: Be sure your CLASSPATH environment variable points to the correct Oracle JDBC driver before proceeding.

  a. Validate the settings in the resource file using the `-vr` parameter.

     - On UNIX or Linux:
       ```bash
       $SYBASE/RAX-15_2/bin/ra_admin.sh -vr myra.rs
       ```
     - On Windows:
       ```bash
       %SYBASE%\RAX-15_2\bin\ra_admin.bat -vr myra.rs
       ```

     Here, `myra.rs` is the path and name of the resource file. Validation results are returned as one of the following:

     - Response-file processing completed
     - Response-file processing completed with errors

     If any validation fails, the `ra_admin` utility returns an error message and information about the failure. You can repeat the validation process as many times as necessary until it executes without error. No entities are changed or created.

  b. After the resource file has been validated, allow the `ra_admin` utility to create and configure the Replication Agent instance, using the `-r` parameter.

     - On UNIX or Linux:
       ```bash
       $SYBASE/RAX-15_2/bin/ra_admin.sh -r myra.rs
       ```
     - On Windows:
       ```bash
       %SYBASE%\RAX-15_2\bin\ra_admin.bat -r myra.rs
       ```
Here, *myra.rs* is the path and name of the resource file.

**Note** If, in your response file, you set `start_instance` to `yes`, your instance is also running. If you set `initialize_instance` to `yes`, your instance is also initialized.

c Results are returned as either:
- Response-file processing completed
- Response-file processing completed with errors

See the *Replication Agent Administration Guide*.

9 If in your resource file you set `start_instance` to `yes` and the log indicates that the Replication Agent instance was started, skip this step, and continue with the next section.

Change to the instance directory and run Replication Agent in the background.
- On UNIX or Linux:
  
  ```
  cd $SYBASE/RAX-15_2/myra
  ```
- On Windows:
  
  ```
  cd %SYBASE%\RAX-15_2\myra
  ```

Execute the *RUN* file in the background.

Your Replication Agent for Oracle is now running.

**Verify the Replication Agent instance**

This section describes how to verify a Replication Agent instance, which includes:

1 Update the Replication Server *interfaces* (UNIX or Linux) or *sql.ini* (Windows) file with the Replication Agent location.

2 Verify the connection to the Replication Agent.

3 Verify the Replication Agent connection to Oracle.
Verifying the Replication Agent

1. Use dsedit to update the Replication Server interfaces (UNIX or Linux) or sql.ini (Windows) file to include an entry for the Replication Agent location.

   Note: You can use any Tabular Data Stream (TDS) client utility (sql, sqlApp, or SQLAdvantage) that you prefer.

2. Verify the connection to the Replication Agent:
   a. Open a command window in the $SYBASE (UNIX or Linux) or %SYBASE% (Windows) directory of your Replication Agent installation.
   b. Set the environment variables by sourcing the SYBASE.csh file (UNIX or Linux) or by executing the SYBASE.bat file (Windows).
   c. Log in to Replication Agent:
      
      isql -Usa -P -S

      Note: The following verification steps are optional because they were performed when you verified the resource file.

3. Verify the Replication Agent connection to Replication Server:
   a. Enter:
      
      test_connection RS
      go
   b. The following appears:
      
      Type Connection
      ------- ********
      RS     succeeded
      (1 row affected)
   c. If the result indicates a failure, either the server is not responding or the connection properties (host, port, user, or password) are incorrect.
      Verify the host and port configuration values, and manually log in to the Replication Server as the configured user to determine which property is incorrectly defined.
      See the Replication Agent Administration Guide.

4. Verify the Replication Agent connection to the primary Oracle database:
CHAPTER 2 Setting Up Replication for Oracle

a Enter:

```
test_connection PDS
go
```

This message appears:

```
Type Connection
----- ----------
PDS succeeded
(1 row affected)
```

b If the result indicates a failure:

- The server is not responding, or
- One of the connection properties is incorrect.

Check the `tnsnames.ora` file and `tnsnames` configuration values, and manually log in to the primary Oracle database as the configured user to find which property is incorrectly defined.

See the *Replication Agent Administration Guide* section titled, “Testing network connectivity.”

**Initializing the Replication Agent instance**

❖ Initializing the Replication Agent instance

1 **Note** If in your resource file you set `initialize_instance` to yes and no errors were received during the creation of the instance, skip this step.

The `pdb_xlog init` command verifies that the primary Oracle database is correctly configured to provide archived logging and supplemental logging, and that the Oracle user ID used by the Replication Agent has the necessary permissions. In addition to creating objects in the database to support stored procedure replication, the `pdb_xlog init` command also initializes the Replication Agent System Database (RASD) by reading schema information, and redo log location information from the primary Oracle database.

To initialize the Replication Agent instance, run:

```
pdb_xlog init

go
```

A message appears, indicating that the procedure was successful.
Enter:

```
resume
go
```

If the Replication Agent successfully transfers to a replicating state, the following result is returned:

```
State Action
-------------------------
REPLICATING Ready to replicate data.
```

A returned state of ADMIN indicates that an error prevented the replicating state from being achieved. To determine the error, review the contents of the Replication Agent system log.

3 The `ra_status` command returns the state of the Replication Agent. It is good practice to verify that the Replication Agent remains in replication state, even after the resume command executes successfully.

To detect an error that occurred after replication start-up, execute:

```
ra_status
go
```

If the Replication Agent is in replicating state, `ra_status` returns:

```
State Action
-------------------------
REPLICATING Ready to replicate data.
```

A returned state of ADMIN indicates that an error prevented the replicating state from being achieved. To determine the error, review the contents of the Replication Agent system log.

4 Validate that both primary and replicate connections are active:

```
isql -Usa -P -SSAMPLE_RS
admin who
```

**Note** Be aware that:

- The DSI connection for the primary database connection is usually down because you are not replicating data back to the primary database.

- The Replication Agent connection, if established for the replicate database connection, is usually down, because you are not replicating data from the replicate database.
Do not proceed until admin who returns similar status for threads to the following:

<table>
<thead>
<tr>
<th>Spid</th>
<th>Name</th>
<th>State</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>
<td>DSI</td>
<td>EXEC</td>
<td>Awaiting Command 101(1) SAMPLE_RS_ERSSD.SAMPLE_RS_ERSSD</td>
</tr>

<td>NY.NYora92</td>
</tr>
</tbody>
</table>

**Testing replication**

After you finish setting up the replication system, you can test replication.

- **Testing replication**
  1. Connect to the primary Oracle instance as a regular user, not the maintenance user. Make sure the regular user also exists in the replicate database.
  2. Create a test table to replicate in the primary database:

        create table T1( a int, b char(10));

  3. Grant permissions to any new or existing object to be replicated in the primary database:

        grant all on T1 to public;

  4. Create a test table in the replicate database:

        create table T1( a int, b char(10));

  5. Grant permissions to any new or existing object to be replicated in the replicate database, so that the Replication Server maintenance user can update this table:

        grant all on T1 to public;
6 Connect to the Replication Agent and run the following command to mark the table:

```
pdb_setreptable T1,mark
```

7 After the table is marked and the Replication Agent is in a replicating state, insert test data into the test table and commit it.

By default, the work performed by the maintenance user of the primary connection is not replicated. The user ID used to insert transactions cannot be the same as the maintenance user defined in the primary connection. See “Configuring Replication Server for replication from the primary database” on page 55.

Replication Agent applies only committed transactions to a replicate database. However, because Oracle expects a commit command to be issued, follow simple test commands with an explicit commit command:

```
insert into T1 values ( 42, 'foo' ) ;
commit;
```

8 Use your preferred Oracle query tool to examine the replicate site for results and compare the contents of your test table from both the primary and replicate sites.

---

### Resetting the primary Oracle database for replication

In a test environment, you may occasionally need to reset the replication environment. Instead of deleting and re-creating a new Replication Agent instance, use this procedure to facilitate resetting the environment.

#### Resetting the primary database for replication

1 Protect your new environment from old log information by using the following command in the Replication Agent to archive all current redo log data:

```
pdb_xlog move_truncpt
```

2 To retain marking and log device information, reinitialize the Replication Agent using `pdb_xlog init` with the `force` option, which forces the Replication Agent repository to be refreshed instead of overwritten:
pdb_xlog init, force

**Note** If you prefer to delete and replace all the information in the Replication Agent repository, issue the `pdb_xlog remove` command followed by a normal `pdb_xlog init` command (without the `force` option).

3 Reset the locator stored in Replication Server:

```sql
isql -USAMPLE_RS_RSSD_prim -PSAMPLE_RS_RSSD_prim_ps -SSAMPLE_RS_ERSSD -DSAMPLE_RS_ERSSD

rs_zeroltm NY, NYora92

GO
```

The following appears:

```
Locator has been reset to zero.
(return status = 0)
```
Testing replication
Setting Up Replication for IBM DB2 Universal Database

This chapter identifies the components that are required to implement a Sybase replication system for the IBM DB2 Universal Database on UNIX, Linux, or Microsoft Windows, as well as an overview of the tasks and instructions for installing and configuring a sample replication environment for IBM DB2 Universal Database.

### Sybase replication system

The components required to implement a replication system are:

- A primary IBM DB2 Universal Database
- A replicate IBM DB2 Universal Database
- A Replication Server
- The Replication Server Options components:
  - Replication Agent
  - ECDA Option for ODBC
Prerequisites

Before you begin setting up the replication system, be familiar with the IBM DB2 Universal Database and have an understanding of Sybase replication. In addition:

- You have obtained the licenses for the Replication Server and the Replication Server Options.
- IBM DB2 Universal Database 8.2.2 or 9.1 must be installed and configured, to serve as the source (primary) database and as the target (replicate) database.
- TCP/IP connectivity must be available.
- Any OS patches required for Java 6.0 have been installed.

