# Develop Mobile Business Objects

Use Sybase® Unwired WorkSpace to develop mobile business objects (MBOs), and generate Object API code that can be used to create native device applications and mobile workflows.

Mobile business objects help form the business logic for mobile applications and mobile workflows by defining the data you want to use from your backend system and to expose through your mobile application or workflow, and the methods and operations to perform.

See *Supported Hardware and Software* for the most current version information.

See *Fundamentals* for high-level mobile computing concepts, and a description of how Sybase Unwired Platform implements the concepts in your enterprise.

## Product Task Flow

---

Use Sybase® Unwired Platform to develop mobile applications, and to manage the production environment. Understanding the end-to-end product task flow enables you to use Unwired Platform strategically in your enterprise.

**Developers** Use Sybase Unwired WorkSpace to develop mobile applications. The developer's license includes everything necessary to develop and test your creations—access to sample or external data sources, access to the Eclipse development environment, API classes, and Unwired Server. The basic steps for creating a mobile application include:

1. Create a connection profile to a structured or unstructured data source.
2. Create a connection profile to Unwired Server.
3. Create mobile business objects.

Use Unwired WorkSpace to create a project container, then create one or more mobile business objects (MBOs). Mobile business objects contain the business logic, operations (create, update, delete, and other), attributes, and relationships for the mobile application, and identify synchronization keys and set up personalization. For example, an MBO may include the business logic for creating, editing, and deleting customer records. You can create an MBO by dragging and dropping an object from the data source, or using the creation wizard and then bind the MBO to a data source. Alternatively, you can create an MBO and defer binding to a data source, or create a local business object.

4. Create device applications or mobile workflows:
  - a. Generate client object API code in Eclipse, then develop the device application in a native IDE. Implement error handling.
  - b. Use Mobile Workflow Forms Editor to develop a message-based workflow package.
5. Deploy the mobile application project from Sybase Unwired WorkSpace to Unwired Server.

6. Deploy the device application (which contains MBOs) to an emulator or mobile device, and test.

**System Administrators** Use the Sybase Control Center administrative console, a Web-based user interface to configure and deploy mobile applications and workflow packages from Unwired Server to the production environment, and to manage the production environment. Multiple users can use the administrative console. Steps for deploying the mobile application in a production environment include:

1. Configure the mobile application for deployment into the production environment.  
Make any configuration changes necessary, such as switching from a development or test database to the production database.
2. Deploy the mobile application package.  
Once configured, deploy the mobile application package. Once deployed, users can access the mobile application from mobile devices. Mobile applications can be pushed to the device or scheduled for deployment. Unwired Server manages synchronization between the data source and the mobile device.  
Optionally use Afaia® with Unwired Platform to provision mobile applications, and manage devices and users. You can purchase Afaia separately to further enhance the management of your mobile enterprise.

**Mobile Device Users** Use mobile devices (including smartphones, laptops, handheld devices, and notebooks) to access mobile applications.

From the mobile device:

- Log in to a mobile application; navigate the user interface; synchronize data and applications through Unwired Server to the data source; and create, update, and delete data records and transactions.
- Use mobile workflow forms to carry out steps in a business workflow process from the mobile device.

## Tutorials

---

Tutorials demonstrate how to use Sybase Unwired Platform tools to mobilize your enterprise, using step-by-step instructions. They are available on Product Documentation, and SAP™ Development Network (SDN).

Check the Sybase Product Documentation Web site regularly for updates: access <http://sybooks.sybase.com/nav/summary.do?prod=1289>, then navigate to the most current version.

Check SDN regularly for tutorials, projects and articles: <http://www.sdn.sap.com/irj/sdn/mobile?rid=/webcontent/uuid/40ea4956-b95c-2e10-11b3-e68c73b2280e>.

**See also**

- *Developer Task Flow* on page 5

## Samples

---

Sample applications are fully developed, working applications that demonstrate the features and capabilities of Sybase Unwired Platform.

Check the SAP® Development Network (SDN) Web site regularly for new and updated samples: <https://cw.sdn.sap.com/cw/groups/sup-apps>.

## Documentation Roadmap for Unwired Platform

---

Sybase® Unwired Platform documents are available for administrative and mobile development user roles. Some administrative documents are also used in the development and test environment; some documents are used by all users.

See *Documentation Roadmap* in *Fundamentals* for document descriptions by user role. *Fundamentals* is available on the Sybase Product Documentation Web site.

Check the Sybase Product Documentation Web site regularly for updates: access <http://sybooks.sybase.com/nav/summary.do?prod=1289>, then navigate to the most current version.

## Develop Mobile Business Objects

# Developer Task Flow

Get started using the Unwired WorkSpace development environment to mobilize your enterprise.

This describes a typical task flow creating a mobile application using a data source and mobile business objects to create the server-side code. You can follow similar task flows to create mobile applications using a variety of data sources (like a Web service, database, or SAP®), and using other client interface tools (like the client object API).

## Understanding the Unwired Platform Development Environment

---

This provides basic information for understanding the Unwired Platform development environment.

### *Developing with Multiple Tools*

Tools within Sybase Unwired Platform help you to move through the MBO development, MBO deployment, monitoring and management, and device application code generation and customization processes.

### *Supported Tooling Environments*

Unwired Platform provides an Eclipse development environment. The Unwired WorkSpace environment works like a plugin for Eclipse, and provides development tools.

Use backend integration models to connect to your enterprise data and create the business logic, then generate device application code for iOS, Android, BlackBerry, Windows Mobile, and Windows. Develop the user interface in its native integrated development environment (IDE).

Use Unwired WorkSpace to develop message-based Workflow clients.

### *Emulators and Simulators*

Use installed versions of emulators and simulators specific to the device IDE to which you are deploying to test your device applications.

### *Command Line Utilities for Development*

Command line utilities support development outside of the user-interface-based tools.

## Understanding Fundamental Mobile Development Concepts

---

This provides basic information for understanding mobile development using Unwired Platform.

### Learning Unwired WorkSpace Basics

If you are already familiar with Eclipse, you will find Sybase Unwired Platform features are well integrated. If you are not familiar, you can quickly learn the basic layout of Unwired WorkSpace and the location of online help.

- From the Welcome page, select the **Development** icon to learn about the tasks you must perform. To close this page, click the **X**.
- You can reopen the Welcome page by selecting **Help > Welcome**.
- From Sybase Unwired WorkSpace, look at the area (window or view) that you will be working in to access, create, define, and update mobile business objects(MBOs).

Window	Description
WorkSpace Navigator view	This view displays mobile application project folders, each of which contains all project-related resources in subfolders, including MBOs, data source references to which the MBOs are bound, personalization keys, and so on.  Use this view to review and modify MBO-related properties.
Enterprise Explorer view	A window that provides functionality to connect to various enterprise back-end systems; for example, database servers, SAP® servers, and Sybase Unwired Server.

Window	Description
Mobile Application Diagram	<p>The Mobile Application Diagram is a graphical editor where you create and define mobile business objects.</p> <p>Use the Mobile Application Diagram to create MBOs (including attributes and operations), then define relationships with other MBOs. You can:</p> <ul style="list-style-type: none"> <li>• Create MBOs in the Mobile Application Diagram using Palette icons and menu selections – either bind or defer binding to a data source, when creating an MBO. For example, you may want to model your MBOs before creating the data sources to which they bind. This MBO development method is sometimes referred to as the top-down approach.</li> <li>• Drag items from Enterprise Explorer and drop them (drag and drop) onto the Mobile Application Diagram to create the MBO – quickly creates the operations and attributes automatically based on the data source being dropped on the Mobile Application Diagram.</li> </ul> <p>Each new mobile application project generates an associated mobile application diagram.</p>
Palette	<p>The Palette is accessed from the Mobile Application Diagram and provides controls, such as the ability to create MBOs, add attributes and operations, and define relationships, by dragging-and-dropping the corresponding icon onto the Mobile Application Diagram or existing MBO.</p>
Properties view	<p>Select an object in the Mobile Application Diagram to display and edit its properties in the Properties view. While you cannot create an MBO from the Properties view, most development and configuration is performed here.</p>
Outline view	<p>Displays an outline of the file that is currently open in the editor area, and lists structural elements. The contents are editor-specific.</p>

Window	Description
Problem view	Displays problems, errors, or warnings that you may encounter. This is a valuable source for collecting troubleshooting information.
Error Log view	Displays error log information. This is a valuable source for collecting troubleshooting information.

- To access the online help, select **Help > Help Contents** from the main menu bar. Expand any of the documents that appear in the left pane. Some documents are for Sybase Unwired Platform, while others are for the Eclipse development environment.

**See also**

- *Basic and Advanced Developer Profiles* on page 8
- *Mobile Business Objects* on page 9
- *Data Sources* on page 9
- *Device Application Types* on page 10
- *Deployment to Unwired Server* on page 11
- *Data Synchronization and Data Refresh* on page 11

**Basic and Advanced Developer Profiles**

Optionally you can set Basic and Advanced (the default) developer profile preferences for Unwired WorkSpace. You can select the specific features to enable or disable viewing from each of the profiles. Features that are disabled are grayed out. You can also right-click in Mobile Application Diagram, and select **Switch Developer Profile > Basic/Advanced** to switch.

- Basic – is a subset of the features available to the Advanced developer, and allows you to develop and deploy MBOs. Customize the Basic profile so that you see only required properties, wizards, screens, and so on.
- Advanced – includes all Unwired WorkSpace features, wizards, and properties, enabling additional MBO customization not provided in the Basic profile.

## **Mobile Business Objects**

A mobile business object (MBO) is derived from a data source, and helps form the business logic for mobile applications. MBOs are grouped in Mobile Application Projects, and then the projects are deployed to an Unwired Server and referenced in mobile devices (clients).

The MBO construct is the representation of the entity model as defined within the enterprise data sources. The MBO abstracts the enterprise information system (EIS) managing the data, and the on-device access to the EIS data. Several MBO specializations include:

- Local business object construct – allows modeling of entities with no binding to a data source in the enterprise, and abstracts the on-device persistence and access.
- Structure construct – allows the modeling of arbitrary complex (nested) types, which are used to model an operation interface with complex arguments.

Multiple MBOs can be generated from a single EIS read operation for Web services that have multiple XSLTs defined, or a SAP BAPI/RFC operation that has multiple output tables.

- *Data Sources* on page 9
- *Device Application Types* on page 10
- *Deployment to Unwired Server* on page 11
- *Data Synchronization and Data Refresh* on page 11

## **Data Sources**

A data source is the enterprise information system (EIS) where data is retrieved from and transactions are executed. A connection profile is a design-time connection to a data source. Connection profiles are created to specific data sources by providing connection information such as host, port, login, and password among others. The connection profiles are used to define MBOs and operations, and mapped to existing, or used to create new, server connections when the package is deployed to Unwired Server.

Unwired Platform hides the interaction complexity with datasource-specific protocols, such as JDBC™ for database and SOAP for Web services.

Unwired Platform currently supports multiple EIS connection types. See *Supported Hardware and Software* for information.

- *Deployment to Unwired Server* on page 11
- *Data Synchronization and Data Refresh* on page 11

### **Device Application Types**

Sybase Unwired Platform supports two mobile business object-based application types: native application and Hybrid Web Container-based mobile workflow.

#### *Native Application*

The native application model enables the developer to generate Object API code from mobile business objects, and write custom code (C#, Java, or Objective-C, depending on the platform) to create a device application. In native application development, the application is based on compiled code that is specific to a particular mobile operating system. Native application development provides the most flexibility in terms of leveraging the device services, but each application must be provisioned individually after being compiled, even for minor changes or updates. Native applications support offline capabilities, leveraging synchronization.

#### *Hybrid Web container-based mobile workflow*

The Hybrid Web Container offers a fast and simple way to build applications that support business processes, such as approvals and requests. With the Hybrid Web Container-based development, the server-side of the application is metadata-driven and the client-side of the application is a fully generated Web application package. This mobile workflow package of platform-independent HTML, JavaScript and CSS resources can be deployed automatically to the Container, a native application on the device, without writing any code. The Hybrid Web Container hosts an embedded browser and launches the individual mobile workflow applications. The workflows are assigned to users by administrators. Once assigned, those workflows can be initiated by the user (client-initiated) or automatically triggered as a result of a back-end event that is sent to the Unwired Server as a data change notification request (server-initiated).

- *Data Synchronization and Data Refresh* on page 11

## **Deployment to Unwired Server**

Deploy mobile business objects (MBOs) in a Mobile Application as a deployment package to Unwired Server.

The deployment package includes everything needed for the MBO to work in a production environment, including server-side artifacts that support the enterprise information system (EIS) connection and device application, and any other MBO functionality.

The production system administrator can then deploy the package to the production environment.

- *Basic and Advanced Developer Profiles* on page 8
- *Mobile Business Objects* on page 9
- *Data Sources* on page 9
- *Device Application Types* on page 10
- *Data Synchronization and Data Refresh* on page 11

## **Data Synchronization and Data Refresh**

Since dataset variations occur between multiple clients and the enterprise information system (EIS) data to which mobile business object (MBO) data is bound, synchronization is required to reconcile differences and bring each client into coherence with the working copy of the EIS data maintained in the Unwired Server cache database (CDB), before writing updates back to the EIS.

These terms describe maintaining data consistency:

- Synchronization – synchronize between the CDB and mobile-device applications. Synchronization transactions require a connection. If a mobile device does not have a connection to Unwired Server, synchronization cannot occur until a connection is established. However, data updates are aggregated and synchronized when a connection becomes available.
- Data refresh – also called cache refresh, synchronize between the CDB and an EIS. Because information is held in the CDB, even if the EIS server fails, the device still has read access to the data in the CDB.

## Developer Task Flow

1. Each client maintains one instance of the data. Similarly, there is only one version of the dataset in the CDB, and only one version in the EIS system.
2. Since variations occur between the different clients and the EIS data, synchronization brings each client into coherence with the working copy of the EIS data that is maintained in the CDB.

- *Deployment to Unwired Server* on page 11

### **Unwired Server Cache**

The Unwired Server cache is the replicated data store component of the cache database (CDB) and is the integration point for synchronization and data refresh. It manages synchronized data between Unwired Server and device applications, and refreshed data between Unwired Server and the enterprise information system (EIS). Administrators can control cache behaviours in Sybase Control Center.

The cache performs a number of important functions, including:

- Maintaining a local copy of enterprise data.
- Managing updates between the CDB and the EIS servers (data refresh).

- Managing updates between CDB and device application data (synchronization), even in environments where there are thousands of simultaneous synchronizations.
- Partitioning of data – partitions for MBO data, for example, based on device client specific parameters. When a device application passes a device client specific parameter used for both synchronization and data refresh, the CDB:
  - Tracks rows under different partitions based on the synchronization parameter values. A synchronization parameter maps to an attribute that acts as a filter or variable that lets you limit the data that is returned to the device to rows in the table based on a supplied value.
  - Keeps track of which partitions each client is interested in from prior synchronizations. For example, Unwired Server knows that client one is only interested in rows containing the "ABC" parameter value, while client two cares only about rows that contain "def".

Many of the complexities of maintaining synchronization and data refresh are transparent to the administrator, however, you can:

- Configure a dedicated CDB to run within a cluster. A cluster can have any number of Unwired Servers, but only one CDB. If you have a dedicated CDB within a cluster, it should be the first node of the cluster.
- Increase the number of worker threads dedicated to the CDB as the number of Unwired Server instances in a cluster increases.
- Modify CDB port number.
- Monitor synchronization and data refresh performance.

### **Synchronization and Data Refresh Triggers**

Initiate synchronization and data refresh using a combination of methods to effectively meet mobile application and system requirements.

### See also

- *Unwired Server Cache* on page 12
- *Synchronization and Data Refresh Data Flow* on page 16
- *Data Refresh Data Flow* on page 20
- *Mobile Workflow Data Flow* on page 23
- *Synchronization and Data Refresh Strategies* on page 24

Synchronization Triggers

Define synchronization through mobile business object (MBO) and device application configuration and programming, or after deployment, through Unwired Server settings.

**Table 1. Synchronization methods and triggers**

Method	Description
Push	<p>For the push method, either the the MBO developer or the administrator configures synchronization timing (on-demand or scheduled). Typically a refresh schedule or data change notification (DCN) is paired with a subscription template for a given MBO with push synchronization enabled. When MBO data in the CDB changes:</p> <ul style="list-style-type: none"> <li>• Notifications are sent at a set interval. The default is one minute and ends when the client acknowledges it has received notification.</li> <li>• Unwired Server determines when individual clients need to be notified of changes and can override device application settings and synchronize the device application with the contents of the CDB.</li> <li>• If Unwired Server does not force a synchronization, device application logic determines how to respond to the push notification. The device application developer can:               <ul style="list-style-type: none"> <li>• Register to receive push notifications from Unwired Server.</li> <li>• Implement a push listener.</li> <li>• Implement logic to react to push notifications. For example, if certain data changes the device application synchronizes with the CDB.</li> </ul> </li> </ul> <hr/> <p><b>Note:</b> Unwired Server initiates notifications only for replicated-based synchronization, while messaging-based synchronization pushes data to the device without notification.</p>

Method	Description
Pull	<p>For the pull method, the MBO developer configures the amount of data that is to be synchronized (through a combination of settings such as Synchronization group, synchronization parameters, data filter, and so on), and the device application developer adds the screens and logic that allows a user to pass synchronization parameters and attributes to trigger and control synchronization, including:</p> <ul style="list-style-type: none"> <li>Starting the device application – this can automatically trigger synchronization.</li> <li>Adding a synchronization event button to the device application – allows the device application user to synchronize based on how the synchronization event is configured. For example, the MBO developer could include a synchronization parameter that filters data displayed by the device application, or supply client parameters (for example, by using the system personalization keys "username" and "password") by which the device synchronizes.</li> <li>Device application logic – the device application developer adds logic that triggers synchronization based on an event.</li> </ul>

### Data Refresh Triggers

Define data refresh through mobile business object (MBO) settings, programmatically through the data change notification (DCN) interface, or through Unwired Server settings.

**Table 2. Data refresh methods and triggers**

Method	Description
DCN (development)   Push Listener (administration)	<p>The enterprise information system (EIS) developer implements DCN using HTTP or HTTPS GET or POST methods. Depending on which is implemented, the administrator needs to configure the push listener synchronization gateway for the correct encrypted or unencrypted protocol chosen. The DCN can be initiated by a database trigger, stored procedure, or some other event to:</p> <ul style="list-style-type: none"> <li>Notify Unwired Server that a particular MBO in the CDB needs to be refreshed.</li> <li>Allow the EIS to invoke a particular MBO operation with a set of specified parameters.</li> </ul>
Cache group	<p>The MBO developer defines any number of cache groups to which one or more MBOs are added based on data refresh requirements. An update policy applies to all MBOs within a cache group.</p>
Cache update policies	<p>The MBO developer can add a cache policy to create, update, or delete operations to control how any EIS affecting operation is applied to the CDB.</p>

Method	Description
Load arguments	The MBO developer can create an MBO that uses load arguments to: <ul style="list-style-type: none"> <li>• Control data refresh for individual MBOs</li> <li>• Create CDB partitions for individual users based on argument values.</li> <li>• Control synchronization if paired with a synchronization parameter.</li> </ul>

**Synchronization and Data Refresh Data Flow**

The way in which data flows through Unwired Server, the enterprise information system (EIS), and device applications depends on the choices you make during design and development.

Sybase Unwired Platform supports both replicated and nonreplicated data within device applications. Except as noted, all references in the synchronization and data refresh overview refer to replicated data flow.

**See also**

- *Unwired Server Cache* on page 12
- *Synchronization and Data Refresh Triggers* on page 13
- *Data Refresh Data Flow* on page 20
- *Mobile Workflow Data Flow* on page 23
- *Synchronization and Data Refresh Strategies* on page 24

**Synchronization Data Flow**

Synchronization is when a device application's data is updated with the contents of the Unwired Server cache database (CDB).

Based on various cache settings, the enterprise information system (EIS) can update or refresh the cache during synchronization. Device application initiated synchronization occurs at the request of the user, through a menu button or triggered programmatically as the result of some application action or timer.

***Filtering and Synchronizing Data***

Use load arguments and synchronization parameters to synchronize selected subsets of data.

***Result Set Filter Data Flow***

A `ResultSetFilter` is a custom Java class deployed to Unwired Server that manipulates rows and columns of data before synchronization.

Result set filters are more versatile (and more complicated to implement) than an attribute filter implemented through a synchronization parameter, since you must write code that implements the filter, instead of simply mapping a parameter to a column to use as the filter. See *Developers Reference: Server API*.

1. Enterprise information system (EIS) data is sent to Unwired Server.
2. The result set filter filters the results, and applies those results to the CDB for a given MBO. For example, the result set filter combines two columns into one.
3. The device application synchronizes with the results contained in the CDB.  
The client cannot distinguish between MBOs that have had their attributes transformed through a `ResultSetFilter` from those that have not.

### *Load Argument Data Flow*

Load arguments allow you to limit data stored in the Unwired Server cache and returned to the device based on the values the device user supplies via the argument over time. They can be paired with synchronization parameters to also control synchronization.

Pairing a load argument with a synchronization parameter during mobile business object (MBO) development, indicates that the user will supply values for this argument over time and the aggregate set of data based on the values provided over time are synchronized with that device. If not paired (or mapped) to a synchronization parameter, no such synchronization filtering occurs for the device and the argument is simply used to update the Unwired Server cache database (CDB) by retrieving a subset of data from the enterprise information system (EIS).

An initial read operation populates a CDB table with all rows of MBO data, which can be included in the data returned in synchronization requests made from one or more clients. In some cases, a load argument is desired to refine the data requested from the EIS. Mapping the load argument to a synchronization parameter partitions data in the CDB according to values sent from each device client.

1. The user initiates a synchronization request and includes an argument value, for example, a user name. Be aware that passwords should not be used as arguments or parameters.
2. If personalization keys are used as the load argument, Unwired Server passes the query to the EIS. If the arguments are user credentials, they are validated by the EIS.
3. The EIS refreshes Unwired Server based on the argument value, for example, it refreshes data only for the validated user. If the argument is region, and the argument value is "western," only results for the western region refresh.
4. Unwired Server creates a partition (branch) with the results in the CDB for the validated user, or updates the partition if the user has previously synchronized.
5. Unwired Server synchronizes the device with the data in the CDB partition for that user.

### *Synchronization Parameter Data Flow*

An attribute corresponds to a column in a table. A synchronization parameter maps to an attribute that acts as a filter or variable that lets you limit the data that is returned to the device to rows in the table based on a supplied value.

Specifying a synchronization parameter during mobile business object (MBO) development allows you to control the amount and type of data that is downloaded from the CDB to the device during synchronization. Without synchronization parameters, large amounts of unnecessary data may be downloaded to devices from the CDB, making viewing difficult and needlessly expending resources, such as device battery life, memory, and network bandwidth.

For example, if a table has a "country" column, a user can supply "USA" as the value in his or her synchronization request. Unwired Server filters and returns only the rows that meets the specified criteria.

1. The user initiates a synchronization request that includes an attribute value (synchronization parameter).
2. Unwired Server filters the data in the CDB. For example, if the attribute is "country" and the user supplied the value "USA," only rows that contain "USA" are returned to the device.  
If the user later supplies the value "Europe", rows for both "USA" and "Europe" are returned to the device, and so on.
3. Unwired Server synchronizes the device with the results.

#### *Synchronization Initiated by Unwired Server*

For replication-based synchronization, you can configure Unwired Server to initiate a push notification to inform users when cached mobile business object (MBO) data changes. Messaging-based applications are inherently capable of sending notifications when the data changes are noted in the CDB.

The Unwired Server administrator schedules notifications to inform registered mobile devices when data changes in the CDB. You can configure Unwired Server to either let device application logic determine if it should synchronize with the changed data, or if configured to do so, override device application logic and force a synchronization.

1. Unwired Server detects a change in the data cache; for example, through a data change notification (DCN) or a data refresh.
2. Unwired Server notifies registered devices of changes to cached MBO data. If it is configured to do so, Unwired Server may force a synchronization with the device; for example, if the data is critical.
3. Implement logic in device applications to appropriately react to push notifications, if the Unwired Server does not force a synchronization.

### **Data Refresh Data Flow**

Data refresh occurs when enterprise information system (EIS) data updates are propagated to the Unwired Server cache database (CDB).

There are two general categories by which data refresh occurs:

- Unwired Server pulls – pulls updates from the EIS either through Unwired Server configuration or policies defined by the MBO developer.
- EIS pushes – a DCN option that includes all information required for an update are pushed to Unwired Server.

### **See also**

- *Unwired Server Cache* on page 12
- *Synchronization and Data Refresh Triggers* on page 13
- *Synchronization and Data Refresh Data Flow* on page 16
- *Mobile Workflow Data Flow* on page 23
- *Synchronization and Data Refresh Strategies* on page 24

### **Data Change Notification Data Flow**

Data change notifications (DCNs) refresh data when a change to the enterprise information system (EIS) occurs.

DCN requests are sent to Unwired Server as HTTP GET or POST operations. Each DCN can instruct Unwired Server to modify cached MBO data.

A DCN can be invoked by a database trigger, an EIS event, or an external process. DCNs are more complex to implement than other data refresh methods, but ensure that changes are immediately reflected in the cache.

1. An event initiates the DCN.
2. The DCN (HTTP POST or GET) is issued to Unwired Server.
3. A result response is returned to the EIS.

### Cache Group Data Flow

A cache group policy determines the frequency and the level to which mobile business objects (MBOs) belonging to that group are refreshed.

## Developer Task Flow

1. The deployed MBO triggers a cache update depending on the cache group to which it belongs.
2. The CDB is updated based on the cache group settings.

---

**Note:** Other settings such as On-demand, Scheduled, and Cache interval determine refresh timing for cache groups.

---

### Operation Cache Policy Data Flow

A cache policy provides a variety of options by which data refresh is controlled for a given MBO create, update, or delete operation, ranging from applying only the results to the cache to invalidating the MBO and refreshing all data (invalidate the cache).

Typically, any EIS data-changing operation invalidates the MBO data to which it is bound, requiring it to be refreshed. This can be inefficient and unnecessary, depending on the nature of the data that changes.

1. The device application initiates a create, update, or delete operation.
2. Unwired Server passes the operation to the EIS, where the operation is executed.
3. The CDB is updated based on the cache policy. A subsequent synchronization reflects the changed CDB.

### Data Refresh Initiated by Unwired Server

Configure Unwired Server to "poll" the enterprise information system (EIS) at scheduled intervals to determine if data has changed. If it has, the EIS refreshes cached MBO data.

The Unwired Server administrator uses the Administration Console to schedule data refresh intervals for a given MBO. This simple and flexible data refresh strategy uses more system resources than data change notification (DCN).

1. Unwired Server polls the EIS at an interval determined by the Unwired Server administrator.
2. If data changes, the CDB is refreshed.

### **Mobile Workflow Data Flow**

In the business workflow model, when you invoke an MBO operation located on Unwired Server using a Submit action, you can specify synchronous behavior (the messaging application waits for a successful or failed response from Unwired Server before proceeding). From an MBO/EIS perspective, Unwired Server updates are asynchronous (the server does not wait for a response).

Some of the differences between messaging mobile applications and replicated mobile applications include:

- The MBOs included in the application are no different than any other MBO: same types of parameters, attributes, CDB caching, synchronization methods, and so on.
- There is no permanent storage of the message. For example, a workflow application consists of the MBO portion, which is managed by Unwired Server, and the message portion. The message portion of the application is the transient store and forward system to deliver the messages reliably between server and device client, and takes advantage of the capability to build messages on the fly and send to the interested devices with them having to explicitly know or request it.

This workflow example is a travel approval application that includes:

- A TravelRequest MBO that includes:
  - dates, location, estimated costs, purpose, and a unique ID.
  - status and comment – included in the MBO definition but implemented by the business process widget.
  - An object query that returns a row based on the submitted ID.
- Two triggers:
  1. Sends an message to the approver when a new row is inserted into the MBO table.

## Developer Task Flow

2. Notifies the requester when the status of the request has been updated by the approver.
- A business process widget that implements the status and comment portion of the application.

1. An e-mail requesting travel is submitted.
2. Depending on the data refresh schedule or the operation's cache policy, the cache in CDB will be updated.
3. Triggers a message to the approver.
4. The travel request is approved through e-mail.
5. The EIS is updated with the approved information.
6. Depending on the data refresh schedule or the operation's cache policy, the cache in the CDB is updated.
7. The requester receives approval.

- *Data Refresh Data Flow* on page 20
- *Synchronization and Data Refresh Strategies* on page 24

### **Synchronization and Data Refresh Strategies**

Combine synchronization and data refresh techniques and strategies to successfully meet the business needs of the mobile application while effectively utilizing resources.

- Design and planning – carefully consider:

- Limiting data in the mobile business object (MBO) to what is required to meet business needs.
- The size and scope of the mobile application.
- Timing – coordinating device application synchronization with data refresh to achieve optimum results.
- Methods – use a combination of methods to control how much data in the Unwired Server cache is updated when EIS data changes. It is relatively simple to design your system to invalidate MBO data in the CDB and refresh it from the EIS whenever EIS data changes, but this can be inefficient.

### Synchronization Scenarios and Strategies

Mobile application development and administration settings allow you to decide when and how to synchronize and refresh data.

The following table describes strategies to consider when designing and developing your mobile applications. Since most mobile applications include several (if not many) MBOs, you will combine various strategies.

**Table 3. Synchronization and data refresh strategies and examples**

Scenario	Strategy
Data changes irregularly in the enterprise information system (EIS), and data is noncritical.	Either: <ul style="list-style-type: none"> <li>• Unwired Server initiates a data refresh once a day at off-peak hours that invalidates and refreshes all MBO data, or</li> <li>• The MBO belongs to a synchronization group that includes a daily interval.</li> </ul> For example, an organization bulk-loads data by performing a data refresh at the end of the work day. Field service personnel filter an attribute and synchronize (synchronization parameter=region) at the beginning of their day to synchronize only data of interest.

Scenario	Strategy
<p>Clients must immediately synchronize critical EIS data changes.</p>	<p>You could either implement a cache policy that immediately applies the results of the MBO operation to the CDB. Or,</p> <p>Implement a data change notification (DCN) that performs a data refresh of targeted MBO data. Unwired Server then sends notifications to registered device clients, and optionally force a synchronization to targeted devices.</p> <p>For example, administrators, professors, and others on a college campus have registered their mobile devices with campus police. When an emergency call from campus is received and entered into the system, a DCN updates the cache. Unwired Server forces synchronization with registered devices.</p>
<p>EIS data changes frequently.</p>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Implement an Unwired Server scheduled refresh that polls the EIS at specified intervals and updates the CDB when changes occur, or</li> <li>• Define various cache groups for MBOs that refresh data as necessary.</li> </ul> <p>For example, set a short data refresh interval to receive up-to-date quotes for an equity tracking mobile application (stocks, bonds, and so on), which also allows users to buy and sell equities.</p>
<p>Device application users change EIS data frequently.</p>	<p>When defining MBO create, update, and delete operations, include a cache policy for EIS modifying operations. Choose a policy that updates the CDB only with necessary changes.</p> <p>For example, a mobile application contains regional sales information. When you make a sale to a new customer, the MBO inserts a new row in the corresponding EIS table. To see changes related to your customers only (rows that contain your territory ID), use the apply operations parameter policy when defining the MBO.</p>
<p>A mobile application supports thousands of individual users, each of which has a set of user specific data.</p>	<p>The MBO developer uses system personalization keys that are used as client parameters ("username" and "password"), which are validated by the EIS.</p> <p>For example, a mobile application used for retail sales maintains login information for validated customers that provides access to account information, shopping cart, wish list, and so on.</p>

Scenario	Strategy
A mobile application has both static and changeable data.	<p>The MBO developer configures two cache groups, designed to refresh Unwired Server cache (CDB) for each MBO based on the frequency of EIS data changes to which each MBO is bound.</p> <p>For example, a mobile application contains a sales_order MBO with a many-to-one relationship to the product MBO. While sales_order related data changes often, as sales are made, product data does not. The MBO developer establishes two cache groups:</p> <ol style="list-style-type: none"> <li>1. The sales_order MBO data cache updates hourly.</li> <li>2. The product MBO data cache updates daily.</li> </ol>
A Human Resources department wants to implement a mobile application used to request and approve travel and expenses.	<p>The message-based mobile application uses both replicated data (managed within the MBO) and nonreplicated messaging data. Unwired Server pushes changes/updates to device application users.</p> <p>For example, the application includes MBO bound data (calendar with requested dates, total cost, and so on). The messaging portion includes additional information including the message. Once requested and e-mailed to the manager, the recipient (manager) approves dates and expenses. The MBOs are updated in the EIS (replicated and synchronized), while the message is not.</p>

### The Impact of Synchronization and Data Refresh

When designing and developing your mobile application solutions, consider the impact of varying synchronization and data refresh methods.

**Table 4. Impact of various data refresh methods**

Data refresh method	Implication
Data change notification (DCN)	Requires a developer familiar with the EIS from which the DCN is sent. Provides more flexibility than a scheduled refresh, but is more complicated to implement. HTTP GET methods are less secure than HTTP POST.
Unwired Server scheduled data refresh	Easily implemented by the Unwired Server administrator. Less targeted than DCN or a cache group. Uses more system resources since it must periodically query the EIS for changes.
Cache group	Easily implemented by the MBO developer. A cache group is a collection of MBOs to which a common refresh policy is applied.

Data refresh method	Implication
Operation Cache policy	Easily implemented by the MBO developer. Updates the CDB for an EIS data effecting operation (create, update, or delete) based on the policy associated with the operation. For example, you could update a modified row or invalidate and refresh the entire MBO.
Load argument	Easily implemented by the MBO developer. Load arguments filter the EIS data and fills the Unwired Server cache database (CDB) with a subset of data from the EIS. They can be used alone or mapped to synchronization parameters to control both data refresh and synchronization.

**Table 5. Impact of various synchronization methods**

Synchronization method	Implication
Initiated by Unwired Server	<p>Easily implemented by the Unwired Server administrator. The primary consideration is balancing performance with resource usage when determining how frequently synchronization is initiated, and to how many registered devices:</p> <ul style="list-style-type: none"> <li>• Download from Server – control when data is downloaded to remote devices. For example, if set to 10 minutes, the server notifies the client of data updates at most every 10 minutes, even if data changes more often.</li> <li>• Device notifications – notifications continue at a predetermined interval until acknowledged by the registered device, even when devices are disconnected or out of range.</li> </ul>
Initiated by the device	<p>Options include:</p> <ul style="list-style-type: none"> <li>• Filtering results – implemented by the MBO and device application developer. The MBO can be configured through load arguments and synchronization parameters to have the CDB maintain partitions for each user, resulting in a growing list of clients who synchronize a filtered data set.</li> <li>• Custom listener – implemented to listen for messages sent by the notifier. When the listener receives a message, it can be programmed to initiate synchronization.</li> </ul>

<b>Synchronization method</b>	<b>Implication</b>
Defined during MBO modeling/design	Options include: <ul style="list-style-type: none"><li data-bbox="717 267 1171 319">• Synchronization group – groups MBOs by synchronization needs.</li><li data-bbox="717 329 1171 409">• Synchronization tab – defines synchronization requirements for individual MBOs, including synchronization parameters.</li></ul>

# Starting and Stopping Unwired Platform Components

Once you have completed the postinstallation tasks for your installation, you may need to start and stop Unwired Platform components during the normal course of operations.

A set of Windows services support Unwired Server. If you did not set these services to start automatically on system start-up, you can change them to start automatically at any time after installation. See *System Administration Guide > System Reference > Unwired Platform Windows Services*.

## Starting Sybase Unwired WorkSpace

---

Start Unwired WorkSpace from the Windows Start menu.

### Prerequisites

To ensure that Eclipse starts properly, be sure the PATH environment variable does not include any embedded double quote characters.

### Task

If Unwired Server is not running, you can still create and edit MBOs and generation code, but you cannot deploy MBOs.

1. From Windows, select **Start > Programs > Sybase > Unwired Platform<version> > Unwired WorkSpace**.

Create a new workspace for Sybase Unwired WorkSpace Eclipse Edition the first time you launch it.

2. If you cannot start or stop Unwired Platform Server services through the Windows Start menu, see *Troubleshooting Sybase Unwired Platform > Troubleshoot Sybase Control Center for Sybase Unwired Platform > Unwired Server Fails to Start*.

### See also

- *Starting Unwired Platform Services* on page 32
- *Development Postinstallation Tasks* on page 32

## Starting Unwired Platform Services

---

Start Unwired Server, the sample database, the cache database (CDB), and other essential services from the Windows Start menu.

In Windows, select **Start > Programs > Sybase > Unwired Platform > Start Unwired Platform Services**.

The Unwired Server services enable you to access the Unwired Platform runtime components and resources.

### See also

- *Starting Sybase Unwired WorkSpace* on page 31
- *Development Postinstallation Tasks* on page 32

## Development Postinstallation Tasks

---

Before starting and working with Unwired WorkSpace, configure your environment.

How you configure components will vary depending on your needs.

**Table 6. Sybase Unwired WorkSpace postinstallation configuration tasks**

Configuration tasks	Where to find more information
<ul style="list-style-type: none"><li>• Creating a connection profile</li><li>• Connecting to Unwired Server</li><li>• Setting preferences</li><li>• Migrating projects and applications</li><li>• (Optional) Importing the Public Certificate</li></ul>	<p>Unwired WorkSpace online help</p> <ol style="list-style-type: none"><li>1. Start the Sybase Unwired WorkSpace.</li><li>2. Select <b>Help &gt; Help Contents</b>.</li><li>3. On the Sybase Unwired Platform bookshelf, select <i>Sybase Unwired WorkSpace - Mobile Business Object Development &gt; Configure &gt; Configure - Eclipse Development Environment</i>.</li></ol>

### See also

- *Starting Sybase Unwired WorkSpace* on page 31
- *Starting Unwired Platform Services* on page 32
- *Creating a Data Source Connection Profile* on page 33

# Configure

Perform the postinstallation configuration tasks for the Unwired Platform components that compose your system.

## Configure - Eclipse Development Environment

Configure your Eclipse Edition development environment by connecting to Unwired Server and your data source, setting preferences, and setting up the tools you need.

### Creating a Data Source Connection Profile

A connection profile contains the connection property information needed to connect to a server in your enterprise.

1. In the Enterprise Explorer, right-click one of the following connection categories and select **New**.
  - Database Connections
  - SAP Servers
  - Web Services
  - Rest Web Services
2. Follow the instructions on the wizard pages to create the selected connection.

#### **See also**

- *Creating a Sybase Unwired Server Connection Profile* on page 49
- *Preferences* on page 51
- *Importing and Exporting Connection Profiles and Projects* on page 60
- *Importing the Public Certificate* on page 64
- *Development Postinstallation Tasks* on page 32

### Connection Profiles

A connection profile enables a runtime connection to enable mobile application development.

A connection profile contains the connection property information needed to connect to an EIS back-end data source/server. For example, a database server, SAP server, or an application server hosting Web services. When you create a connection profile, you specify standard configuration parameters, such as a connection URL.

#### **See also**

- *Creating a Database Connection Profile* on page 34

## Configure

- *Creating an SAP Connection Profile* on page 40
- *Creating a Web Service Connection Profile* on page 44
- *Creating a REST Web Service Connection Profile* on page 45
- *Editing Connection Profile Properties* on page 46
- *Renaming a Connection Profile* on page 46
- *Connecting to a Connection Profile* on page 48
- *Creating a Sybase Unwired Server Connection Profile* on page 49
- *Testing a Connection Profile* on page 48

### **Creating a Database Connection Profile**

A connection profile contains the connection property information needed to connect to a database server in your enterprise.

1. In the Enterprise Explorer, right-click **Database Connections** and select **New**.
2. On the Wizard Selection page, select an option from this list and click **Next**:
  - DB2 for Linux, UNIX, and Windows
  - DB2 for i5/OS
  - DB2 for z/OS
  - Oracle
  - SQL Server
  - Sybase ASA
  - Sybase ASE
3. Follow the instructions on the wizard pages to create the selected database connection profile.

Before creating connection profiles for SQL Server, DB2, and Oracle databases, you must install the appropriate drivers and JAR files.

### **See also**

- *Connection Profiles* on page 33
- *Creating an SAP Connection Profile* on page 40
- *Creating a Web Service Connection Profile* on page 44
- *Creating a REST Web Service Connection Profile* on page 45

- *Renaming a Connection Profile* on page 46
- *Connecting to a Connection Profile* on page 48

Configuring Your Environment to Use a JDBC Driver

Download the appropriate JDBC driver and configure your environment to connect to Oracle, DB2, and Microsoft SQL Server 2005 and 2008 databases.

1. Download the driver.

JDBC driver for:	URL
Oracle	<a href="http://www.oracle.com/technology/software/tech/java/sqlj_jdbc/index.html">http://www.oracle.com/technology/software/tech/java/sqlj_jdbc/index.html</a>
DB2	<a href="http://www-306.ibm.com/software/data/db2/express/download.html">http://www-306.ibm.com/software/data/db2/express/download.html</a>
SQL Server JDBC driver 3.0	Go to <a href="http://msdn.microsoft.com/en-us/data/aa937724.aspx">http://msdn.microsoft.com/en-us/data/aa937724.aspx</a> and select <i>Download SQL Server JDBC Driver 3.0</i> .

2. Shut down Unwired WorkSpace and Unwired Platform Services.
3. For Unwired WorkSpace, put the driver in the correct location.

JDBC driver for:	Action
Oracle	Place the JDBC driver, for example <code>ojdbc14.jar</code> , in: <code>&lt;SUP installation root&gt;\UnwiredPlatform\Unwired_WorkSpace\Eclipse\sybase_workspace\mobile\eclipse\plugins\com.sybase.uep.com.oracle_&lt;version&gt;.&lt;plugin version number&gt;\lib</code>
DB2	Unzip the <code>db2JdbcJars.zip</code> file and copy the JAR files to: <code>&lt;SUP installation root&gt;\UnwiredPlatform\Unwired_WorkSpace\Eclipse\sybase_workspace\mobile\eclipse\plugins\com.sybase.uep.com.db2_&lt;version&gt;.&lt;plugin version number&gt;\lib</code>
SQL Server JDBC driver 3.0	Copy <code>sqljdbc4.jar</code> to: <code>&lt;SUP installation root&gt;\UnwiredPlatform\Unwired_WorkSpace\Eclipse\sybase_workspace\mobile\eclipse\plugins\com.sybase.uep.com.sqlserver_&lt;version&gt;.&lt;plugin version number&gt;\lib</code>

4. Copy the appropriate JAR file to the specified Unwired Server location.

## Configure

JAR file for:	Action
Oracle	Copy ojdbc14.jar to the server location: <SUP Installation root>\UnwiredPlatform\Servers\UnwiredServer\lib\3rdparty
DB2	Copy the JAR files, for example db2jcc.jar and db2jcc_license_cu.jar, to the server location: <SUP Installation root>\UnwiredPlatform\Servers\UnwiredServer\lib\3rdparty
SQL Server JDBC driver 3.0	Copy sqljdbc4.jar to the server location: <SUP Installation root>\UnwiredPlatform\Servers\UnwiredServer\lib\3rdparty

---

**Note:** If you do not copy the JAR files to the server location, you will encounter runtime errors due to the missing JDBC driver.

---

5. Restart Unwired WorkSpace and Unwired Platform Services.

### Creating a DB2 Connection Profile

A connection profile contains the connection property information needed to connect to a DB2 database in your enterprise.

#### **Prerequisites**

Before creating the connection profile, copy your DB2 JAR files (for example, db2jcc.jar and db2jcc\_license\_cu.jar) to:

```
<SUP Installation Path>\Unwired_WorkSpace\Eclipse  
\sybase_workspace\mobile\eclipse\plugins  
\com.sybase.uep.com.db2_.<plugin version number>\lib
```

#### **Task**

1. In **Enterprise Explorer**, right-click **Database connections** and select **New**.
2. Select the DB2 database type for which you are creating the connection profile. For example, **DB2 for Linux, UNIX, and Windows**. Enter a name and optional description and click **Next**.
3. Select the **New driver definition** icon adjacent to the **Drivers** field.
4. From the driver templates choose **IBM Data Server Driver for JDBC and SQLJ**.
5. From the Jar list tab click **Edit Jar/zip** and verify that db2jcc.jar and db2jcc\_license\_cu.jar files point to <SUP-Install-Path>\Unwired\_Work-Space\Eclipse\sybase\_workspace\mobile

\eclipse\plugins\com.sybase.uep.com.db2\_.<plugin version number>\lib.

6. Click **Yes** (from the Update all Jars to use same path prompt), then **OK** on the previous screen (Edit driver definition).
7. Complete the following information.

**Table 7. Specify DB2 database connection details page**

Field	Description
Database	The name of the DB2 database
Host	The host name on which the database resides.
Port number	The port to which you are connecting. For example, 50000.
Use client authentication	Select this option and enter the user name and password in the corresponding fields to provide basic authentication to the database.
User Name	Enter the name for the database login.
Password	Enter the password for the database login, if required.
Save Password	Select the checkbox to save the password.
Connection URL	Read-only details specifying the connection URL.
Connect when the wizard completes	Select this option to connect to the database upon exiting the wizard.
Connect every time the workbench is started	Select this option if you want Unwired WorkSpace to connect automatically to the database (when it is started) and display its contents in Enterprise Explorer.
Test connection	Click <b>Test connection</b> to ping the database and to verify that the connection profile is working.

8. Click **Next** to see the summary page, or **Finish** to create the connection profile.

The connection profile displays under **Database connections** in Enterprise Explorer.

Creating an Oracle Connection Profile

A connection profile contains the connection property information needed to connect to a Oracle database in your enterprise.

**Prerequisites**

Before creating the connection profile, copy your Oracle JAR file (for example, ojdbc14.jar) to:

```
<SUP Installation Path>\Unwired_WorkSpace\Eclipse
\sybase_workspace\mobile\eclipse\plugins
\com.sybase.uep.com.oracle_.<plugin version number>\lib
```

**Task**

1. In **Enterprise Explorer**, right-click **Database connections** and select **New**.
2. Select **Oracle** as the connection profile type, and click **Next**.
3. Select the **New driver definition** icon adjacent to the **Drivers** field.
4. From the driver templates choose Oracle Thin Driver.
5. From the Jar list tab, click **Edit Jar/zip** and verify that ojdbc14.jar points to<SUP-Install-Path>\Unwired\_Work-Space\Eclipse\sybase\_workspace\mobile\eclipse\plugins\com.sybase.uep.com.oracle\_.<plugin version number>\lib
6. Click **Yes** (from the Update all Jars to use same path prompt), then **OK** on the previous screen (Edit driver definition).
7. Complete the following information.

**Table 8. Specify Oracle database connection details page**

Field	Description
SID	The Oracle System ID (SID) used to identify the Oracle database.
Host	The host name on which the database resides.
Port number	The port to which you are connecting. For example, 1521.
User Name	Enter the name for the database login.
Password	Enter the password for the database login, if required.
Save Password	Select the checkbox to save the password.

Field	Description
Connection URL	Read-only details specifying the connection URL.
Catalog	Select the catalog which allows the user to obtain information about the database.
Connect when the wizard completes	Select this option to connect to the database upon exiting the wizard.
Connect every time the workbench is started	Select this option if you want Unwired WorkSpace to connect automatically to the database (when it is started) and display its contents in Enterprise Explorer.
Test connection	Click <b>Test connection</b> to ping the database and to verify that the connection profile is working.

8. Click **Next** to see the summary page, or **Finish** to create the connection profile.

The connection profile displays under **Database connections** in Enterprise Explorer.

#### *Installing the Oracle ojdbc6 Driver*

This procedure describes how to use the Oracle ojdbc6.jar as the driver to connect to Oracle data sources.

1. Download the Oracle ojdbc6.jar file.
2. Edit the MANIFEST.MF file located in the <SUP Installation Root> \Unwired\_WorkSpace\Eclipse\sybase\_workspace\mobile\eclipse\plugins\com.sybase.uep.com.oracle\_<version>.<timestamp>\META-INF directory, and replace this line:  

```
Bundle-ClassPath: lib/ojdbc14.jar
```

with  

```
Bundle-ClassPath: lib/ojdbc6.jar
```
3. Save and close the file.
4. Copy the downloaded ojdbc6.jar file to <SUP Installation Root> \UnwiredPlatform\Unwired\_WorkSpace\Eclipse\sybase\_workspace\mobile\eclipse\plugins\com.sybase.uep.com.oracle\_<version>.<timestamp>\lib.
5. Perform a clean startup:
  - a) Open a command prompt.
  - b) Cd to the <SUP Installation Root>\Eclipse directory.
  - c) Enter the command **UnwiredWorkSpace.bat -clean**

## Configure

6. From Unwired WorkSpace, verify the Oracle connection profile's properties, including the correct path to the `ojdbc6.jar` driver.
7. To enable the driver on Unwired Server, copy the `ojdbc6.jar` file to the `<SUP Installation Root>\UnwiredPlatform\Servers\UnwiredServer\lib\ext` directory.
8. You can now create a connection profile and connect to the Oracle server and create MBOs from the Oracle data source.

### **Creating an SAP Connection Profile**

A connection profile contains the connection property information needed to connect to an SAP server in your enterprise.

### **Prerequisites**

On Windows 7, Windows Vista, and Windows Server 2008, the Microsoft `msvcr71.dll` and `msvcp71.dll` files must be installed in either the `<WINDOWS_HOME>\System32(32-bit)` or `<WINDOWS_HOME\SysWOW64 (64-bit)` directory.

### **Task**

1. In Enterprise Explorer, right-click **SAP Servers** and select **New**.
2. Enter a name and optional description for the connection profile and click **Next**.
3. Complete the following information:

**Table 9. SAP Connection Properties page Connection tab**

Field	Description
Create from properties file  You can create the connection in two methods: Selecting this option allows you to retrieve connection information from a properties file that contains SAP connection information. Or, you can follow the wizard instructions and input the values manually.	Select <b>Create from properties file</b> and then select <b>Browse</b> to select a *.properties file that contains the SAP server connection information. All fields on the Connection page are populated automatically based on the selected properties file.  Example contents are: <ul style="list-style-type: none"><li>• <code>jco.client.client=800</code></li><li>• <code>jco.client.user=uepusr01</code></li><li>• <code>jco.client.passwd=Sybase123</code></li><li>• <code>jco.client.ashost=i18nsap1</code></li><li>• <code>jco.client.sysnr=01</code></li></ul>

Field	Description
Application Server	<p>The host name on which the server resides. The default is "localhost".</p> <p>For SAP R3 systems that use a router, application server must have the format:</p> <p>/H/proxyhost/H/application_server</p> <p>where "H" is literal, and proxyhost and application_server are variables that represent the proxy host and application server respectively. For example:</p> <p>/H/sapm20.anr.ms.test.com/S/3299/H/sapm20.anr.ms.test.com</p> <p>http://sapm20.anr.ms.test.com/S/3299/H/sapm20.anr.ms.test.com</p> <p><b>Note:</b> When connecting to an SAP message server, application server information is not needed, instead only jco.client.mshost, jco.client.gwhost, jco.client.group, and jco.client.r3name properties are required.</p>
System ID	The unique identity of the SAP server.
System Number	The SAP system number.
Client ID	The SAP Client ID. The default is based on the SAP server configuration.
User Name	Enter the name for the server login.
Password	Enter the password for the server login.
Save Password	Select the checkbox to save your password.

**Table 10. SAP Connection Properties page Advanced tab**

Field	Description
Default Code Page	The default language that the SAP server is using.

## Configure

Field	Description
Code Page Number	The default is auto-filled and varies depending on the language you select. For example, if you choose English, then the default is 1100.
Language	ISO two-character language code (for example, EN, DE, FR), or SAP-specific single-character language code. As a result, only the first two characters are ever used, even if a longer string is entered. The default is EN.  If you select a language from the drop down list, code page number will be auto-filled according to the language.
Other Properties	Select this to set advanced properties.

4. (Optional) When connected to an SAP connection profile, expand the data source to which you are connected, right-click either the root object, to refresh the entire data source, or an individual BAPI operation, and select **Refresh**. The refresh is required only if there is a change to the SAP data source.
5. Click **Finish** to create the connection profile.

The connection profile displays under SAP Servers in the Enterprise Explorer.

### SAP External Libraries Overview

Understand the purpose of the external files you can optionally download from SAP and install into Unwired Platform to enable communication with an SAP EIS.

- **SAP Cryptographic Libraries** – required by Unwired Platform to enable Secure Network Communications (SNC) between Unwired Server or Unwired WorkSpace and the SAP EIS.
- **SAPCAR utility** – required to extract files from the SAP cryptographic library.

### Installing the SAPCAR Utility

Unzip and install the latest SAPCAR utility on your Unwired Server or Unwired WorkSpace host, which you can use to extract the contents of compressed SAP files, for example RFC and cryptographic library files.

The installation package is available to authorized customers on the SAP Service Marketplace. There are different distribution packages for various hardware processors. Select the package appropriate for your platform.

1. Go to the SAP Web site at <http://service.sap.com/swdc>.
2. From the SAP Download Center, navigate to **Support Packages and Patches > Browse our Download Catalog > Additional Components**
3. Select **SAPCAR**.
4. Select the current version. For example, **SAPCAR 7.10**, then select and download the SAPCAR appropriate for your platform.

### Installing the SAP Cryptographic Libraries on Unwired Platform

Installation and configuration is required if you want to configure Secure Network Communications (SNC) for Unwired Platform SAP JCo connections. SNC may be required by the SAP EIS in question, if SSO2 tokens or X.509 certificates are used for connection authentication.

### **Prerequisites**

Download and install the SAPCAR utility, which is required to extract the contents of the cryptographic library.

### **Task**

Unzip and install the contents of the latest SAP Cryptographic archive on your Unwired Server host. There are different distribution packages for various hardware processors.

Make sure you are installing the correct libraries for your environment, and into folders based on the particular architecture of your machine.

1. Go to the SAP Web site at <http://service.sap.com/swdc> and download the latest SAP cryptographic library suitable for your platform.
  - a) Navigate to **Installations and Upgrades > Browse our Download Catalog > SAP Cryptographic Software > SAP Cryptographic Software**.
  - b) Select and download the platform specific file.
2. Create a directory in which you unzip the Cryptographic zip file. For example: C:\sapcryptolib.
3. Copy the appropriate Windows cryptographic library for your machine (for example, 90000101.SAR) to the C:\sapcryptolib directory.

## Configure

4. Open a command prompt and navigate to `C:\sapcryptolib`.
5. Extract the SAR file. For example:  
**SAPCAR\_4-20002092.EXE -xvf C:\90000101.SAR -R C:\sapcryptolib**
6. Create a new directory somewhere on your computer (for example, `C:\sapcryptolib`), then:
  - For Itanium 64 bit processors, copy the `ntia64` subdirectory contents.
  - For Intel 64 bit processors, copy the `nt-x86_64` subdirectory contents.
  - For Intel 32 bit processors, copy the `ntintel` subdirectory contents.
7. Delete the corresponding subdirectory when files have been moved.
8. (Optional) Add the SECUDIR environment variable to the user environment batch file: `<UnwiredPlatform_InstallDir>\UnwiredPlatform\Servers\UnwiredServer\bin\usersetenv.bat`.
9. If you have installed Unwired WorkSpace, you must add the SECUDIR variable to the WorkSpace batch file: `<UnwiredPlatform_InstallDir>\UnwiredPlatform\Eclipse\UnwiredWorkspace.bat`.

### **Creating a Web Service Connection Profile**

A connection profile contains the connection property information needed to connect to a Web service in your enterprise.

1. In **Enterprise Explorer**, right-click **Web Services** and select **New**.
2. Complete the following information.

**Table 11. Web service connection details page**

Field	Description
Select the Web service from either a: <ul style="list-style-type: none"><li>• Local file (default) – browse to a file located on the file system that contains connection information.</li><li>• Workspace – browse to the WSDL contained in an existing WorkSpace project.</li><li>• URL – provide a WSDL URL, for example: <code>http://www.rippedevelopment.com/webservices/LocalTime.asmx?WSDL</code></li></ul>	Select the location from which you want to find the Web service, then click Browse to locate the Web service.  You must check From URL to enable the Enable HTTP Authentication field.
Enable HTTP Authentication	Select the checkbox to enable HTTP authentication during WSDL document retrieval. If you enable HTTP authentication, you must enter a User name and password.

3. Click **Finish** to create the connection profile.

The connection profile displays under Web Service in the Enterprise Explorer.

- *Renaming a Connection Profile* on page 46
- *Connecting to a Connection Profile* on page 48

### **Creating a REST Web Service Connection Profile**

A connection profile contains the connection property information needed to connect to a REST Web service in your enterprise.

1. In **Enterprise Explorer**, right-click **REST Web Services** and select **New**.
2. Enter the name and optional description of the connection profile and click **Next**.
3. Complete the following information.

**Table 12. REST Web service connection details page**

Field	Description
Resource base URL	The common base URL referenced by the connection. typically, REST Web service connections begin with the same base URL. For example, <code>http://www.yourcompany.com/</code> could serve as the common prefix for the resource base URL. A base URL must begin with <code>http:</code> .
Resource URI template	A URI template used by mobile business object (MBO) create, read, update, and delete (CRUD) operations on the REST Web service resources through HTTP operations. The URI template should follow this structure: <code>customers/{id(int)}</code>

4. Click **Next** to view a summary of the connection profile, or **Finish** to create the connection profile.

The connection profile displays under REST Web Service in the Enterprise Explorer.

### See also

- *Connection Profiles* on page 33

## Configure

- *Creating a Web Service Connection Profile* on page 44
- *Editing Connection Profile Properties* on page 46
- *Renaming a Connection Profile* on page 46
- *Connecting to a Connection Profile* on page 48

### **Editing Connection Profile Properties**

Edit the properties of a connection profile.

1. Go to Enterprise Explorer.
2. Expand one of the connection profile category/type folders.
3. Right-click a specific connection profile and select **Properties**.
4. Select a property option to display its associated Properties page.
5. Edit the connection profile properties as necessary.

### **See also**

- *Connection Profiles* on page 33
- *Creating a Database Connection Profile* on page 34
- *Creating an SAP Connection Profile* on page 40
- *Creating a Web Service Connection Profile* on page 44
- *Creating a REST Web Service Connection Profile* on page 45
- *Renaming a Connection Profile* on page 46
- *Connecting to a Connection Profile* on page 48

### **Renaming a Connection Profile**

You can rename a connection profile.

### **Prerequisites**

We recommend disconnecting from the server (connection profile) before renaming it.

### **Task**

1. Go to the Enterprise Explorer.
2. Expand the category for the connection profile you want to rename.
3. Right-click the connection profile and select **Rename**.
4. Edit the name of the connection profile and click **OK**.  
The mobile application projects that reference this connection profile are refreshed automatically to reflect the data source reference changes.
5. Click **OK** to save those project changes.

Be advised that you should not rename the "My Unwired server" or "My Sample Database" connection profiles. If you do, they are automatically recreated when you restart Unwired WorkSpace.

### See also

- *Connection Profiles* on page 33

- *Creating a Web Service Connection Profile* on page 44
- *Creating a REST Web Service Connection Profile* on page 45
- *Editing Connection Profile Properties* on page 46
- *Connecting to a Connection Profile* on page 48

### Duplicating a Connection Profile

You can duplicate a connection profile.

1. Open the Enterprise Explorer and locate the connection profile you want to duplicate.
2. Right-click the connection profile and select **Copy**.
3. Right-click the connection profile category folder under which you want the copied connection profile to appear and select **Paste**.
4. Enter a new name for the connection profile in the **Profile Name Input** dialog.

A copy of the connection profile appears under the server category in the Enterprise Explorer.

5. You can also use the following options when right-clicking a connection profile to facilitate creating new connection profiles from existing ones:
  - Undo Copy – removes the previously copied connection profile.
  - Redo Copy – enabled when Undo Copy executes, the removed copied connection profile is added back.

### See also

- *Connecting to a Connection Profile* on page 48

### **Testing a Connection Profile**

Ping the data source/enterprise resource to test a connection profile.

1. Go to Enterprise Explorer.
2. Expand the category for the connection profile you want to test
3. Right-click the connection profile and select **Ping**.
4. Choose from the following:

**Table 13. Ping options**

<b>Option</b>	<b>Action</b>
If the ping fails	Verify that the data source/enterprise resource is running and check the connection profile properties.
To view error information	Click <b>Details</b> in the <b>Error</b> dialog.
If the ping succeeds	Click <b>OK</b> .

- *Editing Connection Profile Properties* on page 46
- *Renaming a Connection Profile* on page 46
- *Connecting to a Connection Profile* on page 48

### **Connecting to a Connection Profile**

Connect to the data source/enterprise resource defined by the connection profile.

1. In Enterprise Explorer, expand the folder for the type of connection profile to which you want to connect: Databases, Unwired Server, Web Services, and so on.
2. Right-click the connection profile and select **Connect**.  
Once connected, you can expand the connection profile to access the data source.

### **See also**

### **Deleting a Connection Profile**

You can delete a connection profile.

#### **Prerequisites**

Disconnect from the database server.

#### **Task**

1. Go to Enterprise Explorer.
2. Expand the category for the connection profile you want to delete.
3. Right-click the connection profile and select **Delete**.
4. Click **Yes** to confirm deletion.

---

**Note:** You cannot delete a connection profile if the profile name begins with leading whitespace, for example " myConnectionProfile". You must rename the profile and remove the leading whitespace before deleting it.

---

### **Creating a Sybase Unwired Server Connection Profile**

Create a new Sybase Unwired Server connection profile to supply runtime connection information.

1. In Enterprise Explorer, right-click **Unwired Servers** and select **New**.
2. Enter a name and optional description of the connection profile and click **Next**.
3. Complete the following information on the wizard pages:

Table 14. Specify Connection Details page

Field	Description
Host	The host name on which the server resides. The default is the machine name.
IP domain	(Optional) The domain name. The default is the Windows domain of the local machine.
Port	The port to which you are connecting. The default port is 2000, use 2001 for HTTPS.
User Name	Enter the name for the server login. For example, supAdmin.
Password	Enter the password for the server login, if required.
Save Password	Select the checkbox to save the password.
Secure	<p>Select the checkbox to enable a secure connection with the server, which is different than a secure connection session.</p> <p>To establish a secure session with Unwired Server:</p> <ol style="list-style-type: none"> <li>1. Enable <b>Secure management port</b> on Unwired Server's administration listener. See the Sybase Control Center help topic for information.</li> <li>2. Enter 2001 as the <b>Port</b>.</li> <li>3. Add the certificate file path to the &lt;Unwired_Platform_Install_Dir&gt;\Eclipse\UnwiredWorkspace.bat file.</li> </ol> <p><b>Note:</b> Unless the Unwired Server administration listener certificate is signed by a trusted certificate authority, or the certificate is imported into the %JAVA_HOME%\jre\lib\cacerts trust store, you see an error message when testing the Unwired Server connection: "unable to find valid certification path to requested target".</p>

Field	Description
Cluster information	<p>The read-only properties for this Server's cluster (or non-cluster) Unwired Server connection information.</p> <p>Connection information includes server host, protocol, and communication ports. Depending on whether the cluster uses a load balancer, you may alternatively set the name of the load balancer host.</p>

4. Click **Next** to review a summary of this connection profile, or **Finish** to create the connection profile. The connection profile displays under Unwired Servers in the Enterprise Explorer.

### See also

- *Creating a Data Source Connection Profile* on page 33
- *Preferences* on page 51
- *Importing and Exporting Connection Profiles and Projects* on page 60
- *Importing the Public Certificate* on page 64

## Preferences

Use preferences to configure the appearance of perspectives and views and to customize its tools.

Some preference settings apply across all development components, while others apply only to a specific component. To enable the sharing of editor preferences across components, see the Eclipse *WorkBench User Guide* on the online bookshelf.

### See also

- *Creating a Data Source Connection Profile* on page 33
- *Creating a Sybase Unwired Server Connection Profile* on page 49

### Setting Help Display Preferences

Define how you want to display help topics from an Eclipse-based product to appear.

1. Select **Window | Preferences** from the main menu bar.
2. In the left pane, select **Help**.

The Help options appear in the right pane.

3. Specify how to display help topics.

## Configure

4. Click **OK**.

### **Setting Mobile Development Preferences**

Use the Preferences dialog to set Mobile Application Diagram and mobile business object preferences.

1. Either:
  - Open the Preferences dialog from the menu, by selecting **Window > Preferences**. This is the recommended method, since it shows all preference options. Or
  - Open the Preferences dialog from the Mobile Application Diagram, by right-clicking in the Mobile Application Diagram and selecting **Preferences**.
2. In the left pane of the Preferences dialog, expand **Sybase, Inc > Mobile Development**.
3. In the Preferences dialog, configure preferences for:
  - Developer Profile
  - Logging
  - Miscellaneous
  - Mobile Application Diagram
  - Mobile Business Object
4. Change preferences for the desired category, then click **Apply** to apply changes, or click **Restore Default** to use the default preference settings.
5. Click **OK**.

### **See also**

- *Mobile Development Developer Profile Preferences* on page 52
- *Mobile Development Logging Preferences* on page 54
- *Mobile Business Object Preferences* on page 59
- *Mobile Application Diagram Preferences* on page 58
- *Mobile Development Miscellaneous Preferences* on page 56

### **Mobile Development Developer Profile Preferences**

Set Basic and Advanced developer profile preferences for Unwired WorkSpace.

Unwired WorkSpace provides two developer profiles, Basic and Advanced (default). Select features so they are available from one or both profiles from the Developer Profile Preferences or Details page. Features that are grayed out cannot be modified. Select **Apply** for changes to take effect, or **Restore Defaults** to restore default profile settings.

Selecting features to include from the Developer Profile preferences page modifies all wizards, properties, and Workspace Navigator folders related to that feature.

**Table 15. Developer profile properties**

Property	Description
Current profile	Select which profile to use during the current session. Advanced is the default.
Switching dialog	When you switch profiles from the Mobile application Diagram, by default a confirmation prompt displays. Select this option to disable confirmation when switching profiles.
Features	<p>Features and default profile settings include:</p> <ul style="list-style-type: none"> <li>• Cache – Advanced</li> <li>• Code generation – Both (cannot be modified)</li> <li>• Deployment – Both (cannot be modified)</li> <li>• Local business object – Advanced</li> <li>• Mobile business object – Both (cannot be modified)</li> <li>• Object query – Advanced</li> <li>• Synchronization group – Advanced</li> </ul>

From the Details preferences page you can control which wizard pages, properties, and Workspace Navigator folders display for a given profile.

**Table 16. Developer profile preferences details**

Property	Description
Feature	Select a feature from the drop-down list to modify the various wizard pages, properties, and any Workspace Navigator folders associated with that feature, or select <b>All</b> and narrow your feature search from each of the Wizard, Property view, and Workspace Navigator tabs.
Wizard	Select the feature from the Wizard drop-down list to display all wizard pages associated with the wizard. Choose which wizard pages to display for a given profile.
Property view	Select the feature from the Context drop-down list to display all property tabs associated with the feature. Choose which tabs display in the Properties view for a given profile.

Property	Description
WorkSpace Navigator	Select which WorkSpace Navigator folders display within a Mobile Application project for a given profile.

**See also**

- *Mobile Development Logging Preferences* on page 54
- *Mobile Business Object Preferences* on page 59
- *Mobile Application Diagram Preferences* on page 58
- *Mobile Development Miscellaneous Preferences* on page 56

**Mobile Development Logging Preferences**

Set mobile development logging preferences for logging events in the Unwired WorkSpace environment.

---

**Note:** To see the logging preferences you must access Preferences by selecting **Window > Preferences**, not from the Mobile Application Diagram.

---

Clear all root log receivers – clears all information for each log described in this section. Some plugins append messages to the root logger, which sends mobile development messages to their appender. The result can be the sending of duplicate messages to the console.

**Table 17. Mobile development logging: Console**

Property	Description
Enable Console logging	Enable logging to the <b>Eclipse Console</b> view (default). To see the <b>Console</b> view, select <b>Window &gt; Show View &gt; Other &gt; General &gt; Console</b> .
Log Level	Select the level of verbosity for console logging: <ul style="list-style-type: none"> <li>• <b>Debug</b> — designates fine-grained informational events that are useful for debugging an application.</li> <li>• <b>Info</b> (default) — designates informational messages that highlight the progress of the application at a coarse-grained level.</li> <li>• <b>Warn</b> — designates potentially harmful situations.</li> <li>• <b>Error</b> — designates error events that might still allow the application to continue running.</li> <li>• <b>Fatal</b> — designates severe error events that will presumably lead the application to abort.</li> </ul>

**Table 18. Mobile development logging: Eclipse**

Property	Description
Enable Eclipse Logging	Enable logging to the Eclipse log file and the Error Log view (default).
Log Level	Select the level of verbosity for console logging: <ul style="list-style-type: none"> <li>• <b>Debug</b> — designates fine-grained informational events that are useful for debugging an application.</li> <li>• <b>Info</b> — designates informational messages that highlight the progress of the application at a coarse-grained level.</li> <li>• <b>Warn</b> — designates potentially harmful situations.</li> <li>• <b>Error</b> — designates error events that might still allow the application to continue running.</li> <li>• <b>Fatal</b> — designates severe error events that will presumably lead the application to abort.</li> </ul>

**Table 19. Mobile development logging: File**

Property	Description
Enable file logging	Write logs to the specified file in the file system (default).
Log level	Select the level of verbosity for console logging: <ul style="list-style-type: none"> <li>• <b>Debug</b> — designates fine-grained informational events that are useful for debugging an application.</li> <li>• <b>Info</b> — designates informational messages that highlight the progress of the application at a coarse-grained level.</li> <li>• <b>Warn</b> — designates potentially harmful situations.</li> <li>• <b>Error</b> — designates error events that might still allow the application to continue running.</li> <li>• <b>Fatal</b> — designates severe error events that will presumably lead the application to abort.</li> </ul>
Log file	Enter or browse to the location and name of the log file. Or use the default log file, uepdev.log.
Rollover frequency	Select how often the log file should be reset: Daily, Weekly (default), or Monthly.
Clear log file on startup	Erases contents of log file each time Unwired WorkSpace is started (default).

**See also**

- *Mobile Development Developer Profile Preferences* on page 52
- *Mobile Business Object Preferences* on page 59

## Configure

- *Mobile Application Diagram Preferences* on page 58
- *Mobile Development Miscellaneous Preferences* on page 56

### Mobile Development Miscellaneous Preferences

Set miscellaneous mobile development preferences for the Unwired WorkSpace environment.

**Table 20. Miscellaneous preferences**

Property	Description
Version	Shows version number on mobile application project
Preview	Determines how a mobile business object component is previewed: <ul style="list-style-type: none"><li>• Show warning when executing – displays warning messages to the console.</li><li>• Show row number – adds a column in the preview output that lists row numbers.</li><li>• Maximum rows to display – limits the number of rows to preview. The default is 100 rows. If this number is too high, the preview may take a long time to complete.</li><li>• Display null value as – enter a value to display for null value. &lt;Null&gt; is the default.</li><li>• Maximum length displayed in column – truncates the output to the maximum length indicated. The default is 30 characters per column.</li></ul>
Result Set Filters and Result Checker	Configures whether or not to prompt to add Java Nature each time you create a result set filter or result checker.
Actions	Determines whether or not you want to confirm any refresh or remap actions, or delete actions that cascade to subsequent MBOs.
Code generation	<ul style="list-style-type: none"><li>• Do not show code generation completion dialog again – select if you do not want to see the code generation completion dialog.</li><li>• JavaDoc generation heap size (MB) – used only when you choose <b>Generate JavaDoc</b> in the configure options in the Generate Code wizard.</li></ul> <p><b>Note:</b> The default heap size is set to 128 MB, but if you get errors, set the heap size larger than the default 128 MB.</p>

Property	Description
Object query	<ul style="list-style-type: none"> <li>Do not show prompt dialog for object query auto-generation – do not show a prompt dialog for an automatically generated object query when an attribute is set to the primary key.</li> <li>Do not show prompt dialog when deleting primary key object query – do not show a prompt dialog when deleting an object query for a primary key.</li> <li>Do not show prompt dialog when automatically changing return type and index setting for object query – do not show a prompt dialog when the query definition contains a join operation and automatically change the return type and index setting for the object query.</li> </ul>
Data length	<p>Sets the default for various attribute and parameter datatype values:</p> <ul style="list-style-type: none"> <li>Default string length – default preference for string length is 20 when String(%n) is selected.</li> <li>Default binary length – default preference for a binary datatype length is 10 when Binary(%n) is selected.</li> </ul> <hr/> <p><b>Note:</b> If String or Binary is selected without "(%n)", Unwired WorkSpace sets them to String(300) and Binary(32762) respectively, and warns the MBO developer to make adjustments to avoid wasting space or data truncation.</p>
Migrating	Do not show prompt dialog for migrate dialog again
Cache policy	Specifies a default cache refresh policy for any cache groups you create.
Relationship	<ul style="list-style-type: none"> <li>Set the mapped attributes or parameter's propagate-to attributes as primary key and auto-generate the object query – set to <b>Prompt</b> (default), <b>Yes</b> (perform without prompt), or <b>No</b> (do not perform).</li> <li>Show label for relationship in diagram editor – select this option to label the relationship when displayed in the Mobile Application Diagram.</li> </ul>

### See also

- *Mobile Development Developer Profile Preferences* on page 52
- *Mobile Development Logging Preferences* on page 54
- *Mobile Business Object Preferences* on page 59
- *Mobile Application Diagram Preferences* on page 58

## Configure

### Mobile Application Diagram Preferences

You can set various preferences for the Mobile Application Diagram by selecting an option in the left pane and making your selections.

#### *Global settings*

Use this section of the Preferences page to enable (or disable) global settings used by the Mobile Application Diagram, including:

- Show connector handles
- Show popup bars
- Enable animated layout
- Enable animated zoom
- Enable anti-aliasing
- Show status line

Show objects in diagram – selecting the option allows it to display in the Mobile Application Diagram:

- Structures – complex datatypes/structure MBOs. This option can also be enabled (disabled) directly from the Mobile Application diagram by right-clicking in the diagram and selecting **Show > Structures**.

#### *Appearance*

Use this section of the Preferences page to edit colors, fonts, and size of objects in the Mobile Application Diagram.

Section	Description
Colors and fonts	Modify the colors and fonts for various Mobile Application Diagram objects by selecting <b>Change</b> , and setting the desired color and font.
Size	Select <b>Auto size</b> to use the default size setting for the Mobile Application Diagram, or unselect this option to define a different size.

#### *Connections*

Set the line style used to define connections within the Mobile Application Diagram: either **oblique** or **rectilinear**.

#### *Pathmaps*

Use the **New**, **Edit**, and **Remove** buttons to modify path variables used for modeling artifacts. Pathmaps is a subset of the path variables used in the Linked Resources preferences page.

#### *Printing*

Define print settings for the Mobile Application Diagram.

Section	Description
Orientation	Either Landscape or Portrait.
Units	Either inches or millimeters.
Size	Select a size from the drop down list. A default value appears for the width and height, that you can accept or override by entering a different value.
Margins	Enter a value in inches for the margins.

### *Rulers and grid*

Edit rulers and grid settings.

Section	Description
Rulers options	To show ruling lines, select <b>Show rulers for new diagram</b> , then select ruler units from the drop-down list.
Grid options	To modify grid settings, select <b>Show grid for new diagrams</b> or <b>Snap to grid for new diagrams</b> , then enter the grid spacing in the text box.

### **See also**

- *Mobile Development Developer Profile Preferences* on page 52
- *Mobile Development Logging Preferences* on page 54
- *Mobile Business Object Preferences* on page 59
- *Mobile Development Miscellaneous Preferences* on page 56

### *Mobile Business Object Preferences*

You can specify various preferences for creating mobile business objects, including defining prefix values for mobile business objects (including operation, attribute, and parameter prefixes).

### *Mobile business object*

Edit mobile business object preferences.

Section	Description
Drag and drop	<p>Specify the wizards that are launched by dragging and dropping the data source onto the Mobile Application Diagram:</p> <ul style="list-style-type: none"> <li>• Choose the part to create when dragging a data source directly on the diagram:                             <ul style="list-style-type: none"> <li>• Prompt – create attributes and operations.</li> <li>• Attributes – creates attributes only.</li> <li>• Operation – creates operations only.</li> </ul> </li> <li>• Do not show Quick Create dialog again.</li> <li>• Do not show warning dialog for external database again.</li> <li>• Do not show Role Assignments dialog again.</li> </ul>
Naming prefix	Assign a default prefix for newly created mobile business objects, attributes, operations, or client parameters.

**See also**

- *Mobile Development Developer Profile Preferences* on page 52
- *Mobile Development Logging Preferences* on page 54
- *Mobile Application Diagram Preferences* on page 58
- *Mobile Development Miscellaneous Preferences* on page 56

**Importing and Exporting Connection Profiles and Projects**

You can export mobile application projects and connection profiles from one Unwired WorkSpace and import them into another, which can be useful when troubleshooting various client and runtime issues.