During this procedure, Sybase recommends that you do not use Replication Server reserved words for object names and connection names. A complete list of reserved words is in the Replication Server Reference Manual.
System requirements

The target computer on which you are installing the replication components must meet the following memory and disk space requirements:

### For Windows

**Table 3-1: Windows memory and disk requirements**

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>380MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>512MB</td>
<td>440MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

### For UNIX

**Table 3-2: UNIX memory and disk requirements**

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>520MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>256MB</td>
<td>700MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

### For Linux

**Table 3-3: Linux memory and disk requirements**

<table>
<thead>
<tr>
<th>Components</th>
<th>Memory (RAM)</th>
<th>Disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Server</td>
<td>512MB</td>
<td>400MB</td>
</tr>
<tr>
<td>ECDA</td>
<td>256MB</td>
<td>590MB</td>
</tr>
<tr>
<td>Replication Agent</td>
<td>512MB</td>
<td>300MB</td>
</tr>
</tbody>
</table>

To improve performance by avoiding multiple network hops, Sybase recommends that Replication Server, ECDA for ODBC, and the target database reside on the same machine.

Installing replication components

For the quick-start process, Sybase recommends that you install all replication components on the same host where an IBM DB2 Universal Database server has already been installed and is running with both the primary and the replicate databases. This simplifies the quick-start process and avoids the step of separately installing IBM DB2 Universal Database clients for Replication Agent and for ECDA Option for ODBC.
Installing replication components

Identifying the Sybase installation directory

Replication Agent, Replication Server, and ECDA are installed in the same base directory, which is identified by the SYBASE environment variable. Select a path on the host drive to be the recipient of the Sybase installation and configuration activities.

Accessing products from the SPDC

If you are not using installation CDs, go to the Sybase Product Download Center (SPCD) Web site to obtain replication software.

❖ Downloading the replication software

Note  This procedure requires you repeat steps to download two products: Replication Server and Replication Server Options.

You must have a login ID and password to download software from the SPDC.

1 Go to SPDC at https://sybase.subscribenet.com/control/sybs/login and enter your login ID and password.

   The Product List page appears.

2 Select Replication Server.

   The high-level Product Information page appears.

3 Select Replication Server again.

   The detailed Product Information page appears.

4 Select the Replication Server software you need by primary database, version, and platform (return later to this detailed Product Information page to select Replication Server Options software).

   The Software Terms and Conditions page appears, listing countries and regions.

5 Either:
   • Select I Agree to accept the terms without reading them, go to the Product Download Page, and continue with step 6, or
   • Select your country or region to read the terms.
The software licence agreement for the software appears. Read the terms and either:

- Select I Agree to accept the terms, go to the Product Download Page, and continue with step 6, or
- Select Cancel to return to the high-level Product Information page.

6 The Product Download Page lists the software and documentation for the product. Select FTP Download or Advanced Download Options for the Replication Server software to download and save the compressed files to your local drive.

**Note** For each product, the documentation download contains installation-related documents, and the SyBooks download contains the rest of the documentation set.

7 Return to the detailed Product Information page that you accessed in step 3 and select the Replication Server Options software by primary database, version, and platform.

The Software Terms and Conditions page appears, listing countries and regions.

8 Navigate the Software Terms and Conditions pages as you did in step 5.

9 At the Product Download Page, select FTP Download or Advanced Download Options for the components of Replication Server Options to download and save the compressed files to your local drive:

- Replication Agent 15.2
- ECDA Options 15.0
- DirectConnect Client 15.0

10 Uncompress and extract all the installation images to your local drive.

11 Download the ECDA 15.0 ESD #3:
   b Select EBFs/Maintenance. If prompted, enter your MySybase user name and password.
   c Select EnterpriseConnect Data Access. A list of EBFs and maintenance releases appears.
Installing replication components

d Find the EBF containing the ECDA 15.0 ESD #3 for your platform, for example:

EBF xxxxx: 15.0 ESD #3

Here, xxxxx is the number of the EBF containing the ECDA 15.0 ESD #3 for your platform.
e Click the Info icon to display the EBF/Maintenance report, and click the product description to download the software.

Installing Replication Agent

If Replication Agent is already installed, go to “Installing Replication Server” on page 83.

Installing the Replication Agent creates a directory structure containing the Replication Agent binaries, scripts, JRE, and associated files. There are no configuration steps during installation.

❖ Installing Replication Agent software

1 Use one of the following methods to install the software.
   • After following the download instructions in “Accessing products from the SPDC” on page 78, go to the location where you extracted the Replication Agent 15.2 installation image, or
   • Insert the Replication Agent CD into your CD drive.
2 Execute the setup routine.
   • For UNIX or Linux (GUI mode):
      
```bash
./setup
```
   • For Windows:
      
```bash
setup
```
3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:
   • For UNIX or Linux:
      
```bash
./setup -is:tempdir someDirectory
```
   • For Windows:
      
```bash
setup -is:tempdir someDirectory
```
Here, `someDirectory` is a directory with at least 100MB of disk space that the installation program can use.

**Note** If you are installing from a remote machine and do not have an X-Windows client, execute `./setup --console`, to run in console mode.

4 On the Welcome window, click Next.

5 Select a geographic location that displays the license agreement. Select I Agree, and click Next.

6 Enter the directory where you want to install Replication Agent:
   - If the directory does not exist, the installation program prompts you to create it. Click Yes.
   - If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Typical for the installation setup type, and click Next.

8 The installation program displays a summary of what is to be installed. Click Next.

9 The installation program starts to install Replication Agent, displaying the progress status. If you see the following message;
   
   There are newer files already installed. Do you want to replace them?
   
   Click No to All.

10 When you receive a message that the installation was successful, click Next.

11 The SySAM License Server window opens and displays this prompt:
   
   Will licenses be obtained from the License Server?
   
   Respond based on how you set up your environment, use the license obtained from the Software Product Download Center (SPDC) Web site for Replication Server Options, and click Next.

12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. At the SySAM notification window, do one of the following:
   - Select Yes and either accept the default values that are supplied, or enter values for the following:
Installing replication components

- SMTP server host name
- SMTP server port number
- Sender e-mail address
- Recipient e-mail address
- Message severity level of an event that triggers an e-mail message. Your choices are:
  - Informational
  - Warning
  - Error
- If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 When you receive a message indicating that Replication Agent was successfully installed, click Finish.

See the Replication Agent Installation Guide.

❖ Verifying the installation

1 Change to the directory where you installed Replication Agent.

2 Set the environment variables by sourcing the $SYBASE.csh file (UNIX or Linux) or by executing the $SYBASE.bat file (Windows).

3 Change to $SYBASE/RAX-15_2/bin (UNIX or Linux) or %SYBASE%\RAX-15_2\bin (Windows).

4 Obtain the Replication Agent version string.
   - For UNIX or Linux:
     
     ./ra.sh -v
   - For Windows:
     
     ra -v

If Replication Agent installs successfully, you see the Sybase copyright and the Replication Agent version string.
Installing Replication Server

If Replication Server is already installed go to “Installing ECDA Option for ODBC” on page 86.

While installing Replication Server:

• Allocate a disk partition of at least 20MB for each Replication Server you are installing. You can add more partitions later, if necessary. Check each partition to make sure it is available and has write permissions.

 Allocate the entire partition to the Replication Server. If you allocate only a portion of the partition to Replication Server, you cannot use the remainder for any other purpose.

❖ Installing Replication Server

1 Use one of the following methods to download Replication Server software:

• After following the download instructions in “Accessing products from the SPDC” on page 78, go to the location where you extracted the Replication Server 15.2 installation image, or

• Insert the Replication Server CD in your CD drive.

2 Execute the setup routine.

• For UNIX or Linux (GUI mode):

  ./setup

• For Windows:

  setup

3 If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:

• For UNIX or Linux:

  ./setup -is:tempdir someDirectory

• For Windows:

  setup -is:tempdir someDirectory

Here, someDirectory is a directory with at least 100MB of disk space that the installation program can use.

4 On the Welcome window, click Next.
5 Select a geographic location that displays the license agreement. Select I agree, and click Next.

6 Enter the directory where you want to install Replication Server:
   - If the directory does not exist, the installation program prompts you to create it. Click Yes.
   - If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7 Select Typical for the installation setup type, and click Next.

8 The installation program displays a summary of what is to be installed. Click Next.

9 The installation program starts to install Replication Server, displaying the progress status. You may see the following message:

   There are newer files already installed. Do you want to replace them?

   Click No to All.

10 When you receive a message indicating that Replication Server software has successfully installed, click Next.

   **Note** This procedure uses the SAMPLE_RS Replication Server.

11 The SySAM License Server window opens and displays this prompt:

   Will licenses be obtained from the License Server?

   Respond based on how you set up your environment and use the license obtained from the Sybase Product Download Center (SPDC) Web site for Replication Server.

   Click Next.

12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. Select Yes, and either accept the default values that are supplied, or enter the following values:

   - SMTP server host name
   - SMTP server port number
   - Sender e-mail address
• Recipient e-mail address
• Message severity level of an event that triggers an e-mail message. Your choices are:
  • Informational
  • Warning
  • Error

If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 To start a sample Replication Server, select Yes, and click Next.

14 This information appears and should be recorded:

This page contains detailed information regarding the sample Replication Server. Please record this information.

The sample Replication Server will be called SAMPLE_RS and will run on port 11752. It will be configured with a user of sa and no password.

The sample Replication Server will use an embedded RSSD called SAMPLE_RS_ERSSD that runs on port 11751. It will be configured with a user of SAMPLE_RS_RSSD_prim and a password of SAMPLE_RS_RSSD_prim_ps.

The installer has updated the appropriate interfaces file or sql.ini file.

All files and logs associated with the sample Replication Server will be located in the directory <samp_repserver>.

The sample Replication Server will be configured using the file <SAMPLE_RS.res>.

Here, <samp_repserver> and <SAMPLE_RS.res> are paths to the sample Replication Server and sample Replication Server configuration file, respectively.

Click Next.

15 When the sample Replication Server is running and an “Installation was successful” message appears, click Finish.
Installing replication components

❖ Verifying the installation

1. Change to the directory where you installed Replication Server.
2. Set the environment variables by sourcing the `SYBASE.csh` file (UNIX or Linux) or by executing the `SYBASE.bat` file (Windows).
3. Log in to Replication Server:
   ```
isql -Usa -P -SSAMPLE_RS
   ```
4. Verify the Replication Server version:
   ```
   admin version
go
   ```
5. Exit the `isql` session with the `quit` command.

Installing ECDA Option for ODBC

If ECDA Option for ODBC is already installed, go to “Configuring replication components” on page 88.

When installing ECDA Option for ODBC, install ECDA on the same server as the replicate database. This eliminates a network hop and improves performance.

❖ Installing ECDA for ODBC in GUI mode

**Note** To install using the console mode or a response file, see the *ECDA Installation Guide* for Linux and UNIX.

1. Use one of the following methods to download the software:
   - After following the download instructions in “Accessing products from the SPDC” on page 78, go to the location where you extracted the ECDA Option for ODBC 15.0 installation image.
   - Insert the CD labeled ECDA 15.0 Option for ODBC.
2. Launch InstallShield:
   - For UNIX or Linux:
     ```
     ./setup
     ```
   - For Windows:
     ```
     setup
     ```
If you see an error message saying that there is not enough temporary disk space, add the following to your setup command:

- For UNIX or Linux:
  ```bash
  ./setup -is:tempdir someDirectory
  ```
- For Windows:
  ```bash
  setup -is:tempdir someDirectory
  ```

Here, `someDirectory` is a directory with at least 100MB of disk space that the installation program can use.

4. On the Welcome window, click Next.

5. Select a geographic location that displays the license agreement. Select I agree, and click Next.

6. Enter the directory where you want to install ECDA:
   - In the destination directory, enter the base directory identified by the SYBASE environment variable. Click Yes to install over an existing directory.
   - If the destination directory exists, you receive a warning message that you are installing into an existing directory. Click Yes.

7. Select Custom setup, and click Next.

8. Unselect ECDA Option for Oracle, and click Next.

9. Verify the modules to install. Click Next.

   You may receive a message:
   ```text
   There are newer files already installed. Do you want to replace them?
   ```

   Click No to All.

10. When you receive a message that the installation was successful, click Next.

11. The SySAM License Server window opens and displays this prompt:

   ```text
   Will licenses be obtained from the License Server?
   ```

   Respond based on how you set up your environment, and use the license obtained from the Software Product Download Center (SPDC) Web site for Replication Server Options.

   Click Next.
12 The SySAM notification window prompts you to configure your server for e-mail notification. When configuration is enabled, you receive information about license management events that require attention. Select Yes and either accept the default values that are supplied, or enter values for the following:

- SMTP server host name
- SMTP server port number
- Sender e-mail address
- Recipient e-mail address
- Message severity level of an event that triggers an e-mail message. Your choices are:
  - Informational
  - Warning
  - Error

If you choose not to have e-mail alerts or severity messages logged, select No.

Click Next.

13 When you receive a message indicating that ECDA was successfully installed, click Finish.

ECDA, including the DirectConnect service, is installed.

14 Apply the ECDA 15.0 ESD #3:

a Extract the tgz or zip file for the ECDA 15.0 ESD #3 that you downloaded in “Downloading the replication software” on page 78.

b Go to the directory into which you extracted the zip file.

c Install the ECDA 15.0 ESD #3 in the same way that you installed ECDA earlier in this procedure.

Configuring replication components

This section describes the tasks you must perform to configure each of the replication components in the replication system.
Setting IBM DB2 Universal Database environment variables

For UNIX and Linux, the IBM DB2 Universal Database installation provides two scripts, one of which needs to be sourced to set up the IBM DB2 Universal Database environment variables: `db2cshrc` for C shell and `db2profile` for Bourne or Korn shell. These scripts set the library path environment variable based on the bit size of the server or client that was installed.

**Note** On Windows, the IBM DB2 Universal Database installation sets all necessary environment variables.

For UNIX and Linux platforms, the 32-bit and 64-bit versions of the driver and API libraries are located in the `$HOME/sqllib/lib32` and `$HOME/sqllib/lib64` directories, respectively, where `$HOME` is the home directory of the IBM DB2 Universal Database instance owner. If Replication Agent is installed on AIX, Solaris, or HP Itanium, the library path environment variable must point to the 64-bit libraries. For all other platforms, the library path environment variable must point to the 32-bit libraries.

**Note** If Replication Agent is installed on Solaris, AIX or HP Itanium, a 64-bit IBM DB2 Universal Database instance must be configured. This can be a server or client instance.

To correctly set the IBM DB2 Universal Database environment variables for Replication Agent and ECDA, you may need to customize either `db2cshrc` or `db2profile`. However, do not change the original scripts, because they may be changed when you apply a FixPak to the IBM DB2 Universal Database server or client.

**Note** Replication Agent requires 32-bit libraries for Linux and Windows and 64-bit libraries for UNIX. Because ECDA may have different requirements, you may want to maintain two separate customized copies of the aforementioned scripts, one copy for Replication Agent and one for ECDA.

- **Setting IBM DB2 Universal Database environment variables to use 32-bit libraries on UNIX or Linux**

1. Navigate to the IBM DB2 Universal Database server or IBM DB2 Universal Database client `sqllib` directory, which is located in the IBM DB2 Universal Database instance owner user home directory. For example:
Configuring replication components

2 Based on the type of UNIX shell you are using, copy either the db2cshrc or db2profile script:
   • For C shell:
     
```
     cp db2cshrc mydb2cshrc
     ```
   • For Bourne or Korn shell
     
```
     cp db2profile mydb2profile
     ```

3 Edit your copy of the file. Add a statement at the very end of the file that sets the platform-specific library path variable to point to the 32-bit IBM DB2 Universal Database libraries. For example, on Solaris or Linux, add these lines:
   • For C shell, in mydb2cshrc:
     
```
# force 32-bit libraries
setenv LD_LIBRARY_PATH $HOME/sqllib/lib32:$LD_LIBRARY_PATH
     
Here, $HOME is the home directory of the IBM DB2 Universal Database instance owner.
   • For Bourne or Korn shell, in mydb2profile:
     
```
# force 32-bit libraries
LD_LIBRARY_PATH=$HOME/sqllib/lib32:$LD_LIBRARY_PATH
export LD_LIBRARY_PATH
     ```

4 Before starting either Replication Agent or ECDA, always source your file, if you have customized it. Otherwise, source the original db2cshrc or db2profile script.

Cataloging a node and a database in an IBM DB2 Universal Database client

To access their respective IBM DB2 Universal Databases, both the Replication Agent for UDB and ECDA Option for ODBC must use IBM DB2 Universal Database client libraries. The process of cataloging configures an IBM DB2 Universal Database client so that it knows how to connect to a particular database. This process also creates a database alias, which Replication Agent or ECDA uses as the data source name.
By default, IBM DB2 Universal Database client libraries are installed when the IBM DB2 Universal Database server is installed. In addition, an IBM DB2 Universal Database client can be separately installed on a host other than the one on which the IBM DB2 Universal Database server is installed. In either case, cataloging must be performed in the IBM DB2 Universal Database client that Replication Agent or ECDA is using. If Replication Agent and ECDA are installed on different hosts, they are using different IBM DB2 Universal Database clients, so the cataloging must be performed in both of the IBM DB2 Universal Database clients.

If the IBM DB2 Universal Database client and the IBM DB2 Universal Database server are on the same host, and there is only one IBM DB2 Universal Database server running, cataloging may have been performed when the IBM DB2 Universal Database instance was installed and the databases configured. If so, then no further cataloging needs to be performed.

❖ Cataloging a node in an IBM DB2 Universal Database client

1 On UNIX or Linux, navigate to the IBM DB2 Universal Database server or IBM DB2 Universal Database client sqllib directory, which is located in the IBM DB2 Universal Database instance owner user home directory. For example, on UNIX:

```
cd /db2home/db2inst1/sqllib
```

2 On UNIX or Linux, set the IBM DB2 Universal Database environment variables by sourcing the appropriate script:

- For C shell:
  ```
  source db2cshrc
  ```

- For Bourne or Korn shell:
  ```
  . db2profile
  ```

If necessary, log in to the operating system as the IBM DB2 Universal Database instance owner. Logging in sets up all the IBM DB2 Universal Database environment variables.

**Note** On Windows, the IBM DB2 Universal Database installation sets up all necessary environment variables.

3 Start the IBM DB2 Universal Database command line processor (CLP).

- On UNIX or Linux, enter the following command:

  ```
  db2
  ```
• On Windows, select Start | Programs | IBM DB2 | Command Line Tools | Command Line Processor.

4 Determine if the desired IBM DB2 Universal Database node has already been cataloged. At the CLP prompt, enter:

`list node directory`

If a node has already been cataloged, depending on whether the node is local (first entry below) or remote (second entry below), you see results similar to this:

Node 1 entry:

Node name = DB2NODE1
Comment =
Directory entry type = LOCAL
Protocol = LOCAL
Instance name = DB2_01

Node 2 entry:

Node name = DB2NODE2
Comment =
Directory entry type = LOCAL
Protocol = TCPIP
Hostname = 10.22.85.228
Service name = 50001

5 If your desired node is not listed, catalog it at the CLP prompt.

• To catalog a local node, issue this command:

`CATALOG LOCAL NODE node_name INSTANCE db2_instance_name`

where:

• `node_name` is the name of the node on the local host.
• `db2_instance_name` is the name of the associated DB2 instance.