**See also**

- *Creating a Data Source Connection Profile* on page 33
- *Creating a Sybase Unwired Server Connection Profile* on page 49
- *Preferences* on page 51
- *Importing the Public Certificate* on page 64

**Exporting Connection Profiles**

Export connection profiles to an external file.

Exported connection profiles retain their connection information, allowing you to use them later (provided connection information remains the same) by importing them into other Unwired WorkSpace installations or when migrating to a more current version of Unwired WorkSpace.

1. From Enterprise Explorer, select the **Export** icon (below) to launch the Export Connection Profiles wizard .

2. Select the connection profiles to include in the export, or click **Select all** to export all connection profiles.
3. Specify a file name, or **Browse** to the location of an existing file.  
A single file can contain multiple connection profiles. By default, files are encrypted.
4. Click **OK** to export the selected connection profiles to the specified file.

### **Exporting a Project**

You can export a project that can then be imported and shared with other developers.

Exported mobile application projects retain all of their reference information (data sources, roles, generated code, and so on), allowing you to use them later by importing them into other Unwired WorkSpace installations, or when migrating to a more current version of Unwired WorkSpace, or as part of collecting troubleshooting information.

---

**Note:** You cannot export project resources, such as services. You must export the entire project. However, you can copy, paste, or move services and folders between projects.

---

1. To refresh the project to ensure that all project files are up to date, select **File > Refresh** from the main menu bar.
2. Right-click the project you want to export in the WorkSpace Navigator and select **File > Export** from the main menu bar.

The Export wizard opens.

3. From the General node, select one of the following:

**Table 21. Export options**

Option	Description
Archive file	Select this method for projects that use double-byte characters in the service name.  <b>Note:</b> If you do not select this option, the exported project will have corrupted service names.
File system	Select this option to export all other project types.

4. Click **Next**.
5. To specify the project you want to export, select one of the following:

**Table 22. Project types**

Project type	Description
File system	Do the following: <ol style="list-style-type: none"> <li>1. Select the project resources that you want to export.</li> <li>2. In the To directory field, browse for the directory that you want to export the project into.</li> <li>3. Select any of the following options:               <ul style="list-style-type: none"> <li>• Overwrite existing files without warning.</li> <li>• Create directory structure for files.</li> <li>• Create only selected directories.</li> </ul> </li> </ol>
Archive file	Do the following: <ol style="list-style-type: none"> <li>1. Select the project resources that you want to export.</li> <li>2. In the To archive field, browse for the directory that you want to export the project into.</li> <li>3. Select any of the following options:               <ul style="list-style-type: none"> <li>• Save in zip format.</li> <li>• Save in tar format.</li> <li>• Compress the contents of the file.</li> <li>• Create directory structure for files.</li> <li>• Create only selected directories.</li> </ul> </li> </ol>

6. Click **Finish** to export the specified project to the destination location.

### **Importing Connection Profiles**

Import connection profiles that were exported to an external file.

#### **Prerequisites**

Export the connection profile.

#### **Task**

Exported connection profiles retain their connection information, allowing you to use them later (provided connection information remains the same) by importing them into other Unwired WorkSpace installations or when migrating to a more current version of Unwired WorkSpace.

1. From Enterprise Explorer, select the **Import** icon (below) to launch the Import Connection Profiles wizard.

2. Specify a file name, or **Browse** to the location of exported file that contains the connection profile you are importing.
3. (Optional) Select **Overwrite existing connection profiles with same names**.
4. Click **OK** to import the selected connection profiles from the specified file.

When the import process completes, the connection profiles are automatically refreshed.

### **Importing a Project**

You can import a copy of project or projects into your *workspace* as an archive file or directly from a local file system.

---

**Warning!** If you import a project directly from the file system by pointing to an existing project in the WorkSpace Navigator, you are not importing a duplicate copy of the project. Changes made to this project are simultaneously made to the original project as well.

---

1. Set up your exported project for import and do one of the following:
  - Copy the exported project folder into the Eclipse *workspace folder* in your installation directory.
  - Unzip the exported project file into the workspace folder in your installation directory.

---

**Note:** If an existing project has the same name as the project you are importing, the existing project is overwritten. Change the name of one of the projects when you do the copy.

---

2. Select **File > Import** from the main menu bar.  
The Import wizard opens.
3. Select **Existing Project into Workspace** and click **Next**.
4. Select the project you want to import selecting one of the following:

**Table 23. Import a project**

Field	Description
Select root directory	<ol style="list-style-type: none"> <li>1. Browse for the directory that contains the project you want to import.</li> <li>2. Select the projects you want to import from the Projects list.</li> </ol>
Select archive file	Browse for the archive that contains the project that you want to import.

5. Click **Finish**.

The project is now available for use.

6. After importing the project, right-click the project and select **Update WorkSpace Build Path Entries**.

Running this option ensures that the paths for build and deploy are updated for the workspace to which the project was imported.

## Importing the Public Certificate

Use the `keytool` command to import the public certificate into your testing or Unwired WorkSpace environment, so that you can establish HTTPS connections with Unwired Server.

### Prerequisites

You must first configure Unwired Server to accept HTTPS connections. You can then import the public certificate generated during that process and use it to secure HTTPS communications with Unwired Server.

### Task

Use the Java `keytool` command to import the public certificate into the JRE on the host from which you want to connect to Unwired Server using HTTPS. The host is your Unwired WorkSpace installation, or the host on which you develop .NET client applications; for example, `C:\Sybase\UnwiredPlatform\JDK<version>\jre`). This task prepares your system to run J2SE Unwired Platform device applications.

1. From the `JRE\bin` directory enter the command: `%JAVA_HOME%\bin\keytool -import -keystore "%JAVA_HOME%\jre\lib\security\cacerts" -file (path to the certificate)`

The `-file` argument is the path to the public certificate.

If the import is successful, replace the default keystore password, which can be whatever you want. For example:

```
Enter keystore password:mykey
Re-enter new password:mykey
```

2. After entering the password you see output, similar to this, that identifies the certificate:

```
Owner: CN=UEP, OU=ITS, O=Sybase, L=Concord, ST=NH, C=US
Issuer: CN=UEP, OU=ITS, O=Sybase, L=Concord, ST=NH, C=US
Serial number: 31
Valid from: Sun May 11 16:04:03 EDT 2008 until: Wed May 12 16:04:03
EDT 2010
Certificate fingerprints:
MD5: 50:E1:8E:53:FE:3C:C9:E6:34:70:71:01:8E:09:C8:CE
SHA1: 20:B5:26:B0:9B:8B:F7:9E:16:BA:2E:13:3D:03:73:32:AA:6A:
52:53
Signature algorithm name: MD5withRSA
Version: 3
Extensions:
#1: ObjectId: 2.5.29.15 Criticality=true
KeyUsage [
Key_Encipherment
Key_Agreement
Key_CertSign
Crl_Sign
]
#2: ObjectId: 2.5.29.19 Criticality=true
BasicConstraints:[
```

```
CA:true
PathLen:10
]
```

The owner and Issuer information should match the information you entered when you generating the certificate and key.

**3. Answer Y** when asked whether to trust this certificate or not:

```
Trust this certificate? [no]: y
Certificate was added to keystore
```

If you accept the default [no], the certificate is not added to the keystore.

The certificate should now be available from the keystore. If you enter an incorrect or invalid keystore path, or if the certificate import fails for other reasons, you receive a connection error when a J2SE client running on Windows attempts to connect (assuming this client points to the same %JAVA\_HOME% as your import command). For example:

```
java.lang.RuntimeException:
Synchronization of MetaData failed:
ianywhere.ultralitej.implementation.JrException:
UltraLiteJ Error[-44]: Sync upload failure:
'sun.security.validator.ValidatorException:
PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException:
unable to find valid certification path to requested target'
```

- *Creating a Sybase Unwired Server Connection Profile* on page 49
- *Preferences* on page 51
- *Importing and Exporting Connection Profiles and Projects* on page 60
- *Certificate Generation Command Line Utility Reference* on page 65

### **Certificate Generation Command Line Utility Reference**

Use the Certificate generation utility (gencert) to create a certificate or to sign pre-generated certificate requests.

#### Syntax

Option	Description
-c	Specifies a certificate you can use to sign other certificates. If used with -r, generates an enterprise root certificate.

## Configure

Option	Description
-s	Specifies a server identity certificate. The server identity is a combination of a server's private key and public certificate. You reference the server identity certificate when you start Unwired Server (for transport-layer security) or database server (for SQL Anywhere client-server transport-layer security). If used with -r, generates a self-signed server certificate.
-r	Specifies a self-signed root certificate. If used with -s, gencert creates a self-signed server certificate. If used with -c, gencert creates an enterprise root certificate you can use to sign other certificates. If you specify gencert -r with no additional options, gencert creates a certificate you can use as a server certificate or an enterprise root. This option is not compatible with -q.
-q request-file	Sign a pre-generated certificate request. If used with -s, gencert creates a server certificate. If used with -c, gencert creates an enterprise root certificate you can use to sign other certificates. If you specify gencert -q with no additional options, gencert creates a certificate you can use as a server certificate or an enterprise root. The -q option is not compatible with -r.

If you do not specify -s or -c, the certificate contains the functionality provided by both options, so it can be used to sign other certificates or you can use it directly as a server certificate.

### *Description*

You can use the gencert utility to generate trusted public certificates, private keys, and server certificates used to secure Unwired Server synchronizations or SQL Anywhere® client-server communication. This utility creates X.509 certificates (a standard certificate format) for various security configurations.

Gencert prompts you for the following information:

Field	Description
Cipher	For an RSA certificate, it prompts for a key size between 512 and 2048, and then creates a certificate using RSA. (In general, longer keys provide stronger encryption but take longer to process.)
Country, State/Province, and Locality	These values provide general certificate identification. The locality fields are also required by third-party Certificate Authorities if you plan to use globally-signed certificates.

Field	Description
Organization, Organizational Unit, and Common Name	These fields provide additional security that the client is authenticating the correct certificate. On the client side, they correspond to the certificate_company, certificate_unit, and certificate_name protocol options, respectively.
Serial number	You are prompted to choose a serial number for the certificate. The serial number must use alphanumeric characters.
Certificate valid for how many years	You are prompted for the period (in years) that the certificate remains valid. If the certificate expires, all certificates signed by this certificate will also be invalid. Following the specified period, you will need to regenerate the enterprise root, each server certificate, and the public certificates distributed to clients.
Enter password to protect private key	This is the password you will specify in the certificate_password protocol option.
Enter file path to save certificate	Choose a file name and location for the certificate.
Enter file path to save private key	Choose a file name and location for the private key.
Enter file path to save server identity	Choose a file name and location for the server certificate.

## Using Unwired Server in a Development Environment

You may be using Unwired Server in a personal development environment or a shared development environment.

In a personal development environment, Unwired Server is installed on your machine with the Sybase Unwired WorkSpace Eclipse development environment, so you can test and refine packages you develop. Default Unwired Server settings should be sufficient for personal development and subsequent deployment. However, should you need to tune settings, you can refer to the Sybase Control Center online help for details.

In a shared development environment, Unwired Server is typically installed by a Unwired Platform administrator (supAdmin) on a separate machine shared by multiple developers. This requires a multiple-seat site license. The supAdmin, is tasked with configuring and

## Configure

maintaining the cluster to which the server has been installed. However, developers can be made domain administrators so they can deploy and test packages they have created. The `supAdmin` accomplishes this by:

- Creating an administration user for each developer.
- Assigning those administration users to a domain.

For information on how to perform domain administration tasks and which artifacts you can manage within a domain, see the "Systems Administration" chapter in *System Administration*.

# Develop

Develop mobile applications in Eclipse Edition. A mobile application is an end-to-end application, which includes the mobile business object (MBO) definition (back-end data connection, attributes, operations, relationships, cache policies, and synchronization strategies), the generated server-side code, and the device application. The device application is the client-side application code that can be created using native coding or the programming APIs.

Use the following topics to guide you through developing mobile applications.

## Developing a Mobile Business Object

---

You can define attributes and operations of a mobile business object (MBO) without immediately binding them to a data source, define them from and bind them to a data source, or create an MBO that does not bind to a data source (local business object, or uses only DCN as the refresh mechanism).

### Prerequisites

Before developing MBOs, understand the key concepts and principals described in *Understanding Fundamental Mobile Development Concepts*. Also, see the companion guide, *Mobile Data Models: Using Mobile Business Objects*, for a deeper understanding of how to build an efficient MBO model.

### Task

The attributes and operations that define an MBO must be bound to a data source at some point in the development process, unless it is a local business object, or the MBOs data is to be loaded only through Data Change Notification (DCN). If you already have a connection to the data source through a connection profile, you can quickly generate attribute and operation bindings based on the data source. However, if you do not have access to the required data source, you define the MBO, but bind your operations and attributes to the data source at a later point. The difference between the two development approaches is when you create and bind the attributes and operations:

- Create an MBO and bind to a data source immediately – includes two methods:
  1. Drag and drop the data source onto the Mobile Application Diagram, which launches the appropriate wizards and automatically creates bindings based on the selected data source.
  2. Create an MBO and its operations and attributes using the Mobile Application Diagram and palette that launches a set of wizards and allows you to bind them directly to a data source.

## Develop

- Create an MBO and defer data source binding – create an MBO and its operations and attributes using the Mobile Application Diagram and palette that launches a set of wizards and allows you to bind the MBO to a data source at a later time. After you define the data source, you bind the MBO to it from the Properties view.
- Create an MBO using a DCN cache group policy without data source binding – when an MBO's CDB data is to be filled only through DCN, a data source binding is not necessary. In these cases, the MBO must reside in a cache group that uses the DCN policy.
- Create a local business object – create a local business object by clicking the local business object icon in the palette then click the object diagram. Local business objects can only run on the client and cannot be synchronized. It can contain attributes and operations that run on the device. For example, the local business object could be combined with other MBOs, where the local business object runs an object query against results returned by other MBOs.

### See also

- *Working with Mobile Business Objects* on page 119
- *Packaging and Deploying Mobile Business Objects* on page 171
- *Mobile Business Object Overview* on page 70

## Mobile Business Object Overview

The cornerstone of the solution architecture is the concept of the mobile business object (MBO). For native Object API applications and mobile workflows, mobile business objects form the business logic by defining the data you want to use from your back-end system and exposing it through your mobile application or workflow.

MBO development involves defining object data models with back-end EIS connections, attributes, operations, and relationships that allow filtered data sets to be synchronized to mobile devices. MBOs are built by developers familiar with the data and transactional requirements of the mobile application, and how that connects to the existing EIS data sources.

A mobile business object (MBO) is derived from a data source (such as a database server, Web service, or SAP® server). MBOs are deployed to Unwired Server, and accessed from mobile device application client code generated from Unwired WorkSpace or by using command line tools. MBOs:

- Are created using the Unwired WorkSpace graphical tools. These tools simplify and abstract back-end system connections, and provide a uniform view of transactional objects
- Are reusable, allowing you to leverage business logic or processes across multiple device types.
- Future-proof your application; when new device types are added, the same MBO can be used.
- Provide a layer of abstraction from Unwired Server's interaction with heterogenous back ends/devices, as shown in the following diagram.

MBOs are developed to include:

- Implementation-level details – metadata columns that include information about the data from a data source.
- Abstract-level details – attributes that correspond to instance-level properties of a programmable object in the mobile client, and map to data source output columns. Parameters correspond to synchronization parameters on the mobile client, and map to data source arguments. For example, output of a SQL SELECT query are mapped as attributes, and the arguments in the WHERE clause are mapped as load arguments and/or synchronization parameters, so that the client can pass input to the query. MBO operations include arguments that map to data source input parameters. The source of the argument's value passed to the enterprise information system (EIS) at runtime can come from an MBO attribute, personalization key, client parameter, or a default/constant value.
- Relationships – defined between MBOs by linking attributes and load arguments in one MBO, to attributes and load arguments in another MBO.

Developers define MBOs either by first designing attributes and load arguments, then binding them to a data source; or by specifying a data source, then automatically generating attributes and load arguments from it.

A mobile application package includes MBOs, roles, data source connection mappings, cache policies, synchronization related information, and other artifacts that are delivered to the Unwired Server during package deployment.

When the data model is complete, code artifacts are generated. The MBO package, containing one or more MBOs is deployed to Unwired Server. Other MBO artifacts are used to develop a mobile application using Native Object API or HTML5/JS Hybrid App API — when the

application is deployed to a device, the MBO data model set resides on the device (in API code form). On device data changes are synchronized to the MBO on the server and then to the EIS back end. Back end changes are communicated to the device via the MBO on the server that sends a notification to the device and updates the MBO data on the device.

The following sections cover MBOs from a high level; for more detail, see:

- *Sybase Unwired WorkSpace - Mobile Business Object Development*
- *Developer Guide: Unwired Server*

**See also**

- *Creating a Mobile Application Project* on page 72
- *Switching Between Developer Profiles* on page 74
- *Creating Mobile Business Objects* on page 75
- *Binding Mobile Business Objects to Data Sources* on page 82
- *Deploying Custom Classes to Unwired Server* on page 119
- *Developing a Mobile Business Object* on page 69
- *Working with Mobile Business Objects* on page 119
- *Packaging and Deploying Mobile Business Objects* on page 171

**Naming Conventions**

Follow naming convention guidelines to name resources.

Resource	Guideline
Project	Project names cannot contain a space.
Mobile business object	Mobile Business object names must start with an alphabetic character or an underscore. MBOs cannot contain C# or Java reserved words.
Mobile business object parameter	Parameter names: <ul style="list-style-type: none"><li>• Cannot contain C# or Java reserved words.</li><li>• Have a maximum length of 64 characters.</li><li>• Must start with an alphabetic character or an underscore.</li></ul>

See the *Unwired WorkSpace Validation Rules and Error Messages* for a complete list of guidelines.

**Creating a Mobile Application Project**

A mobile application project is the container for the mobile business objects that forms the business logic of mobile applications.

You must create a mobile application project before you can create mobile business objects. See *Eclipse Basics* for information about projects.

1. Select **File > New > Mobile Application Project** from the main menu bar.
2. Enter a:
  - Name
  - Location (if other than the default).
3. Click **Finish**.

An empty Mobile Application Diagram opens.

### See also

- *Mobile Business Object Overview* on page 70
- *Switching Between Developer Profiles* on page 74
- *Creating Mobile Business Objects* on page 75
- *Binding Mobile Business Objects to Data Sources* on page 82
- *Deploying Custom Classes to Unwired Server* on page 119

### Opening a Mobile Application Diagram

Use the mobile application diagram to display and manage mobile business objects in a graphical view.

### Prerequisites

You must create a mobile application project before you can open the Mobile Application Diagram.

### Task

1. Locate the mobile application project you want to open in the WorkSpace Navigator.
2. Right-click the project and select **Open in Diagram Editor**.

### Copying a Project

Make a copy of an existing mobile application project from WorkSpace Navigator.

1. Right-click the mobile application project and select **Copy**.
2. Right-click and select **Paste**. Enter a new project name in the Copy Project dialog, then click **OK**.

### Mobile Application Diagram

Each Mobile Application project has an associated Mobile Application Diagram that provides a graphical representation of all mobile business objects (MBOs) within the project.

Launch the wizards that define MBOs (including operations, relationships, and so on) by selecting the appropriate item from the palette and dropping it on the diagram. The Attributes Creation wizard launches automatically when you create an MBO.

**Mobile Application Diagram Palette**

Create mobile business objects and attributes, add operations to the object, define relationships between two objects, and so on, by selecting the appropriate palette icon and dropping it on the Mobile Application Diagram.

**Table 24. Palette icons and usage**

Icon	Description
Select	Selects a mobile business object or relationship.
Zoom	Zooms in or out on a selected element.
Note	Creates a note or note attachment in the Mobile Application Diagram for an existing note.
Mobile Application Diagram	Expand this folder to access the mobile business object related icons. The folder is expanded by default.
Mobile Business Object	Creates a new mobile business object and launches the mobile business object Attributes Creation wizard.
Local Business Object	Creates a new local business object and launches the local business object Attributes Creation wizard.
Relationship	Creates a relationship between two mobile business objects.
Attribute	Creates an attribute for an existing mobile business object.
Operation	Adds an operation to a mobile business object, and allows you to bind the operation to a data source now or later.

**Switching Between Developer Profiles**

Switch between basic and advanced developer profiles in the Mobile Application Diagram.

Unwired WorkSpace provides two developer profiles:

- Basic – is a subset of the features available to the Advanced developer, and allows you to develop and deploy mobile business objects (MBOs). Customize the Basic profile so that you see only required properties, wizards, screens, and so on.
- Advanced (default) – includes all Unwired WorkSpace features, wizards, and properties, enabling you to perform additional MBO customization not available in the Basic profile.

Determine what profile to use based on the features required to develop your MBOs. If you cannot meet your needs with the Basic profile, use the features available in the Advanced profile, or customize a profile to provide access to specific features.

Switch to the basic profile if you need to use only basic Unwired WorkSpace features.

If you want to use the basic profile by default, modify your developer profile preference settings. See *Mobile Development Developer Profile Preferences*.

- To switch between developer profiles, right-click in the Mobile Application Diagram, select **Switch Developer Profile**, then select either **Basic** or **Advanced**.
- To view or modify your preference settings for the developer profile, click **Window > Preferences > Sybase, Inc. > Mobile Development > Developer Profile**.

## Creating Mobile Business Objects

Create various types of mobile business objects (MBOs) and bind them to data sources to implement mobile application business logic.

### See also

- *Mobile Business Object Overview* on page 70
- *Creating a Mobile Application Project* on page 72
- *Switching Between Developer Profiles* on page 74
- *Binding Mobile Business Objects to Data Sources* on page 82
- *Deploying Custom Classes to Unwired Server* on page 119

### Creating a Mobile Business Object by Dragging and Dropping a Data Source

Create a mobile business object (MBO), define the attributes and operations, and bind directly to the data source by dragging and dropping the data source onto the Mobile Application Diagram.

### Prerequisites

You must have a Mobile Application project and a connection to the data source before creating the MBO.

---

**Note:** When dragging and dropping a non-Sybase database data source, you must modify the SQL definition as indicated by the warning dialog to create non-Sybase MBOs or operations using the Mobile Application Diagram (where you can manually enter the SQL definition).

---

## Task

1. Drag a data source entry (for example, a database table from a connection profile) and drop it onto the Mobile Application Diagram.

An MBO is created and data source information is automatically filled in with the appropriate operation and argument mappings, and/or attribute mappings.

---

### Note:

- If you drag-and-drop a data source that includes a column with a computed default value, arguments for that column are not generated. You must manually modify the SQL definition to add the column from the Properties view after creating the MBO.
- When dragging and dropping an ASE database that includes a computed column table, Unwired Workspace does not generate operations automatically. You must define them with the Operation Creation Wizard.
- Drag-and-drop may not generate correct MBOs for ASE/ASA views and non-Sybase databases.

- 
2. Follow the wizard instructions to complete the MBO.

Attribute and operation information varies, depending on the data source to which you bind.

3. Once defined, use the Properties view to modify if necessary.

## **Creating a Mobile Business Object and Deferring Data Source Binding**

Launch the wizards used to create a mobile business object, attributes, and operations from the Mobile Application Diagram. Then bind the mobile business object to a data source from the Properties view when the data source is available.

1. *Creating Attributes for a Mobile Business Object*

Select the Mobile Business Object menu item from the Palette to invoke the New Mobile Business Object wizard to create a mobile business object (MBO) and its attributes.

2. *Creating Operations for a Mobile Business Object*

Use the Operation Creation wizard to create an operation and add it to the mobile business object.

3. *Binding Mobile Business Objects to Data Sources*

Create mappings and bind data source content to mobile business object operations and attributes either when you create them, or later using the Properties view.

### Creating the Mobile Business Object using the Mobile Business Object Palette item

Select the Mobile Business Object menu item from the Palette to create a mobile business object.

#### Prerequisites

Before you create a mobile business object, open the Mobile Development perspective and create a Mobile Application project.

#### Task

1. From the Mobile Application Diagram, select the Mobile Business Object icon from the palette, then click an empty area of the diagram.  
The Attributes Creation wizard displays. By default, the mobile business object is named Objectx, where x is 1 if this is the first object in the diagram, 2 if the second, and so on.
2. (Optional) Change the default name of the mobile business object.
3. In the next page select **Bind data source later**.
4. In the last page add attributes and click **Finish**.

#### See also

- *Mobile Business Object Properties* on page 127
- *Mobile Business Object Attribute Properties* on page 130
- *Mobile Business Object Operation Properties* on page 132
- *Datatype Support* *Unwired WorkSpace* supports a variety of datatypes, from a simple type to an array of objects.
- *Old Value Argument* on page 135

### Creating Multiple Mobile Business Objects From a Single Read Operation

Create multiple mobile business objects (MBOs) from a single read operation, which allows selection of multiple output objects and tables from a single call to the enterprise information system (EIS) to which the MBO is bound.

#### Prerequisites

The data source from which you are creating the MBO must contain either:

- Multiple SAP output tables – EIS operations that contain multiple business application programming interface/remote function calls BAPI/RFC operations that contain multiple output tables. Each selected SAP output table is regarded as an independent result set, and mapped to corresponding MBOs. Those MBOs share a single BAPI/RFC operation.
- Multiple Web service XSLTs – EIS operations that contain multiple methods bundled with multiple XSLTs. All XSLTs can be used to generate first/subsequent MBOs. You can define more than one XSLT for a single Web service EIS operation. Each XSLT is regarded

## Develop

as an independent result set used to create a Web service MBO. Each MBO can be created from a single XSLT.

Multiple MBOs that are created from the same data source and share the same EIS operation are treated as a whole unit, which affects certain behavior:

- Executing the EIS operation once updates all MBOs, improving performance compared to calling the operation for each MBO.
- Subsequent MBOs cannot exist without a first MBO. Copying, pasting, or deleting a first MBO performs the same action on subsequent MBOs.
- All subsequent MBOs are included in the search results of the first MBO.

### Task

1. Launch the MBO Creation wizard. For example, drag and drop the data source onto the Mobile Application Diagram.
2. On the Definition page, select and define the first MBO.
3. (Optional) On the Parameters page, define the first MBO's default values.
4. On the Attributes Mapping page, select the Web service XSLT or SAP table for the attributes used to specify the First MBO.
5. The Create Multiple Mobile Business Objects page appears if:
  - You select multiple output tables on the Definition page for SAP, or
  - There are multiple XSLTs defined on the Definition page for Web services.

The Definition window varies, depending on the data source type, and allows you to determine which SAP output table or Web service XSLT to designate as subsequent MBOs.

**Table 25. Multiple mobile business object data source**

Data source	Description
SAP	<p>A BAPI/RFC operation that contains multiple output tables. All output tables, except the one defined as the first MBO, can be used to generate subsequent MBOs.</p> <p>In cases where you select an output parameter (either a primitive or structured output parameter), the &lt;HEADER FIELDS&gt; option is available in the Attribute Mapping page in both the creation wizard and the Attributes tab, available from the Properties view.</p> <p>When you select &lt;HEADER FIELDS&gt; as the <b>Select an output table to map attributes option</b>, Unwired WorkSpace generates a MBO that contains the result set from only the output parameters, not from any output tables. The &lt;HEADER FIELDS&gt; result set is a pseudo-table that behaves as a table result set:</p> <ul style="list-style-type: none"> <li>• It is the first MBO by default.</li> <li>• If you select another table's output as the first MBO result set, the &lt;HEADER FIELDS&gt; result set generates a subsequent MBO.</li> </ul>
Web service	<p>A method bundled with the multiple XSLTs. All XSLTs, except the one selected as the first MBO, can be used to generate subsequent MBOs.</p>

6. On the Create Multiple Mobile Business Objects page, select any of the subsequent MBOs, and optionally change the default names. By default, all MBOs listed on this page are selected.

Complete definition of the MBOs and select **Next** to configure role mappings (Advanced profile only) or **Finish** to exit the wizard.

7. (Optional) Map the first MBO and operations to logical roles. Subsequent MBOs inherit logical role assignments from the first.
8. Select **Finish** to create the MBOs and exit. You can perform some configuration from the creation wizard, however Sybase recommends that you perform any additional configuration using the Properties view.

Once created, multiple MBOs:

- Are stacked on each other and identified in the Mobile Application Diagram by a dashed line between the first MBO and all subsequent MBOs. You can independently delete subsequent MBOs.
- Have a "shared" relationship, identified by a different decorator (icon) in the WorkSpace Navigator, indicating the operation is shared. If the operation changes, all related MBOs automatically change.

#### First/Subsequent Mobile Business Object Properties

First/subsequent mobile business object (MBO) properties available from the Properties view.

First MBO refers to the first MBO defined from a single EIS operation from which multiple MBOs can be defined. Subsequent MBO refers to any other MBOs defined from this

operation. To ensure that the properties of the first and subsequent MBOs maintain synchronization, most subsequent MBO properties are read-only. The shared properties (definition, load arguments, and so on) of subsequent MBOs can be modified only through the first MBO.

**Table 26. Multiple MBO attribute properties**

Property tab	First/subsequent MBO
Share	<p>Identifies the enterprise information system (EIS) operation to which the MBOs are bound.</p> <p>The share tab appears for:</p> <ul style="list-style-type: none"> <li>• Any MBO (except JDBC and REST) with multiple result sets.</li> <li>• First MBOs with at least one subsequent MBO.</li> <li>• Subsequent MBOs.</li> </ul> <p>The first MBO Share tab includes Add, Delete, and Delete All buttons, which you can use to add or delete subsequent MBOS.</p> <p>If you delete all subsequent MBOs, the first MBO reverts to a "normal" MBO. If a subsequent MBO is added to a normal MBO, the normal MBO becomes the first MBO in a first/subsequent MBO relationship. In other words, Unwired WorkSpace supports switching MBOs between normal and first MBOs.</p>
Data source	<p>Available only from the first MBO.</p> <ul style="list-style-type: none"> <li>• <b>Change Connection Profile</b> – retains the first/subsequent MBO relationship.</li> <li>• <b>Bind Data Source</b> – drops the first/subsequent MBO relationship and deletes all subsequent MBOs. The first MBO reverts to a normal MBO.</li> </ul>
Definition	<p>The definition only can be changed in the first MBO, other than the ability to modify subsequent result set filters.</p> <p>After changing the definition, Unwired WorkSpace attempts to match and merge the changes, which may include adding, refreshing, or deleting subsequent MBOs.</p> <p>First and subsequent MBOs share the same credential properties.</p>

Property tab	First/subsequent MBO
Roles	Subsequent MBOs inherit roles from the first (as defined in the wizard), but you can also add or modify roles for subsequent MBOs.
Load arguments	Available from the first MBO and is read-only for subsequent MBOs. For each MBO, the load argument can only propagate (propagate to attribute) to its own attributes.
Attributes mapping	Modify attribute mappings for subsequent MBOs independently of the first.
Object queries	Create object queries for subsequent MBOs independently of the first.
Cache group	First MBO and all its subsequent MBOs must be in the same cache group, but can be in different synchronization groups.

### **Creating a Local Business Object**

Local business objects can be deployed to Unwired Server and include Object API code generated that performs business functions local to the device application. For example, the local business object can call object queries or persist application specific configuration information locally across application restarts

A local business object is not bound to any data source, has no server runtime artifacts like result set filters or result checkers, and has no effect on the Unwired Server cache database (CDB) and operation replay. For example, a local business object cannot be filtered or synchronized with the CDB, and does not belong to any synchronization or cache groups.

1. Launch the Local Business Object Creation wizard by selecting the Local Business Object icon from the Palette and dragging it onto the Mobile Application Diagram.

---

**Note:** You cannot create a local business object by dragging and dropping a data source onto the Mobile Application Diagram, since this method automatically binds the MBO to the data source.

---

2. On the Attributes Definition page, define the attribute values as you would any other MBO.
3. Select the Update and/or Delete operations if needed by the local business object (The Create operation is always selected).
4. Make any changes from the Properties view, if necessary.

Local business objects support object queries, and are listed (and can be included) in the Code Generation wizard, since local business objects can be referenced in device application code.

## **Binding Mobile Business Objects to Data Sources**

Create mappings and bind data source content to mobile business object operations and attributes either when you create them, or later using the Properties view.

### **Prerequisites**

You must create a mobile business object before you can bind data sources, unless you have created the mobile business object by dragging and dropping a data source onto the Mobile Application Diagram, in which case the binding is performed automatically. The data source to which you are binding must be running and accessible. For example, a connection to the database is available through a connection profile.

### **Task**

The binding of data source information to mobile business object attributes and operations varies, depending on the data source to which you are binding. There are several places within Unwired WorkSpace from which you can bind to a data source. Not all options are available from all locations. The Properties view offers the broadest support when binding/rebinding or editing MBO data sources.

---

**Note:** Use the Bind Data Source button available from the Properties view to bind to a data source if you are binding after you have created attributes and/or operations.

---

1. Bind a data source to mobile business object attributes and operations from:

<b>Option</b>	<b>Description</b>
<b>New Mobile Business Object or New Operation wizard</b>	Bind to a data source when adding operations and attributes to a new mobile business object.
<b>Properties view</b>	For an existing mobile business object that you have created in a top-down fashion (in which you create attributes and/or operations without binding to a data source immediately), there are a number of places that you can create a data source binding depending on the context you are in (for example, selecting the Attributes tab), then selecting the <b>Bind Data Source</b> button.

2. Follow the wizard instructions to bind the particular data source information to mobile business object attributes and operations.

### **Supported Data Sources**

This topic describes the various data sources to which you can bind the operations and attributes of a mobile business object. When you bind a mobile business object to a data source, the attribute and operation mappings vary depending on the type of data source to which the mobile business object is bound.

**Table 27. Mobile business object data sources**

<b>Data source</b>	<b>Description</b>
Database (various types)	A database object (table, view, stored procedure, and so on)
SAP	An SAP BAPI, or RFC operation
Web service and RESTful Web services	A local or remote WSDL file, a SOAP service or a resource URL

### **Propagating a Client's Credentials to the Back-end Data Source**

Use client credentials to establish enterprise information system (EIS) connections on the client's behalf for all data source types.

To use client credentials, map an EIS connection's user name and password properties to system-defined "user name" and "password" personalization keys respectively. This creates a new connection for each client and the connection is established for each request (no connection pooling.)

1. During development of the mobile business object MBO/operation, from the data source definition page (available either in the Creation wizard or from the Properties view), in the **Runtime Data Source Credential** section (or **HTTP Basic Authentication** section for a Web Service, RESTful Web Service, or SOAP MBO), enter the client credentials in the User name and Password fields. The runtime data source credential values (user name and password) that Unwired WorkSpace uses for refresh or preview operations is taken in this order:
  - a) Any literal value entered in the User name and Password fields.
  - b) User-defined personalization keys that have non-empty default values.
  - c) System personalization keys 'user name' and 'password'.
  - d) User name and password property values contained in the connection profile.
2. During deployment of the package that contains such MBOs, map the design-time connection profiles to the existing or new server connections, but be aware that the user name and password portions for the selected server connection is replaced by the user name and password propagated from the device application.

---

**Note:**

- Do not set client credentials using the Runtime Data Source Credential option for MBO's that belong to a cache group that uses a Scheduled policy, since this is unsupported.
  - In general, a MBO operation that uses data source credential settings as connection properties cannot have these settings mapped to an enterprise information system (EIS) during deployment. Instead, they maintain their original settings, which you can map after deployment using Sybase Control Center (SCC).
  - When you create a new security configuration that includes the SAPSSOTokenLoginModule, and deploy it to a new domain, if the mobile workflow application uses the MBOs associated with the new security configuration, you must specify an Unwired Server domain that corresponds to the domain using the security configuration. See the Sybase Unwired Platform *Security* guide for more information about security configurations
- 

**Implementing SSO for SAP**

Configure SAP MBOs so they can be used in device applications that implement SSO.

To implement single sign-on for SAP in the development environment, you must bind your MBO to the SAP data source or bind your MBO to a SAP interface exposed as a Web service:

- MBO bound to SAP data source – set "Runtime Data Source Credentials and Connection Properties", by propagating the client's credentials to the back-end data source using the username and password personalization keys.
- MBO bound to SAP Web service – set "HTTP Basic Authentication", by propagating the client's credentials to the back-end data source using the username and password personalization keys.

For the production environment, see the topic *Implementing SSO for SAP* in *System Administration*.

- *Binding an SAP Data Source to a Mobile Business Object* on page 93
- *Configuring an SAP Exposed Web Service MBO to Use Credentials* on page 104

**Binding a Database Data Source to a Mobile Business Object**

Bind the attributes and operations of a database object to a mobile business object.

1. In the Bind Data Source wizard, enter the following information and click **Next**:

Field	Action
<b>Specify data source</b>	Select and bind to a data source now.

Field	Action
<b>Data source type</b>	Select JDBC from the drop-down list.
<b>Connection profile</b>	Select the database connection profile to which you are binding your mobile business object attributes. If the required data source is not in the list, click <b>Create</b> to define a new connection profile.

2. Follow the wizard instructions to configure and bind data source information to mobile business object attributes and operations. Some fields are specific to attributes, while others are common to both attributes and operations. For example, Result set filters are attribute specific.