• To catalog a remote node, issue this command:

`CATALOG TCPIP NODE node_name REMOTE ip_address SERVER port_number`

where:

• `node_name` is the name of the node on the remote host.
• `ip_address` is either the IP address or name of the host on which the remote node is running.
• `port_number` is the port on which the remote node is listening for client connections.

6 Verify that the node has been cataloged by issuing the `list node directory` command again.

❖ **Cataloging a database in an IBM DB2 Universal Database client**

1 Determine if the database has already been cataloged. At the CLP command prompt, execute this command:

   ```
   list database directory
   ```

Depending on whether the database is local (first entry below) or remote (second entry below), you see results similar to this:

**Database 1 entry:**

- Database alias = GRP_DB
- Database name = GRP_DB
- Local database directory = /db2home/db2inst1
- Database release level = b.00
- Comment = UTF-8(Unicode DB)
- Directory entry type = Indirect
- Catalog database partition number = 0
- Alternate server hostname =
- Alternate server port number =

**Database 2 entry:**

- Database alias = DB1V9_DS
- Database name = DB1_V9
- Node name = DB2NODE2
- Database release level = b.00
- Comment =
- Directory entry type = Remote
- Catalog database partition number = -1
- Alternate server hostname =
- Alternate server port number =

2 If your desired database is not listed or does not have a database alias, catalog it at the CLP prompt.

• To catalog a database using the default alias, which is the same as the database name:

   ```
   CATALOG DATABASE database_name AT NODE node_name
   ```

   where:
Configuring replication components

- `database_name` is the name of either the primary or replicate database.
- `node_name` is the name of the node that contains the database.

To catalog a database with a specific alias:

```
CATALOG DATABASE database_name AS my_alias AT NODE node_name
```

where:
- `database_name` is the name of either the primary or the replicate database.
- `my_alias` is your desired alias.
- `node_name` is the name of the node that contains the database.

3 Verify that the database has been cataloged by issuing the `list database directory` command again.

4 To exit the DB2 CLP, enter the `quit` command.

Configuring ECDA Option for ODBC

Configuring ECDA Option for ODBC involves:

1 Configuring and starting the DirectConnect service
2 Creating a maintenance user for replication

Configuring and starting the DirectConnect service

Before you begin to create and configure the DirectConnect service, make sure that:

- The DB2 client has been configured as described in “Cataloging a node and a database in an IBM DB2 Universal Database client” on page 90.
- The port to be used by the DirectConnect service is unused and available.

Creating and configuring a DirectConnect service

1 Start the Create Server wizard:

   - For UNIX or Linux:
     ```
     DCWizard.sh
     ```
   - For Windows:
DCWizard.bat

2 When the Welcome Create Server wizard appears, click Next. The Create DirectConnect Server Options window appears.

3 Select the ECDA Option for ODBC option, and click Next. The Server Name and Port Information window appears.

4 Enter the server name for the new DirectConnect service and the port number that you want the server to “listen” on. Click Next. The ECDA - ODBC Driver Manager Options window appears.

5 Select the unixODBC Driver Manager without a Driver Manager Option, and click Next. The Driver Manager Information window appears.

6 Select the following from the browse files:

   • The path to the IBM DB2 Universal Database ODBC Driver file, for example:
     
     /software/IBM/db2_09_01/lib/libdb2.so

     **Note** Version 9.1 of the HP Itanium IBM DB2 Universal Database ODBC 64-bit driver is named *libdb2o.so*.

   • On UNIX or Linux, the DB2 script file that must be sourced before the DirectConnect service is started.

     If you have customized the IBM DB2 Universal Database environment script as described in “Setting IBM DB2 Universal Database environment variables” on page 89, use the path to that script. Otherwise, use the path to the original IBM DB2 Universal Database script, either *db2cshrc* or *db2profile*.

     For example, to use your customized script for C shell, enter the following:

     ```
     source path/mydb2cshrc
     ```

     Here, *path* is the full path to the directory in which you saved your customized file.

     For example, to use the original IBM DB2 Universal Database script for Bourne or Korn shell, enter the following:

     ```
     . path/sqlib/db2profile
     ```

     Here, *path* is the home directory of the owner of the replicate IBM DB2 Universal Database instance.
7 Click Next. The DirectConnect Service Name window appears.

8 Enter the ECDA access service name that you want to use for this server, and click Next. The ECDA Server Summary and Build window appears.

9 Verify the ECDA Server information that appears:
   • If correct, select Create Server. The Start DirectConnect server (Optional) window appears.
   • If incorrect, click Back to change the information.

10 Open the `%SYBASE%\DC-15_0\servername\cfg\dcany.cfg` file (Windows) or the `$SYBASE/DC-15_0/servername/cfg/dcany.cfg` file (UNIX or Linux), where `servername` is the name of the server you created using the DCWizard.

11 In the file, locate the name of the IBM DB2 Universal Database access service that you created in step 4 above using the DCWizard. Under that, set the ConnectionSpec1 parameter to the name of the IBM DB2 Universal Database ODBC data source you created. For example:

   ```
   [Service Library]
   {Logging}
   LogSvcLibStatistics=0
   {Client Interaction}
   SvclibDescription=Access Service Library for ODBC
   [my_udb_access_service]
   {ACS Required}
   ConnectionSpec1=my_udb_datasource_name
   ```

12 Start the DirectConnect service:
   a Navigate to the DirectConnect installation directory, for example:
     ```
     cd /software/sybase/DC-15_0
     ```
   b Execute the `DC_SYBASE.csh` (UNIX or Linux) or `DC_SYBASE.bat` (Windows) script to set the DirectConnect environment variables.
   c Navigate to the DirectConnect `bin` directory.
   d Start the DirectConnect service in the background, which also starts all the configured access services:
     ```
     DCSMStart -Sservicename &
     ```
     Here, `servicename` is the name of the DirectConnect service.
Verifying that you can connect to IBM DB2 Universal Database

1. Open a command window in the $SYBASE (UNIX or Linux) or %SYBASE% (Windows) directory of your ECDA installation.
2. Change to the $SYBASE/DC-15_0 (UNIX or Linux) or %SYBASE%\DC-15_0 (Windows) directory.
3. Set the environment variables by sourcing the $SYBASE/DC_SYBASE.csh file (UNIX or Linux) or by running the %SYBASE%\DC_SYBASE.bat file (Windows).
4. Log in to the IBM DB2 Universal Database through the DirectConnect service:

   isql –U validuser –P password –S DCService

   Here, validuser and password are any valid user and password, and DCService is the DirectConnect service name.
5. Verify the connection to the replicate IBM DB2 Universal Database:

   select @@sqlDbmsname
   go

   SQLDbmsName
   ---------------------
   DB2/SUN

   select @@sqlDbmsver
   go

   SQLDbmsVer
   ---------------------
   09.01.0005
6. Exit the isql session with the quit command.

Creating a maintenance user for replication

The maintenance user is a valid IBM DB2 Universal Database user that the Replication Server uses to apply commands to the replicate IBM DB2 Universal Database. Replication Server requires one maintenance user to be defined for each connection.
A user must already exist on the operating system before it can be added to an IBM DB2 Universal Database. To add an existing operating system user to the database, use the Control Center administration tool, which is included with either the server or client installation of IBM DB2 Universal Database on Microsoft Windows. You may choose to install an IBM DB2 Universal Database client on a Windows machine and use it to administer the IBM DB2 Universal Databases.

Creating a maintenance user in IBM DB2 Universal Database

1. Select an existing operating system user to be added to the replicate database as a maintenance user.
2. Select Start | Programs | IBM DB2 | Control Center.
3. Configure the Control Center administration tool to connect to the replicate IBM DB2 Universal Database according to the IBM documentation. Once the Control Center administration tool has been configured, the replicate database appears in the All Databases view.
4. In the Control Center administration tool display window, right-click the replicate database name, and select Authorities from the context menu.
5. In the Database Authorities window, click Add User.
6. In the Add User window, select the user to add to the database from the list of displayed operating system users, and click OK.
7. Click Grant All to add necessary authorities to the maintenance user.

Note In a POC environment, the user is created by an IBM DB2 Universal Database system administrator.

Configuring Replication Server

Configuring Replication Server involves:

1. Configuring Replication Server for replication to the target data server
2. Configuring Replication Server for replication from the primary database
3. Verifying the ECDA installed objects
Configuring Replication Server for replication to the target data server

❖ Creating a Replication Server connection to replicate

1. Navigate to the $SYBASE/RAX-15_2/scripts/ibmudb (UNIX or Linux) or %SYBASE%\REP-15_2\scripts/ibmudb directory.

2. Make a copy of the udb_create_rs152_standby_connection.sql script named my_udb_create_rs152_standby_connection.sql.

3. Before executing the my_udb_create_rs152_standby_connection.sql script against your Replication Server, change the name of the connection that Replication Server uses to connect to the DirectConnect service, where:
   - \{rds\}.{rdb} is the DirectConnect service name followed by the replicate database name.
   - rs_maint_user and rs_maint_user_pwd are the maintenance user and password created in ECDA Option for ODBC, in step 2 of “Configuring ECDA Option for ODBC” on page 94.

For example:
```
create connection to DCService.my_udb_db
using profile rs_udb_to_udb;standard
set username maintuser
set password "password"
go
```

**Note** In the above example, password is a Replication Server reserved word and, therefore, must be enclosed in double quotes.

4. Create the connection to the replicate database:
```
isql -Usa -P -SSAMPLE_RS -i my_udb_create_rs152_standby_connection.sql
```

5. Log in to SAMPLE_RS and verify the Replication Server connection to the replicate database:
```
isql -Usa -P -SSAMPLE_RS
admin who
```
You should see a message returned for the DSI connection \{rds\}.{rdb}. Verify that the status is “Awaiting Message” or “Awaiting Command.”