Field	Action
<b>Data source specific information</b>	In the wizard, enter the SQL statement used to access the database information. Click: <ul style="list-style-type: none"> <li>• SQL Statement Type – either a SQL query statement or a stored procedure.</li> <li>• Validate syntax – to validate the syntax of the SQL statement.</li> <li>• Preview – to view the results of the SQL statement against the data source.</li> </ul>
<b>Runtime Data Source Credential</b>	(Optional) The <b>User Name</b> and <b>Password</b> required to gain access to the runtime data source.  The user name and password can be entered directly, retrieved from a personalization key, or by selecting <b>New key</b> and creating a new personalization key.
<b>Result set Filters</b>	Optionally add a result set filter to the MBO.  A result set filter is a custom Java class that manipulates the rows or columns of data returned from a read operation for an MBO. To write a filter, developers must have previous experience with Java programming — particularly with the reference implementations for <code>javax.sql.RowSet</code> , which is used to implement the filter interface. See <i>Result Set Filters</i> .
<b>Parameters</b>	From the Parameters page you can configure these MBO argument properties that are modeled from the data source's remote operation argument: <ul style="list-style-type: none"> <li>• Argument – the MBO argument name</li> <li>• Datatype – datatype of the argument</li> <li>• Nullable – identifies if NULL is a valid value</li> <li>• Default value – the default value, if any, of the MBO argument</li> </ul> <p>Due to JDBC driver meta data retrieval related API limitations, Unwired WorkSpace does not always set the correct attribute length, especially for operation and load argument types and lengths, and you must set them manually to avoid run-time errors.</p>

Field	Action
<b>Attributes Mapping</b>	<p>Attributes mapping is generated as follows:</p> <ol style="list-style-type: none"> <li>1. The tabular view columns are generated automatically.</li> <li>2. If an existing attribute matches the name and data type of one of the columns, they are mapped.</li> <li>3. Otherwise, you must manually link (map) from the attribute to the tabular view columns.</li> </ol> <p>(Properties view only) The methods that you use to map attributes include:</p> <ol style="list-style-type: none"> <li>1. In the visual portion of the diagram, drag from the square icon of an attribute to the square icon of a tabular view column.</li> <li>2. In the bottom table, select a column from the drop-down list of the map To cell.</li> </ol> <p>From the Attributes Mapping screen, you can modify the mappings by selecting:</p> <ul style="list-style-type: none"> <li>• Up or Down – adjust attribute position.</li> </ul>

3. The **Role Assignments** screen allows you to **Create, Add, and Remove** role assignments from the mobile business object.
4. Click **Finish** when done.  
The Mobile Application Diagram is refreshed with the new mobile business object attributes.

**See also**

- *Result Set Filters* A result set filter is a custom Java class an experienced developer writes in order to specifically manipulate the rows or columns of data returned from a read operation for an MBO.

AutoCommit Option for JDBC MBOs Using an ASE Data Source

When you create MBOs from Adaptive Server® Enterprise stored procedures that use temporary tables, you must select the **AutoCommit** check box in the New Attributes or New Operation definition screen.

An error message displays in Unwired WorkSpace if Auto Commit is not selected. For example, create a temporary table named “tempstores” in this stored procedure:

```
CREATE PROCEDURE dbo.ase_sp
AS
BEGIN
    create table tempstores (temp_row_id integer, temp_id integer )
    insert tempstores select 1, 1
    insert tempstores select 2, 2
    insert tempstores select 3, 3
    select temp_row_id, temp_id from tempstores group by temp_row_id
    drop table tempstores
END
```

If this stored procedure is used to model an MBO (attributes and operations), when you preview an operation, this error message displays:

The 'CREATE TABLE' command is not allowed within a multi-statement transaction in the 'tempdb' database.

### Stored Procedures with Output Parameters and Result Sets

Define a mobile business object (MBO) from a stored procedure's Scalar and Cursor output parameters (and Cursor result sets).

Scalar parameters are common to all databases and Cursor parameters are exclusive to Oracle and DB2 databases.

### *Defining MBOs from stored procedures with output parameters (SPOP)*

From a stored procedure, the developer can map attributes of a MBO to:

- Scalar output parameters
- Cursor as output parameters
- Cursor as result sets

**Table 28. Stored procedures with output parameters definition examples**

Stored procedure's output parameter	SQL query/definition
Scalar output parameter (ASA)	<pre>{CALL sampledb.dba.testScalarSPOP(:id,:amount)}</pre> <pre>create PROCEDURE dba.testScalarSPOP (in id INT, out amount INT) BEGIN     select * from bonus;     select bonus_amount into amount     from bonus     where emp_id = :id; END</pre>
Cursor as output parameter (Oracle)	<pre>{CALL TESTCURSORSPOP(["pcursor"=:pcursor])}</pre> <pre>create or replace procedure testCursor- SPOP( p_cursor out types.cursorType ) as begin     open p_cursor for select * from tblSPOP; end;</pre>

Stored procedure's output parameter	SQL query/definition
Cursor as return result set (DB2)	<pre>{CALL TESTCURSORSPOP()}  CREATE PROCEDURE testCursorSPOP() LANGUAGE SQL DYNAMIC RESULT SETS 1 BEGIN     DECLARE C1 CURSOR WITH RETURN TO CLIENT FOR     SELECT * FROM tblSPOP;     OPEN C1; END</pre>

*Preview dialog*

Only In and Inout parameters appear in the Preview dialog. Out parameters are filtered from the parameter table.

When the mouse hovers over an optional result set in the **Select a result set to preview** field, a tooltip describes the column structure of the result set.

All possible result sets are listed in the corresponding input field, from which you can select one to preview. Result sets can be derived either from an input SQL statement or output parameters of stored procedures, and are represented either as:

- DERIVED – identifies the result set that was derived from a list of stored procedure out parameters. Or,
- RESULT SET- n – identifies a result set returned from a stored procedure or SQL statement. For a stored procedure that returns multiple result sets the index (1, 2, and so on) identifies the result set in the list of result sets returned by the stored procedure.

All Scalar output parameters are grouped into a single result set (DERIVED in the **Select a result set to preview** field) while each Cursor output parameter derives a separate result set.

*Attributes Mapping and Properties view*

Similar to the Preview dialog, in that when the mouse hovers over the result set in the **Select a result set to preview** field, a tooltip describes the column structure. All possible result sets are listed in the corresponding input field (DERIVED and RESULT SET -n), from which you can select one for attribute mapping.

Whenever you change the result set, the mapping control and mapping table are automatically refreshed.

### Creating Multi-level Insert Operations Using Autoincrement Primary Keys

When creating multi-level (chained) insert operations where the primary key of the parent MBO is set to autoincrement, use the "@@identity" parameter in the select statement to provide the chained insert value.

This method of creating a multilevel insert operation is useful if the primary key is set to autoincrement, you are making the relationship between two related Adaptive Server Enterprise/SQL Anywhere database mobile business objects, and you are creating them from the tool palette within the Mobile Application Diagram.

1. Create two MBOs (for example, Customer and Sales\_order).

The Customer table has an "id" column which is a primary key of int type with autoincrement default values (or identify type). Sales\_order is another table, which has a column named "cust\_id" ( a foreign key of int type).

Since "id" is set to autoincrement, each new row added to the table is uniquely identified. ("id" becomes "@@identity" from the first SQL insert statement).

2. From the Mobile Application Diagram, define the relationship between the MBOs as a **Composite** and **One to many**, and link the Customer table's "id" attribute to Sales\_order's "cust\_id".

Be sure that the child MBO will be synchronized either independently, or through the parent MBO.

3. Use a **create** statement to insert into the Customer MBO and add a **select** statement that returns the "@@identity" row. The ID column returned via this select query serves as the ID used by the chained insert statement into the Sales\_Order MBO:

#### **Example: Chained insert SQL statement**

```
INSERT INTO sampledb.dba.customer
(
  fname,
  lname,
  address,
  city,
  state,
  zip,
  phone,
  company_name)
VALUES
('["id"=":id"]',
["fname"=:fname]',
["lname"=:lname]',
["address"=:address"]',
["city"=:city"]',
["state"=:state"]',
["zip"=:zip"]',
["phone"=:phone"]',
["company_name"=:company_name"]')
```

```
)
SELECT * FROM sampledb.dba.customer WHERE id=@@IDENTITY
```

**Note:** "id" is a primary key column of identity(or autoincrement) type. Notice that the extra **select** statement and 'id' are not part of the insert statement itself.

### *Understanding Multi-level Insert Operations*

In a multi-level insert, multiple mobile business objects are synchronized in a single operation. The mobile business objects must be bound to a JDBC datasource, have a defined relationship, and the insert parameters must support the relationship.

Some business processes require multiple related enterprise information system (EIS) operations; for example, creating a sales order with line items. The parent/child relationship is often represented by primary key(PK) / foreign key(FK) attributes in the parent and child mobile business objects (MBOs). When you construct these types of MBOs in an offline client application, the primary-key and foreign-key values are transitory. When EIS operations are called to create real data, the EIS systems generate the actual key values, and the primary key of the parent is copied to the related child MBO creation operations. These types of operations are known as "chained insert" or "multilevel insert."

For database MBOs using Sybase databases, dragging and dropping a table that contains autoincrement columns (one mechanism for generating primary keys) automatically creates the appropriate operations for obtaining the parent's generated keys and applying them to the children.

Typically, in a multi-level insert operation, you:

1. Create the parent MBO, and indicate the attributes that constitute that MBO's primary key.
2. Create the child MBO and define a relationship from the parent MBO's primary-key attributes to the child's foreign-key attributes.

Synchronization of the child MBO should occur either independently or through the parent MBO. See the *Client Object API* documentation for details.

3. Define the insert operations for the parent and child MBOs.

The insert operation for the parent MBO must return a single row that contains the primary-key values. The column labels must match the attribute names of the parent MBO. With this information, and the relationship-mapping data, Unwired Workspace modifies the input parameters for the insert operation of the child MBOs by replacing the foreign-key attributes with the ones returned from the parent MBO's insert operation. For example:

```
CREATE TABLE parent(pk int autoincrement primary key, p1
varchar(30), ...)
CREATE TABLE child(fk int references parent.pk, ...)
```

The parent insert MBO is defined as:

```
INSERT INTO parent(p1, ...) VALUES(?, ...); SELECT @@IDENTITY AS
id;
```

This batch query inserts the new parent row, and returns the newly generated primary key value.

You must understand the key-generation mechanism used by the EIS application from which you are developing, and be able to determine how to retrieve the newly generated keys during the insert operation (frequently, this logic is wrapped in a stored procedure).

This same technique applies to Web service, SAP, and other EIS systems, though the insert-operation definitions differ.

---

**Note:**

- The name of the from attribute of the insert operation parameter and parameter of the insert operation do not need to be the same name.
- The insert query returns only the identity column.

The single row that is returned must contain the column referenced in the relationship between the parent MBO and the child MBO, and the label of the column must match the from attribute name of the parent MBO.

Not all columns in the inserted row are required. For example, not all columns are selected or required for a drag-and-drop database operation.

- A multilevel insert records all logs under the parent MBO. All pending actions are also listed under the parent MBO.

---

Errors may occur if:

- The client sends the parent ID, which does not correspond to the server's interpretation of the parameters of the insert operation.
- The customer's primary key consists of more than one attribute.  
If the child has multiple foreign-key attributes pointing to the parent, the relationship should list all relevant parent-to-child attributes. As long as the row returned from the parent insert contains all those columns, the child insert should work; all the foreign-key fields are populated from the parent insert result set.
- The insert operation of the parent fails at the back end.
- There is no association relationship between customer and order in which the source attribute/parameter in customer is a primary key and the target parameter in order is a foreign key to customer.
- The result set generated by the parent's insert operation does not have the required single row with the newly created primary key of that operation.

---

**Note:** Unwired Server does not report the specific reason of a multilevel insert failure. If you receive errors, or if the insert fails, check each of these items to try and identify the problem.

---

### *Creating Multi-level Insert Operations for Non-autoincrementing Primary Keys*

Modify the **create** statement from the Properties view to support a multi-level (chained) insert operation where the primary key does not autoincrement.

If you drag and drop an Adaptive Server Enterprise (ASE) or SQL Anywhere database table to create the **insert/create** operation used in a chained insert operation, the Quick Create wizard creates the mobile business object with default generated operation statements:

- If the database table has a primary key column that is of autoincrement or identity type, then you do not need to modify the **insert** and **select** statements, if the MBO is the parent MBO used later for the chained insert.
- If the primary key is not autoincrement/identity type, modify the **insert** statement manually after the MBO is created to perform the chained insert operation.

1. Drag and drop the data source onto the Mobile Application Diagram. For example, drag and drop a table named customer2 onto the Mobile Application Diagram.
2. Click **OK** in the Quick Create wizard to generate the MBO with default values. The following **create** statement is automatically generated for the database table, and can be viewed and modified in the Properties view, by selecting the **create** operation in the Mobile Application Diagram, then the **Definition** tab in the Properties view.

```
INSERT INTO sampledb.dba.customer2
(id,
fname,
lname,
address,
city,
state,
zip,
phone,
company_name)
VALUES
(
(['id "=" :id'],
['fname "=" :fname'],
['lname "=" :lname'],
['address "=" :address'],
['city "=" :city'],
['state "=" :state'],
['zip "=" :zip'],
['phone "=" :phone'],
['company_name "=" :company_name']
)
```

3. The primary key column "id" is not autoincrement (or identity type), and you must manually enter the appropriate SQL statement, since the Fill from attribute setting in this case is not supplied automatically. From the Definition tab in the Properties view, click **Edit** and modify the statement as follows:

```
INSERT INTO sampledb.dba.customer2
(id,
fname,
```

```

lname,
address,
city,
state,
zip,
phone,
company_name)
VALUES
('["id"=:id]',
["fname"=:fname]',
["lname"=:lname]',
["address"=:address]',
["city"=:city]',
["state"=:state]',
["zip"=:zip]',
["phone"=:phone]',
["company_name"=:company_name]']
)
SELECT * FROM sampledb.dba.customer WHERE id=:id

```

This serves as the parent MBO's insert statement in the relationship, which returns the inserted row.

4. Define the relationship to the second MBO used in the chained insert operation as a **Composite** and **One to many**.

Map the child MBO's foreign key attribute to the parent MBO's primary key, "id" in the above example.

### **Binding an SAP Data Source to a Mobile Business Object**

Bind the attributes and operations of an SAP object or Business Application Programming Interface (BAPI) to a mobile business object.

1. In the Bind Data Source wizard, enter the following information and click **Next**:

Field	Action
<b>Data source type</b>	Select SAP.
<b>Connection profile</b>	Select the SAP connection profile to which you are binding your mobile business object attributes/operations. If the required data source is not in the list, click <b>Create</b> to define a new connection profile.

2. Enter the SAP definition information. You can bind attributes and operations using this screen.

Field	Action
<b>Method definition</b>	<p><b>Browse</b> for the BAPI or RFC operation from which the attribute or operation is bound. Once selected, the wizard automatically retrieves the meta data (for example, parameters, and input/output tables of the specified BAPI/RFC operation) and builds models for the MBO instance in the table definition.</p> <p>If you select <b>Browse</b>, the wizard displays a tree that represents the data source from which you can access the BAPI or operation. You can enter text to filter specific SAP business objects, or use the <b>Search BAPIs/RFCs</b> dialog box. Once you select the business object of interest, the associated BAPI operations are listed in the table.</p> <p>Select <b>Refresh</b> in the Search dialog to refresh the SAP data source and display current BAPIs/RFCs. This is only necessary if there is a change to the data source and need to display the current BAPIs/RFCs.</p> <p>Select the operation and click <b>OK</b>.</p>
<b>Parameters definition</b>	Select the parameters, structure, input tables, or output tables of the BAPI operation and choose one or more table (or columns inside the tables), or output parameters to be mapped as mobile business object attributes.
<b>Runtime data source credential and connection properties</b>	If the data source is protected, and if the user name and password (data source access credentials) are different than the selected connection profile, you need to enter the <b>User Name</b> and <b>Password</b> that provides access. You can also set default values, or use personalization keys for all JCo connection properties.
<b>Result checker</b>	<p>Optionally add a result checker to the MBO.</p> <p>A result checker is a custom Java class that implements error checking for mobile business objects (MBOs). See <i>Adding a Result Checker</i>.</p>
<b>Result set filters</b>	<p>Optionally add a result set filter to the MBO.</p> <p>A result set filter is a custom java class that manipulates the rows or columns of data returned from a read operation for an MBO. To write a filter, developers must have previous experience with Java programming — particularly with the reference implementations for <code>javax.sql.ResultSet</code>, which is used to implement the filter interface. See <i>Result Set Filters</i>.</p>
<b>Preview</b>	Click <b>Preview</b> to preview the newly defined mobile business object attributes.
<b>Refresh</b>	(Optional) Select <b>Refresh</b> to refresh the parameters for the selected BAPI operation. Any changed parameters are decorated with an asterisk "*" at the beginning of the name. This is required only if there is a change to the BAPI.

3. Click **Finish** to use default mappings, or **Next** to modify the columns to attributes mapping, or parameter mapping.
4. From the Parameters page you can configure these MBO argument properties that are modeled from the data source's remote operation argument:

- Argument – the MBO argument name
- Datatype – datatype of the argument  
The datatype of a data source column is read-only, and changes only if the **Map to** column changes.
- Nullable – identifies if NULL is a valid value
- Default value – the default value, if any, of the MBO argument

Click **Next** or **Finish** when done.

5. The Attributes Mapping screen provides a graphical view of the columns to table mappings. You can collapse and expand the view and click the navigational buttons to rearrange attributes, remove and add individual attributes, and remove a mapping or all mappings. Click **Next** or **Finish** when done.

You can remove mappings without removing associated attributes from the graphical view only.

6. The **Role Assignments** screen allows you to **Create**, **Add**, and **Remove** role assignments from the mobile business object. Click **Finish** when done.

### See also

- *Creating an SAP Connection Profile* on page 40
- *Configuring an SAP Exposed Web Service MBO to Use Credentials* on page 104

- *Result Set Filters* A result set filter is a custom Java class an experienced developer writes in order to specifically manipulate the rows or columns of data returned from a read operation for an MBO.

### Searching for SAP BAPIs and RFCs

Use regular expression pattern matching to locate SAP BAPIs and RFCs from the Search BAPIs/RFCs dialog box.

The **Search BAPIs/RFCs** dialog used to locate SAP BAPIs and RFCs that bind to mobile business object attributes and operations searches for regular expressions, which should not be confused with wildcard syntax used in other search dialogs (the LIKE clause of a SQL query, or an operating system's file name search mechanism for example).

By convention, all custom RFCs have names beginning with Y or Z. If you were to enter "Z\*" as the search string, the BAPIs and RFCs returned would match Z, ZZ, ZZZ, and so on. To search for all BAPIS and RFCs that begin with "Z", enter "Z.\*" in the **Search BAPIs/RFCs** dialog. To find all custom RFCs enter "[YZ].\*".

### Configuring the SAP AutoCommit Feature

Configure an SAP operation, so `commit` is always called after the operation succeeds.

For an SAP operation, if the AutoCommit feature is enabled (`requireCommit` property is set to true), `commit` is always called following a successful operation; if the operation fails,

changes are rolled back. By default, the AutoCommit feature is enabled; if disabled, you must explicitly call `commit` after the operation succeeds.

1. In the Mobile Business Object Properties dialog, select **Attributes** or **Operation**, then click the **Definition** tab.
2. Click **Edit**.
3. To enable the AutoCommit feature, check **Commit SAP Operation**; to disable, uncheck **Commit SAP Operation**.
4. Click **OK**.

### Modifying SAP Connection Properties

Use SAP connection properties as mobile business object (MBO) parameters when making connections from an SAP MBO to an enterprise information system (EIS).

Modify SAP Java connector (JCo) connection properties when creating or editing an SAP MBO. You can then use these connection properties as parameters, for example, as personalization keys or default values.

Modify connection properties either from the Mobile Business Object Creation wizard or the Properties view.

1. In the Definition window of the Mobile Business Object Creation wizard, expand **Runtime Data Source Credential and Connection Properties**.
2. The Connection Properties table displays the configurable connection properties. The Property column is read-only, but you can modify some SAP JCo connection properties.

For example, you can either input a value or select a personalization key from the drop down list for the property. You can also create a new personalization key for any property. However, you cannot input a new value for language or code page properties.

3. To modify connection properties after the MBO is created:
  - a) From the Properties view, select the **Attributes** tab on the left, then the **Definition** tab.
  - b) Click **Edit**.
  - c) Modify as required and click **OK**.

Once you have created or modified your MBO, you can use these parameters as default values and personalization keys as needed.

At runtime, you can manage SAP connection properties as parameters. For example, if you have an SAP **SalesOrder.CreateFromData1** operation that inserts a sales order for a particular user that occurs in the context of a known SAP user, the user's credentials can be used in the insert operation. User credentials are checked in this order:

1. SAP single sign-on (SSO2) tokens.

2. X.509 single sign-on certificates.
3. Constant and personalization key values for each property.

### Modifying SAP BAPIs that Contain Namespaces so they are Valid In Unwired WorkSpace

Unwired WorkSpace does not allow a structure datatype to contain names with special characters (a forward slash '/' in this case), because the forward slash is used as a Java class name after deployment and code generation.

1. After creating MBOs from SAP BAPIs that contain namespaces, modify the definition by removing any forward slashes.

For example, If the BAPI contains a structure

```
/SAPPO/BAPI_ORDER_OPEN
```

, rename the structure.

2. In this case you could remove the /SAPPO/ prefix.

Modify the structure datatype names before making any other changes to the MBO, since renaming the structure type name or structure attribute recreates the parameter of the MBO or operation parameter, causing the previous definition to be lost.

### **Binding a Web Service Data Source to a Mobile Business Object**

Bind the attributes and operations of a Web or SOAP service to a mobile business object.

1. In the Bind Data Source wizard, enter the following information and click **Next**:

Field	Action
<b>Data source type</b>	Select one of: <ul style="list-style-type: none"> <li>• Web Service</li> <li>• SOAP – supported styles of service are document/literal and rpc/literal.</li> </ul>
<b>Connection profile</b>	If the data source type is Web Service, select the Web Service connection profile to which you are binding your mobile business object attributes. If the required data source is not in the list, click <b>Create</b> to define a new connection profile.

2. Depending on the selected data source (Web service or SOAP service), enter the attributes definition information in the Attributes wizard. This information translates into the detailed tabular view of the Web service which is mapped to mobile business object attributes.

Field	Action (Web service data source)
<b>Method</b>	The Web service method of the data source that is to be mapped to the mobile business object. To change the method, select a different one from the drop-down list.

Field	Action (Web service data source)
<b>Binding</b>	<p>A binding defines message format and protocol details for operations and messages defined by a particular portType. Since multiple ports can be associated with a single binding, a default port is selected. To change the binding, select a different port from the drop-down list.</p>
<b>Configure XSLT</b>	<p>To map Web service methods to mobile business object attributes, the Web service response message is converted to a table format. Select the <b>Edit</b> or <b>Add</b> button to invoke the <b>Edit XSLT</b> dialog, where you can define or adjust the XSLT that is used to flatten the response messages. Options include:</p> <ul style="list-style-type: none"> <li>• <b>Generate XSLT from response message elements selection</b> – Unwired WorkSpace automatically creates the XSLT and selects all elements by default. Select/unselect the desired elements to be mapped to the MBO attributes. When a complex type has one or more nested type structures, the first nested structure is automatically selected. Selecting an array (list) of a child node that is not under the same tree is not supported and generates an error.</li> <li>• <b>Define XSLT manually</b> – a default XSLT is generated by default. Manually edit the elements and attributes:             <ul style="list-style-type: none"> <li>• <b>Save to file</b> – modify by changing the selections and save to a file.</li> <li>• <b>Load from file</b> – since it is difficult to type in the XSLT contents accurately, this option allows you to retrieve an existing XSLT file from the file system. If you choose this option the XSLT text in the window is replaced by the information contained in the selected file.</li> </ul> </li> <li>• <b>OK</b> – saves your changes and exits the dialog.</li> </ul> <hr/> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• A Web service response containing an <code>&lt;s : any&gt;</code> node may result in two columns being generated. Manually remove the least relevant entry in these cases.</li> <li>• When Unwired WorkSpace generates a default XSLT for transformation of the output of a Web service operation, each result field in the XSLT includes an <code>op_bindpath</code> setting. If you modify the XSLT, leave the <code>op_bindpath</code> intact, since it's value is required to match columns from the transformed result set with fields from the original enterprise information system (EIS)-returned XML response element.</li> </ul>
<b>HTTP Basic Authentication</b>	<p>Select this option and enter the user name and password in the corresponding fields to provide basic authentication to the Web service URL before gaining access to the Web service method.</p> <p>The user name and password fields can be entered directly, retrieved from a personalization key, or by selecting <b>New key</b> and creating a new personalization key.</p>

Field	Action (Web service data source)
<b>Result Checker</b>	Optionally add a result checker to the MBO.  A result checker is a custom Java class that implements error checking for mobile business objects (MBOs). See <i>Adding a Result Checker</i> .
<b>Result Set Filters</b>	Add a custom java class to manipulate (filter) the rows or columns of data returned to the MBO. See Result Set Filters.
<b>Preview/Test Execute</b>	Click <b>Preview/Test Execute</b> to preview the results of the WSDL method invocation. You may need to enter valid values for the WSDL method parameters for the preview to succeed. Optionally, you can save multiple sets of arguemnt values into Preview/test execute configurations for reuse later. Once the preview results are verified with the provided input argument values, you can select <b>Save as default values</b> to save those values as the default values for the operation arguments/load arguments.

Field	Action (SOAP Service data source)
<b>Input SOAP message</b>	The input SOAP message from which the mobile business object attributes are derived.
<b>Destination URL</b>	The URL from which the SOAP message is accessible. Include the <b>Action URI</b> ( identifies the intent of the SOAP message) and <b>Method name</b> (identifies the SOAP method/operation).  When you fill in the <b>Input SOAP message</b> and <b>Destination URL</b> fields, and implement the XSLT, the <b>Next</b> and <b>Finish</b> buttons are enabled. If you click <b>Finish</b> at this point, a default set of attributes mappings are automatically generated based on the SOAP message definition and you are placed in the Operation editor, from which you can define the mobile business object using the fields described for defining a Web service. Or, complete the remaining fields and click <b>Next</b> .

Field	Action (SOAP Service data source)
<b>Configure XSLT</b>	<p>To map Web service operations to mobile business object attributes, the Web service response message is converted to a table format. Select the <b>Configure XSLT</b> button to display the <b>Define XSLT</b> dialog where you can define the XSLT used to flatten the response messages. Options include:</p> <ul style="list-style-type: none"> <li>• <b>Generate XSLT from response message elements selection</b> – Unwired WorkSpace automatically creates the XSLT and selects all elements by default. Select/unselect the desired elements to be mapped to the MBO attributes. When a complex type has one or more nested type structures, the first nested structure is automatically selected. Selecting an array (list) of a child node that is not under the same tree is not supported and generates an error.</li> <li>• <b>Define XSLT manually</b> – a default XSLT is generated by default. Manually edit the elements and attributes: <ul style="list-style-type: none"> <li>• <b>Save to file</b> – modify by changing the selections and save to a file.</li> <li>• <b>Load from file</b> – since it is difficult to type in the XSLT contents accurately, this option allows you to retrieve an existing XSLT file from the file system. If you choose this option the XSLT text in the window is replaced by the information contained in the selected file.</li> </ul> </li> <li>• <b>OK</b> – saves your changes and exits the dialog.</li> </ul> <hr/> <p><b>Note:</b> A Web service response containing an <code>&lt;s:any&gt;</code> node may result in two columns being generated. Manually remove the least relevant entry in these cases.</p>
<b>HTTP Basic Authentication</b>	<p>Select this option and enter the user name and password in the corresponding fields to provide basic authentication to the Web service URL before gaining access to the Web service method.</p> <p>The user name and password fields can be entered directly, retrieved from a personalization key, or by selecting <b>&lt;New key&gt;</b> and creating a new personalization key.</p> <p>To use the device user runtime credentials, you need to select system defined personalization keys ('username' and 'password'), in the corresponding fields.</p>
<b>Result Checker</b>	<p>Use the predefined <b>Default</b> or <b>None</b> result checker, or define and use a <b>Custom</b> result checker. See <i>Adding a Result Checker</i>.</p>
<b>Result Set Filters</b>	<p>Add a custom Java class to manipulate (filter) rows or columns of data returned for an MBO. See <i>Result Set Filters</i>.</p>

Field	Action (SOAP Service data source)
<b>Preview/Test Execute</b>	Click <b>Preview/Test Execute</b> to preview the results of the SOAP method invocation. You may need to enter valid values for the SOAP method parameters for the preview to succeed. Optionally, you can save multiple sets of arguemnt values into Preview/test execute configurations for reuse later. Once the preview results are verified with the provided input argument values, you can select <b>Save as default values</b> to save those values as the default values for the operation arguments/load arguments.

- Click **Finish** to use default mappings, or **Next** to modify the columns to attributes mapping, or parameter mapping.
- From the Parameters page you can configure these MBO argument properties that are modeled from the data source's remote operation argument:
  - Argument – the MBO argument name
  - Datatype – datatype of the argument
  - Nullable – identifies if NULL is a valid value
  - Default value – the default value, if any, of the MBO argument

Click **Next** or **Finish** when done.

- The **Attributes Mapping** screen provides a graphical view of the columns to table mappings. You can collapse and expand the view and click the navigational buttons to rearrange attributes, remove and add individual attributes, and remove a mapping or all mappings. Click **Next** or **Finish** when done.

You can remove mappings without removing associated attributes from the graphical view only.

- After the Definition page of the New Operation wizard, you can modify operation and client parameters from the Parameters page by selecting the corresponding tab:
  - Operation Parameters – lists all operation arguments, associated datatypes, nullability, and the arguments value can be filled from attributes, client parameters, or default values.
  - Client Parameters – add client parameters used by device application users to provide values to the operation arguments during runtime.
- The **Role Assignments** screen allows you to **Create**, **Add**, and **Remove** role assignments from the mobile business object. Click **Finish** when done.

### See also

- Result Set Filters* A result set filter is a custom Java class an experienced developer writes in order to specifically manipulate the rows or columns of data returned from a read operation for an MBO.

### Creating Multi-level Insert Operations for Web Service Mobile Business Objects

Create a multi-level insert operation for two Web service mobile business objects (MBOs).

In this example, you have two MBOs, Order and OrderItem, that both have defined create (insert) operations: the OrderItem.create operation requires the Order.id, but Order.id is assigned by the enterprise information system (EIS) and not available until the order is created in the EIS. You can create a multilevel insert operation to address this problem. When creating the multilevel insert (create) operation:

- Ensure that Order.create operation contains a response XSLT that has the newly created Order.Id as one of the elements.
- Chain the two create operations by creating the appropriate relationship.
- Ensure the association from Order to OrderItem is from Order.id.
- Ensure consistent naming: the **Primary key** attribute of Order (ID) must match the ID argument of OrderItem.create.

1. Create a Web service connection profile to the data source from which you created the MBOs.
2. Create attributes of the parent MBO (Order). For example, you can drag and drop the Web service data source onto the Mobile Application Diagram, and use the Quick Create wizard to define the MBO.

Define the MBO create operation.

---

**Note:** Web service multilevel inserts support SOAP bindings only.

---

3. Click **Finish**.
4. Set or verify the **Fill from attribute** setting:
  - a) In the Mobile Application Diagram, double-click the create operation that serves as the insert operation for the parent MBO.
  - b) From the left side of the Properties view, select the **Parameters** tab.
  - c) Verify that each argument name has a corresponding **Fill from attribute** value defined.

All arguments of the create operation in the parent MBO and the child MBO must be set to the related **Fill from attribute** value. By default, the related value is set automatically, but in some cases the value cannot be found, so double check the values.

5. Set or verify the **Primary key** setting:
  - a) In the Mobile Application Diagram select within the header of the MBO to view the MBO properties in the Properties view.
  - b) From the left side of the Properties view, select the **Attributes** tab located on the left, then the **Attributes Mapping** tab located on the top.
  - c) Locate and select the **Primary key** check box for the attribute that serves as the primary-key equivalent for the parent MBO (for example, Id).

6. Create the child MBO (OrderItem) the same way you created the parent – drag and drop the data source onto the Mobile Application Diagram, and follow the Quick Create wizard instructions to create the attributes and operations.
7. From the Properties view, verify that each argument name of the create operation has a corresponding **Fill from attribute** setting.
8. In the Mobile Application Diagram, click **Relationship**, and use the wizard to define a relationship between the MBOs. For example, link the Source object Order "Id" attribute to the Target object OrderItem "Id." Select **Composite** and **One to many**.

Synchronization of the child MBO should occur either independently or through the parent MBO. See the *Client Object API* documentation for details.

### Web Service Mobile Business Object Limitations

Understand Web service mobile business object (MBO) limitations.

This section describes known limitations when binding an MBO to Web service data sources.

#### *Unsupported types*

These Web service types are currently unsupported:

- Recursive definitions of element types.
- Soapenc encoded arrays.
- gDay, gYear, gMonth, gYearMonth
- HexBinary datatypes are not supported, instead use base64Binary.
- Unsupported datatypes are either ignored or recognized as a String.

#### *Unsupported derived or complex types*

These complex datatype scenarios are currently unsupported for Web service MBOs:

- This structure is not supported:

```
Structure A[]:
x of type struct B[]
(y of type struct C[])
```

but does support:

```
Struct A[]:
< scalar type > x,
y of type Struct B[]
```

#### *Unsupported schema constructs*

- Schema used as element data (i.e. an element is a schema).

#### *Unsupported Web service operations*

- One way operation

### *MBO Mapping restrictions*

For WSDL and SOAP Web service data sources, if an Update operation that uses the **Apply results to the cache** cache policy does not have an XSLT, an error message displays:

```
The ''UPDATE'' operation 'Customer- > updateStudent()' with ''Apply results to the cache'' cache policy does not have XSLT.
```

### *Configuring an SAP Exposed Web Service MBO to Use Credentials*

Enable SSO with X.509 certificates or SSO2 tokens for SAP BAPIs that are exposed as Web services.

1. From Unwired WorkSpace, define a connection profile for the Web service MBO:
  - a) In the Web Service Connection Details dialog, select **From URL** and enter the URL of the SAP BAPI that is exposed as a Web service.
  - b) Select **Enable HTTP authentication**.
  - c) Enter a user name and password used for authentication.
2. Define the attributes of the Web service MBO:
  - a) Connect to the Web service connection profile.
  - b) Expand the connection profile and drag-and-drop the interface for which you are creating an MBO.
  - c) From the Definition scree, select **HTTP Basic Authentication**.
  - d) In the HTTP Basic Authentication fields, specify the system provided default **username** and **password**.

### **Next**

Deploy the MBO and configure the Workflow application to use either X.509 or SSO2 credentials.

### **See also**

- *Creating an SAP Connection Profile* on page 40
- *Binding an SAP Data Source to a Mobile Business Object* on page 93
- *Implementing SSO for SAP* on page 84

### *Accessing a Web Service from an HTTPS Port*

To access an SAP BAPI exposed as a Web Service from an HTTPS port, add the same SAP server certificate you imported into the Unwired Server truststore into an Unwired WorkSpace truststore.

Perform this configuration on the Unwired WorkSpace host, or an SSL security exception is returned when trying to connect to the connection profile of the HTTPS WSDL URL.

1. Add `truststore.jks` to the `<UnwiredPlatform_InstallDir>` `\UnwiredPlatform\Eclipse` directory.
2. Use the Java **keytool** command to add the same SAP server certificate you imported into the Unwired Server truststore into `truststore.jks`.
3. Add this argument to the `<UnwiredPlatform_InstallDir>` `\UnwiredPlatform\Eclipse\UnwiredWorkspace.bat` file:

```
-Djavax.net.ssl.trustStore=%ECLIPSE_ROOT%\truststore.jks
```

4. Create and run a `setup-truststore.bat` file that sets up your truststore environment. For example:

```
copy ..\JDK1.6.0_23\jre\lib\security\cacerts truststore.jks
@echo *
@echo * Answer Yes to "Trust this certificate?".
@echo *
keytool -import -keystore truststore.jks -file sap-doe-
vml.sybase.com.PEM.crt -storepass changeit
@echo *
@echo * Add to eclipse vmargs: -Djavax.net.ssl.trustStore=
%ECLIPSE_ROOT%\truststore.jks
@echo *
```

5. Restart Unwired WorkSpace.

### **Binding a REST Web Service Data Source to a Mobile Business Object**

Bind the attributes and operations of a REST (Representational State Transfer) Web service to a mobile business object.

The main difference with binding to a REST Web service data source and any other Web service data source is the definition page. Other pages (parameter mapping, attributes mapping, role mapping, and so on), are the same. Successfully invoking a REST Web service requires:

- A URI template.
- An HTTP method.
- A request representation using XSD.
- A response representation using XSD. For Read operations, the response representation (XSLT) is mandatory for MBO attributes. For Create, Update, Delete and Other operations, the request and response representation is optional. You can also define multiple-XSLTs for a commingled MBO (multiple MBOs from a single operation).
- HTTP headers declaration.
- Optional authentication configuration.

1. In the Bind Data Source wizard, enter the following information and click **Next**:

Field	Action
<b>Data source type</b>	REST Web Service
<b>Connection profile</b>	Select the REST Web Service connection profile to which you are binding your mobile business object attributes. If the required data source is not in the list, click <b>Create</b> to define a new connection profile.

2. In the Definitions page, enter the attributes definition information.

This information translates into the detailed tabular view of the REST Web service that is mapped to mobile business object attributes:

Tab	Description
Resource base URL	<p>The base URL for a REST Web service resource URL, required to construct the resource URI. For example, <a href="http://example.com">http://example.com</a>.</p> <p>The base URL was defined in the connection profile, and is shown (read-only) in the definition page for attributes or operations.</p>

Tab	Description
Resource URI template	<p>The URI template is appended to the base URL (for example, customers/{id}). The template determines how the URI is parsed so all possible parameters are retrieved. All parameters are treated as enterprise information system (EIS) operation arguments, enabling MBO create, read, update, and delete (CRUD) operations on the REST Web service resources.</p> <p>You can specify the datatype for parameters defined in the URI template using this format: {paramName (xsdType) } For example, <b>'/getCustomer/{id(int)}'</b>. A string datatype is used if you do not explicitly specify the datatype. You can also specify support of nullable for the parameter as: <b>'/getCustomer/{id(int?)}'</b>. These datatypes can be specified in the URI template and are case-sensitive:</p> <ul style="list-style-type: none"> <li>• boolean</li> <li>• string</li> <li>• binary</li> <li>• char</li> <li>• byte</li> <li>• short</li> <li>• int</li> <li>• long</li> <li>• integer</li> <li>• decimal</li> <li>• float</li> <li>• double</li> <li>• date</li> <li>• time</li> <li>• dateTime</li> </ul> <p>You cannot specify the length in the URI template for parameters, but can modify parameter length after the REST MBO is created from the Properties view.</p>
HTTP method	The method called, either GET, PUT, POST, or DELETE.
Expected status code	<p>All available HTTP status codes are shown in the drop-down list. The default is 200. If you change it to NONE, it means that the returned status code is not checked.</p> <p>For each EIS REST Web Service operation, you can choose an HTTP status code as the expected status code. If the returned status code is the same as the specified expected status code, the EIS operation was executed successfully.</p> <p>If the returned status code does not match the specified expected status code, the EIS operation fails.</p>

Tab	Description
Representation	<p>Allows you to specify the request or response representation. Select the representation type:</p> <ul style="list-style-type: none"> <li>• Request</li> <li>• Response</li> </ul> <p>Enter or select:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> – name of the representation, which must be unique.</li> <li>• <b>Referenced representation</b> – All existing representations defined for the same MBO are listed and can be selected, but only the same Type of representation can be referenced. For example, if you previously defined a request representation for a create EIS operation, you can use it as a referenced request representation to define a new update representation for a EIS operation.</li> </ul> <p>Click <b>Edit</b> to specify the XML schema for a request or response representation, instead of referencing an existing representation:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> – name of the XSD.</li> <li>• <b>Type</b> – Request or response.</li> <li>• <b>XSD URL</b> – URL to an available XSD.</li> <li>• <b>XSD file</b> – allows you to import the XSD from a local file.</li> <li>• <b>Root element</b> – The root element used as the XSD request input.</li> <li>• <b>Load element</b> – Select this after specifying the XSD URL or XSD file, to retrieve all available load elements defined in the XSD.</li> </ul> <p>Only one XSD can be defined for a given representation.</p> <p><b>Define XSLT manually</b> – for response representation, after the XSD definition and root element was specified, Unwired WorkSpace automatically generates a default XSLT for the response representation. You can open the XSLT editing dialog to modify the XSLT. Modifying multi-XSLTs for one response representation to support commingled MBOs is also supported. All available XSLT definitions are listed in the table in the XSD definition dialog:</p> <ul style="list-style-type: none"> <li>• <b>Save to file</b> – modify by changing the selections and save to a file.</li> <li>• <b>Load from file</b> – since it is difficult to type in the XSLT contents accurately, this option allows you to retrieve an existing XSLT file from the file system. If you choose this option the XSLT text in the window is replaced by the information contained in the selected file.</li> </ul> <p>Select <b>OK</b> to save your definition and exit the dialog.</p>

Tab	Description
Authentication	<p>Supports HTTP Basic Authentication:</p> <ul style="list-style-type: none"> <li>• <b>User name</b> – authenticated user</li> <li>• <b>Password</b> – password of the authenticated user.</li> </ul> <p>The user name and password fields can be entered directly, retrieved from a personalization key, or by selecting &lt;New key&gt; and creating a new personalization key.</p> <p>To use the device user runtime credentials, you need to select system defined personalization keys ('username' and 'password'), in the corresponding fields from the drop-down list.</p>
HTTP header	<p>Captures all properties needed to execute or manage the REST Web Service.</p> <p>You can enter the existing HTTP header as defined in the HTTP specification, or declare your own HTTP header. For each element of the HTTP header you can:</p> <ul style="list-style-type: none"> <li>• Input/Output – specify if it is used as an input, output or both.</li> <li>• Variable – specify a literal value as the HTTP header's value. Specify a "Variable" to denote it as a 'parameterized' header. For parameterized headers, Unwired WorkSpace parses and treats the value as an input argument or output column of the EIS operation (depending on whether the definition is input or output).</li> <li>• Value – specify the header value. For example application/xml.</li> </ul> <p>The Input/Output/Both setting determines if Variable and Value are enabled:</p> <ul style="list-style-type: none"> <li>• Input – Variable is enabled: <ul style="list-style-type: none"> <li>• If you select Variable, the Value field is disabled and cleared.</li> <li>• If you unselect Variable, the Value field is enabled, and you must specify a value.</li> </ul> </li> <li>• Output – Variable is an automatically selected read-only field. The Value field is disabled and cleared.</li> <li>• Both – Variable is an automatically selected read-only field. The Value field is disabled and cleared.</li> </ul>

3. Click **Finish** to use default mappings, or **Next** to modify the columns to attributes mapping, or parameter mapping.
4. From the Parameters page you can configure these MBO argument properties that are modeled from the data source's remote operation argument:
  - Argument – the MBO argument name
  - Datatype – datatype of the argument
  - Nullable – identifies if NULL is a valid value
  - Default value – the default value, if any, of the MBO argument

Click **Next** or **Finish** when done.

5. The Attributes Mapping screen provides a graphical view of the columns to table mappings. You can collapse and expand the view and click the navigational buttons to rearrange attributes, remove and add individual attributes, and remove a mapping or all mappings. Click **Next** or **Finish** when done.

You can remove mappings without removing associated attributes from the graphical view only.

6. After the Definition page of the New Operation wizard, you can modify operation and client parameters from the Parameters page by selecting the corresponding tab:
  - Operation Parameters – lists all operation arguments, associated datatypes, nullability, and the arguments value can be filled from attributes, client parameters, or default values.
  - Client Parameters – add client parameters used by device application users to provide values to the operation arguments during runtime.
7. The **Role Assignments** screen allows you to **Create**, **Add**, and **Remove** role assignments from the mobile business object. Click **Finish** when done.

### REST Web Services

A REST (Representational State Transfer) Web service is a set of architectural principles by which you design Web services that focus on a system's resources, including how resource states are addressed and transferred over HTTP by a wide range of clients written in different languages.

REST Web services support these key principals:

- Provides an ID (structure-like URIs) for every resource
- Links resources together
- Uses standard HTTP methods
- Supports resources with multiple representations (Transfer XML, JavaScript Object Notation (JSON), or both)
- Communicates statelessly

Representational State Transfer – when called, a representation of the resource is returned, which places the client application in a state. Traversing the returned URL accesses another resource, placing the client application into yet another state. Thus, the client application changes (transfers) states with each resource representation.

REST establishes a one-to-one mapping between mobile business object (MBO) create, read, update, and delete (CRUD) operations and HTTP methods:

- Use POST to create a resource on Unwired Server
- Use GET to retrieve a resource
- Use PUT to change or update the state of a resource
- Use DELETE to remove or delete a resource

Example REST URIs include:

```
http://example.com/customers/1234
http://example.com/orders/2007/10/776654
http://example.com/products/4554
http://example.com/orders/2007/11
http://example.com/products?color=green
```

and this XML code fragment which links the resources together:

```
<order self='http://example.com/customers/1234' >
  <amount>23</amount>
  <product ref='http://example.com/products/4554' />
  <customer ref='http://example.com/customers/1234' />
</order>
```

With this representation, the standard HTTP GET method executes on the first resource:

```
http://example.com/customers/1234
```

**Table 29. Generic interface relationship**

<interface>  Resource: GET PUT POST DELETE	/orders:  GET - list all orders PUT - unused POST - add a new order DELETE - unused
	/orders/{id}:  GET - get order details PUT - update order POST - add item DELETE - cancel order
	/customers:  GET - list all customers PUT - unused POST - add a new customers DELETE - unused
	/customers/{id}:  GET - get customer details PUT - update customer POST - unused DELETE - delete customer
	/customers/{id}/orders:  GET - get all orders for customer PUT - unused POST - add order DELETE - cancel all customer orders

### REST Web Service Mobile Business Object Limitations

Understand REST Web service mobile business object (MBO) limitations.

- If an Update operation using the **Apply results to the cache** cache policy does not have a response representation, an error displays:

```
The 'UPDATE' operation 'Customer- > updateStudent()' with 'Apply results to the cache' cache policy does not have response representation.
```

- If the response representation of an Update operation using the **Apply results to the cache** cache policy does not have an XSLT, an error message displays:

```
The response representation of the 'UPDATE' operation 'Customer- > updateStudent()' with 'Apply results to the cache' cache policy does not have an XSLT defined.
```

### Rebinding Data Sources to Mobile Business Objects

Use the Bind Data Source wizard in the Properties view to change a mobile business object's binding to a different data source.

The binding of data source information to MBO attributes and operations varies, depending on the data source to which you are binding.

1. In the Properties view, select the **Attributes** or **Operations** tab, then click **Bind Data Source**.

A prompt informs you that the attributes are already bound to a data source.

2. Click **Yes** to rebind to a different data source.

3. Follow the Bind to a Data Source wizard instructions to bind to a different data source.

You can bind to the same or different type of data source depending on the original MBO and binding. The default mappings change accordingly.

### Changing a Data Source's Connection Profile

Change the connection profile associated with an MBO's attributes or operations to another connection profile of the same type. This allows the MBO developer to switch to a different data source, assuming the MBO attributes and operations metadata are identical. For example, MBO developers use a development database data source to develop the MBO, then another team chooses a different database server with the same metadata/configuration for testing.

### **Prerequisites**

Change a connection profile binding by selecting a different connection profile of the same data source type. The connection profile to which you are binding must be available.

### **Task**

If you change the connection profile for an MBO definition that also has operations that use the same connection profile, Unwired WorkSpace prompts you to apply the connection profile

change to the operations as well as the definition. Sybase recommends that you apply the connection profile change to the MBO operations, if not, the operations are applied to a different data source than the one from which the MBO reads.

1. You can modify connection profile to MBO attributes and operation bindings from the Properties view: there are a number of places from which you can change the connection profile to which the MBO is bound, depending on the context you are in, by selecting the **Change Connection Profile** button.

The Change Data Source dialog displays. The **Data source type** field is read-only in this dialog, you can only change the connection profile.

2. Select a connection profile from the drop-down list to switch to a different connection profile of the same data source type.

### **Adding a Result Checker**

Add a result checker to implement operation result processing logic in custom code. The deployed result checker logically validates operation results and produces log records for device clients or the server package log.

See the *Mobile Data Models: Using Mobile Business Objects* for information about writing a custom result checker.

Add a result checker when you edit Attribute or Operation properties for a mobile business object derived from a data source. Add a result checker after you have either written a custom one or use a predefined one in Unwired WorkSpace (the latter of which can be configured when you create an object).

1. In the New Attributes or New Operation wizard, in the Result checker section, select from these options:

Option	Description
<b>Default</b>	<p>The result checker depends on the data source type:</p> <ul style="list-style-type: none"> <li>• SAP – <code>com.sybase.sup.sap3.SAPOperationHandler</code>. If a RETURN parameter is found in the selected operation, this option is automatically selected.</li> <li>• Web service (SOAP) – <code>com.sybase.sup.ws.soap.SoapOperationHandler</code>. The default checker always returns the status as successful.</li> <li>• Web service (RESTful) – <code>com.sybase.sup.ws.rest.RestOperationHandler</code>. The default checker always returns the status as successful.</li> </ul>

Option	Description
<p><b>None</b></p>	<p>Return the status as successful with no message. The result checker used depends on the data source type:</p> <ul style="list-style-type: none"> <li> <p>SAP:</p> <pre> package com.sybase.sap3;  import com.sybase.sup.sap3.SAPOperationHandler;  /*  * Abstract SAPOperationHandler already defines  the no-op methods  */ public class NoopSAPOperationHandler extends SAPOperationHandler {  }                     </pre> </li> <li> <p>Web service (SOAP):</p> <pre> package com.sybase.sup.ws;  import com.sybase.sup.ws.soap.SoapOperationHan- dler;  public class NoOpSoapOperationHandler extends SoapOperationHandler {  }                     </pre> <p>For SOAP, use the <b>Default</b> result checker instead of <b>None</b> to parse the SOAP fault and return it to the client as a log record.</p> </li> <li> <p>Web service (RESTful):</p> <pre> package com.sybase.sup.ws;  import com.sybase.sup.ws.rest.RestOperationHan- dler;  public class NoOpRestOperationHandler extends RestOperationHandler {  }                     </pre> </li> </ul>
<p><b>Custom</b></p>	<p>Specify a custom result checker.</p> <p>See the topic <i>Writing a Custom Result Checker</i> in <i>Mobile Data Models: Using Mobile Business Objects</i> for information about writing a custom result checker.</p>

- (Optional) If you have not yet created the result checker classes, select **Custom** in the Result checker area of the New Attributes or New Operation dialog, and click **Create** to run the New Java Class wizard.
- If prompted, add a Java nature.

- a) (Recommended) Click **Yes** to add a Java nature. In Eclipse, a Java nature adds Java-specific behavior to projects.

In the New Java Class wizard, enter:

Option	Description
<b>Source folder</b>	By default, this is the <code>Filters</code> folder from your project. Click <b>Browse</b> to locate the source folder for the Java class.
<b>Package</b>	Click <b>Browse</b> to locate the package for the new Java class.  <b>Note:</b> Sybase recommends that you do not leave this field blank. Otherwise, the <code>JDK&lt;version&gt; Java class</code> in the default package cannot be resolved in other packages.
<b>Enclosing type</b>	Choose a type in which to enclose the new class. You can select either this option or the Package option, above. Enter a valid name or click <b>Browse</b> .
<b>Name</b>	Enter a name for the result checker class.
<b>Modifiers</b>	Select the Java class modifiers. The default modifier is public.
<b>Superclass</b>	<ol style="list-style-type: none"> <li>1. Click <b>Browse</b>.</li> <li>2. In the Superclass Selection dialog, enter: <ul style="list-style-type: none"> <li>• Choose a Type</li> <li>• Matching Items</li> </ul> </li> <li>3. Click <b>OK</b>.</li> </ol>
<b>Interfaces</b>	By default, this is populated with the corresponding interface for the selected data source type. Click <b>Add</b> to select interfaces implemented by the new class.
<b>Which Method Stubs Would You Like to Create</b>	<ul style="list-style-type: none"> <li>• <b>Public Static Void Main</b></li> <li>• <b>Constructors From Superclass</b></li> <li>• (Default) <b>Inherited Abstract Methods</b></li> </ul>
<b>Do You Want to Add Comments</b>	Select <b>Generate Comments</b> to add comments. From here, you can modify the preferences of the code templates by clicking <b>Configure templates and default values</b> .

- b) Click **No** if you do not want to add the Java nature to the selected mobile application project.

- c) Click **Finish** to compile the Java skeleton source file and add the skeleton Java checker class to the MBO.  
The result checker appears next to the Custom option.
4. In the Result checker section, next to the Custom option, click **Browse** to find an existing result checker class.
  - a) In the Select Result Checker Class dialog, select the result checker class and click **OK**.  
The result checker class appears next to the Custom option.
5. Validate the result checker:
  - a) To reuse input values you have already saved for previous previews, select **Existing Configuration**. Otherwise, load defaults, or create a new set of input values expressly for this preview instance.
  - b) Click **Preview**.

If the data runs successfully, `Execution Succeeded` appears at the top of the Preview dialog and data appears in the **Preview Result** window.

#### Editing the Result Checker

Change the result checker settings using the Change Definition dialog.

1. Right-click inside the Mobile Application Diagram and select **Show Properties View**, or select **Window > Show View > Properties**.
2. In the Properties view, click the **Attributes** or **Operations** tab, then the **Definition** tab.
3. Click **Edit**.
4. Make your changes in the Change Definition dialog, and click **OK**.

If you see this error message after defining an SAP custom result checker from an attribute and refreshing Unwired WorkSpace, click **OK** and ignore the message: `can't be cast to com.sybase.sup.sap.SAPResultChecker`.

SAP custom result checkers do not support the Unwired WorkSpace Preview option.

#### Refactoring a Result Checker

When a result checker is deleted, renamed, or moved, update its references automatically.

#### *Deleting References to a Result Checker*

Delete all references to a result checker from the workspace.

1. In WorkSpace Navigator, select the mobile application project that contains the result checker, and expand the **Filters** folder.
2. Right-click the result checker and select **Delete**.
3. In the Confirm Delete dialog, verify the selected references, and click **OK**.

### *Renaming a Result Checker*

Rename a result checker, and update its references in the workspace.

1. In WorkSpace Navigator, select the mobile application project that contains the result checker you want to rename, and expand the **Filters** folder.
2. Right-click the result checker, and select **Refactor > Rename**.
3. In the Rename Type dialog, verify the changes, and click **Finish**.

### *Moving a Result Checker*

Move a result checker to another location, and update its references in the workspace.

1. In WorkSpace Navigator, select the mobile application project that contains the Web result checker you want to move, and expand the **Filters** folder.
2. Right-click the result checker, and select **Refactor > Move**.
3. In the Move dialog, click **OK**.

### **Adding a Result Set Filter**

Add a result set filter to manipulate the rows or columns of data returned to Unwired Server from the enterprise information system (EIS) by an MBO read operation.

See *Mobile Data Models: Using Mobile Business Objects* for information about writing a custom result filter.

Choose and add a result set filter when you edit Attribute properties for a mobile business object from the **Definitions** tab. You can also configure result set filters when you create an object. You can choose a predefined or a custom filter, if you have created one.

1. (Optional) If you have not yet created the classes, then in the **Resultset Filters** area of the **New Attributes** dialog, click **Create** to run the New Java Class wizard.
2. If prompted, add a Java nature.
  - (Recommended) Click **Yes** to add a Java nature. In Eclipse, a Java nature adds Java-specific behavior to projects. A Java nature is recommended because you are creating a new Java project and adding a Java class to it. By default an Unwired Platform project does not include all the required behaviors for Java development. Clicking **Yes** automates this process.

If you clicked **Yes**, a wizard appears allowing you to enter the java package name and java class name. Click **Finish** in the wizard to compile the java skeleton source file and add the skeleton java filter class to the MBO. If you are adding the filter from the **Definition** tab of Attribute Properties view, you are prompted to refresh the data source definition. Choose **Yes** in response to this prompt. Other wise, choose **No** and only refresh after the logic has been put implemented and the java class has been built.

---

**Note:** Only the wizard generates a skeleton java source file.

---

- Click **No** if you do not want to add the Java nature to the selected Mobile Application Project.

---

**Note:** When a mobile application project is exported as an archive file, the `Filters` folder is not archived in the zip file if the `Filters` folder is empty. In these cases, you must manually create the `Filters` folder after you import the project into Unwired WorkSpace.

---

3. Implement the new class by writing the real implementation on top of the skeleton created as documented in *Writing a Custom Result Set Filter* in Mobile Data Models: Using Mobile Business Objects.
4. Add the filter you require to your mobile business object. In the **ResultSet Filters** area of the **New Attributes** dialog, click **Add**. If you are creating an MBO, you can also perform similar action with the corresponding wizard.
5. Select an existing filter class that you imported into Unwired WorkSpace.  
Only valid filters (that is, filters implemented with `com.sybase.uep.eis.ResultFilter`) appear in the filters table.
6. (Optional) Repeat steps 3 and 4 to add more filters to the mobile object.
7. (Optional) If the filters are not in the order you require, reorder them with either the **Up** or **Down** button. The order of multiple filters affects the actual Result set and metadata.
8. Test and preview the Result of your filter settings:
  - a) To reuse input values you have already saved for previous previews, select **Existing Configuration**. Otherwise, load defaults, or create a new set of input values expressly for this preview instance.
  - b) To run the preview, click **Preview**.

If the data filters successfully, `Execution Succeeded` appears at the top of the Preview dialog and data appears in the **Preview Result** window.

### See also

- *Result Set Filters* A result set filter is a custom Java class an experienced developer writes in order to specifically manipulate the rows or columns of data returned from a read operation for an MBO.

### Viewing the Filter Class Output Stream

You can set debugging options to view the output stream when using `System.out.println` in filter classes to help you debug your filter classes.

1. Go to `<SUP Installation Root>\Eclipse` and open the `UnwiredWorkSpace.bat` file with a text editor.
2. If the `-vm` options is specified, replace `javaw.exe` with `java.exe`.

---

**Note:** The **javaw.exe** command is the same as the **java.exe** command except that with **javaw.exe**, there is no associated console window.

---

3. After the line `%ECLIPSE_ROOT%\eclipse.exe" %ADDITIONAL_ARGS%` add either `-debug` or `-consoleLog`.
4. Start Eclipse.  
A Java console window appears with the output.
5. View the debugging statement through `System.out.println` on the server side.  
On the Unwired Server side, all debug statements are saved to the `ml.log` file.

## **Deploying Custom Classes to Unwired Server**

Deploy result checker and result set filter classes to Unwired Server when you deploy mobile business objects (MBOs) that contain them.

If any of your MBOs includes a result checker, result set filter (or other user-defined classes), the **Package User-defined Classes** page of the deployment wizard prompts you for the location of the Jar/class files to deploy to Unwired Server.

1. (Optional) To maintain and deploy a single file, create a Java archive of all your classes, or add an existing JAR file.
2. When finished with MBO development, deploy the MBOs to Unwired Server. Follow the prompts to include the custom classes.

- *Creating a Mobile Application Project* on page 72
- *Switching Between Developer Profiles* on page 74
- *Creating Mobile Business Objects* on page 75
- *Binding Mobile Business Objects to Data Sources* on page 82

## **Working with Mobile Business Objects**

Create attributes and operations for mobile business objects, create relationships between mobile business objects, bind them to a back-end data sources, modify and test them.

### **See also**

- *Developing a Mobile Business Object* on page 69
- *Packaging and Deploying Mobile Business Objects* on page 171
- *Mobile Business Object Overview* on page 70

## Modifying Mobile Business Object Properties

Edit existing MBO operations, attributes, relationships, and so on, as well as Mobile Application Diagram properties from the Properties view.

1. Right-click inside the Mobile Application Diagram and select **Show Properties View**, or select **Window > Show View > Properties**.
2. Display and edit any of these properties from the Properties view by clicking in the Mobile Application Diagram.

**Table 30. Properties view context**

<b>Edit</b>	<b>Action</b>
<b>Mobile business object</b>	Click inside the MBO (or inside the title area), but do not click an attribute or operation.
<b>Attributes compartment</b>	Click the attributes compartment to show a different representation than the 'mobile business object' context – the Data source, Definition, Attribute Mapping, Parameters, and Roles tabs are laid out as vertical tabs instead of horizontal tabs.  <b>Note:</b> If the mobile business object attributes are not bound to a data source, only the Data Source, Attributes, and Roles tabs display.
<b>Attribute</b>	Click an MBO attribute.
<b>Operation</b>	Click an MBO operation.
<b>Relationship</b>	Click the line (relationship) that connects two MBOs.
<b>Mobile Application Diagram</b>	Click inside the Mobile Application Diagram, but outside any object it contains.

3. Modify the properties and save your changes. You can select **File > Save**, enter CTRL-s, or select the Workbench save button (the floppy disk icon).

Any changes you make in the Properties view are immediately reflected in the Mobile Application Diagram, however you must save the changes or they are lost once you exit the Mobile Application Diagram.

## Mobile Business Object General Properties

Perform general tasks related to mobile business objects (MBOs) and the Mobile Application Diagram.

### **Copying a Mobile Business Object**

Create a copy of an existing mobile business object, attribute, or operation, which you can then modify as needed.

1. In the Mobile Application Diagram, right-click the mobile business object, attribute, operation or multiple objects (to select multiple MBOs, hold down SHIFT, then use the left mouse button to select additional MBOs) you want to copy so that the entire object is selected. Select **Edit > Copy**(or Ctrl-C).  
A copy of the mobile business object is created in the Mobile Application Diagram.
2. Select **Edit > Paste**(or Ctrl-V) to create a copy of the original object or objects.
3. Change the name of the duplicated mobile business object, and modify any other contents as needed using the Properties view.

### **Deleting a Component of a Mobile Business Object**

Delete a mobile business object, operation, attribute, or relationship.

From the Mobile Application Diagram, right-click the MBO, operation, attribute, or relationship, and select **Delete**.

### **Searching for Mobile Business Objects**

Search for existing mobile business objects based on name, attributes, operations, relationships, and so on. Search results display in the Search view.

1. From the workbench menu, select **Search > Unwired WorkSpace**, or select the **Ctrl+H** keys.
2. In the Search dialog, define your search criteria and click **Search**.

**Table 31. Search criteria**

<b>Option</b>	<b>Description</b>
<b>Search string</b>	Enter a search string, including wildcard characters, used as the name pattern used as search criteria for your other selections. Use wildcards, "*" ; matches all, "?" matches single character.  Unwired WorkSpace supports approximate string matching (fuzzy searches). For example, if you enter "test" as your MBO search string, the results display all MBOs that contain the string "test."
<b>Search for</b>	Searches for a matching mobile business object, attribute, or operation.
<b>Limit to</b>	Limit the search to declarations, references, or all occurrences of the specified search.
<b>Data source reference</b>	Filter a search based on data source information; search for items that are bound to a data source, data source type, or connection profile name.

Option	Description
<b>Role assignments</b>	Select mode (And or Or) and enter specific role names. Both "*" and "?" wild cards are supported. Use ";" as the delimiter when entering multiple search strings. For example, "roleA;*B;C?".
<b>Personalization key reference</b>	Select an existing personalization key from the drop-down list. Both "*" and "?" wild cards are supported.
<b>Resultset filter reference</b>	Select an existing filter from the drop-down list. Both "*" and "?" wild cards are supported.
<b>Scope</b>	Limit the scope by mobile application project: <ul style="list-style-type: none"> <li>• All – searches all projects</li> <li>• Enclosing – defines the scope as the currently selected elements</li> <li>• Single – select the project from the list.</li> </ul>

Search results are displayed in the Search view.

**Editing Multiple Rows of Table Information**

Batch edit multiple rows of table information by selecting the desired rows, making the change, and applying the change to the selected rows.

You can batch edit table row information in these locations:

- Attribute mapping table (available from the wizard during MBO creation, and the Properties view during editing)
- Parameter mapping table (available from the wizard during MBO creation, and the Properties view during editing)
- Preview Dialog (for input parameters and input table data)

1. To edit a field in multiple table rows, select the rows, by either:
  - a) Left-clicking while pressing “Ctrl” to select individual rows, or
  - b) Selecting “Shift” and left-clicking a row to include all rows in between the two selections.
2. Make changes in a cell of one of the selected rows.  
 For example, if you are changing the datatype for all selected rows, right-click the datatype cell in any of the selected datatype rows and select the datatype.
3. To apply changes to the selected rows, change the focus by clicking outside the selected rows. Your changes are applied to all rows.

To undo changes made in the Properties view, select **Edit > Undo**. To undo your changes when creating the MBO or in the Preview dialog, repeat steps one and two.

## **Mobile Application Diagram Properties**

Modify Mobile Application Diagram settings.

**Table 32. Mobile Application Diagram properties**

Tab	Contents
<b>Appearance</b>	From the Properties view, define various aspects of the Mobile Application Diagram's appearance, including: <ul style="list-style-type: none"> <li>• Fonts and Colors – changes the appearance of the text displayed in the Mobile Application Diagram.</li> <li>• Title fonts and colors – changes the appearance of the titles displayed in the Mobile Application Diagram.</li> </ul>

### *Resizing mobile business object compartments*

You can resize the attributes and operations portion of a mobile business object from the Mobile Application Diagram by dragging the line that separates the compartments to make the compartment larger or smaller.

## **Mobile Application Diagram Related Features**

You can generate and save an image of an MBO from the Mobile Application Diagram.

### *Generating a file image of an MBO*

1. Right-click the MBO and select **File > Save as Image File** .
2. Select the name and other properties of the image and click **OK**.

---

**Note:** PDF is not a supported image format.

---

### *Managing Mobile Application Diagram Filters and Logical Groups*

A filter defines a list of selected mobile business objects. If a filter is applied, only the mobile business objects defined in that filter appear. Logical groups keep selected mobile business objects and other logical groups together.

Because there is only one Mobile Application Diagram for all mobile business objects in a given project, filters and logical groups can be useful for viewing only mobile business objects of interest. You can create two types of filters:

- Filter by Mobile Business Objects – include only selected mobile business objects in the filter.
- Filter by Logical Group – include entire subfolders and their contents in the filter.

### *Creating a Mobile Application Diagram Filter*

For a given Mobile Application Diagram, create a filter (diagram filter) to view only mobile business objects of interest.

Filters and diagram filters both perform the same function, the difference is creating a diagram filter allows you to select the MBOs, while creating a filter pre-selects MBOs.

1. If you are creating a diagram filter:
  - a) Right-click in an empty area of the Mobile Application Diagram and select **Diagram Filter**.
  - b) Click **Select Filters**, then **New** to launch the New Filter wizard.
  - c) Select the filter type:
    - Mobile business objects – select individual mobile business objects
    - Logical group – select logical groups (subfolders) and the mobile business objects that the logical group contains.
  - d) Enter a descriptive **Filter name**, and select the individual mobile business objects (or logical groups) to include in the filter. For logical groups, select **Recursively include all the sub logical groups** to include subfolder contents in the filter.
  - e) Click **Finish** to create the filter.
2. If you are creating a filter:
  - a) Select multiple MBOs in the Mobile Application Diagram (hold the Shift key while selecting individual MBOs).
  - b) While holding the Shift key (after selecting the last MBO), right-click and select **New > Filter**.
  - c) Enter a filter name. Verify, add, or remove MBOs to be included in the filter.
  - d) (optional) Select **Apply the filter immediately** to apply the filter as soon as you click Finish.
  - e) Click **Finish** to create the filter.

### *Editing a Mobile Application Diagram Filter*

Modify an existing mobile application diagram filter.

When editing an existing mobile application diagram filter, you can change only the contents of the filter, not the type of filter.

1. Right-click in an empty area of the Mobile Application Diagram and select **Diagram Filter**.
2. Double-click the filter you want to modify or click **Edit**.
3. Modify the name or contents of the filter by selecting (or unselecting) the mobile business objects or logical groups that you want to add (or remove) from the filter, and click **OK**.
4. Click **OK** when done.

### *Selecting a Mobile Application Diagram Filter*

Determine which mobile business objects to view in the Mobile Application Diagram by selecting a mobile application diagram filter.

1. Right-click in an empty area of the Mobile Application Diagram and select **Diagram Filter**.
2. Select **No Filter** to view all mobile business objects within the Mobile Application Diagram, or select **Select Filters** and select a filter to view only the mobile business objects defined by that filter within the Mobile Application Diagram.
3. Click **OK**.

You cannot arrange MBOs using any of the Arrange options when a diagram filter is applied.

### *Deleting a Mobile Application Diagram Filter*

Delete a mobile application diagram filter.

1. Right-click in an empty area of the Mobile Application Diagram and select **Diagram Filter**.
2. Select the filter you want to delete and click **Remove**.
3. Click **OK**.

### *Creating a Logical Group*

Create a logical group to keep selected mobile business objects together. Only mobile business objects and other logical groups can be part of a logical group.

You can create logical groups from the File menu, the Mobile Application Diagram, or WorkSpace Navigator.

1. If you are creating a logical group from the File menu:
  - a) Select **File > New > Logical Group**.
  - b) Select the Mobile Application folder to act as the parent folder of the logical group. By default the logical group is created in the parent's Mobile Business Objects subfolder. But you can also select an existing logical group folder as the parent. Enter the **Logical group name**.
  - c) Click **Finish** to create the logical group.
2. If you are creating a logical group from the Mobile Application Diagram:
  - a) Right-click an MBO and select **New > Logical Group**.
  - b) Select the MBOs to be included in the logical group and click **Next**.

You can right-click one MBO to create a logical group, or select several MBOs and right-click to create a logical group, to which the selected MBOs are included in the Logical Group wizard by default.

- c) Select the Mobile Application folder to act as the parent folder of the logical group. By default the logical group is created in the parent's Mobile Business Objects subfolder. But you can also select an existing logical group folder as the parent. Enter the **Logical group name**
  - d) Click **Finish** to create the logical group.
3. If you are creating a logical group from WorkSpace Navigator:
- a) Expand the project folder, the Mobile Business Objects folder. Right-click any MBO and select **New > Logical Group**.
  - b) Select the MBOs to be included in the logical group and click **Next**.  
You can right-click one MBO to create a logical group, or select several MBOs and right-click to create a logical group, to which the selected MBOs are included in the Logical Group wizard by default.
  - c) Select the Mobile Application folder to act as the parent folder of the logical group. By default the logical group is created in the parent's Mobile Business Objects subfolder. But you can also select an existing logical group folder as the parent. Enter the **Logical group name**
  - d) Click **Finish** to create the logical group.

The logical group displays under the Mobile Business Objects folder in WorkSpace Navigator.

#### *Adding Mobile Business Objects to a Logical Group*

A logical group can be used to manage a project that contains a large number of mobile business objects (MBOs).

1. From WorkSpace Navigator, expand the project folder and Mobile Business Objects folder that contains the logical group folder.
2. Drag-and-drop the MBOs to the logical group folder.  
You can also drag MBOs from other projects, or drag an MBO out of a logical group folder into another logical group, or into the Mobile Business Objects folder.

#### *Deleting a Logical Group*

Delete a logical group and its contents.

1. From WorkSpace Navigator, expand the project folder and Mobile Business Objects folder that contains the logical group folder.
2. Right-click the logical group folder and select **Delete**.

---

**Note:** Deleting a logical group deletes its entire contents. If you want to save its contents (MBOs or any logical groups) drag them to another folder before deleting the logical group.

---

## **Mobile Business Object Data Properties**

Modify mobile business object (MBO) data properties to customize mobile application business logic.

## **Mobile Business Object Properties**

Modify mobile business object properties from the Properties view.

**Table 33. Mobile business object properties**

Tab	Contents
<b>General</b>	<ul style="list-style-type: none"> <li>• Name – the name of the mobile business object (MBO).</li> <li>• Comment – describes the mobile business object.</li> <li>• Generate metadata options – select to generate the metadata class for the corresponding MBO attributes and operations. This option is unselected by default. Generate metadata when you want to further customize generated MBO code. There are also Generate metadata options in the Code Generation wizard. If selected, those options override the MBO level options.</li> </ul>

Tab	Contents
<p><b>Attributes</b></p>	<p>If the mobile business object attributes are bound to a data source, the contents of the Attributes tabs include:</p> <ul style="list-style-type: none"> <li>• <b>Data Source</b> – information about the data source from which the attributes are derived and bound. Select <b>Change Connection Profile</b> to change the connection profile of the same data source type, or <b>Bind Data Source</b> to bind or rebind the mobile business object to a data source of any supported type.</li> <li>• <b>Definition</b> – displays the defined attributes and any runtime credential/authentication requirements, which vary depending on the data source type. Select <b>Edit</b> to launch the Change Definition dialog and modify the definition. You can also create a resultset filter skeleton or add an existing resultset filter class. Select <b>Preview</b> to preview the mobile business object.</li> </ul> <p>Result Set Filters shows resultset filters and their paths.</p> <ul style="list-style-type: none"> <li>• <b>Load Arguments</b> – see <i>Adding a Load Argument</i> for details.</li> <li>• <b>Attributes Mapping</b> – Includes:             <ul style="list-style-type: none"> <li>• <b>Attributes</b> <ul style="list-style-type: none"> <li>• <b>Name</b> – name of the attribute.</li> <li>• <b>Datatype</b> – attribute datatype</li> <li>• <b>Nullable</b> – a Null value for the attribute is valid.</li> <li>• <b>Primary key</b> – analogous to a relational database table's primary key, when set, MBO data can be searched/found using the attribute's value.</li> </ul> <p>When set, a findByPrimaryKey object query is generated by default, and the generated device client code contains FindBy-PrimaryKey methods (along with associated parameters and return types). At runtime, FindByPrimaryKey methods return a collection of objects that match the specified search criteria defined in the object query.</p> <hr/> <p><b>Note:</b> The Unwired Server cache database (CDB) does support identical rows. If a SQL query statement generates identical rows, the CDB identifies and stores one unique row, resulting in only one row displaying on the device after synchronization.</p> <hr/> </li> <li>• <b>Data Source</b> <ul style="list-style-type: none"> <li>• <b>Map to</b> – data source column to which the corresponding attribute is mapped.</li> <li>• <b>Datatype</b> – data source column datatype to which the corresponding attribute is mapped.</li> <li>• <b>Nullable</b> – select this option only for enterprise information system (EIS) arguments that support NULL as a valid value.</li> </ul> <hr/> <p><b>Note:</b> For SAP and Web service data sources, the Nullable and Datatype columns are read-only. You cannot change them, in-</p> </li> </ul> </li> </ul>

Tab	Contents
	<p>stead, Unwired WorkSpace correctly identifies and sets them from the back-end data source. But for a JDBC data source, Unwired WorkSpace may not be able to correctly identify the Datatype and nullability, so you need data source knowledge to correct them if needed.</p> <ul style="list-style-type: none"> <li>• Click <b>Refresh</b> to refresh the metadata (parameters and columns). Use the <b>Add</b>, <b>Delete</b>, <b>Delete All</b> buttons to remove attributes.</li> <li>• Click <b>Remap</b> to automatically generate new mappings for unmapped attribute columns based on metadata changes of the data source to which the mobile business object (MBO) is bound.</li> <li>• Show figure button – when selected, the visual display of the attribute to tabular view column mapping displays.</li> <li>• Roles – lists all logical roles assigned to the mobile business object along with all available roles. Use <b>Add</b> and <b>Add All</b> to move available roles to assigned roles, and <b>Remove</b> and <b>Remove All</b> to remove roles from a mobile business object (or double-click a role to add or remove it). Select <b>Create</b> to define a new role.</li> <li>• Object Queries – displays the auto-generated object queries based on which attributes are primary key attributes. Also allows you to add, edit, or delete object queries. See <i>Object Queries</i> for details.</li> </ul>
<b>Operations</b>	<p>Lists all operations defined for the mobile business object. Select <b>Add</b> to define a new operation, highlight an existing operation and select <b>Edit</b> to modify an existing operation, or use <b>Delete</b> and <b>Delete All</b> to remove operations.</p> <p>Select <b>Bind</b> to bind an operation to a data source, or <b>Rebind</b> to change an existing binding to a different data source. see <i>Mobile Business Object Operation Properties</i> for details.</p>
<b>Relationships</b>	<p>Lists all relationships defined between this and other mobile business objects. Select <b>Add</b> to define a new relationship, highlight an existing relationship and select <b>Edit</b> to modify an existing relationship, or use <b>Delete</b> and <b>Delete All</b> to remove relationships.</p>
<b>Synchronization</b>	<p>Define various synchronization aspects of the MBO from the Advanced Developer profile. See <i>Defining Synchronization Properties</i>.</p>
<b>Appearance</b>	<p>Modify certain look-and-feel aspects of the mobile business object from the Advanced Developer profile.</p>

**Creating Attributes for a Mobile Business Object**

Select the Mobile Business Object menu item from the Palette to invoke the New Mobile Business Object wizard to create a mobile business object (MBO) and its attributes.

1. Name the MBO and optionally provide comments in the Mobile Business Object page, and click **Next**.
2. Select the **Bind data source later** radio button in the Data Source page, and click **Next**.
3. Select **Add** to add attributes and adjust datatypes and nullability in the Attributes page.

---

**Note:** An MBO may not always contain attributes. For example, the developer can create an empty MBO with Other type operations.

---

4. (Optional) Select the logical roles assigned to the MBO in the Role Assignment page.
5. Click **Finish**.

## **Creating Operations for a Mobile Business Object**

Use the Operation Creation wizard to create an operation and add it to the mobile business object.

### Prerequisites

You must first create a mobile business object before adding an operation, unless you create the mobile business object directly from the data source, in which case you can drag-and-drop the data source on to the Mobile Application Diagram which launches the **Quick Create** wizard for automatic creation of attributes and operations.