6. Exit the isql session with the quit command.
Configuring Replication Server for replication from the primary database

This section describes the configuration steps required for replication from the primary database. It includes:

- Creating a Replication Server connection to the primary database
- Creating a database replication definition
- Creating the database replication subscription

❖ Creating a Replication Server connection to the primary database

1. Go to the $SYBASE/RAX-15_2/scripts/sybase (UNIX or Linux) or %SYBASE%/RAX-15_2/scripts/sybase (Windows) directory.

2. Make a copy of the rs_create_test_primary_connection.sql script named my_udb_rs_create_test_primary_connection.sql.

3. Before executing the my_udb_rs_create_test_primary_connection.sql script against your Replication Server, change all occurrences of value \{rax\}, \{test\} to the name of the Replication Server connection between it and Replication Agent for UDB, where:
   - rax is the name of the data server of the primary IBM DB2 Universal Database.
   - test is the name of the primary IBM DB2 Universal Database.

   For example, NY.NYudb9.

   **Note** Save these values to be used later for the rs_source_ds and rs_source_db parameters in the Replication Agent ibmudb.rs file.

4. Change sys and sys_pwd to the user ID and password of the IBM DB2 Universal Database user who must have permission to apply DML operations against all user tables to be replicated, where:
   - sys is the user ID of the IBM DB2 Universal Database user (sys).
   - sys_pwd is the password of the IBM DB2 Universal Database user (change_on_install).

   **Note** This user must be a valid user in the IBM DB2 Universal Database.

The following command creates a Replication Server connection to the primary database example:

```
create connection to NY.NYudb9
```
set error class rs_sqlserver_error_class
set function string class rs_udb9_function_class
set username sys
set password change_on_install
with log transfer on, dsi_suspended
go

5 Execute this script in Replication Server:

isql -Usa -P -SSAMPLE_RS -i my_udb_rs_create_test_primary_connection.sql

A message appears that indicates the Replication Server connection to the primary database has been created.

❖ Creating the database replication definition

1 Navigate to the $SYBASE/RAX-15_2/script/sybase (UNIX or Linux) or %SYBASE%\RAX-15_2\script\sybase (Windows) directory.

2 Make a copy of the rs_create_test_db_repdef.sql script named my_udb_rs_create_test_db_repdef.sql.

3 Before executing the my_udb_rs_create_test_db_repdef.sql script, change the value of {pds}.{pdb} to the name of the connection string you defined for the primary database, where:
   • pds is the name of the data server of the primary IBM DB2 Universal Database.
   • pdb is the name of the primary IBM DB2 Universal Database.

For example, NY.NYudb9.

Note Save these values to be used later for the rs_source_ds and rs_source_db parameters in the Replication Agent ibmuudb.rs file.

This is a database replication definition example:

create database replication definition NY_repdef1
with primary at NY.NYudb9
go

4 Connect to the Replication Server and enter:

isql -Usa -P -SSAMPLE_RS -i my_udb_rs_create_test_db_repdef.sql

A message appears that indicates the database replication definition has been created.
Creating the database replication subscription

1. Make a copy of the `rs_create_test_db_sub.sql` script named `my_udb_rs_create_test_db_sub.sql`.

2. Before executing the `my_udb_rs_create_test_db_sub.sql` script, change the `{pds}.{pdb}` and `{rds}.{rdb}` to the appropriate connection name, where:
   - `pds` is the name of the data server of the primary IBM DB2 Universal Database.
   - `pdb` is the name of the primary IBM DB2 Universal Database.
   - `rds` is the DirectConnect service name.
   - `rdb` is any valid identifier. Sybase recommends that you use the IBM DB2 Universal Database replicate database name.

   **Note** Save these values to be used later in the Replication Agent `ibmuudb.rs` file.

Here is an example of create database replication subscription:
```
create subscription NY_sub1
  for database replication definition NY_repdef1
  with primary at NY.NYudb9
  with replicate at DCService.udb_db
  without materialization

GO
```

3. Connect to Replication Server and execute:

```bash
isql -Usa -P –SSAMPLE_RS -i my_udb_rs_create_test_db_sub.sql
```

A message appears that indicates the subscription is being created.

Verifying the ECDA installed objects

Verifying the ECDA installed objects

1. Log in to IBM DB2 Universal Database through ECDA as `maintuser`.
   - To verify whether the `rs_info` table has been created successfully, enter:

     ```bash
     isql -Umaintuser -P MyPassword -SSDCService
     select * from rs_info
     GO
     ```
CHAPTER 3  Setting Up Replication for IBM DB2 Universal Database

This is returned:

<table>
<thead>
<tr>
<th>RSKEY</th>
<th>RSVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset_name  iso_1</td>
<td></td>
</tr>
<tr>
<td>sortorder_name  bin_iso_1</td>
<td></td>
</tr>
</tbody>
</table>

(2 rows affected)

- To verify whether the rs_lastcommit table has been created successfully, enter:

  isql –Umaintuser –Ppassword –S DCService
  select * from rs_lastcommit
  go

The following is returned:

<table>
<thead>
<tr>
<th>ORIGIN</th>
<th>ORIGIN_QID</th>
<th>SECONDARY_QID</th>
<th>ORIGIN_TIME</th>
<th>DEST_COMMIT_TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(0 rows affected)

If the ECDA objects are not installed successfully, no results appear, and you see an error message.

2  Exit the isql session with the quit command.

Configuring Replication Agent

Configuring Replication Agent involves:

1  Configuring and verifying the primary IBM DB2 Universal Database for replication
2  Creating the Replication Agent instance
3  Verifying the Replication Agent instance
4  Initializing the Replication Agent instance

Configuring and verifying the primary IBM DB2 Universal Database for replication

Before you install Replication Agent, configure the primary IBM DB2 Universal Database for replication. To do so, you may need to connect to the primary database using the primary database instance owner user.
Configuring replication components

❖ Verifying the current archive setting of the transaction log

Replication Agent requires that the primary IBM DB2 Universal Database transaction logging be archive logging, not circular logging.

1 Determine the LOGARCHMETH1 setting.
   a Connect to the database by entering the following command at the CLP prompt.

   ```
   CONNECT TO dbalias USER db2_user USING db2_user_ps
   ```

   Here, `dbalias` is the cataloged alias of the primary database, `db2_user` is the primary database user, and `db2_user_ps` is the password.

   b Determine the LOGARCHMETH1 setting:

   ```
   GET DB CFG FOR dbalias
   ```

2 If the results do not show that LOGARCHMETH1 is set to LOGRETAIN or to the path name of the directory to which logs are archived, set it:
   • To use the default archive location:

   ```
   UPDATE DATABASE CONFIGURATION USING logarchmeth1 LOGRETAIN
   ```

   • To use a specific archive location:

   ```
   UPDATE DATABASE CONFIGURATION USING logarchmeth1 DISK:path
   ```

   Here, `path` is the full path name of the directory where the archive logs are to be stored.

❖ Setting the IBM DB2 Universal Database connectivity autocommit parameter

Replication Agent requires that the IBM DB2 Universal Database connectivity autocommit parameter be turned on (`autocommit=1`). The autocommit parameter is specified in the DB2 call-level interface (CLI) configuration file for the primary database. If the autocommit parameter is not turned on, a deadlock problem may occur.

• To set the autocommit parameter, edit the `db2cli.ini` file.

   It is located in `<HOME>\sqlib`, where `<HOME>` is the home directory of the IBM DB2 Universal Database instance owner (UNIX or Linux) or the IBM DB2 Universal Database client or server installation directory (Windows).
Creating an IBM DB2 Universal Database user and grant permissions

Replication Agent requires an IBM DB2 Universal Database login that has permission to access data and create new objects in the primary database. The IBM DB2 Universal Database login must have SYSADM or DBADM authority to access the primary database transaction log.

1. Create a new operating system user named `ra_user` using commands appropriate for your operating system.

   For example, the following command can be used to create a user named `ra_user` on the UNIX and Linux operating systems:
   ```bash
   useradd -g users -G mgmt -s /bin/shell -p password -d /home/ra_user -m ra_user
   ```
   Here, `password` is the password corresponding to the `ra_user` user name.

2. Select Start | Programs | IBM DB2 | Control Center.

3. Configure the Control Center administration tool to connect to the primary IBM DB2 Universal Database according to the IBM documentation. Once the Control Center administration tool has been configured, the primary database appears in the All Databases view.

4. In the Control Center administration tool display window, right-click the primary database name, and select Authorities from the context menu.

5. In the Database Authorities window, click Add User.

6. In the Add User window, select `ra_user` from the list of displayed operating system users, and click OK.

7. Click Grant All to add necessary authorities to `ra_user`.

Note: In a POC environment, the user is created by an IBM DB2 Universal Database system administrator.

Adding a temporary tablespace to the primary database

1. In the Control Center All Databases view, right-click the Table Spaces folder under your primary database, and select Create from the context menu.

2. In the Name window, specify a name for the new table space, and select the Let DB2 Manage My Storage radio button. Click Next.

3. In the Type window, select User Temporary, and click Next.

4. In the Buffer Pool window, click Create.
Configuring replication components

5 In the Create Buffer Pool window, specify a name for the buffer pool, specify at least 8KB as the page size in the drop-down menu, select Create Bufferpool Immediately, and click OK.

6 Click Finish to create the table space. The new table space appears in the Table Spaces folder.

Creating the Replication Agent instance

A single installation of the Replication Agent can support replication from multiple databases. However, one Replication Agent instance is needed for each IBM DB2 Universal Database that is to be replicated.

Note To replicate from multiple databases, using one Replication Agent instance for each database, you must create a separate IBM DB2 Universal Database user for each primary database, as described in “Creating an IBM DB2 Universal Database user and grant permissions” on page 105. You cannot use the same user for multiple Replication Agents.