### Task

1. Launch the **New Operation** wizard from the Mobile Application Diagram by selecting the **Operation** icon from the palette, then selecting the operation section of the mobile business object to which you are adding the operation.
2. Follow the wizard instructions to add an operation to the mobile business object. Include the operation type that allows you to Create, Update, or Delete data on the back-end data source, or Other for other types (or undefined) operations.

---

**Note:** The New Operation wizard varies depending on the type of data source to which the operation is bound. See the corresponding binding topic for detailed information.

---

3. Select either:

Option	Description
<b>Specify a data source</b>	Specify the data source to which the mobile business object operation maps. This creates a default mapping depending on the data source to which you are mapping. You must have access to the data source (for example, a data source connection profile) to which you are binding to use this option.
<b>Bind data source later</b>	Manually define the operation, parameters, and role assignments without binding to the data source.

- *Old Value Argument* on page 135

*Mobile Business Object Operation Properties*

Modify mobile business object operation properties using the Properties view.

**Table 35. Operation properties**

Tab	Contents
<p><b>General</b></p>	<ul style="list-style-type: none"> <li>• Operation name – the name of the operation.</li> <li>• Operation type – the operation to be performed. Operation types include Create, Update, Delete, and Other. Use Other only when there are no attributes associated with the MBO. In these cases the Fill from Attribute field is disabled since there are no attributes associated with Other operations.</li> <li>• Comment – describes the operation.</li> </ul>
<p><b>Data Source</b></p>	<p>Information about the data source from which the operation is derived. Select <b>Change Connection Profile</b> to bind the operation to a different connection profile of the same data source type, or <b>Bind Data Source</b> to bind the operation to a data source, or to rebind to a data source.</p>

Tab	Contents
<b>Definition</b>	<p>View, modify, and test operations:</p> <ul style="list-style-type: none"> <li>• View – display the operation (SQL statement, or Web service method, for example) in a read-only window.</li> <li>• Edit – modify the operation definition. You can change the type of operation as long as it is supported by the data source, and validate your changes. Enter credentials, if required, to access the data source.</li> <li>• Test execute – tests the operation against the data source to which it is bound. The <b>Test execute</b> dialog allows you to load any existing test configurations and preview the results. Be advised that using Test execute or Preview for large data or object types (BigString/BigBinary), can result in out of memory errors in Unwired WorkSpace.</li> </ul> <hr/> <p><b>Note:</b> Selecting Test execute can modify data stored on the data source to which the operation is bound. However, SQL statements are automatically rolled back and do not modify data.</p>

Tab	Contents
<p><b>Operation Parameters</b></p>	<p>View or configure the operation parameters that map to data source arguments. Select <b>Refresh</b> to update the parameters. For example, if the data source argument changes.</p> <p><b>Data Source</b></p> <ul style="list-style-type: none"> <li>• Argument – name of the operation argument. Names cannot contain C# or Java reserved words.</li> <li>• Datatype – the argument's datatype.</li> <li>• Old value argument (update and delete operations only) – maps a parameter to a second (old) argument. See <i>Old Value Argument</i>.</li> </ul> <p><b>Value</b></p> <ul style="list-style-type: none"> <li>• Fill from attribute – fills the argument's value with that of the selected attribute.</li> </ul> <p>If a create, update, or delete (CRUD) operation parameter argument is a fill from attribute parameter and is bound to a personalization key, you cannot set &lt; NULL &gt; value for this argument. If you want to pass &lt; NULL &gt; value for a CRUD operation parameter argument which is fill-from-attribute, model additional operations without personalization keys or default values bound to the argument.</p> <ul style="list-style-type: none"> <li>• Personalization key – select a personalization key to map to the argument, which provides the value.</li> <li>• Client Parameter – select a client parameter to map to the argument, which provides the value.</li> <li>• Default value – the default value of the argument.</li> </ul> <p>For MBO operations with a non-nullable argument, the argument must come from either a fill-from-attribute, personalization key, client parameter, or default value. If a non-nullable argument includes a fill-from-attribute or client parameter, the default value is ignored, even though Unwired WorkSpace allows you to input a default value. Also, if the personalization key or fill-from-attribute is used to fill the value of the argument, the client parameter might not be used.</p>

Tab	Contents
<b>Client Parameters</b>	<p>Client parameters are available in the device application and allows the user to enter values that are passed to the enterprise information system (EIS) operation argument during operation replay. Client parameters can be mapped to operation parameter arguments to determine how the client passes information to the EIS:</p> <ul style="list-style-type: none"> <li>• Name – name of the client parameter. Names cannot contain C# or Java reserved words.</li> <li>• Datatype– the argument's datatype. <b>BigString/BigBinary</b> datatypes are not supported, and an error displays if the MBO developer selects a structure type that contains <b>BigString</b> or <b>BigBinary</b> fields. To provide client parameters for <b>BigString/BigBinary</b> datatypes, or a structure with <b>BigString/BigBinary</b> fields, use compatible types: <b>String</b> for <b>BigString</b>, <b>Binary</b> for <b>BigBinary</b>. For a structure, copy the original structure in <b>WorkSpace Navigator</b>, and change the large object type fields to <b>String/Binary</b>, then use the new structure as the datatype of the client parameter.</li> <li>• <b>Nullable</b> – accepts null as a valid value.</li> </ul>
<b>Roles</b>	<p>Lists all logical roles granted to the operation along with all available roles. Use <b>Add</b> and <b>Add All</b> to move available roles to granted, and <b>Remove</b> and <b>Remove All</b> to remove roles from an operation. Select <b>Create</b> to define a new role.</p>
<b>Cache Policy</b>	<p>Determine how the results of an MBO operation are applied to the Unwired Server cache. See <i>Cache Policy</i>.</p>

- *Modifying Load Arguments* on page 157

### Old Value Argument

Use the **Old Value Argument** field to map a mobile business object(MBO) parameter to a second (old) argument in update or delete operations.

Use the **Old value argument** field to change an update or delete operation's parameter from its current value to a new value, while still allowing access to the parameter through the previously defined argument. For example, if you use the update/delete operation of an MBO to modify/delete the **lname** parameter's argument from Jones to Smith, the **Argument** value is Smith, and if you choose to, you can map the **Old value argument** to Jones.

The old value is available from a drop down list, in the form `old.argument_name` (where `argument_name` is the name of the original argument, lname in the above example. The Unmap option unmaps the old value.

The old value argument does not support bigstring or bigbinary datatypes.

The **Old value argument** field is available from a number of Properties view locations, including:

- Parameters tab of an update or delete operation's Property view.
- Operation Editing dialog.
- Test execute dialog supports selection of `old.argument` parameters when testing update and delete operations.

---

**Note:** Although the parameter can be mapped to both **Argument** and **Old value argument**, when you select **Show Figure**, only the connection to the **Argument** displays.

---

### *Avoiding synchronization conflicts with the old value argument*

If a mobile business object (MBO) performs an update or delete operation, the device sends additional parameters to the server that contain the original values of the database columns mapped to the object's parameters. These original values are shared with the enterprise information system (EIS) server in specially-named arguments. That is, if an argument is named A, and if the original value is available, it is provided in the argument named `old.A`. By checking whether or not the original value has become stale, the EIS operation can avoid conflicting updates, also known as Optimistic Concurrency Control (OCC).

### **Old value argument with an Update operation**

Consider a database that contains table Person with three columns: `socialsecurity_num (pk)`, `fname`, and `lname`. Then consider what happens in case of updates by different device applications.

1. Two devices, D1 and D2, have downloaded a row 999-55-1212, 'Joe', 'User'.
2. D1 updates the `fname` to Jane and succeeds.
3. D2 updates `lname` to Yooser, and consequently supplies the original values Joe and User.

Because the current `lname (Jane)` is not same as `old.fname (Joe)` the update for D2 does not occur.

### **Old value argument with a Delete operation**

This example illustrates the steps for support of the delete operation old value argument:

1. Create an MBO from a JDBC data source using this SQL statement:

```
SELECT * FROM contact
```

2. Create a Delete operation defined as:

```
DELETE FROM sampledb.dba.contact  
WHERE (id = :id)
```

```
AND (:first_name IS NOT NULL)
AND (first_name = :old.first_name)
```

3. Deploy the MBO and create a client application that loads all data from the enterprise information system (EIS) to the client.
4. For a given row, for example, `id=1`, client one modifies `first_name` (Jane) to Mary.
5. Client two fails when attempting to delete the changed row whose `id=1`, since the `first_name` has changed.

- *Old Value Argument* on page 135

### Previewing Mobile Business Object Attributes

Configure load arguments and preview the results against the data source to which they are bound. Optionally create a reusable configuration for future previews.

1. From the Mobile Application Diagram, select the mobile business object you want to test by clicking once anywhere in the mobile business object.
2. Right-click the mobile business object and select **Preview**.

---

**Note:** You can also access the Preview dialog when defining attributes for a newly created mobile business object. Or you can click the Definition tab of Attributes in the Properties view then click the **Preview** button to see the Preview dialog.

---

3. From the Preview dialog, configure the attribute parameters used to test and preview the mobile business object and preview the results.

**Table 36. Preview dialog instructions**

Field	Description
Load arguments	<ul style="list-style-type: none"> <li>• Argument name – (read-only) the name of the argument.</li> <li>• Datatype – (read-only) the parameter's datatype.</li> <li>• Nullable – (read-only) accepts NULL if selected.</li> <li>• Value – supply a value for the attribute's parameter compatible with the datatype, to pass to the data source. To select NULL as the value, click in the field next to the parameter, then click the down arrow on the right to select NULL as the value from the drop-down. If the datatype is binary, bigbinary, bigstring, date, datetime, or time, select the input dialog in which you can select a value.</li> </ul> <p>If the datatype is TABLE, click in the Value field, then click the ellipsis (...) within the Value field to launch the Input Table Data dialog. The Input Table Data dialog contains columns that correspond to that of the selected parameter.</p> <p>the parameter displays only if you have defined it, otherwise the table is empty.</p> <p>You can order the load arguments by selecting the column heading by which you want to order.</p>
Existing Configurations	<p>Select either an existing configuration that contains attribute parameter value settings, or preview without using a configuration:</p> <ul style="list-style-type: none"> <li>• If you continue without a configuration, then the preview uses the parameter data you provided. Optionally, provide a configuration name then click <b>Save</b> to save your settings as a configuration. If you enter a name without clicking <b>Save</b>, the configuration is not created.</li> <li>• Select an existing configuration from which you preview the attributes.</li> <li>• <b>Delete</b> – deletes the selected configuration.</li> <li>• <b>Delete all</b> – deletes all saved configurations.</li> <li>• <b>Load default</b> – loads the default configuration.</li> </ul>
Preview	<p>Select <b>Preview</b> to pass the parameters to the data source and view the results in the Preview Result screen.</p> <hr/> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• If the MBO definition requires a default value, and you do not provide one, the data source returns an error which Unwired Workspace displays, when you select Preview.</li> <li>• By default, 100 rows display at a time. You can change the default in the Miscellaneous Preferences dialog (Maximum rows to retrieve). But if this number is too high, the preview may take a long time to complete.</li> </ul>

Field	Description
Save as default values	Saves the argument values during the preview as default values for the load argument, which are reflected in the Load Arguments tab in the Properties view.

### See also

- *Result Set Filters* A result set filter is a custom Java class an experienced developer writes in order to specifically manipulate the rows or columns of data returned from a read operation for an MBO.

### Testing Mobile Business Object Operations

Configure operation arguments and test them against the data source to which they are bound. Optionally create a reusable configuration for future testing.

1. From the Mobile Application Diagram, select the operation you want to test.
2. Right-click the operation and select **Test Execute**.

---

**Note:** You can also access the Test Execute dialog when creating mobile business object operations, or from the operation's Definition tab in the Properties view.

---

3. From the Test Execute dialog, configure the operation arguments used to test the operation.

**Table 37. Test Execute dialog instructions**

Field	Description
Operation arguments	<ul style="list-style-type: none"> <li>• Argument name – (read-only) the name of the data source argument.</li> <li>• Datatype – (read-only) the argument's datatype.</li> <li>• Nullable – (read-only) accepts NULL if selected.</li> <li>• value – supply a value for the operation argument compatible with the datatype, to pass to the data source. To select NULL as the value, click in the field next to the parameter, then click the down arrow on the right to select NULL as the value from the drop-down. If the datatype is binary, bigbinary, bigstring, date, datetime, or time, select the input dialog in which you can select a value.</li> </ul> <p>You can order the operation arguments by selecting the column heading by which you want to order.</p>

Field	Description
Existing Configurations	<p>Select either an existing configuration that contains test settings, or test without using a configuration:</p> <ul style="list-style-type: none"> <li>• If you continue without a configuration, then the preview uses the parameter data you provided. Optionally provide a configuration name and click <b>Save</b> to save your settings as a configuration. If you enter a name without clicking <b>Save</b>, the configuration is not created.</li> <li>• Select an existing configuration from which you test the operation.</li> <li>• <b>Delete</b> – deletes the selected configuration.</li> <li>• <b>Delete all</b> – deletes all saved configurations.</li> <li>• <b>Load default</b> – loads the default value for each parameter.</li> </ul>
Test Execute	<p>Select <b>Test Execute</b> to pass the parameters to the data source and view the results in the Preview Result screen. A warning message appears. Click <b>OK</b> to continue.</p>
Save as default values	<p>The argument values provided during test execution are used as the operation argument default values, and reflected in the Operation Parameters tab in the Properties view.</p>

*Unwired WorkSpace Crashes When Previewing or Test Executing Large Amounts of Data*

Problem: When previewing attributes or test executing operations that involve large amounts of data in Unwired WorkSpace, for example, either a large number of rows, or large object in the returned result, Unwired WorkSpace can run out of memory and crash.

Solution: Either do not preview or test execute large results, or increase the java VM arguments -Xss, -Xms, and -Xms in the UnwiredWorkSpace.bat file to increase the stack and memory (heap) size and restart Unwired WorkSpace.

**Creating Relationships Between Mobile Business Objects**

Use the New Relationship wizard to create relationships between two or more mobile business objects.

**Prerequisites**

At least two mobile business objects and at least one attribute must be defined for either mobile business object before you can create a relationship between them. You can also create relationships between MBOs through load arguments.

**Task**

1. Launch the New Relationship wizard from the Mobile Application Diagram by selecting the Relationship icon from the palette, then make a connection between two mobile business objects by clicking in the name or attribute section of one mobile business object (parent/source), and then dragging the line to the other (child/target).

You cannot create relationships between local business objects and MBOs bound to a data source.

2. Follow the wizard instructions to define a relationship between the mobile business objects. Include:

- **Source object** – read-only and automatically filled in. Enter the source object **Attribute** name, which identifies the name of the source of the relationship, and is independent of any MBO attribute.
- **Target object** – select a target of the relationship from the drop-down list. Enter the target object **Attribute** name, which identifies the name of the target of the relationship, and is independent of any MBO attribute.
- **Comment** – (Optional)
- **Relationship type** – either:
  - **One to many** – the source for this relationship is one-to-many (default). For example, one manager manages multiple employees.

- **One to one** – a one-to-one relationship between the target and the source. For example, a manager manages only one department.

- **Many to one** – the source of this relationship is many-to-one. For example, many employees work in one department.

- **Bi-directional** – indicates a two-way relationship. That is, changes can be propagated in either direction.

- **Composite** – create, update and delete operations on a parent MBO automatically cascades changes to the child entity. For example, deleting the parent Customer MBO cascades directly to the child MBO Sales Order. This option is disabled for many-to-one relationships.

3. Create the mappings from the source mobile business object to the target by selecting a source object attribute, load argument, or structured load argument and dragging it to the corresponding target to which you want to map. Structured load argument relationships are not true relationships, but allows mapping of structures. Unwired WorkSpace also

supports attribute-to-load argument, load argument-to-attribute, and load argument-to-load argument mappings.

4. Click **OK** when finished.

Relationships are identified in the Mobile Application Diagram by a line connecting the related MBOs, with a different type of arrow for each type of relationship (one-to-one, one-to-many, or many-to-one).

Mobile Business Object Relationship Properties

Modify the relationship of two mobile business objects using the Properties view.

**Table 38. Relationship properties**

Tab	Contents
<p><b>General</b></p>	<ul style="list-style-type: none"> <li>• Source object – the source MBO.</li> <li>• Source attribute – identifies the name of the source of the relationship, and is independent of any MBO attribute.</li> <li>• Target object – the target MBO.</li> <li>• Target attribute – identifies the name of the target of the relationship, and is independent of any MBO attribute.</li> <li>• Comment – a description of the relationship.</li> <li>• One-to-many, one-to-one, or many-to-one – select the type of relationship. By default, the relationship is one-to-many.</li> <li>• Composite – create, update and delete operations on a parent MBO automatically cascade changes to the child entity. For example, deleting the parent Customer MBO cascades directly to the child MBO Sales Order. This option is disabled for many-to-one relationships.</li> <li>• Bi-directional – indicates a two-way relationship and optional for all relationships, which enables selection of unidirectional, one-to-many, and many-to-one relationships.</li> </ul>

Tab	Contents
<b>Mapping</b>	<p>View or change the mappings for this relationship. While attribute-to-attribute mapping is explicitly supported, you can also map:</p> <ul style="list-style-type: none"> <li>Argument-to-argument mapping, including structure arguments (structure MBOs) – requires that you set a <b>propagate to attribute</b> for the argument, then map the argument from the relationship mapping tab. For example, the Customer MBO has an attribute named state and an argument named state_name, from the attributes Load Arguments tab, select state as the propagate to attribute for the state_name argument. Then map the state_name argument in a relationship. You must map sub-arguments when mapping structured arguments. For example, if Customer[] is the structured argument, and it contains state as a sub-argument, you must map the state sub-argument, and not the Customer[] argument.</li> <li>Attribute-to-argument and argument-to-attribute mappings are also supported.</li> </ul>
<b>Appearance</b>	<p>Modify the appearance of the text and line that represents the relationship. For example:</p> <ul style="list-style-type: none"> <li>Fonts and Colors – changes the appearance of the relationship text displayed in the Mobile Application Diagram.</li> <li>Routing – changes the routing of the relationship connector line displayed in the Mobile Application Diagram.</li> <li>Line and arrows – changes the style of lines and arrows.</li> <li>Smoothness – changes the Smoothness of the relationship line.</li> <li>Jump links – changes the placement and appearance of any jump links.</li> </ul>

Relationship Guidelines

Follow these guidelines when configuring MBOs and enterprise information systems (EISs) used in relationships.

**Table 39. Relationship guidelines**

Guideline	Example
<p>These examples use SQL Anywhere to illustrate how to properly configure the EIS so delete operations behave as expected</p>	<ul style="list-style-type: none"> <li> <p>Example one consist of two MBOs:</p> <pre>Address: addr_id, street, city, country</pre> <pre>Employee: emp_id, name, addr_id (foreign key references Address.addr_id)</pre> <p>The MBOs have a relationship defined, for example, a composite, uni-directional, one-to-one relationship:</p> <pre>Employee(Parent) --&gt; Address(Child)</pre> <p>At runtime, if you delete Employee, Unwired Server attempts to delete the child Address first, which fails because of the Employee.addr_id-to-Address.addr_id reference. For the delete operation to perform as expected, the addr_id foreign key must be defined in the EIS database as <b>on delete set null</b> to enable deletion.</p> <p>This requirement applies regardless of the type of relationship defined between the MBOs.</p> </li> <li> <p>Example two also uses the Employee and Address MBOs in a relationship that has mutual references:</p> <pre>Address: addr_id, street, city, country, emp_id(foreign key references Employee.emp_id)</pre> <pre>Employee: emp_id, name, addr_id(foreign key references Address.addr_id)</pre> <p>You must set both foreign keys in the EIS database as <b>on delete set null</b> or <b>on delete cascade</b>, regardless of the type of relationship you define for Address and Employee, or neither of them can be deleted.</p> </li> </ul>
<p>If the foreign key in a relationship points to a <code>char(n)</code> column, and it is the only column in the table, use the <b>rtrim(column name)</b> function in the MBOs column definition</p>	<p>This example has a relationship defined as:</p> <pre>States(Parent) --&gt; Sales_region(Child)</pre> <p>Sales_region contains one column named Region with a data type of char(7). The MBO definition should be:</p> <pre>SELECT rtrim(region) as region FROM sampledb.dba.sales_regions</pre>

Guideline	Example
MBOs used in a relationship must belong to the same Synchronization group	MBOs in a relationship need to share the same synchronization characteristics for proper synchronization of all MBOs within the relationship, therefore verify that all MBOs are in the same synchronization group.
By default, all MBOs in a relationship are assigned to the same cache group	You can assign different cache groups to MBOs within a relationship, however, doing so generates a warning message. You may want to, for example, separate cache groups with different cache policies for a <code>sales</code> MBO, which changes frequently, that has a relationship with the <code>catalog</code> MBO, which changes infrequently.
Unwired WorkSpace does not support Circular relationships	<p>Do not create circular relationships that work from parent-to-child then, eventually, back to the parent. For example:</p> <p>A relationship that includes three MBOs: A, B, and C, where</p> <pre>A-----&gt;B-----&gt;C-----&gt;A</pre> <p>is not supported.</p>
Composite relationship behavior	<ul style="list-style-type: none"> <li>• If a parent MBO's primary key is auto-incremental and you want to perform multi-level insert operations, then the relationship must be composite. Otherwise the child MBO can only be created on an existing parent MBO.</li> <li>• When Composite is selected, all child operations are performed through the parent.</li> <li>• Foreign key attributes are updated automatically when setting a related parent/child object. Do not directly update the child's attribute (row) identified by the foreign key.</li> <li>• Multi-level insert (MLI) operations require composite relationships.</li> <li>• A child MBO can have multiple parents (many to one), but only one parent can have a composite relationship to the child.</li> </ul> <p>In a composite relationship, when one child MBO does not have a synchronization parameter, and has multiple parents, each of which has a synchronization parameter, the child inherits synchronization behavior from both of the parents. If a composite relationship does not exist, Unwired WorkSpace randomly selects a parent through which the child synchronizes. Sybase recommends that you define one parent MBO as the composite parent to avoid unintended behavior. For example:</p> <p>There are two one-to-many relationships: <code>A&lt;---&gt;&gt;C</code> and <code>B&lt;---&gt;&gt;C</code>. Both MBOs A and B have a synchronization parameter while MBO C has none. In this case, one of the relationships should be a composite.</p>

Guideline	Example
First/subsequent MBO relationship behavior	<p>Multiple MBOs created from a single operation result:</p> <ul style="list-style-type: none"> <li>Subsequent MBOs as child entities (if the relationship mapping is based on a subsequent MBO load argument) are supported, and the relationship is treated the same as a relationship on an attribute, meaning it does not affect MBO loading.</li> <li>Relationships from subsequent to first MBOs where the relationship mapping is based on the load argument of the first MBO are not supported.</li> </ul>
Local business objects	<ul style="list-style-type: none"> <li>A relationship between two local business objects that does not have a primary key set is invalid.</li> </ul> <p>You cannot create relationships between local business objects using a composite primary key.</p>
Multi-level insert operation behavior	<p>Multi-level insert operations do not support unidirectional one to many relationships – newly created rows in the child MBO do not display prior to synchronization in a unidirectional one to many relationship. To view details prior to synchronization from the device application, go to the pending operations screen.</p>
Automatic setting of primary keys	<p>Relationships require all primary keys on the source or target MBO (source or target depends on the relationship type) to be referenced in the relationship. If you design a relationship that does not include all the primary keys, a warning prompt allows you to decide whether to automatically set reference attributes to primary keys, and unset the unreferenced attributes primary keys. If you select <b>Yes</b>, Unwired WorkSpace automatically sets the primary key, if not, Unwired WorkSpace maintains the existing primary key setting, and displays a validation message according to the relationship rules.</p>
Personalization key and default value removed from child parameter.	<p>When creating a relationship from an attribute of a parent MBO to a load argument of a child MBO, the personalization key and default value cell of the load argument is disabled, and the personalization key and the default values, if any, are cleared, since those values are not used to load the child's value from the EIS at run-time.</p>

**Refreshing Attributes and Arguments**

The refresh option generates new mappings for attribute/columns or operation arguments/load arguments based on the metadata of the data source to which the mobile business object (MBO) is bound

For MBOs already bound to data sources, selecting **Refresh** refreshes and/or remaps operation arguments, load arguments, and attributes based on the EIS data source metadata changes. Refresh is available from both the Attributes and Operation Parameters tabs in the

Properties view, and also affects how Preview refreshes attributes and operation arguments. Internally, selecting **Refresh**:

- Queries the data source metadata from scratch.
- Creates new columns or arguments using the fresh metadata information (name, type, default value).
- Generates new data source mappings for attributes, load arguments, or operation arguments.
- Establishes "Fill from attribute" links for operation arguments.

You have an MBO with attributes bond to a database table defined as:

```
Customers[ID, Surname, GivenName, Address, Phone]
```

As the developer, you want to eliminate the "Address" column and better represent the address information. You modify the EIS database schema to:

```
Customers[ID, Surname, GivenName, Street, City, State, Country, PostalCode, Phone]
```

The MBO attributes become out of date because of the schema change, requiring the developer to **Refresh** the metadata. Note that after you refresh, the "Address" attribute is unbound. You can manually add attributes and map them to the columns in the tabular view, or select **Remap** to create the new attributes and map them to the appropriate columns automatically based on the modified metadata.

### **Managing Personalization Keys**

Personalization keys allow the mobile user to define (personalize) certain input field values within the mobile application, by associating a name (key) with a simple or complex datatype value.

Mobile development supports two types of personalization keys:

- User-defined – you can define these when developing a mobile business object. Before using these keys in a device application, each user sets their own values. For example; name, address, zip code, currency, location, customer list, and so on.
- System defined (username/password) – refers to the user's login credentials used to access enterprise information system (EIS) data. Unlike preference attributes, username/password is read-only and reset each time the user logs in or changes their password. The values are typically used as personalization attributes or other data source runtime credentials. The username/password system personalization keys do not support NULL values.

#### **Creating a Personalization Key**

Create a personalization key using the Personalization Key wizard.

1. Launch the Personalization Key wizard from either the:

- Workspace Navigator – right-click the Mobile Application project, the Personalization Keys folder within the Mobile Application project, or an existing

personalization key within the Personalization Keys folder and select **New > Personalization Key**.

- Mobile Development perspective – select **File > New > Personalization Key**, or **File > New > Other > Mobile Application Project > Personalization Key**.

The New Personalization Key wizard displays:

2. Follow the wizard instructions and click **Finish** to create the new personalization key:
  - Mobile Application project (available only if invoked from the Mobile Development perspective) – the project in which this personalization key is created. The newly created personalization key will be displayed under the Personalization Key folder of the selected Mobile Application project.
  - Name – the name of the personalization key
  - Type – select the supported data type of the personalization key value. If the type is an array, for example `String[]`, then it supports a list of values.
  - Nullable – accepts null as a valid value.
  - Protected – obfuscates the personalization key value, making it more secure.
  - Default value(s) – supports multiple values. Select the ellipsis (...) to **Add** or **Delete** multiple default values in these situations:
    - The type is Binary/Date/DateTime/Time or String whose length is larger than 300.

---

**Note:** If you add a default value, for these data types, the default value is initially read only. To edit this value, click the ellipsis (...) in the Edit Properties dialog of the wizard. For the DATETIME and TIME types, note that you can add or edit the millisecond value. The precision of millisecond is limited to three digits. For example, a value of .1 is rendered as .100.

---

- The type is a primitive list. For example, `STRING[]`, `BINARY[]`, and so on.
- The type is a structure or list of structures.

All default values must be of the same data type as specified in the Type field.

- Storage – determines where the key values are stored and maintained. Options include:
  - Server – on Unwired Server
  - Client – on the device client
  - Transient – only saved in memory of the current login session
- Description – (optional) the description of this personalization key

### Copy and Pasting Personalization Keys

Create a new personalization key by copy and pasting an existing key.

1. Navigate to the existing personalization key you want to copy by expanding the Mobile Application project folder, then the Personalization Keys folder.
2. Right-click the personalization key you want to copy and select **Copy**.
3. Navigate to the Mobile Application project to which you want to paste the personalization key. Right-click the Personalization Keys folder and select **Paste**.

If the pasted personalization key has the same name as an existing personalization key in the Personalization Keys folder to which you are pasting, rename the personalization key.

If you are copying and pasting a personalization key that contains a structure, the same structure must be available in the project to which the personalization key is copied.

### Modifying Personalization Key Properties

Modify common personalization key properties from the personalization key's Properties dialog box.

1. Access the Properties dialog box by right-clicking the personalization key you want to modify and selecting **Properties**.
2. From the Common tab, modify any of these properties:
  - Name
  - Type
  - Nullable (checkbox)
  - Protected (checkbox)
  - Default value(s)
  - Storage
  - Description
3. Click **OK** to save your changes.

### Deleting a Personalization Key

Delete an existing personalization key from the Personalization Keys folder.

To determine the mobile business objects, attributes, and operations referenced by the personalization key you are deleting, right-click the personalization key and select **References > option** (where option is the reference type of interest).

1. Navigate to the personalization key you want to delete, by expanding the Mobile Application folder then the Personalization Keys folder.
2. Right-click the personalization key and select **Delete**.  
A confirmation dialog appears with a list of all mobile business objects, attributes, and operations referenced by the personalization key.
3. Click **Ok** to delete the personalization key.

All MBO and operation assignments are removed and the personalization key is deleted from the Personalization Keys folder.

### Personalization Key Guidelines and Limitations

Understand the limitations when configuring MBOs that contain personalization keys.

- **Maximum length** – the value of personalization keys are BASE64 encoded. After encoding, the sum of the length of the personalization key values cannot exceed 16\*4000, or a synchronization exception occurs during synchronization.
- **Personalization keys mapped to parameters and arguments** – if a personalization key is nullable and does not have a default value, and is mapped to an MBO sync parameter,

load argument, or operation's argument, the default value for that sync parameter, load argument, or operation's argument can be modified, otherwise the default value is empty and read-only.

- **Mapping a personalization key to operation/synchronization parameter/load argument** – if a personalization key is mapped to either an operation argument, load argument, or synchronization parameter, the Properties view default value selection is disabled and the default value is removed.
- **Setting the personalization key in the device application** – the priority with regard to the device application user setting the personalization key value is:
  1. The user sets the personalization key value. If the personalization key equals NULL,
  2. Use the personalization key default value. If the personalization key default value equals NULL,
  3. Use the parameter default value.

In cases where the personalization key is not nullable:

1. the default value for the parameter is never to be used and the default value for the synchronization/operation parameter is read-only.
2. The actual synchronization/operation parameter is not visible from the device application. The device application user cannot overwrite the value with any arbitrary value.
3. Updating the personalization key value results in an update of the original subscription, and not the creation of a second subscription.

### **Managing Roles and Permissions**

Logical roles provide authorization for mobile business objects and operations during development.

The Sybase Unwired Platform supports two types of roles:

- Logical roles – defined and used within the development environment to provide security to mobile business objects and MBO operations during development, and eventually mapped to physical roles during deployment. Mobile device users have no interaction with logical roles.
- Physical roles – enterprise-oriented and managed by the Unwired Server administrator or through some other enterprise security provider. Physical roles control the access to the back-end data sources of an MBO during runtime.

When deploying MBOs to a Unwired Server, you can map logical roles to existing physical roles that are located on the Unwired Server. The mapping transfers authorization and other properties from the physical role to the logical role.

The need for role mapping exists because, in most cases, any role-based authorization used while developing an MBO is invalid once the MBO is deployed to the Unwired Server, since it is likely the Unwired Server uses a different security mechanism/set of roles, or the data source changes and uses different authorization than used during development.

If development and Unwired Servers do use the same set of roles, you can map the logical role name directly to the physical role when deploying the MBO. See *Packaging and Deploying Mobile Business Objects*.

The Roles folder contains user-defined roles, that can be modified and reused.

Role assignments are not propagated from the mobile business object to the operations it contains. If you want to control access to any operation, you must explicitly set the appropriate role ( by default, if no role is assigned then the operation is assigned the role 'everybody' which allows unlimited access).

### Creating Logical Roles

Use the New Role wizard to create a logical role in the Mobile Application project's Roles folder.

The context from which you launch the New Role wizard determines the default project location of the new role.

1. Launch the New Role wizard by selecting **File > New > Other > Sybase > Mobile Development > Role**.
2. Specify:

**Table 40. Create a new logical role**

Field	Description
Mobile Application project	Select the Mobile Application project to which this role is added. The role is stored in the Roles folder of the selected Mobile Application project.
Name	Enter a name for the new role.
Description	(Optional) Enter a description for the role.
Default role	(Optional) set this role as the default role assigned to all mobile business objects and operations created from that point forward for the specified Mobile Application project.

3. Click **Finish**.

The new logical role is now available from the Roles folder of the Mobile Application project in which it was created.

### Copy and Pasting Logical Roles

Create a new logical role by copying and pasting an existing role.

1. Navigate to the existing role you want to copy by expanding the Mobile Application project folder, then the Roles folder.
2. Right-click the role you want to copy and select **Copy**.
3. Navigate to the Mobile Application project to which you want to paste the role. Right-click the Roles folder and select **Paste**.

If the pasted role has the same name as an existing role in the Roles folder to which you are pasting, rename the role.

### Modifying Logical Role Properties

Modify common role properties from the role's Properties dialog box.

1. Access the Properties dialog box by right-clicking the role you want to modify and selecting **Properties**.
2. Select **Common**.
3. Modify:
  - Name – role name.
  - Description – role description.
  - Default role – set and unset this role as the default.
4. Click **OK** to save your changes.

### Setting and Unsetting the Default Logical Role

Optionally set a default role that is assigned to all mobile business objects and operations created from that point forward for the Mobile Application project.

1. Navigate to the role you want to set as the default by expanding the Mobile Application folder then the Roles folder.
2. Right-click the role and select **Set as Default**.
3. To remove the default setting, select the default role and click **Set as Default** again.

### Assigning Roles to Mobile Business Objects and Operations

Assign logical roles to mobile business objects and operations using the role's Properties dialog box.

1. Right-click the role you want to assign and select **Properties**.
2. Select **Assignments**.
3. Modify role assignments by selecting the tab that corresponds to the assignment you want to make:
  - Mobile Business Objects – displays all MBOs that are contained in the same Mobile Application project as the role. Select individual MBOs to which you assign the role, or use the **Select All** and **Deselect All** buttons. Assigning a role to an MBO assigns the role to all operations and attributes of that MBO.
  - Operations – displays all MBO operations that are contained in the same Mobile Application project as the role. Select individual operations to which you assign the role, or use the **Select All** and **Deselect All** buttons.

---

**Note:** You can also assign a role by dragging-and-dropping the role to the operation or MBO.

---

4. Click **OK** to save your changes.

### Finding Role References

Locate mobile business objects and operations that the role references.

1. Navigate to the role whose references you want to find by expanding the project folder then the Roles folder.
2. Right-click the role, select **References**, then select:
  - Mobile Business Object – displays mobile business objects referenced by this role.
  - Operation – displays mobile business object operations referenced by this role.
  - All References – displays mobile business objects and operations referenced by this role.

Referenced objects display in the Search view. Double-clicking objects in the Search view changes the focus in the Mobile Application Diagram to the object.

### Deleting a Logical Role

Delete an existing logical role from the Roles folder.

1. Navigate to the role you want to delete, by expanding the project folder then the Roles folder.
2. Right-click the role and select **Delete**.
3. Click **Yes** to delete the role.

The Delete dialog box displays all mobile business objects and operations referenced by the role.

All mobile business object and operation assignments are removed and the role is deleted from the Roles folder.

## **Mobile Business Object Mobility Properties**

Mobility properties determine data movement within the enterprise, once mobile business objects are deployed to Unwired Server and device applications access MBO data.

### **Synchronization**

Determine the amount of data (filter), and under what conditions (timing and triggers), mobile devices upload MBO data to and download data from the Unwired Server cache (CDB).

Synchronization properties are unavailable for MBOs in cache groups that use an Online policy.

### Defining Synchronization Properties for Individual Mobile Business Objects

Each mobile business object (MBO) that can be synchronized includes a Synchronization tab from which you configure synchronization behavior.

1. From the Mobile Application Diagram, right-click the MBO for which you are configuring synchronization, and select **Show Properties View**.

---

**Note:** MBOs that use an Online cache policy do not support synchronization.

---

2. In the Properties view, select the **Synchronization** tab.

---

**Note:** If you do not see the Synchronization tab, switch to the Advanced Developer profile.

---

3. Complete the synchronization parameter configuration:

Use the **Add**, **Delete**, and **Delete All** buttons to create or remove parameters. You can also supply additional parameter information for each parameter, including:

- **Parameter name** – by default each new parameter name is parameter $N$  ( $N$  is the number of the parameter), which you can change.
- **Datatype** – the datatype of the parameter. Datatypes in the Personalization key and Mapped-to columns must be compatible with the datatype selected here.

---

**Note:** Synchronization parameters do not support structure types.

---

- **Nullable** – accepts null as a valid value. Unselect this option if the argument to which this parameter is mapped does not support null as a valid value.
  - **Personalization key** – maps the synchronization parameter to a personalization-key value. If you specify a **Personalization Key**, the client is not required to provide a value, but must define a personalization value for the key before successfully using the MBO.
  - **Default value** – enter a valid value.
  - **Mapped to** – maps the synchronization parameter to an existing attribute. During synchronization, the application's synchronized local cache contains only entities that match the synchronization parameter value with that of the mapped attribute.
  - **Query limiting – deprecated.** Instead, define object queries or use the objectAPI dynamic queries (SUPQuery class) to limit synchronization to the last value entered by the device application user.
4. Select **Customized download data** to generate the SQL statement that defines the synchronization filter. Unselecting this option clears the statement.

By default, the internally generated SQL statement, based on the synchronization parameters, includes only the '=' operator. To properly generate the SQL for any MBO that is bound to a JDBC data source that includes a **where** clause operator other than '=' (>, <, < >, !=, >=, <=, !>, !<, and so on), update the generated SQL statement after selecting **Customized download data**. For example, change the '=' operator to '>'.

**Next**

(Optional) For a parameter to serve as both a load argument and a synchronization parameter, select **Synchronization parameter** for the argument to which the synchronization parameter is mapped from the attribute's **Load Arguments** tab after you define the synchronization parameter.

**See also**

- *Combining Load Arguments and Synchronization Parameters* on page 159
- *Load Arguments* on page 156

**Creating Synchronization Groups**

A synchronization group includes a policy that defines the synchronization schedule for the mobile business objects (MBOs) within it. Create as many synchronization groups as required to meet the varying synchronization schedules of the MBOs for a given mobile application project.