❖ Preparing the Replication Agent instance

1 Locate the resource file template.

   The majority of configuration values required to create and initialize a Replication Agent can be recorded and stored in a resource file. Using a resource file provides a way to record or retain the configuration information for a Replication Agent instance, allowing an instance to be removed and re-created Replication Agent instance, allowing an instance to be removed and re-created.

   The resource file template for an IBM DB2 Universal Database instance is $SYBASE/RAX-15_2/init/ibmdb.rs (UNIX or Linux) or %SYBASE%\RAX-15_2\init\ibmdb.rs (Windows).

2 Create an instance resource file:

   Copy the resource file template to another file that contains the configuration information for a new instance, for example, myra.rs.

   Change the values assigned to properties in the resource file so they match the values required for your environment. The majority of these values are host, port, user, and password information for the IBM DB2 Universal Database, Replication Server, and RSSD connections.
• Set the value of `rs_source_ds` to the value you chose for `pds` in previous procedures.

• Set the value of `rs_source_db` to the value you chose for `pdb` in previous procedures.

The resource file is self-documenting, with each parameter described. See the *Replication Agent Administration Guide*.

**Note** Table 3-4 lists parameters in the order they appear in the resource file, not alphabetically.

### Table 3-4: Resource file parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>instance_name</code></td>
<td>Any valid name.</td>
<td><code>myra</code></td>
</tr>
<tr>
<td><code>admin_port</code></td>
<td>Port number that Replication Agent uses.</td>
<td><code>9030 (if in use, select a different port number)</code></td>
</tr>
<tr>
<td><code>pds_host_name</code></td>
<td>Machine (host) where IBM DB2 Universal Database is installed.</td>
<td><code>NY</code></td>
</tr>
<tr>
<td><code>pds_port_number</code></td>
<td>Port number for IBM DB2 Universal Database.</td>
<td><code>50007</code></td>
</tr>
<tr>
<td><code>pds_database_name</code></td>
<td>Name of the primary database.</td>
<td><code>NYu db9</code></td>
</tr>
<tr>
<td><code>pds_username</code></td>
<td>User ID that Replication Agent uses to access primary data server.</td>
<td><code>ra_user</code></td>
</tr>
<tr>
<td><code>pds_password</code></td>
<td>Password for <code>pds_username</code>.</td>
<td><code>sybase</code></td>
</tr>
<tr>
<td><code>pds_datasource_name</code></td>
<td>Data source name or database alias for the primary database.</td>
<td><code>DBALIAS</code></td>
</tr>
<tr>
<td><code>rs_host_name</code></td>
<td>Machine where Replication Server is installed.</td>
<td><code>jdoe_host1</code></td>
</tr>
<tr>
<td><code>rs_port_number</code></td>
<td>Port where Replication Server is installed.</td>
<td><code>11752</code></td>
</tr>
<tr>
<td><code>rs_username</code></td>
<td>Replication Server user with CONNECT SOURCE and CREATE OBJECT capabilities.</td>
<td><code>SAMPLE_RS_ra</code></td>
</tr>
<tr>
<td><code>rs_password</code></td>
<td>Password for <code>rs_username</code>.</td>
<td><code>SAMPLE_RS_ra_ps</code></td>
</tr>
<tr>
<td><code>rs_source_ds</code></td>
<td>Valid name representing data server of primary IBM DB2 Universal Database.</td>
<td><code>NY</code></td>
</tr>
<tr>
<td><code>rs_source_db</code></td>
<td>Valid name representing primary IBM DB2 Universal Database.</td>
<td><code>NYu db9</code></td>
</tr>
</tbody>
</table>
Configuring replication components

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example values</th>
</tr>
</thead>
<tbody>
<tr>
<td>rs_charset</td>
<td>Character set that Replication Server is using.</td>
<td>• Windows: cp850&lt;br&gt;• UNIX: iso_1</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The value defined for the rs_charset configuration parameter must match the RS_charset value in the Replication Server configuration file, $SYBASE/REP-15_2/install/&lt;server&gt;.cfg (UNIX or Linux) or %SYBASE%/REP-15_2/install/&lt;server&gt;.cfg (Windows).</td>
<td></td>
</tr>
<tr>
<td>rssd_host_name</td>
<td>Machine where RSSD resides.</td>
<td>jdoe_host1</td>
</tr>
<tr>
<td>rssd_port_number</td>
<td>Port number where RSSD resides.</td>
<td>11751</td>
</tr>
<tr>
<td>rssd_database_name</td>
<td>Database name for RSSD.</td>
<td>SAMPLE_RS_ERSSD</td>
</tr>
<tr>
<td>rssd_username</td>
<td>Valid user for RSSD.</td>
<td>SAMPLE_RS_RSSD_maint</td>
</tr>
<tr>
<td>rssd_password</td>
<td>Password for rssd_username.</td>
<td>SAMPLE_RS_RSSD_maint_ps</td>
</tr>
<tr>
<td>pdb_archive_remove</td>
<td>Enables or disables the removal of archived IBM DB2 Universal Database transaction log files from the path specified by pdb_archive_path.</td>
<td>USE_DEFAULT</td>
</tr>
<tr>
<td>pdb_archive_path</td>
<td>Identifies directory path where Replication Agent expects to find archived IBM DB2 Universal Database transaction log files.</td>
<td>A valid directory path on the machine hosting Replication Agent that points to a location where IBM DB2 Universal Database puts the archived transaction log files</td>
</tr>
<tr>
<td>start_instance</td>
<td>Start the instance that was created.</td>
<td>yes</td>
</tr>
<tr>
<td>initialize_instance</td>
<td>Initialize the Replication Agent instance.</td>
<td>yes</td>
</tr>
</tbody>
</table>

**Warning!** The rs_source_ds and the rs_source_db values must match the “pds.pdb” values of your Replication Server primary connection name that you configured in step 3 in the procedure “Creating a Replication Server connection to the primary database” on page 100.

3 Set the IBM DB2 Universal Database environment variables by sourcing `db2cshrc`, `db2profile`, or your customized versions of the scripts as described in “Setting IBM DB2 Universal Database environment variables” on page 89.

4 Create and execute the new instance resource file:
   a Validate the settings in the resource file using the `-vr` parameter.
CHAPTER 3  Setting Up Replication for IBM DB2 Universal Database

• On UNIX or Linux:
  
  $SYBASE/RAX-15_2/bin/ra_admin.sh -vr myra.rs

• On Windows:
  
  %SYBASE%\RAX-15_2\bin\ra_admin.bat -vr myra.rs

Here, myra.rs is the path and name of the resource file.

Validation results are returned as one of the following:

• Response-file processing completed
• Response-file processing completed with errors

If any validation fails, the ra_admin utility returns an error message and information about the failure. You can repeat the validation process as many times as necessary until it executes without error. No entities are changed or created.

b After the resource file has been validated, allow the ra_admin utility to create and configure the Replication Agent instance, using the -r parameter.

• On UNIX or Linux:
  
  $SYBASE/RAX-15_2/bin/ra_admin.sh -r myra.rs

• On Windows:
  
  %SYBASE%\RAX-15_2\bin\ra_admin.bat -r myra.rs

Here, myra.rs is the path and name of the resource file.

Note If, in your response file, you set start_instance to yes, your instance is also running. If you set initialize_instance to yes, your instance is also initialized.

c Creation results are returned as one of the following:

• Response-file processing completed
• Response-file processing completed with errors

See the Replication Agent Administration Guide.

5 If, in your resource file, you set start_instance to yes, skip this step, and continue with the next section. If your resource file did not configure start_instance to yes, change to the instance directory and run Replication Agent in the background.
Configuring replication components

• On UNIX or Linux:
  cd $SYBASE/RAX-15_2/myra
• On Windows:
  cd %SYBASE%\RAX-15_2\myra

Execute the RUN file in the background.

Your Replication Agent for UDB is now running.

Verifying the Replication Agent instance

This section describes how to verify a Replication Agent instance, which involves:

1 Update the Replication Server interfaces (UNIX or Linux) or sql.ini (Windows) file with the Replication Agent location.
2 Verify the connection to the Replication Agent.
3 Verify the Replication Agent connection to IBM DB2 Universal Database.

燚 Verifying the Replication Agent

1 Use dsedit to update the Replication Server interfaces (UNIX or Linux) or sql.ini (Windows) file to include an entry for the Replication Agent location.

Note You can use any TDS client utility (isql, isqlApp, or SQLAdvantage) that you prefer.

2 Verify the connection to the Replication Agent:
   a Open a command window in the $SYBASE (UNIX or Linux) or %SYBASE% (Windows) directory of your Replication Agent installation.
   b Set the environment variables by sourcing the SYBASE.csh file (UNIX or Linux) or executing the SYBASE.bat file (Windows).
   c Log in to Replication Agent:
     isql -Usa -P -Smyra

Note The following verification steps are optional because they were performed when you verified the resource file.
3 Verify the Replication Agent connection to Replication Server:
   a Enter:
      
      test_connection RS
      go

   b The following appears:
      
      Type Connection
      ---- ----------
      RS succeeded
      (1 row affected)

   c If the result indicates a failure, either the server is not responding or
   the connection properties (host, port, user, or password) are incorrect.
   Verify the host and port configuration values, and manually log in to
   the Replication Server as the configured user to determine which
   property is incorrectly defined.
   
   See the Replication Agent Administration Guide.

4 Verify the Replication Agent connection to the primary IBM DB2
Universal Database:
   a Enter:
      
      test_connection PDS
      go

      This message appears:
      
      Type Connection
      ---- ----------
      PDS succeeded
      (1 row affected)

   b If the result indicates a failure:
      
      • The server is not responding, or
      • One of the connection properties is incorrect.

      Manually log in to the primary IBM DB2 Universal Database as the
      configured user to find which property is incorrectly defined.

      See the Replication Agent Administration Guide section titled,
      “Testing network connectivity.”
Initializing the Replication Agent instance

Note If, in your resource file, you set initialize_instance to yes, skip this step and continue to step 2.

The pdb_xlog init command verifies that the primary IBM DB2 Universal Database is correctly configured to provide archived logging and that the IBM DB2 Universal Database user ID used by the Replication Agent has the necessary permissions. In addition, the pdb_xlog init command creates objects in the primary database to support replication.

1 To initialize the Replication Agent instance, run:

   pdb_xlog init
   go

   A message appears, indicating that the procedure was successful.

2 Enter:

   resume
   go

   If the Replication Agent successfully transfers to a replicating state, the following result is returned:

<table>
<thead>
<tr>
<th>State</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPLICATING</td>
<td>Ready to replicate data.</td>
</tr>
</tbody>
</table>

   A returned state of ADMIN indicates that an error prevented the replicating state from being achieved. To determine the error, review the contents of the Replication Agent system log.

3 The ra_status command returns the state of the Replication Agent. It is good practice to verify that the Replication Agent remains in replication state, even after the resume command executes successfully.

   To detect an error that occurred after replication start-up, execute:

   ra_status
   go

   If the Replication Agent is in replicating state, ra_status returns:

<table>
<thead>
<tr>
<th>State</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPLICATING</td>
<td>Ready to replicate data.</td>
</tr>
</tbody>
</table>
A returned state of ADMIN indicates that an error prevented the replicating state from being achieved. To determine the error, review the contents of the Replication Agent system log.

4 Validate that both primary and replicate connections are active:

```sql
isql -Usa -P -SSAMPLE_RS
admin who
go
```

**Note** Be aware that:

- The DSI connection for the primary database connection is usually down because you are not replicating data back to the primary database.

- The Replication Agent connection, if established for the replicate database connection, is usually down, because you are not replicating data from the replicate database.

Do not proceed until `admin who` has similar status for threads to the following:

```sql
admin who
go
```

The following appears:

```
<table>
<thead>
<tr>
<th>Spid</th>
<th>Name</th>
<th>State</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>
<td>DSI EXEC</td>
<td>Awaiting Command</td>
<td>101(1)SAMPLE_RS_ERSSD</td>
</tr>
<tr>
<td>9</td>
<td>DSI</td>
<td>Awaiting Message</td>
<td>101SAMPLE_RS_ERSSD</td>
</tr>
<tr>
<td>8</td>
<td>SQM</td>
<td>Awaiting Message</td>
<td>101:0SAMPLE_RS_ERSSD</td>
</tr>
<tr>
<td>54</td>
<td>DSI EXEC</td>
<td>Awaiting Command</td>
<td>102(1)DCService.rdb</td>
</tr>
<tr>
<td>53</td>
<td>DSI</td>
<td>Awaiting Message</td>
<td>102 DCService.rdb</td>
</tr>
<tr>
<td>17</td>
<td>SQM</td>
<td>Awaiting Message</td>
<td>102:0 DCService.rdbDCSI</td>
</tr>
<tr>
<td></td>
<td></td>
<td>EXEC Suspended</td>
<td>103(1)NY.NYudb9</td>
</tr>
</tbody>
</table>
```
Testing replication

After you finish setting up the replication system, you can test replication.

❖ Testing replication

1 Connect to the primary IBM DB2 Universal Database instance as a regular user, not the maintenance user. Make sure the regular user also exists in the replicate database.

   • To connect to the database with CLP, use:

   ```
   CONNECT TO dbalias USER db2_user USING db2_user_ps
   
   Here, dbalias is the cataloged alias of the primary database, db2_user is the primary database user, and db2_user_ps is the password.
   ```

2 Create a test table in the primary database:

   ```
   create table T1( a int, b char(10))
   ```

3 Grant permissions to any new or existing object to be replicated in the primary database:

   ```
   grant all on T1 to public
   ```

4 Create a test table in the replicate database:

   ```
   create table T1( a int, b char(10))
   ```

5 Grant permissions to any new or existing object to be replicated in the replicate database, so that the Replication Server maintenance user can update this table:
grant all on T1 to public

6 Connect to the Replication Agent and run the following command to mark the table:

    pdb_setreptable T1, mark

7 After the table is marked and the Replication Agent is in a replicating state, insert test data into the test table and commit it.

By default, the work performed by the maintenance user of the primary connection is not replicated. The user ID used to insert transactions cannot be the same as the maintenance user defined in the primary connection. See “Configuring Replication Server for replication from the primary database” on page 100.

8 Use your preferred IBM DB2 Universal Database query tool to examine the replicate site for results and compare the contents of your test table from both the primary and replicate sites.

Resetting the primary IBM DB2 Universal Database for replication

In a test environment, you may occasionally need to reset the replication environment. Instead of deleting and re-creating a new Replication Agent instance, use this procedure to facilitate resetting the environment.

❖ Resetting the primary database for replication

1 Log in to the Replication Agent and issue:

    suspend
    go

2 Reset the locator stored in the Replication Agent:

    ra_locator zero
    go

3 Reset the locator stored in Replication Server:

    isql -USAMPLE_RS_RSSD_prim -PSAMPLE_RS_RSSD_prim_ps -SSAMPLE_RS_ERSSD -DSAMPLE_RS_ERSSD
    rs_zeroltm NY, NYudb9
    go

   This message appears:

   Locator has been reset to zero.
Testing replication

(return status = 0)

4 Resume replication:

resume

go
Glossary

This glossary describes Replication Agent terms.

Adaptive Server
The brand name for Sybase relational database management system (RDBMS) software products.

- Adaptive Server Enterprise manages multiple, large relational databases for high-volume online transaction processing (OLTP) systems and client applications.
- Adaptive Server IQ manages multiple, large relational databases with special indexing algorithms to support high-speed, high-volume business intelligence, decision support, and reporting client applications.
- SQL Anywhere (formerly Adaptive Server Anywhere) manages relational databases with a small DBMS footprint, which is ideal for embedded applications and mobile device applications.

See also DBMS and RDBMS.

atomic materialization
A materialization method that copies subscription data from a primary database to a standby database in a single, atomic operation. No changes to primary data are allowed until the subscription data is captured at the primary database. See also bulk materialization and nonatomic materialization.

BCP utility
A bulk copy transfer utility that provides the ability to load multiple rows of data into a table in a target database. See also bulk copy.

bulk copy
An Open Client™ interface for the high-speed transfer of data between a database table and program variables. Bulk copying provides an alternative to using SQL insert and select commands to transfer data.

bulk materialization
A materialization method whereby subscription data in a standby database is initialized outside of the replication system. You can use bulk materialization for subscriptions to table replication definitions or function replication definitions. See also atomic materialization and nonatomic materialization.
client

In client/server systems, the part of the system that sends requests to servers and processes the results of those requests. See also client application.

client application

Software that is responsible for the user interface, including menus, data entry screens, and report formats. See also client.

commit

An instruction to the DBMS to make permanent the changes requested in a transaction. See also transaction. Contrast with rollback.

data client

A client application that provides access to data by connecting to a data server. See also client, client application, and data server.

data distribution

A method of locating (or placing) discrete parts of a single set of data in multiple systems or at multiple sites. Data distribution is distinct from data replication, although a data replication system can be used to implement or support data distribution. Contrast with data replication.

data replication

The process of copying data to remote locations, and then keeping the replicated data synchronized with the primary data. Data replication is different from data distribution. Replicated data is stored copies of data at one or more remote sites throughout a system, and it is not necessarily distributed data. Contrast with data distribution. See also disk replication and transaction replication.

data server

A server that provides the functionality necessary to maintain the physical representation of a table in a database. Data servers are usually database servers, but they can also be any data repository with the interface and functionality a data client requires. See also client, client application, and data client.

database

A collection of data with a specific structure (or schema) for accepting, storing, and providing data for users. See also data server, DBMS, and RDBMS.

database connection

A connection that allows Replication Server to manage the database and distribute transactions to the database. Each database in a replication system can have only one database connection in Replication Server. See also Replication Server and route.

datatype

A keyword that identifies the characteristics of stored information on a computer. Some common datatypes are: char, int, smallint, date, time, numeric, and float. Different data servers support different datatypes.

DBMS

An abbreviation for database management system, a computer-based system for defining, creating, manipulating, controlling, managing, and using databases. The DBMS can include the user interface for using the database, or it can be a standalone data server system. Compare with RDBMS.
disaster recovery A method or process used to restore the critical business functions interrupted by a catastrophic event. A disaster recovery (or business continuity) plan defines the resources and procedures required for an organization to recover from a disaster, based on specified recovery objectives.

ERSSD An abbreviation for Embedded Replication Server System Database, which manages replication system information for a Replication Server. See also Replication Server.

failback A procedure that restores the normal user and client access to a primary database, after a failover procedure switched access from the primary database to a standby database. See also failover.

failover A procedure that switches user and client access from a primary database to a standby database, particularly in the event of a failure that interrupts operations at the primary database, or access to the primary database. Failover is an important fault-tolerance feature for systems that require high availability. See also failback.

function A Replication Server object that represents a data server operation such as insert, delete, or begin transaction. Replication Server distributes operations to standby databases as functions. See also function string.

function string A string that Replication Server uses to map a function and its parameters to a data server API. Function strings allow Replication Server to support heterogeneous replication, in which the primary and standby databases are different types, with different SQL extensions and different command features. See also function.

gateway Connectivity software that allows two or more computer systems with different network architectures to communicate.

inbound queue A stable queue managed by Replication Server to spool messages received from a Replication Agent. See also outbound queue and stable queue.

interfaces file A file containing information that Sybase Open Client and Open Server™ applications need to establish connections to other Open Client and Open Server applications. See also Open Client and Open Server.

isql An Interactive SQL client application that can connect and communicate with any Sybase Open Server application, including Adaptive Server, Replication Agent, and Replication Server. See also Open Client and Open Server.