1. To launch the New Synchronization Group wizard, either:
  - Switch to the Advanced developer profile, then right-click the Synchronization Groups folder under a mobile application project from the Workspace Navigator, and select **New > Synchronization group**, or
  - From Unwired Workspace, select **File > New > Synchronization group**.
2. Specify properties for the synchronization group and click **Finish**.
  - **Name** – name of the synchronization group.
  - **Change detection interval** – the frequency, in hours, minutes, and seconds, with which Unwired Server is notified of data changes within the synchronization group.
  - **Description** – an optional description.
  - **Use as default synchronization group** – identifies the synchronization group as the project's default. All MBOs automatically belong to the default synchronization group when created, except MBOs that are not bound to any data source, and cannot be synchronized.

Unwired Workspace includes a read-only "Default" synchronization groups folder (that uses a change detection level of 10 minutes), which ensures there is always at least one folder available.

The synchronization group folder you just added appears under the Synchronization groups parent folder in the mobile application project for which it was created. You can drag-and-drop MBOs between synchronization group folders.

**Deleting Synchronization Groups**

Deleting a synchronization group folder assigns all mobile business objects (MBOs) currently in the folder to the default Synchronization group folder.

You cannot delete the predefined "Default" synchronization group.

1. From WorkSpace Navigator, expand the project folder that contains the synchronization group folder.
2. Right-click the synchronization group folder of interest and select **Delete**.  
All MBOs in the deleted synchronization group folder are assigned to the default synchronization group folder.

### **Load Arguments**

Load arguments control the amount of data refreshed between the enterprise information system (EIS) and the cache database (CDB), and each load argument creates its own partition in the CDB based on load argument value (partition key). Partitions are refreshed concurrently, thus improving performance. In contrast, synchronization parameters filter CDB data downloaded to the mobile device during device application synchronization.

Set load arguments in the Properties view, from the **Attributes > Load Arguments** tab. Set synchronization parameters from the Synchronization tab. It is important to understand both their differences and how they work together to load (data refresh) and filter (synchronize) data. For example, you can use:

- A synchronization parameter and a separate load argument – refresh data based on an argument independent of synchronization, or
- A load argument that maps to a synchronization parameter – use the same value for both refreshing and synchronizing data. Basically, one synchronization parameter induces one CDB partition. This provides more fine-grained CDB partitioning and concurrency, but may introduce more partition refresh overhead and less data sharing across devices when there are too many different values from synchronization parameters.

**Figure 1: Synchronization parameter**

**Figure 2: Load argument****See also**

- *Mobile Business Object Attribute Properties* on page 130
- *Defining Synchronization Properties for Individual Mobile Business Objects* on page 154

**Modifying Load Arguments**

Manage certain aspects of load arguments such as mapping them to synchronization parameters or personalization keys.

Use load arguments to control data refresh, create partitions, and, if mapped to a synchronization parameter, filter data that is returned to the mobile device. If you drag and drop a data source, or otherwise create MBO attributes that automatically generate attribute parameter-to-argument mapping, steps 1–3 below are optional. Do not confuse load arguments with operation arguments, which are defined or modified for individual operations.

1. In the Mobile Application Diagram, right-click the MBO, and select **Show Properties View**. Alternatively, click in the MBO title header to open the associated MBO properties view.
2. In the Properties view, select the **Attributes** tab, then select the **Load Arguments** tab.

Any arguments defined as part of the MBO definition automatically appear as load arguments, and you cannot arbitrarily add new arguments. For example, if your MBO is bound to the sample database's customer table, and the SQL definition is:

```
SELECT customer.id,
       customer.fname,
       customer.lname,
       customer.address,
       customer.city,
       customer.state,
       customer.zip,
       customer.phone,
       customer.company_name
```

```
FROM customer
WHERE customer.state = :state_name
```

then **state\_name** is a load argument and **state** is the **Propagate to attribute**. You can modify load arguments from the Load Arguments tab.

- For each argument, you can specify:

Property	Description
<b>Data Source</b>	
Argument	Data source argument name to which the load argument is mapped.
Datatype	Datatype of the data source argument to which the parameter is mapped.  You can change the argument's datatype only if the MBO is bound to a JDBC data source.
Nullable	Select this option only for data source arguments that support NULL as a valid value.
<b>Value</b>	
Propagate to attribute	(Optional) Select an attribute to use its value for that of the argument.  <b>Note:</b> When the MBO belongs to a cache group that uses an Online policy, the selected attribute is used as the query parameter of the automatically generated findByParameter object query.
Personalization key	(Optional) You can select a personalization key to map to the argument, which provides an argument value. For example, you can create and specify the "state" personalization key, and return values that match a specific value, such as "California." If <b>Synchronization parameter</b> is selected, this option is unavailable.

Property	Description
Synchronization parameter	<p>(Optional and unavailable for MBOs in cache groups that use an Online policy) Map the load argument to an existing synchronization parameter (defined from the Synchronization tab) to use the synchronization parameter's value to refresh and filter data between the EIS and CDB, and download to mobile devices.</p> <p>See <i>Combining Load Arguments and Synchronization Parameters</i> for details.</p> <p>The <b>Default value</b> and <b>Personalization key</b> options are ignored if you select synchronization parameter.</p>
Default value	<p>(Optional) Enter a default value for the parameter. If <b>Synchronization parameter</b> is selected, this option is unavailable.</p>

### Combining Load Arguments and Synchronization Parameters

Combine load arguments and synchronization parameter settings to control how data is cached in the CDB, and filtered and returned to a device application.

Design and implement load and synchronization for efficient data control, especially where large sets of data are involved, or Unwired Server and device applications may perform poorly. For example:

- Unwired Server – load arguments that load too much enterprise information system (EIS) data into the CDB at a given time can impact performance and, in some cases, generate memory errors (`java.lang.OutOfMemoryError`). Define load arguments to divide data into smaller segments so data loads efficiently. Otherwise, you may have to increase the server's JVM heap size to accommodate the extra load.
- Device application – synchronization parameters limit CDB to device application data. If you do not define synchronization parameters, a client may download all data in the CDB (for a particular MBO), and, in the worst case, cause the device application to crash. Define

synchronization parameters to divide data into manageable segments so every synchronization finishes quickly.

These results are based on the customer table in the sampledb database in the My Sample Database connection profile.

Parameters	Result
No load arguments or synchronization parameters are defined.	All table data is downloaded to the device. The SQL definition is:  <code>select * from sampledb.dba.customer</code>
The region synchronization parameter is defined, but not used as a load argument.	Only customers from a specific region are downloaded to the device. Typically, region is paired with a personalization key. For example, a sales representative living and working in the western region is interested only in customers from that region. The SQL definition is:  <code>select cust_id, cust_name, region from sampledb.dba.customer where region=:region</code>
The region load argument is defined, and used as a synchronization parameter.	Occurs if data refresh requires a region parameter and a synchronization parameter. This scenario is more likely for Web service and SAP MBOs than for database MBOs.
Load arguments are mapped to username and password personalization keys, and a separate synchronization parameter is mapped to region.	Refresh data only for the authenticated user, but synchronize based on the region:  <code>select cust_id, cust_name, region from sampledb.dba.customer where region=:region, for user A.</code>

- *Defining Synchronization Properties for Individual Mobile Business Objects* on page 154

### Mapping a Load Argument to a Synchronization Parameter

Map a load argument to a synchronization parameter to control both enterprise information system (EIS) caching on Unwired Server when a mobile business object (MBO) is accessed by a device application and filter data that is downloaded to the device application.

1. From the Mobile Application Diagram, right-click the MBO for which you are configuring synchronization and select **Show Properties View**.
2. In the Properties view, select the **Attributes** tab from the left side, then select the **Load Arguments** tab, located on the top.
3. To use the load argument for synchronization, select the **Synchronization parameter** from the drop-down list.

If the load argument maps to a synchronization parameter, the value can be supplied by the client each time it synchronizes the MBO. During subsequent synchronizations, the client may provide different values for the parameter, which affects EIS data refresh results from Unwired Server.

If the parameter includes a default value, a client-supplied value is optional.

### Configuring Mobile Business Objects for Mobile Workflow Online Data Access

You can define load arguments that determines what data to return to a Mobile Workflow application.

You can map load arguments to either transient personalization keys or propagate-to attributes to define load arguments used within a Workflow application, the difference is:

- personalization keys – the value is passed in as personalization key values. For example, a user name and password that returns a result set for that particular user.
- propagate-to attribute – when this method is used, and the MBO uses an Online cache group policy, the value of the load argument always comes from the `findByParameter` object query parameter. And the data is real-time enterprise information system (EIS) data. That is, every call to the object query results in an immediate data refresh, and delivery of requested data to the client.

### Defining Mobile Workflow Load Arguments From Mapped Transient personalization Keys

Map load arguments to transient personalization keys. Specify values for those personalization keys when you invoke an operation or object query from the mobile workflow form.

The basic task flow for mapping and specifying values for transient personalization keys from Unwired Workspace is:

1. Create a mobile business object that has load arguments. For example, the Customer MBO could have this definition:

```
SELECT id,
```

```

fname,
lname,
address,
city,
state,
zip,
phone,
company_name FROM sampledb.dba.customer
where state = :state_load_arg

```

2. Create a corresponding personalization key for each load argument where the Storage type is **Transient**.
3. Map each load argument to the corresponding personalization key. Set the load arguments in the MBO Properties view, from the Load Arguments tab.
4. (Optional – specify the cache group policy that meets the Workflow client's needs. The policy defined here, results in a immediate data refresh for every client request). Set the **On demand** cache group policy for the MBO with a **Cache interval** of zero.
  - a) Add the MBO to a Cache Group that uses the On demand cache group policy. For example, create a new cache group named CacheGroupOnDemand and set the policy to **On demand** and the **Cache interval** to zero.
  - b) Drag and drop the MBO to the CacheGroupOnDemand cache group.

At runtime, when the client passes in their transient personalization key values (user name and password for example), the entire cache for the MBO refreshes prior to synchronization. While this ensures the device receives up-to-date EIS data, it is more costly in terms of resources compared to a cache policy with a longer cache interval.

5. Deploy the project that contains the MBO to Unwired Workspace.

#### Defining Mobile Workflow Load Arguments from Mapped Propagate to Attributes

Create an MBO with at least one load argument, map as propagate to attributes, then assign the MBO to a cache group that uses an Online policy.

1. From Unwired Workspace, create an MBO that has at least one load argument. For example, you could define an Emp MBO as:

```

SELECT id,
empName,
empDeptId FROM sampledb.dba.employee
WHERE empDeptId = :deptIdLP

```

2. In the MBO Properties view, select the **Attributes > Load Arguments** tab, map each load argument to be used as an operation load argument for the Mobile Workflow package to a Propagate to Attribute. This example requires you to map the deptIdLP load argument to the empDeptId attribute. You must also verify that data types are INT and the default value is a valid INT.
3. Set the Online cache group policy for the MBO.

- a) Add the MBO to a cache group that uses the Online cache group policy. For example, create a new cache group named CacheGroupOnline and set the policy to **Online**.
- b) Drag and drop the MBO to CacheGroupOnline.

The `findByParameter` object query is automatically generated based on all load arguments that have `propagate-to` attributes:

4. Deploy the project that contains the MBO to Unwired Server.

### **Cache Groups**

A cache group specifies the data refresh behavior for every mobile business object (MBO) within that group.

During development, you can group MBOs based on their data refresh requirements. Some terms and concepts you should be familiar with are:

- **Cache group** – includes a cache policy and the MBOs that share that policy. An MBO can belong to only one cache group.
- **Cache** – MBO data in the Unwired Server cache (CDB) can be refreshed according to a cache policy, along with other mechanisms, such as data change notification (DCN).
- **Cache policy** – defines the cache refresh behavior and properties for the MBOs within the cache group based on the policy:
  - **On demand** – the cache expires after a certain period of time (cache interval) such as 10 minutes. The cache is not updated until a request is made of the cache and the cache has expired. If a request is made of the cache and it is expired, there may be a delay responding to the request while the cache is refreshed.
  - **Scheduled** – the cache is refreshed according to a schedule such as 7:00 am, 1:00 pm, or 6:00 pm. Note that load arguments filled from transient personalization keys cannot be used with a scheduled cache type, because transient personalization key values are stored in the device application session, and unknown to Unwired Server.
  - **DCN** – the cache never expires. Data refresh is triggered by an enterprise information system (EIS) Data Change Notification. The cache interval fields are disabled when DCN is selected.

You can define MBOs without any load operations (not bound to a data source), only if the MBO belongs to a cache group that uses a DCN policy.

See the *Developer Guide for Unwired Server* for details about implementing DCN.

- **Online** – only can be used with message-based mobile workflow applications. See *Online Cache Group Policy* and *Configuring Mobile Business Objects for Mobile Workflow Online Data Access*.

Each cache group contains a cache policy, which in turn contains cache refresh/update properties. When a refresh occurs, the Unwired Server calls the default read operation (for each MBO in the cache group), and all of the rows that are returned from the enterprise information system (EIS) are compared to existing rows in the CDB as follows:

- If the CDB is empty, all rows are inserted.
- If any rows exist in the CDB, Unwired Server processes the row-set and checks (using the primary key) to determine if the row already exists in the cache:
  - If it does, and all columns are the same as the EIS, nothing happens. When a client synchronizes to request all rows that have changed since the last synchronization, only rows that have changed are included, which is important for performance and efficiency.
  - If the row does not exist, it is inserted and the next synchronization query retrieves the row.

### Creating Cache Groups

Each cache group has a cache group policy that defines the data refresh properties/schedule for the mobile business objects (MBOs) within them. Create as many cache groups as required to meet the varying data refresh needs of the MBOs for a given mobile application project.

1. To launch the New Cache Group wizard, either:
  - Right-click the Cache Groups folder from the Workspace Navigator, and select **New > Cache Group**, or
  - From Unwired Workspace, select **File > New > Cache Group**.

---

**Note:** If you do not see the Cache Groups folder, switch to the Advanced Developer profile.

---

2. Specify general properties and the data refresh schedule for the cache group and click **Finish**.
  - **Mobile application project** – the mobile application project to which this cache group belongs. This option does not appear if you launch the wizard from the Workspace Navigator.
  - **Name** – name of the cache group.
  - **Description** – an optional description.
  - **Policy** – select the policy to be used by all MBOs within the cache group. The cache group policy determines the method and timing by which the Unwired Server cache is refreshed from the enterprise information system (EIS) for all MBOs within the cache group:

Policy	Description
On demand	<p>Application logic combined with the cache interval determines when a cache refresh is triggered. The cache is not updated until a request is made of the cache and the cache has expired. If a request is made of the cache and it has expired, there may be a delay responding to the request while the cache is refreshed.</p> <p>You can select <b>Partition by Requester and Device Identity</b> only if using an On demand policy. To enable, select this option from the Cache Group Property Policies tab.</p>
Scheduled	The cache is refreshed when a scheduled task executes, and can be defined by the Unwired Server administrator or by setting the cache interval. Note that load parameters filled from transient personalization keys can not be used with a scheduled cache type.
DCN	The cache never expires. Data refresh is triggered by an EIS Data Change Notification. The cache interval fields are disabled when DCN is selected.
Online	Used strictly with Mobile Workflow applications where access to real-time EIS data is required, bypassing the Unwired Server cache (CDB). See <i>Online Cache Group Policy</i>

- **Cache interval** – used by both On demand and Scheduled, the cache interval allows you to associate an interval (hour, minute, seconds, and so on) for the cache group. If an application tries to synchronize:
  - Before the cache interval expires – the client application receives the data currently in the Unwired Server cache database (CDB).
  - After the cache interval expires – the CDB is refreshed from the enterprise information system (EIS), and the client synchronizes with the data in the CDB. If the cache interval is set to zero, each device-initiated synchronization refreshes the entire cache prior to synchronization. While this ensures the device receives up-to-date EIS data, it is costly in terms of resources. A Scheduled cache policy does not support a zero interval.

Examples include:

  - An On demand policy with a 0 cache interval – each client request for data results in the data being retrieved from the EIS and delivered to the client through the cache, but the cache is immediately invalidated, ensuring the most current EIS data is available to clients.
  - An On demand setting with a two hour cache interval – after each cache refresh, the cache is valid for two hours. Each client request for data is serviced by the cache. When a client requests data at least two hours after the last data refresh, the cache is refreshed from the EIS and the cache interval resets for two hours.
  - A Scheduled setting with a 24 hour cache interval setting – the data is refreshed every 24 hours.

- **Use as default cache group** – identifies this cache group as the project's default. All MBOs automatically belong to the default cache group when created, except for local business objects, which cannot belong to a cache group.

Modifying Cache Group Properties

Modify common and policy properties for cache groups.

Each mobile application project contains a Cache Groups folder that contains all cache groups for the mobile business objects (MBOs) belonging to that project.

1. In WorkSpace Navigator, expand the mobile application project to access the Cache Groups folder.
2. Expand the Cache Groups folder, right-click the cache group you want to view or modify, and select **Properties**.
3. In the left pane, select either the **Common** or **Policies** tab, and view or modify:

**Table 41. Cache group properties**

Property	Description
Common	<ul style="list-style-type: none"> <li>• <b>Name</b> – name of the cache group.</li> <li>• <b>Description</b> – a description of the cache group.</li> <li>• <b>Use as default cache group</b> – sets this cache group as the default.</li> </ul>
Policies	The cache group policy determines the method and timing by which the Unwired Server cache is refreshed from the enterprise information system (EIS) for all MBOs within the cache group.

4. Click **OK** to save changes and exit, or **Cancel** to undo any changes.

*Setting the Data Partitioning by User and Device Identity Property*

Select Partition by Requester and Device Identity to partition mobile business object (MBO) data by a requester's identity (user id plus device id). This option ensures that data loaded into the Unwired Server cache (CDB) using an On demand cache policy is accessible only by that requestor.

The requestor identity is derived from the device id and the user from which a request originates, meaning that two users on the same device have different requestor identities, and the same user on different devices has a different requestor identity for each device.

1. Verify that the MBO belongs to a cache group that uses an On demand policy.
2. From the Policies window of the cache group select **Partition by Requester and Device Identity**.

All MBOs within the cache group partitions data by requester and device identity.

### *Partitioning Data by User and Device Identity Guidelines*

Follow these guidelines when configuring MBOs that partition MBO data by a requester's identity.

**Table 42. Guidelines for defining an MBO that partitions data by user identity**

<b>Guideline</b>	<b>Description</b>
Setting Partition by Requester and Device Identity	You can select this option when defining a new cache group or modifying the properties of an existing cache group. The default value is unselected.
Relationship	<p>If an MBO references a user-partitioned MBO then both MBOs must be user-partitioned. User-partitioned MBOs can reference non-user-partitioned MBOs. For example, there are three MBOS:</p> <ul style="list-style-type: none"> <li>• SalesOrderMBO</li> <li>• LineItemMBO</li> <li>• ProductMBO</li> </ul> <p>The LineItemMBO has a foreign key reference to the SalesOrderMBO and a foreign key reference to the ProductMBO.</p> <p>In this case the modeler/developer specifies the SalesOrderMBO is requestor-partitioned, meaning that the LineItemMBO must also be requestor-partitioned (since it contains a foreign key reference to another requestor-partitioned MBO).</p> <p>The modeler does not specify the ProductMBO as requestor-partitioned since doing so needlessly duplicates reference data in the cache.</p>
Cache group	The MBO must be in a cache group that uses the On demand policy.
MBO cache affecting operations	Any cache affecting operation is localized to the partition of the requester.
Data change notification (DCN)	DCN does not support modifying data at the partition level.

### Assigning Mobile Business Objects to a Cache Group

Assign mobile business objects (MBOs) to a cache group based on the group's data refresh needs. Once deployed to Unwired Server, the cache policy determines the data refresh policy for each cache group.

All MBOs, except for local business objects, belong to a cache group. By default, new MBOs are assigned to the designated default cache group, which is initially defined to use an On demand policy with a zero cache interval.

1. To move an MBO from one cache group to another from the WorkSpace Navigator, drag and drop the MBO from the old cache group to the new.
2. To change the default cache group, right-click the cache group to designate as the new default and select **Set as Default**. Alternatively, select **Use as default cache group** in the Properties dialog.

### Operation Cache Policy

Fine-tune device application and Unwired Server performance by defining an operation cache policy for mobile business object operations.

Setting an operation cache policy for mobile business object (MBO) operations gives you more control of both Unwired Server interactions with the enterprise information system (EIS) to which the MBO is bound, and Unwired Server cache database (CDB) updates. Fine-tuning these interactions and updates improves both Unwired Server and device application performance.

- MBO operations perform specific functions based on their definition:
  - Read operation (MBO attributes, load arguments, and synchronization parameters) – the EIS operation used to define and initially populate the CDB (from the EIS) for the MBO. Also called a load operation.
  - Create, update, delete ( CRUD operations) – modify EIS data depending on the definition of the operation. Unwired Server maintains a cache (CDB) of back-end EIS data to provide differential synchronization and to minimize EIS interaction. When an operation is submitted from a device application to the EIS, the cache must be refreshed.

While this type of bulk-fetch and CDB caching are effective in reducing the number of interactions required with the back-end EIS, and work well in some other cases (where MBO data is occasionally updated in the back-end), performance suffers if changes are initiated from Unwired Server (by way of MBO operations), or if changes are frequent.

An operation cache policy provides additional methods for updating the cache at finer granularity, which improves performance.

- Operation cache policy – determines how the CDB is updated after an operation. You can set the cache policy for operations, with these exceptions:
  - "Other" operations do not support a cache policy.

- Delete operations always use the Apply results to cache policy, which cannot be unselected. You can also select Invalidate the cache.

The cache policies from which to choose to associate with MBO CUD operations:

- Apply results to the cache
- Invalidate the cache
- No effect – if a cache policy is not selected, the operation results are not applied to the cache.

When an MBO operation is called, its cache policy determines how operation results are applied to the CDB.

---

**Note:** Other mechanisms used to update the CDB that are external to MBO operations, and not associated with operation cache policies include:

1. EIS-initiated DCN – an HTTP request to Unwired Server, in which the DCN request contains information about the changed data, or the changed data itself.
  2. Scheduled data refresh – Unwired Server polls the EIS for changes at specified intervals.
  3. MBO cache group – every MBO belongs to a cache group that specifies a cache refresh policy for every MBO in that group. Plan carefully to maximize cache group and cache policy efficiency. Examples include:
    - A poorly designed MBO might have an operation with a cache policy that updates only the operation results to the CDB, but the MBO belongs to a cache group with an interval that refreshes the entire MBO on too short a schedule, minimizing the value of the cache policy.
    - This same MBO properly designed might have a cache group that refreshes the MBO nightly, increasing Unwired Server performance by deferring load from peak usage hours.
- 

### Setting an Operation Cache Policy

Set an operation's cache policy from the Properties view.

1. From the Mobile Application Diagram, click an operation to access it from the Properties view.
2. Select the **Cache Policy** tab.
3. Select the cache policy. You can select multiple cache policies for a given operation, depending on the results you want to achieve:

Cache Policy	Description
<p>Apply results to the cache</p>	<p>Modifies the CDB based on the returned result set of the called MBO operation:</p> <ul style="list-style-type: none"> <li>• Create and update operation use this policy by default, which can be modified.</li> <li>• Delete operations use this policy which is always set and cannot be modified.</li> </ul> <p>Validation for this cache policy for Web service and SAP MBOs includes:</p> <ul style="list-style-type: none"> <li>• A warning message if you model a create MBO operation that does not have a <b>Primary key</b> definition.</li> <li>• A warning message if you model a create MBO operation if the output record does not contain the "primary-key columns"</li> </ul> <p>Operation 'Entity-&gt;create()' has 'Apply results to the cache' option set without returning primary key fields.</p> <p>For database MBOs:</p> <ul style="list-style-type: none"> <li>• Unwired WorkSpace must execute a database MBO operation to retrieve the output records.</li> <li>• The output record of the "CREATE" operation "{0}" with "Apply results to the cache" option set does not contain the primary key columns.</li> </ul> <p>For JDBC data sources, Unwired WorkSpace does not validate whether an operation with Apply result to the cache policy returns primary key fields as part of the output record. If user want to use this policy option, you need to know whether the definition of the operation can return the primary key column or not.</p> <ul style="list-style-type: none"> <li>• "CREATE" operation "{0}" has "Apply results to the cache" option set without returning primary key fields.</li> </ul>

Cache Policy	Description
Invalidate the cache	<p>restricts invalidation to only those cache partitions affected by the create or update operation.</p> <p>An operation that uses the invalidate cache policy:</p> <ol style="list-style-type: none"> <li>1. Performs the create or update operation. For example, insert a new record or update an existing record in the enterprise information system (EIS).</li> <li>2. Invalidates and refreshes the cache (CDB) for those mobile business object (MBO) partitions affected by the operation, not the entire MBO instance.</li> </ol> <p>When defining MBO CUD operations, use cache invalidation sparingly, since it invalidates the entire MBO cache table. Consider using apply results instead, since this updates a single row in the cache rather than invalidating all rows in the cache for an MBO. When the client invokes a CUD operation on an MBO it can be modeled to invalidate the cache for that MBO. When an MBO cache is marked as "invalid" the next read request for that MBO refreshes the cache. This places load on the Enterprise Resource as well as the Unwired Server.</p> <p>Do not use the "Invalidate the cache" policy for an operation when the MBO is in a DCN (Data Change Notification) cache group, since the "Invalidate the cache" policy will have no effect.</p> <hr/> <p><b>Note:</b> To achieve optimum performance when using cache invalidating operations, result-affecting load arguments should be propagated into the MBO attributes, which are defined in the <b>Attributes &gt; Load Arguments</b> tab.</p>
No cache update policy	<p>If you unselect all check boxes for create or update operations, the operation has no effect on the CDB. Data refresh depends on other mechanisms to update the CDB. For example, the cache group to which the MBO belongs.</p>

## Packaging and Deploying Mobile Business Objects

Create and deploy a deployment package to the Unwired Server that contains your mobile business objects (including role mappings, server connection mappings, and other mobile business object related artifacts). Optionally create a deployment profile that allows you to manage multiple deployment packages.

You can either:

- Deploy a Mobile Application project – only the selected project is deployed. This method allows you to save the project in a deployment profile so that it can be reused.
- Create the mobile deployment package from the Deployment Package wizard – allows you to select any number of projects to add to the mobile deployment package. This method

provides maximum flexibility allowing you to reuse the deployment profile, bundle multiple deployment packages, deploy to multiple Unwired Servers, and so on.

### See also

- *Developing a Mobile Business Object* on page 69
- *Working with Mobile Business Objects* on page 119
- *Mobile Business Object Overview* on page 70

## Deploying a Mobile Application Project

Deploy a Mobile Application project directly to an Unwired Server, and optionally create a reusable deployment profile.

To avoid errors or inconsistent behavior, client applications must be regenerated whenever a package has been redeployed. Restarting the client application is not sufficient to reset the client for a package that has been redeployed.

### 1. Right-click the Mobile Application project and select **Deploy Project**.

Alternatively, you can launch the deployment wizard, which automatically sets the Unwired Server portion of the wizard, by dragging a Mobile Application project folder from Workspace Navigator and dropping it on the Unwired Server in Enterprise Explorer to which you are deploying.

---

**Note:** As an option, you can press F9 when your cursor is in the Mobile Application Diagram to launch the Deployment wizard for the corresponding project. If a deployment profile exists for the project, F9 performs quick deployment of the project according to the profile.

---

2. Select a deployment mode (**Update**, **Replace**, or **Verify**), target version, Package name, and click **Next**.
3. Select the MBOs from each Synchronization Group to be deployed and click **Next**.

---

**Note:** If any selected MBOs contain errors, the **Next** and **Finish** buttons are disabled.

---

4. Create or add required JAR files for MBOs that use Resultset Filters or Custom Result Checkers and click **Next**.
5. Select a target server, click **Connect**, and select a Domain and Security Configuration for the deployment package and click **Next**. (Optional) If no Unwired Server connection exists, click **Create** and define a connection profile for one to which you can connect and deploy the deployment package.
6. Deploy applications to Unwired Server – select the applications to deploy to Unwired Server. A unique Application ID identifies the application and uses the project name by default.
7. Map connection profile to server connections – you must map design-time connection profiles to server-side (run-time) enterprise information system (EIS) data sources referenced by the MBOs in the project. Deployment fails if the EIS data sources are not

running and available to connect to. To map the connection profile to a server connection, select the connection profile from the list of available connection profiles then select the corresponding server connection to which it maps, or select **<New Server Connection...>** to create a new server connection.

Contact the system administrator in cases where your development environment permits access to systems that the Unwired Server prohibits.

**Note:** You can also modify server connection properties (Web service connections only).

8. If a logical role is defined in your MBO, map logical roles to physical roles. If there are no logical roles defined, this page is skipped. Click **Next**.
9. (Optional) Specify the name and location for the new deployment profile. This is useful for troubleshooting MBO and deployment errors. See *Troubleshoot Mobile Business Object Development*.
  - Save the deployment settings as a deployment profile – if you do not save your settings to a deployment profile, they are lost when you exit the Deploy wizard.
  - Enter or select the parent folder – by default, Deployment is the folder in which the deployment profile is saved.
  - File name – the name of this deployment profile. The deployment profile is assigned a `.deploy` extension.
10. Click **Finish** to deploy the project to the Unwired Server's Packages folder.

## Creating a Mobile Deployment Package

Create a mobile deployment package that contains the mobile business objects (MBOs) to be deployed to an Unwired Server.

1. Launch the New Mobile Deployment Package wizard.

From	Action
<b>WorkSpace Navigator</b>	Right-click the Mobile Application project and select <b>Create Mobile Deployment Package</b> .
<b>File menu</b>	Select <b>File &gt; New &gt; Mobile Deployment Package</b> .

2. Enter the project folder and file name for the mobile deployment package and click **Next** (the file name is used as the default 'package name' in the next step).  
By default, when the mobile deployment package is created, it is given a `.pkg` extension. For example, if the file name is `test_package`, the mobile deployment package file name is `test_package.pkg`.
3. Enter the name of the mobile deployment package (maximum 64 characters) that is deployed to the Packages folder of the target Unwired Server, and an optional description and click **Next**.

The value of the Package name field entered here is not the package name on the Unwired Server.

4. Select the MBOs to be included in the package and click **Finish** or **Next**:
  - Select the project level to select all of the MBOs from the project.
  - Select one or more individual MBOs.

---

**Note:** If any MBO contains an error, an error icon displays next to that MBO. You can still include the MBO in the package.

If any MBOs in the package have dependencies, those dependencies are included, and display in the **Dependencies** section.

---

5. If any of the MBOs include JAR files, for example, if you have created custom result checkers or result set filter classes, the Package User-defined Classes page prompts you to deploy them to Unwired Server. You must deploy your custom classes to the server to use them.
6. Select and assign available applications to be deployed. Each application has an Application ID that uniquely identifies the application and is required for certain application types (for example: messaging, workflow, and OData).
7. Review the summary and click **Finish**.

The mobile deployment package (<file name>.pkg) appears in the WorkSpace Navigator and the Mobile Deployment Package editor opens.

### **Configuring a Mobile Deployment Package**

Use the Mobile Deployment Package editor to configure or modify the contents of the mobile deployment package.

1. Open the Mobile Deployment Package editor:

From	Action
<b>A new mobile deployment package</b>	The editor automatically opens after creating a mobile deployment package.
<b>An existing mobile deployment package</b>	Right-click the mobile deployment package and select <b>Open</b> .

2. Select the **Configuration** tab to configure or modify these mobile deployment package settings:

**Table 43. Mobile deployment package configuration**

Screen	Description
General Informa- tion	<ul style="list-style-type: none"> <li>• Package name – identifies the package to be deployed to the Unwired Server.</li> <li>• Description – (optional) a description of the package.</li> </ul>

Screen	Description
Contents	Lists MBOs included in the package. You can add or remove MBOs. Any dependencies are automatically updated.
Package User-defined classes	If any of the MBOs include custom result checkers or result set filter classes, the Package User-defined Classes screen prompts you to deploy them to Unwired Server.
Application and Application ID	Each application has an Application ID that uniquely identifies the application and is required for certain application types (for example: messaging, workflow, and OData).
Roles	A read-only field that displays the roles assigned to the MBOs or operations. You must modify roles at the MBO or operation level. You can map logical roles to physical roles when you deploy the package or create a deployment profile.
Dependencies	A read-only field that displays any MBO dependencies.
Data Sources	A read-only field that displays the data source to which the MBOs are bound. You can bind or rebind to a server connection when you deploy the package or create a deployment profile.

### 3. Select **File > Save**.

### **Building a Mobile Deployment Package**

Construct a JAR file that contains XML files that contain the metadata of the mobile deployment package.

### **Prerequisites**

A mobile deployment package must already exist before you can build it.

### **Task**

1. Expand the Deployment subfolder of the Mobile Application project.
2. Right-click the deployment package and select either **Build Package (full)** or **Build Package (incrementally)** to build the JAR file.

## **Deploying Mobile Deployment Packages while Creating a Deployment Profile**

Deploy a mobile deployment package and optionally create a deployment profile to store a deployment scenario that can be executed multiple times.

### **Prerequisites**

A connection profile to at least one Unwired Server must be available before you deploy mobile deployment packages to a server.

### **Task**

Following these instructions you can:

- Deploy a mobile deployment package without creating a deployment profile, Or
  - Deploy a mobile deployment package and create a reusable deployment profile.
1. Launch the Mobile Deployment Package wizard by Right-clicking the mobile deployment package ( the file with the .pkg extension) and selecting **Deploy Package**.
  2. Enter the deployment mode for the package, a target version (including the package namespace), and click **Next**.
  3. Select a target Unwired server for the package, connect to it, select the domain and security configuration (if not using the default), and click **Next**.
  4. Select and assign available applications to be deployed. Each application includes an Application ID that uniquely identifies the application and is required for certain application types (for example: messaging, workflow, and OData).
  5. (Optional) Map connection profile to server connection. Allows you to map connection profiles used for development to an appropriate server-side connection. For example, your development environment might permit access to certain systems that the Unwired Server prohibits. To map the connection profile to a server connection select the connection profile from the list of available connection profiles then select the corresponding server connection to which it maps.
  6. Map logical roles to physical roles. Click **Next**.
  7. (Optional) Specify the name and location for the new deployment profile:
    - Select **Save the deployment settings as a deployment profile** – if you do not save your settings to a deployment profile, they are lost when you exit the Deploy Package wizard.
    - Enter or select the parent folder – by default, Deployment is the folder in which the deployment profile is saved.
    - File name – the name of this deployment profile. The deployment profile is assigned a .deploy extension.

8. Click **Finish** to deploy the mobile deployment package to the Unwired server's Packages folder, and save the information in a deployment profile.

### **Configuring a Deployment Profile**

Update existing deployment profiles, bundle multiple mobile deployment packages, and deploy contents to multiple Unwired servers.

1. Expand the Mobile Application project of interest.
2. Right-click the mobile deployment profile identified by the `.profile` extension, and click **Open**.
3. Use the Target Mapping section of the Configuration page to edit the configuration and target Unwired servers for a package.
4. Use the Package Description section of the Configuration page to edit the package description.
5. Use the Servers section of the Configuration page to edit the servers for a package.

### **Editing General Deployment Profile Information**

Review and edit general deployment profile information from the Overview page of the Deployment Profile editor.

1. Select the **Overview** tab from the Deployment Profile editor.
2. Review or edit the information on this page.

**Table 44. Overview page**

<b>Option</b>	<b>Description</b>
General Information	Basic information about the deployment profile, including the name, and description. You can edit both the name and description.
Servers	(Read only) The Unwired servers that are targeted for deployment using this deployment profile.
Packages	(Read only) The packages included in this deployment profile.

### **Adding a Package to a Deployment Profile**

The deployment profile can contain multiple packages, each with multiple target servers and settings.

1. In the Deployment Profile editor, select the Configuration tab.
2. In the Target Mapping section, click **Add Package**.
3. Select one or more packages to include in this deployment profile.
4. Click **OK**.

### Removing a Package from a Deployment Profile

You can remove a package from a deployment profile when it is no longer needed.

1. In the Deployment Profile editor, select the Configuration tab.
2. In the Target Mapping section, select the package you want to remove from the deployment profile.
3. Click **Remove Package**.

All custom configurations for the specific servers are also removed.

### **Packaging Jars for Deployment**

If you have created JAR files for custom result checkers or result set filters during mobile application development, include them when deploying the mobile application project to Unwired Server.

1. During deployment of a Mobile Application project or Mobile Deployment package, the **Package Jars** dialog allows you to add JAR files.
2. Select the **Add JAR** to add a JAR file from a Mobile Application Project or **Add external JAR** to add a JAR file from the file system. Select **Delete** or **Delete all** to remove JAR files from this deployment.

---

**Note:** By default, all result checker or result set filter classes used by selected MBOs to be deployed are checked in the wizard and the default JAR location is the root folder of the current SUP project. Class files with compile errors are excluded.

---

3. Click **Next** when you have included all JAR files.

### **Modifying Target Servers**

Modify target Unwired Servers to which mobile deployment packages are deployed. A deployment profile can contain multiple mobile deployment packages, each with multiple target Unwired Servers as their destination.

### Adding a Target Server to a Deployment Package

You can select multiple target Unwired Servers to which a package within a deployment profile is deployed.

1. In the Deployment Profile editor, select the Configuration tab.
2. Select a package in the Target Mapping section.
3. Click **Add Target**.
4. Select a server to add as a target for this package.
5. Click **OK**.

### Changing a Target Server for a Deployment Package

You can change the target Unwired Server for a deployment package contained in a deployment profile.

1. In the Deployment Profile editor, select the Configuration tab.
2. Expand the deployment package in the Target Mapping section and select the server you want to change.
3. Click **Change Target**, located on the right.
4. Select a different server to use as a target for this package.
5. Click **OK**.

The existing configuration settings used for the original target server are used for the new target server.

### Removing a Target Server from a Deployment Package

You can remove a target Unwired Server from a deployment package contained in a deployment profile.

1. In the Deployment Profile editor, select the Configuration tab.
2. Expand the package in the Target Mapping section and select the server you want to remove
3. Click **Remove Target**.  
Any custom configuration settings for the target are also removed.

### Configuring a Mobile Deployment Package for the Target Unwired Server

Define the deployment mode, server connection mappings, and role mappings for the mobile deployment package based on the target server's environment.