Java An object-oriented programming language developed by Sun Microsystems. A platform-independent, “write once, run anywhere” programming language.
**Java VM**  
The Java Virtual Machine. The Java VM (or JVM) is the part of the Java Runtime Environment (JRE) that is responsible for interpreting Java byte codes. See also **Java** and **JRE**.

**JDBC**  
An abbreviation for Java Database Connectivity. JDBC is the standard communication protocol for connectivity between Java clients and data servers. See also **data server** and **Java**.

**JRE**  
An abbreviation for Java Runtime Environment. The JRE consists of the Java Virtual Machine (Java VM or JVM), the Java Core Classes, and supporting files. The JRE must be installed on a machine to run Java applications, such as the Replication Agent. See also **Java VM**.

**LAN**  
An abbreviation for “local area network,” a computer network located on the user premises that covers a limited geographical area (usually a single site). Communication within a local area network is not subject to external regulations; however, communication across the LAN boundary can be subject to some form of regulation. Contrast with **WAN**.

**latency**  
In transaction replication, the time it takes to replicate a transaction from a primary database to a standby database. Specifically, latency is the time elapsed between committing an original transaction in the primary database and committing the replicated transaction in the standby database.

In disk replication, latency is the time elapsed between a disk write operation that changes a block or page on a primary device and the disk write operation that changes the replicated block or page on a replicate device.

See also **disk replication** and **transaction replication**.

**LOB**  
An abbreviation for large object, a type of data element that is associated with a column that contains extremely large quantities of data.

**Log Reader**  
An internal component of the Replication Agent that interacts with the primary database to capture transactions for replication. See also **Log Transfer Interface** and **Log Transfer Manager**.

**Log Transfer Interface**  
An internal component of the Replication Agent that interacts with Replication Server to forward transactions for distribution to a standby database. See also **Log Reader** and **Log Transfer Manager**.

**Log Transfer Manager**  
An internal component of the Replication Agent that interacts with the other Replication Agent internal components to control and coordinate Replication Agent operations. See also **Log Reader** and **Log Transfer Interface**.
<table>
<thead>
<tr>
<th><strong>maintenance user</strong></th>
<th>A special user login name in the standby database that Replication Server uses to apply replicated transactions to the database. See also Replication Server.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>materialization</strong></td>
<td>The process of copying the data from a primary database to a standby database, initializing the standby database so that the Replication Agent system can begin replicating transactions. See also atomic materialization, bulk materialization, and nonatomic materialization.</td>
</tr>
<tr>
<td><strong>nonatomic materialization</strong></td>
<td>A materialization method that copies subscription data without a lock on the primary database. Changes to primary data are allowed during data transfer, which may cause temporary inconsistencies between the primary and standby databases. Contrast with atomic materialization. See also bulk materialization.</td>
</tr>
<tr>
<td><strong>ODBC</strong></td>
<td>An abbreviation for Open Database Connectivity, an industry-standard communication protocol for clients connecting to data servers. See also JDBC.</td>
</tr>
<tr>
<td><strong>Open Client</strong></td>
<td>A Sybase product that provides customer applications, third-party products, and other Sybase products with the interfaces needed to communicate with Open Server applications. See also Open Server.</td>
</tr>
<tr>
<td><strong>Open Client application</strong></td>
<td>An application that uses Sybase Open Client libraries to implement Open Client communication protocols. See also Open Client and Open Server.</td>
</tr>
<tr>
<td><strong>Open Server</strong></td>
<td>A Sybase product that provides the tools and interfaces required to create a custom server. See also Open Client.</td>
</tr>
<tr>
<td><strong>Open Server application</strong></td>
<td>A server application that uses Sybase Open Server libraries to implement Open Server communication protocols. See also Open Client and Open Server.</td>
</tr>
<tr>
<td><strong>outbound queue</strong></td>
<td>A stable queue managed by Replication Server to spool messages to a standby database. See also inbound queue and stable queue.</td>
</tr>
<tr>
<td><strong>primary data</strong></td>
<td>The version of a set of data that is the source used for replication. Primary data is stored and managed by the primary database. See also Replication Agent, primary database, and Replication Server.</td>
</tr>
<tr>
<td><strong>primary database</strong></td>
<td>The database that contains the data to be replicated to another database (the standby database) through a replication system. The primary database is the database that is the source of replicated data in a replication system. Sometimes called the active database. Contrast with standby database. See also primary data.</td>
</tr>
<tr>
<td><strong>primary key</strong></td>
<td>The column or columns whose data uniquely identify each row in a table.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>primary site</td>
<td>The location or facility at which primary data servers and primary databases are deployed to support normal business operations. Sometimes called the active site or main site. See also primary database and standby site.</td>
</tr>
<tr>
<td>primary table</td>
<td>A table used as a source for replication. Primary tables are defined in the primary database schema. See also primary data and primary database.</td>
</tr>
<tr>
<td>primary transaction</td>
<td>A transaction that is committed in the primary database and recorded in the primary database transaction log. See also primary database, replicated transaction, and transaction log.</td>
</tr>
<tr>
<td>quiesce</td>
<td>To cause a system to go into a state in which further data changes are not allowed. See also quiescent.</td>
</tr>
<tr>
<td>quiescent</td>
<td>In a replication system, a state in which all updates have been propagated to their destinations. Some Replication Agent and Replication Server commands require that you first quiesce the replication system.</td>
</tr>
<tr>
<td>RASD</td>
<td>An abbreviation for Replication Agent System Database. Information in the RASD is used by the primary database to recognize database structure or schema objects in the transaction log.</td>
</tr>
<tr>
<td>RCL</td>
<td>An abbreviation for Replication Command Language, the command language used to manage Replication Server.</td>
</tr>
<tr>
<td>RDBMS</td>
<td>An abbreviation for relational database management system, an application that manages and controls relational databases. Compare with DBMS. See also relational database.</td>
</tr>
<tr>
<td>relational database</td>
<td>A collection of data in which data is viewed as being stored in tables, which consist of columns (data items) and rows (units of information). Relational databases can be accessed by SQL requests. See also SQL.</td>
</tr>
<tr>
<td>replicated data</td>
<td>A set of data that is replicated from a primary database to a standby database by a replication system. See also primary database, replication system, and standby database.</td>
</tr>
<tr>
<td>replicated transaction</td>
<td>A primary transaction that is replicated from a primary database to a standby database by a transaction replication system. See also primary database, primary transaction, standby database, and transaction replication.</td>
</tr>
</tbody>
</table>
**Replication Agent**
An application that reads a primary database transaction log to acquire information about data-changing transactions in the primary database, processes the log information, and then sends it to a Replication Server for distribution to a standby database. See also **primary database** and **Replication Server**.

**replication definition**
A description of a table or stored procedure in a primary database, for which subscriptions can be created. The replication definition, maintained by Replication Server, includes information about the columns to be replicated and the location of the primary table or stored procedure. See also **Replication Server** and **subscription**.

**Replication Server**
The Sybase software product that provides the infrastructure for a robust transaction replication system. See also **Replication Agent**.

**RSSD**
An abbreviation for Replication Server System Database, which manages replication system information for a Replication Server. See also **Replication Server**.

**replication system**
A data processing system that replicates data from one location to another. Data can be replicated between separate systems at a single site, or from one or more local systems to one or more remote systems. See also **disk replication** and **transaction replication**.

**rollback**
An instruction to a database to back out of the changes requested in a unit of work (called a transaction). Contrast with **commit**. See also **transaction**.

**SQL**
An abbreviation for Structured Query Language, a nonprocedural programming language used to process data in a relational database. ANSI SQL is an industry standard. See also **transaction**.

**stable queue**
A disk device-based, store-and-forward queue managed by Replication Server. Messages written into the stable queue remain there until they can be delivered to the appropriate process or standby database. Replication Server provides a stable queue for both incoming messages (the inbound queue) and outgoing messages (the outbound queue). See also **database connection**, **Replication Server**, and **route**.

**standby data**
The data managed by a standby database, which is the destination (or target) of a replication system. See also **data replication** and **standby database**.
standby database  A database that contains data replicated from another database (the primary database) through a replication system. The standby database is the database that receives replicated data in a replication system. Sometimes called the replicate database. Contrast with primary database. See also standby data.

standby site  The location or facility at which standby data servers and standby databases are deployed to support disaster recovery, and normal business operations during scheduled downtime at the primary site. Sometimes called the alternate site or replicate site. Contrast with primary site. See also standby database.

subscription  A request for Replication Server to maintain a replicated copy of a table, or a set of rows from a table, in a standby database at a specified location. See also replication definition and Replication Server.

table  In a relational DBMS, a two-dimensional array of data or a named data object that contains a specific number of unordered rows composed of a group of columns that are specific for the table. See also database.

transaction  A unit of work in a database that can include zero, one, or many operations (including insert, update, and delete operations), and that is either applied or rejected as a whole. Each SQL statement that modifies data can be treated as a separate transaction, if the database is so configured. See also SQL.

transaction log  Generally, the log of transactions that affect the data managed by a data server. Replication Agent reads the transaction log to identify and acquire the transactions to be replicated from the primary database. See also Replication Agent, primary database, and Replication Server.

transaction replication  A data replication method that copies data-changing operations from a primary database transaction log to a standby database. See also data replication and disk replication.

transactional consistency  A condition in which all transactions in the primary database are applied in the standby database, in the same order that they were applied in the primary database.

WAN  An abbreviation for “wide area network,” a system of local area networks (LANs) connected together with data communication lines. Contrast with LAN.