For each Unwired Server to which you deploy a mobile deployment package, you can modify package settings such as server connection mappings (data source to server connection), role mappings(logical to physical), and deployment modes specific for that server's environment. Modify settings for:

- A mobile deployment package
- A Mobile Application project
- A deployment profile – from the Deployment Profile editor's Configuration tab, expand the package and select the server you are configuring the package for and select **Configure Package**.

### Deployment Mode and Target Version

You can set the version and modes in which a Mobile Application project or mobile deployment package are deployed to the target Unwired server.

**Table 45. Deployment modes and target version**

Option	Description
Update	<p>(Default) Updates the target package with an updated version.</p> <p>Use update where existing deployments and client applications need to continue to work.</p> <p>After a successful (or failed) Update deployment, existing client applications previously synchronized with Unwired Server continue to function: existing surrogate keys do not change, all operations are fully functional, and so on. No data loss on the devices occur, and the existing client can synchronize and upload operations as if the Update deployment never occurred.</p>
Replace	<p>Replaces any of the target objects with those in the package.</p> <p>Replace deletes an existing package immediately and replaces it with the newly deployed package with same name and version. Active client connections or EIS connections are terminated. Unwired Server disables the package automatically and re-enables it once it becomes fully functional again. Replace and Update options should not be used for active packages, which may require the administrator to manually disable the package.</p>
Verify	<p>Does not deploy the package but reports what, if any, errors would occur if you were to deploy the package using Update mode.</p> <p>Verify ensures that any existing client is still able to operate fully after a deployment. A limitation for MBS clients is that the old client could receive unnecessary data that is ignored on the device.</p>
Target version	<p>Determines the version of the target package to which the package is to be deployed. By default, the current project version is used. You can enter a different version, if appropriate. The version consists of two numbers. For example, 1.0.</p>
Package name	<p>The location in which the deployed unit resides. The default value is the Mobile Application project name.</p>

*Supported Changes for Update Deployment*

Understand package changes supported by an Update deployment.

Allowed package updates include:

- Adding MBOs to a new synchronization group
- Changing the Cache Policy
- Adding or removing Result Set Filters
- Adding or removing Result Checkers
- Adding operation parameters with default values
- Adding or removing a logical role

During deployment, multiple messages may be returned via the ProgressMonitor, which display in the Error Log view in Unwired Workspace. Verification does not halt if an error is

detected, it continues to log all relevant error messages. When deploying a package in Update mode where an existing version of that package is deployed, deployment fails verification and returns an error if it "breaks" the existing application.

Detailed messages returned from Unwired Server for an Update deployment indicating what the update consists of includes:

- virtualTable {MBOName} :removed MBO
- MBO: {MBOName} Column {name} :new attribute
- MBO: {MBOName} Column {name} :removed attribute
- Columns Conflict in MBO {MBOName} different nodes
- MBO: {MBOName} Implementations {MBOName} :new Implementation
- MBO: {MBOName} Implementations {MBOName} :removed Implementation
- Implementations Conflict in MBO {MBOName} different nodes
- Service {name} :removed Service
- Cache {name} :removed Cache
- cachedTable {virtualTableName} :removed cachedTable from {name}
- loadGroup {name}:removed loadGroup

Schema validation messages returned from Unwired Server if an Update deployment fails include:

- New deployment document fails schema validation.
- Virtual table {name} does not contain referenced column {columnRef}.
- Virtual table {name} contains an empty or invalid primary key definition.
- Verify that the {name} MBO contains attributes suitable for inclusion in a primary key (i.e. non-blob non-clob columns).
- Cache-referenced virtual table {referencedTable} does not exist.
- queryReference virtual table {referencedTable} does not exist.
- Virtual table {virtualTableName} referenced by cache {cache} does not contain column {cachedColumnName}.
- The virtual table {tableName} is referenced by more than one cache definition.
- The data source {dataSourceName} is not a resource defined on the SUP server
- The connection factory {dataSourceName} is not a resource defined on the SUP server
- The endpoint factory {endpointName} is not a resource defined on the SUP server
- Deploys intersect, not allowed with mode UPDATE
- Cannot Merge Documents. Name or version does not match

Target Server Properties

Select Unwired Server specific domain properties when deploying a project to the server to which you are connected.

**Table 46. Target server properties**

Property	Description
Domain	The domain to which deployment occurs. Separating projects into domains allows you to share various Unwired Server resources between customers while keeping their data separate.
Security configuration	Each domain supports a variety of security configurations, which allows each customer to have a security configuration that meets their needs. Once configured on Unwired Server, select the security configuration from the drop-down list.

Configuring Server Connection Mappings

Map design-time data source connection profiles to server connections supported by the Unwired Server.

When developing mobile applications, you bind the mobile business objects to the data sources available to the Unwired WorkSpace and available from the Enterprise Explorer. When you deploy Mobile Application projects or Mobile Deployment packages to the Unwired Server, you must change data sources from connection profiles to server connections available to the Unwired Server .

1. During deployment of a Mobile Application project or Mobile Deployment package, the **Server Connection Mapping** dialog allows you to change data sources.

If Unwired Server has a server connection name that matches that of the connection profile, it is selected by default. Otherwise, the server connection mapping is left empty.

2. Map each design-time connection profile to a corresponding server connection by selecting a server connection from the drop-down list, or select **New Server Connection** to create a new server connection.

The **Server connection properties** field displays information about the selected server connection.

---

**Note:** If you modify an existing design-time connection profile for which there is an existing server connection mapping, you must create a new server connection mapping for the changed design-time connection profile. For example, if you use a connection profile with a port number of 1112 and create a corresponding server connection mapping during deployment, then modify the connection profile port to 1113, when you redeploy the

project you cannot use the existing server connection mapping and instead must create a new one.

---

For Web service MBOs the mapping dialog automatically loads the design-time SOAP address in the address field, which you can change. Be sure the address is a SOAP address location in the published WSDL, not the WSDL address itself.

3. Click **Next/Finish** when you have mapped all connection profiles to server connections.

### Configuring Role Mappings

Map design-time logical roles to runtime physical roles.

When developing mobile business objects you can create and assign logical roles to mobile business objects and operations. When you deploy mobile business objects to Unwired Server, you can map these logical roles to physical roles that are valid on Unwired Server.

When mapping logical roles to physical roles, the wizard:

- The wizard displays roles and mappings of the server to which you are deploying. When creating a deployment profile, only user configured role mappings display.
  - Allows you to map a logical role to None (authorization always fails if a role is mapped to None, which disables access to the operations protected by this role).
  - Allows you to map a logical role to Auto (automatically passes through the mapping if the role exists on Unwired Server and the logical and physical role names match).
1. During deployment of a Mobile Application project or mobile deployment package, follow wizard instructions to map logical roles to physical roles. Change the mapping for a logical role, if required:
    - To change the state to either None or Auto, click the cell adjacent to the logical role and click one of these options.
    - To change the role mapping itself, click the cell adjacent to the logical role and choose (**Map Role**). This command displays the **Role Mappings** dialog that allows you to manually set the logical and physical role mappings you require.
  2. Selecting (**Map Role**) displays the Role Mappings dialog with the name of the physical roles to which you map in the text area of the dialog. When saved, the mapped physical roles display as a comma separated list.
 

Click **OK** after you map the role. You must map at least one physical role to enable **OK**.

**Table 47. Role mappings dialog**

Option	Description
Role mappings	For this deployment. For example, if a mobile business object operation has the role <code>design_role</code> assigned to it, and the Unwired Server to which you are deploying has a physical role named <code>runtime_role</code> , if you map <code>design_role</code> to <code>runtime_role</code> , any mobile business objects and operations assigned the logical role <code>design_role</code> are assigned <code>runtime_role</code> upon deployment and assume the characteristics of <code>runtime_role</code> .
Available physical roles	Displays the physical roles that are available on the Unwired Server to which you are deploying.
Assigned physical roles	Displays the physical roles that are assigned to the package that you are deploying.
Physical role availability	<p>Modify physical role availability:</p> <ul style="list-style-type: none"> <li>• Add – add a physical role to the list of assigned physical roles, allowing that physical role to be mapped to a logical role.</li> <li>• Input – allows you to enter a known physical role even if it is not listed.</li> <li>• Remove – makes the selected physical role unavailable for mapping.</li> <li>• Add All – makes all physical roles located on the Unwired Server available for mapping.</li> <li>• Remove All – makes all physical roles located on the Unwired Server unavailable for mapping.</li> </ul> <hr/> <p><b>Note:</b> Removing physical roles only removes their availability to be mapped to logical roles. It does not remove them from the Unwired Server.</p>

## **Deleting a Mobile Deployment Package**

Delete a mobile deployment package from the Deployment folder.

1. Open the Mobile Application project folder that contains the package you want to delete.
2. Right-click the package (a package icon at the same level as the other folders identified with a `.pkg` extension) and click **Delete**.

## **Deleting a Deployment Profile**

Delete a deployment profile from the Deployment folder.

1. Open the Mobile Application project folder that contains the deployment profile you want to delete.
2. Right-click the deployment profile (a profile icon at the same level as the folders identified with a `.profile` extension) and click **Delete**.

Deleting a deployment profile does not delete the deployment packages that it contains.

## Viewing Deployment Errors

View deployment errors by selecting the Show Deployment Status option from the deployment error dialog.

1. Deploy a project or deployment package.
2. If an error occurs during deployment, select the **Show Deployment Status** button on the Problem dialog to display additional error information.

You can also view errors from the Error view, by selecting **Window > ShowView > Other > Error Log**.

## Managing Deployed Packages and Mobile Business Objects

Once deployed, manage deployment packages and mobile applications from the administration console. However, you can perform limited administration from the Mobile Development perspective.

### Managing a Deployed Package

From the Enterprise Explorer you can refresh or remove deployment packages from an Unwired Server.

1. From the Enterprise Explorer, expand the Unwired Servers folder, Unwired Server, Domain folder, specific domain, then the Packages folder.
2. Right-click the package and select:
  - Enable – allows client access to the mobile business objects contained in the package.
  - Disable – denies client access to the mobile business objects within the package.
  - Delete – deletes the package and its contents from the Unwired Server.
  - Refresh – reflects any changes made to the package and its contents.

### Managing a Deployed Mobile Business Object

From the Enterprise Explorer you can refresh, enable, disable, and view the properties of a mobile application's mobile business object deployed to an Unwired Server.

1. From the Enterprise Explorer, expand the Unwired Servers folder, Domains, domain of interest, and expand the package.
2. Right-click the Mobile Business objects folder and select **Refresh** – reflects any changes made to the mobile business objects in the folder.
3. Expand the Mobile Business objects folder, right-click the MBO of interest and select **Properties**. You can view (but not modify) these properties:
  - Common properties
  - Data Sources
  - mobile business object operations and their properties

- Role mappings

---

**Note:** You cannot delete individual mobile business objects from the Unwired Server. Instead you must either delete the package and redeploy an updated package, or deploy a new package.

---

### **Managing Deployed Personalization Keys**

From the Enterprise Explorer you can refresh and view the properties of a personalization key deployed to Unwired Server.

1. From the Enterprise Explorer, expand the Unwired Servers folder, Domains, domain of interest, and expand the package.
2. Right-click the Personalization keys folder and select **Refresh** – reflects any changes made to the personalization keys contained in the folder.
3. Expand the Personalization keys folder, right-click the personalization key of interest and select **Properties**. You can view (but not modify) these common properties:
  - Name
  - Type
  - Protected
  - Default value(s)
  - Description

---

**Note:** You cannot delete individual personalization keys from Unwired Server. Instead you must either delete the package and redeploy an updated package, or deploy a new package.

---

## **Automated Deployment of Unwired WorkSpace Projects**

Save a mobile application project's deployment unit to a model file, which can be deployed to Unwired Server using command line utilities.

A model file allows you to deploy a deployment unit from batch files or other processes where deployment outside of Unwired WorkSpace is desired.

### **Saving the Deployment Unit to a Model File**

Save a mobile application project's deployment unit to a model file from Unwired WorkSpace.

#### **Prerequisites**

Ensure all referenced data sources are running and that Unwired WorkSpace has access to them.

#### **Task**

1. From WorkSpace Navigator, right-click the project and select **Save Deployment Unit to Model File**.

The deployment unit for the project is saved to the model file of the project, named `sup.model`.

2. If there are any changes to the project, rerun **Save Deployment Unit to Model File**, so that the deployment unit is saved to the model file and the project and model file remain in sync.

### **Extracting the Deployment Unit**

Use the `AFX_EXTRACTOR` utility to extract the deployment unit from the model file.

### **Syntax**

```
java -classpath "AFX_EXTRACTOR_PATH;LOG4J_PATH"
com.sybase.uep.tooling.utilities.AFXExtractor
"MODEL_FILE_PATH" "DIRECTORY_STORED_AFX"
```

### **Parameters**

- **AFX\_EXTRACTOR\_PATH** – represents the path of the JAR file including the `AFXExtractor` class, which is installed in the `<UnwiredPlatform_InstallDir>\UnwiredPlatform\Unwired_WorkSpace\Eclipse\sybase_workspace\mobile\eclipse\plugins` directory.
- **LOG4J\_PATH** – represents the path of the `log4j` JAR file, which is installed in the `<UnwiredPlatform_InstallDir>\UnwiredPlatform\Unwired_WorkSpace\Eclipse\sybase_workspace\mobile\eclipse\plugins\com.sybase.uep.tooling.api_<version number>\lib` directory.
- **MODEL\_FILE\_PATH** – represents the path of the model file.
- **DIRECTORY\_STORED\_AFX** – represents the directory path which contains the deployment unit file.

### **Examples**

- ```
- java -classpath "C:\Sybase\UnwiredPlatform
\Unwired_WorkSpace\Eclipse\sybase_workspace\mobile\eclipse
\plugins
\com.sybase.uep.tooling_utilities_1.7.0.201104081506.jar;C
:\Sybase\UnwiredPlatform\Unwired_WorkSpace\Eclipse
\sybase_workspace\mobile\eclipse\plugins
\com.sybase.uep.tooling.api_1.5.5.201012021142\lib
\log4j-1.2.15.jar "
com.sybase.uep.tooling.utilities.AFXExtractor "c:
\sup.model" "c:\afx\result"
```

Errors are logged to the `afx_extractor.log` file located in the directory from which you run the `AFX_EXTRACTOR` utility. For example, if you run the utility from the

default command-line directory, C:\Documents and Settings\<>USERNAME>, then the log file is C:\Documents and Settings\<>USERNAME>\afx\_extractor.log.

### **The Deployment Descriptor File**

A deployment configuration can be defined in the deployment descriptor file, including deployment mode, synchronization mode, package name, domain name, named security, endpoint mapping information, and role mapping information.

You can deploy with this descriptor file using the option **-dcf descriptorFile** option. Most of the configuration can be specified in the deployment command. For endpoint mapping, map an existing endpoint for an entity or operation.

### *Schema*

The schema for the descriptor file is:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:dd="http://www.sybase.com/sup/supadmin"
  xmlns:afx="http://www.sybase.com/sup/afx"
  targetNamespace="http://www.sybase.com/sup/supadmin"
  elementFormDefault="qualified"
  attributeFormDefault="unqualified">

  <xs:import namespace="http://www.sybase.com/sup/afx"
    schemaLocation="afx.xsd"/>

  <xs:element name="deployment">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="dd:deploy_mode" minOccurs="1"
          maxOccurs="1"/>
        <xs:element ref="dd:sync_mode" minOccurs="1"
          maxOccurs="1"/>
        <xs:element name="package_name" type="xs:string"
          minOccurs="1"

## Develop a Device Application

---

Develop custom device applications from your data source for one or more device platforms.

Once you have developed your mobile business objects (MBOs), you have these options for creating custom device applications:

- In the Mobile Application Diagram, invoke the Generate Code wizard to generate code in Java (BlackBerry and Android devices), C# (Windows Mobile devices), or Objective C (iOS devices), which can be used to call the mobile business object operations. This code can then be imported into an integrated development environment (IDE) of your choice to create the device application. You can also customize the generated object API code in the applicable development environment, where you can then test by deploying to an emulator or device.

For example, if you are using Visual Studio to develop custom applications for Windows Mobile devices, generate the C# code from the data source in Eclipse, then customize the client object API code for the device application in Visual Studio.

See the *Developer Reference Guide* for your platform (BlackBerry, Windows Mobile, or iOS) for more information.

- Use the Mobile Workflow Forms Editor in Eclipse to generate the code for a mobile workflow package.

See *Sybase Unwired WorkSpace – Developing a Mobile Workflow Package* for more information.

### Generating Object API Code

Generate object API code containing mobile business object (MBO) references, which allows you to use APIs to develop device applications for various mobile devices.

#### Prerequisites

- Before generating device client code, develop the MBOs that will be referenced in the device applications you are developing. You must have an active connection to the data sources to which the MBOs are bound.

- Ensure the enterprise information system (EIS) data sources referenced by the MBOs are running and available or code generation fails.
- Install either the `net_rim_api.jar` file (BlackBerry) or the `android.jar` file (Android) before generating code for these platforms.

## Task

1. Launch the **Code Generation** wizard.

| From                                  | Action                                                                                                                                                      |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>The Mobile Application Diagram</b> | Right-click within the Mobile Application Diagram and select <b>Generate Code</b> .                                                                         |
| <b>WorkSpace Navigator</b>            | Right-click the Mobile Application project folder that contains the mobile objects for which you are generating API code, and select <b>Generate Code</b> . |

2. (Optional) Enter the information for these options:

**Note:** This page of the code generation wizard is seen only if you are using the Advanced developer profile. See *Switching Between Developer Profiles*. The most recent configuration is used if the code generation wizard is invoked from the Basic developer profile.

| Option                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Code generation configuration | <p>A table lists all existing named configurations plus the most recently used configuration. You can select any of these, click <b>Next</b>, and proceed. Additionally, you can:</p> <ul style="list-style-type: none"> <li>• Create new configuration – click <b>Add</b> and enter the <b>Name</b> and optional <b>Description</b> of the new configuration and click <b>OK</b> to save the configuration for future sessions. You can also select <b>Copy from</b> to copy an existing configuration which can then be modified.</li> <li>• Most recent configuration – if you click <b>Next</b> the first time you generate code without creating a configuration, the configuration is saved and displays as the chosen configuration the next time you invoke the code generation wizard. If the most recent configuration used is a named configuration, it is saved as the first item in the configuration table, and also "Most recent configuration", even though it is still listed as the original named configuration.</li> </ul> |

3. Click **Next**.
4. In Select Mobile Objects, select all the MBOs in the mobile application project or select MBOs under a specific synchronization group, whose references, metadata, and dependencies (referenced MBOs) are included in the generated device code.

Dependent MBOs are automatically added (or removed) from the Dependencies section depending on your selections.

Unwired WorkSpace automatically computes the default page size after you choose the MBOs based on total attribute size. If an MBO's accumulated attribute size is larger than the page size setting, a warning displays.

5. Click **Next**.
6. Enter the information for these code generation options:

| Option         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Language       | Choose the language used for developing the client applications: <ul style="list-style-type: none"> <li>• Java</li> <li>• C#</li> <li>• Objective-C</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Platform       | Select the platform ( target device) from the drop-down list for which the device client code is intended. The platform is dependent on the language selected. <ul style="list-style-type: none"> <li>• Java                             <ul style="list-style-type: none"> <li>• Java ME for BlackBerry</li> <li>• Android</li> </ul> </li> <li>• C#                             <ul style="list-style-type: none"> <li>• NET Framework for Windows</li> <li>• NET Compact Framework 3.5 for Windows Mobile</li> </ul> </li> <li>• Objective C                             <ul style="list-style-type: none"> <li>• iOS</li> </ul> </li> </ul> |
| Unwired Server | Specify a default Unwired Server connection profile to which the generated code connects at runtime.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Server domain  | Choose the domain to which the generated code will connect. If you specified an Unwired Server to which you previously connected successfully, the first domain in the list is chosen by default. You can enter a different domain manually. <hr/> <p><b>Note:</b> This field is only enabled when an Unwired Server is selected.</p>                                                                                                                                                                                                                                                                                                           |

| Option                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Page size                          | <p>Optionally, select the page size for the generated client code. If the page size is not set, the default page size is 4KB at runtime. The default is a proposed page size based on the selected MBO's attributes.</p> <p>The page size should be larger than the sum of all attribute lengths for any MBO that is included with all the MBOs selected, and must be valid for the database. If the page size is changed, but does not meet these guidelines, object queries that use string or binary attributes with a <b>WHERE</b> clause may fail.</p> <hr/> <p><b>Note:</b> This field is only enabled when an Unwired Server is selected. The page size option is not enabled for message-based applications.</p> |
| Package, Namespace, or Name Prefix | <ul style="list-style-type: none"> <li>• Package – enter a package name for Java. The package name must follow Java naming conventions for packages. For example, no leading or trailing spaces and no special characters such as \$&amp;/, except that the first letter may be upper-case.</li> <li>• Namespace – enter a namespace for C#.</li> <li>• Name Prefix – enter a name prefix for Objective C.</li> </ul>                                                                                                                                                                                                                                                                                                    |
| Destination                        | <p>Specify the destination of the generated device client files. Enter (or <b>Browse</b>) to either a <b>Project path</b> (Mobile Application project) location or <b>File system path</b> location. Select <b>Clean up destination before code generation</b> to clean up the destination folder before generating the device client files.</p> <hr/> <p><b>Note:</b> If you select Java as the language, enter a project path, specify a mobile application project folder, and select <b>Generated Code</b> as the destination. JAR files are automatically added to the destination for the platform that supports compiling of the generated client code.</p>                                                       |

| Option               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Third-party jar file | <p>Enter or browse to the location of the third party jar file. For example, <code>net_rim_api.jar</code> for BlackBerry, or <code>android.jar</code> for Android.</p> <p>If you select Java as the language, and if the BlackBerry or Android third-party JAR file has not been added, the warning The dependent third-party class 'net.rim.device.api.system.ApplicationDescriptor' cannot be found or The dependent third-party class 'android.content.Context' cannot be found displays.</p> |

7. Select **Generate metadata classes** to generate metadata for the attributes and operations of each generated client object.

The "Including object manager classes" option is only available if you select "Generate metadata classes."

8. Select **Including object manager classes** to generate both the metadata for the attributes and operations of each generated client object and an object manager for the generated metadata.

The object manager allows you to retrieve the metadata of packages, MBOs, attributes, operations, and parameters during runtime using the name instead of the object instance.

---

**Note:** When generating code for Android, "Generate metadata classes" is automatically selected and cannot be unselected. The "Including object manager classes" option is unavailable and unsupported.

---

9. If you selected Java as the language, you can select **Generate JavaDoc** to include the Object API JavaDoc documentation in the output directory.

10. Click **Finish**.

### **Installing the net\_rim\_api.jar or android.jar File**

Depending on your Java development environment, install either the `net_rim_api.jar` file (BlackBerry) or the `android.jar` file (Android) to avoid code generation errors when generating Java code for native application development.

After generating Java code for BlackBerry or Android, error icons appear next to the project for which you generated the code. These errors can be viewed in the Problems view and usually in the project's `<MobileApplicationProjectName>DB.java` file, and appear because of dependencies on the `net_rim_api.jar` or `android.jar` file if not in

the project build path. You can avoid these errors by following this procedure for any projects for which you generate Java code:

1. Install the BlackBerry or Android development environment.
2. During code generation, set **Third-party jar file** to the appropriate JAR file. For example, for BlackBerry locate `net_rim_api.jar` file, which depends on where the JDE is installed. For example, `C:\Program Files\Research In Motion\BlackBerry JDE 5.0.0\lib`.

Develop

# Eclipse Basics

Basics topics describe user interface functionality. Topics describe perspectives, views, editors, resources, and other general user interface features and tasks.

Some features and tasks are provided by Eclipse functionality.

For additional information, see the Eclipse *Workbench User Guide* located at the main level of the online help bookshelf. This documentation is also available on the Eclipse Web site at <http://www.eclipse.org/documentation/>.

## Projects

---

A project is a collection of resources that together accomplish a task.

A project is the first resource that is created because it is the container for all other resources.

For example, in Database development, a project typically stores related SQL files that can be used later for queries or in creating procedural objects.

In Mobile Application development, a project stores mobile business objects and its components.

- *Opening a View* on page 203
- *Introduction to Sybase Help* on page 213

## Opening a Perspective

---

Open a perspective to work with its resources to perform a task.

1. Choose one of:

•

Click **Open Perspective**  on the main toolbar.

- Select **Window > Open Perspective** from the main menu bar.
2. If the perspective that you want to open is not in the list, select **Other**.
3. Select the perspective that you want to open and click **OK**.

## **Perspectives**

A perspective provides a set of capabilities that enable you to work with resources to perform a task.

A perspective is the arrangement of views and editors in the *Workbench*.

- Views provide ways to navigate and work with *resources*. Each view has associated menus and may have its own toolbar.
- Editors provide tools to create and modify resources.
- Menu bars and context menus provide the items you need to create and manipulate resources.
- Creation wizards, which are associated with the resources in a view, guide you through the process of creating resources, for example, a project.
- Cheat sheets guide you through complex tasks by either showing you how to perform the task or performing some of the task for you. A cheat sheet opens as a view in a perspective.

More than one perspective can be open, but only one perspective at a time can be displayed in the Workbench. When more than one perspective is open, you can select the perspective that you want to display from the Perspective shortcut bar.

### **See also**

- *Perspective Shortcut Bar* on page 200
- *Rearranging Views in a Perspective* on page 201
- *Moving the Perspective Shortcut Bar* on page 202
- *Resetting an Active Perspective to its Default Appearance* on page 202
- *Resetting an Inactive Perspective to its Default Appearance* on page 203

## **Perspective Shortcut Bar**

Use the Perspective shortcut bar to quickly access open *perspectives*.

You can also open a perspective using the Open Perspective button  on the shortcut bar. Multiple perspectives can be open, but only one perspective can be active at a time. When you select a perspective from the Perspective shortcut bar, it becomes the active perspective. Any perspective that you open, but do not close, appears on the Perspective shortcut bar.

You can rearrange the order of the perspectives by dragging and dropping the perspective tabs in the shortcut bar.

By default, the Perspective shortcut bar is docked horizontally in the top-right corner. It can also be docked under the main toolbar or vertically to the left of a perspective. Right-click the shortcut bar to change the docking location.

- *Resetting an Active Perspective to its Default Appearance* on page 202
- *Resetting an Inactive Perspective to its Default Appearance* on page 203

**Rearranging Views in a Perspective**

Rearrange the views in a perspective by moving a view to a new docking location in the perspective.

1. Click in the title bar of the view that you want to move.
2. Hold down the left mouse button and drag the view to the new area.

As you move the view, the drop cursor icon changes appearance to help you determine where the view can be docked.

**Table 48. Drop cursors**

| Drop cursor                                                                         | Cursor name       | Description                                                                   |
|-------------------------------------------------------------------------------------|-------------------|-------------------------------------------------------------------------------|
|    | Dock Above        | Dock above the view that is under the cursor.                                 |
|    | Dock Below        | Dock below the view that is under the cursor.                                 |
|   | Dock to the Right | Dock to the right of the view under the cursor.                               |
|  | Dock to the Left  | Dock to the left of the view under the cursor.                                |
|  | Stack             | The view appears as a tab in the view under the cursor.                       |
|  | Restricted        | The view cannot be docked. For example, a view cannot be docked in an editor. |

3. When the view is in position, release the left mouse button to drop the view onto the new location.

When you close the application, the new configuration is saved.

## **Moving the Perspective Shortcut Bar**

The Perspective shortcut bar runs horizontally in the upper left corner of a perspective by default.

The Perspective shortcut bar can be docked horizontally at the top right, or vertically to the left of a perspective.

1. Right-click in the Perspective shortcut bar to open its context menu.
2. Do one of the following:

| Select                        | To dock the shortcut bar                                                   |
|-------------------------------|----------------------------------------------------------------------------|
| <b>Dock on &gt; Top Right</b> | At the top right, horizontally adjacent to the main toolbar.               |
| <b>Dock on &gt; Top Left</b>  | At the top left, horizontally below the main toolbar. This is the default. |
| <b>Dock on &gt; Left</b>      | At the top right, vertically on the side of a perspective.                 |

- *Rearranging Views in a Perspective* on page 201
- *Resetting an Active Perspective to its Default Appearance* on page 202
- *Resetting an Inactive Perspective to its Default Appearance* on page 203

## **Resetting an Active Perspective to its Default Appearance**

After you customize a perspective, you can return to its default layout.

1. Select **Window > Reset Perspective** from the main menu bar.
2. Click **OK** to reset the perspective to its original layout.

### **See also**

- *Perspectives* on page 200

- *Rearranging Views in a Perspective* on page 201
- *Moving the Perspective Shortcut Bar* on page 202
- *Resetting an Inactive Perspective to its Default Appearance* on page 203

## Resetting an Inactive Perspective to its Default Appearance

After you customize a perspective, you can return to its default layout.

1. Select **Window > Preferences**.
2. Expand **General** and select **Perspectives**.

The right pane is titled Perspectives.

3. From the **Available Perspectives** list, select the perspective that you want to reset.
4. Click **Restore Defaults**.
5. Click **OK** to reset the perspective to its original layout.

### See also

- *Rearranging Views in a Perspective* on page 201
- *Moving the Perspective Shortcut Bar* on page 202
- *Resetting an Active Perspective to its Default Appearance* on page 202

## Opening a View

You can open a view in a perspective.

1. Select **Window > Show View** from the main menu bar.

A list of available views displays.

---

**Note:** If the view you want does not display, select **Window > Show View > Other**.

---

2. Select the view that you want to open.

### See also

- *Creating a Fast View* on page 205
- *Opening a Perspective* on page 199
- *WorkSpace Navigator* on page 207
- *Enterprise Explorer* on page 209

## Views

A view is similar to a pane. Views are based on perspectives and provide different ways to navigate and work with *resources*.

Views can be:

- Moved from area to area with simple drag and drop to customize your perspective.
- Stacked on top of one another in a tabular form to reduce clutter and increase the area for competing views.
- Detached from a perspective and displayed as a standalone window. When you maximize pages in the editor view or design canvas, all detached views remain open and visible. However, detached views do not remain visible when you change perspectives.

Each view has associated menus and may have its own toolbar. The menu at the top left of the view's title bar provides common functions to manipulate the view, such as moving, resizing, and maximizing the view. The pull-down menu at the right end of the view's title bar contains functions that apply to all of the resources in a view, not to just one particular resource. These functions may include sorting or filtering. The menus and toolbar associated with a view only affect the resources in that view. Modifications made in a view are saved immediately.

- *Editors* on page 209
- *Resources* on page 210

## Detaching a View

You can detach any number of views from a perspective and display them as separate windows that float on the perspective.

When you maximize pages in the editor view or design canvas, all detached views remain open and visible. However, detached views do not remain visible when you change perspectives.

1. Right-click the tab of the view you want to detach and select **Detached**.

The view reappears as a standalone window.

2. Drag the view to the desired location.

3. To reanchor the view, right-click the tab of the view and unselect **Detached**.

The view is reattached to its default location.

- *Editors* on page 209
- *Resources* on page 210

## **Floating a View**

You can detach a view and float it on top of a perspective.

1. Click in the title bar of the view that you want to float.
2. Hold down the left mouse button and drag the view to an area on your desktop outside the perspective.
3. When the view is in position, release the left mouse button to drop the view onto the new location.

When you close the application, the new configuration is saved.

### **See also**

- *Editors* on page 209
- *Resources* on page 210

## **Creating a Fast View**

A Fast View lets you manage the use of perspective space.

1. Click in the title bar of the *view* that you want to move.
2. Drag and drop the view onto the **Fast View** shortcut bar, which, by default, runs vertically to the left of a perspective.

When you release the mouse button and drop the view, its icon appears on the Fast View shortcut bar, and the view no longer appears in the perspective.

### **See also**

- *Views* on page 203
- *Detaching a View* on page 204
- *Floating a View* on page 205
- *WorkSpace Navigator* on page 207
- *Enterprise Explorer* on page 209
- *Editors* on page 209
- *Resources* on page 210
- *Opening a Perspective* on page 199

### **Fast Views**

A Fast View is an effective way to store and quickly access views in a perspective.

Fast Views:

- Help you manage the use of your perspective space.
- Give you quick and easy access to views that are open, but are not currently displayed in your perspective.
- Display in the perspective with a single click from the Fast View shortcut bar.
- Move back to the Fast View shortcut bar when you click outside the view.

### **Fast View Shortcut Bar**

Use the Fast View shortcut bar to quickly access an open view.

The Fast View shortcut bar may, by default, either run vertically down the left side of a perspective or horizontally at the bottom left of the perspective. You can also dock the shortcut bar vertically to the right of a perspective. When a view is dropped onto the Fast View shortcut bar, the view appears as an icon.

### **Converting a Fast View to a View**

You can convert a Fast View to a view.

1. Click the icon of the view on the **Fast View** shortcut bar that you want to convert to a view.

The Fast View shortcut bar, by default, runs vertically on the left of a perspective.

2. Drag the view and drop it in the perspective.

### **Moving the Fast View Shortcut Bar**

Move the Fast View shortcut bar to dock it horizontally at the bottom of a perspective or vertically to the right of a perspective.

The Fast View shortcut bar, by default, runs vertically down the left side of a perspective.

1. Right-click in the Fast View shortcut bar.
2. Do one of the following:

| Select                     | To dock the shortcut bar                                           |
|----------------------------|--------------------------------------------------------------------|
| <b>Dock On &gt; Left</b>   | Vertically on the left side of a perspective. This is the default. |
| <b>Dock On &gt; Right</b>  | Vertically on the right side of a perspective.                     |
| <b>Dock On &gt; Bottom</b> | Horizontally at the bottom of a perspective.                       |

## **WorkSpace Navigator**

The WorkSpace Navigator view displays *resources* in a hierarchy.

The top-level resource, or parent, is always a project, which is a container for all other resources.

Use tools in the WorkSpace Navigator view to:

- Navigate around your resources using the WorkSpace Navigator toolbar
- Show or hide file extensions
- Show or hide WorkSpace Navigator extensions
- Filter
- Sort
- Link a resource with an editor
- Select project natures
- View resources by file type

### **See also**

- *Editors* on page 209
- *Resources* on page 210
- *Opening a Perspective* on page 199

### **Showing File Extensions**

You can display hidden file extensions in the WorkSpace Navigator.

1. Click **Menu**  in the title bar of the WorkSpace Navigator.
2. Select **Show File Extensions**.

### **Creating a Working Set**

Use working sets in WorkSpace Navigator and Enterprise Explorer to limit the resources that appear.

If you select a working set, only the resources contained in the working set appear in your resource view.

---

**Note:** Currently, the working set feature in Enterprise Explorer supports elements in SQL Anywhere, Adaptive Server Enterprise, and connection profiles only.

---

1. From the WorkSpace Navigator or Enterprise Explorer toolbar, click the arrow to open the drop-down menu.
2. Select **Select Working Set**.
3. In the Select Working Set dialog box, click **New**.
4. Select the working set type that you want to use.
5. Click **Next**.
6. Enter a **Working set name**.
7. Expand the directory structure for **Working Set Contents**, and select the resources and folders for the working set definition.
8. Click **Finish**.
9. Select the working set that you just created and click **OK**.

The Select Working Set dialog box closes. Only the resources and folders that you selected now appear in the WorkSpace Navigator or Enterprise Explorer.

### **Editing the Active Working Set**

You can edit a working set, which restricts displayed resources.

Both the WorkSpace Navigator and Enterprise Explorer support working sets.

1. From the toolbar of the view displaying the working set, click **Menu**.
2. Select **Edit Active Working Set**.
3. Expand the directory structure for **Working Set Contents**, and select the resources and folders to include in the working set.
4. Click **Finish**.

### **Unselecting a Working Set**

If you unselect a working set, the hidden resources display.

Both the WorkSpace Navigator and Enterprise Explorer support working sets.

1. From the toolbar of the view displaying the working set, click **Menu**.
2. Select **Deselect Working Set**.

The working set is deselected and all *resources* display.

### **Filtering Resources**

Filter the resources in the WorkSpace Navigator to show only the resources that you want to see.

1. From the WorkSpace Navigator title bar, click the arrow to open the drop-down menu.
2. Select **Customize View**.
3. Select the **Filters** tab.

4. To use a Workbench-provided filter, from the Filters list, select each resource that you want to filter (hide).
5. Click **OK**.

The WorkSpace Navigator now displays the only the filtered resources.

6. After a filter is defined, you can toggle it both off and on using **Filters Toggle** from the title bar drop-down menu.

### **Linking a Resource to a Specific Editor**

You can associate a specific editor to open with a resource.

If you link a resource to an editor, when you select the editor, the resource is selected in the WorkSpace Navigator. Conversely, when you select the resource in the WorkSpace Navigator, the editor is selected.

1. Select the resource in the WorkSpace Navigator.
2. Do one of the following:
  - Right-click and select **Open With** > <editor name>.
  - Click **Link with Editor** in the Workspace Navigator toolbar.

## **Enterprise Explorer**

The Enterprise Explorer view displays enterprise resources, such as servers, in folders organized by type.

The Enterprise Explorer view contains an icon for each enterprise resource and external server you have set up in your *workspace*. Each is represented by a Connection Profile icon. Use Enterprise Explorer to create connection profiles to access and use the associated servers.

### **See also**

- *WorkSpace Navigator* on page 207
- *Editors* on page 209
- *Resources* on page 210
- *Opening a Perspective* on page 199

## **Editors**

The editor area of a perspective is where a *resource* is created or modified.

When you double-click a resource in the WorkSpace Navigator, an editor opens. The resource type determines what type of editor is opened. For example, if you are creating a service, the Service editor opens.

Most editors initially open to the Introduction page.

- Click Start to go to the editor page to start working.
- Click Tutorial to open a cheat sheet that guides you through the task.
- Click Help to open the help topic for the editor.

### Editor tabs

More than one editor can be opened at a time, but only one editor is active. Each open editor has a tab labeled with its resource name. To switch to a different editor, click its tab. If numerous editors are open, use the scroll arrows to the left of the editor tabs to view the open editors. When an editor is active, the main menu bar and toolbar display tools applicable to that editor.

### Unsaved changes

An asterisk displays on the left-hand side of the editor's tab to indicate that the editor contains unsaved changes. If you are closing either the editor or the application, you are prompted to save these changes. You can close either one selected open editor or all open editors at one time. If you are closing all open editors, you are prompted to save the changes in any editor that contains unsaved changes.

### See also

- *Views* on page 203
- *Detaching a View* on page 204
- *Floating a View* on page 205
- *Creating a Fast View* on page 205
- *WorkSpace Navigator* on page 207
- *Enterprise Explorer* on page 209
- *Resources* on page 210

## Resources

A resource is any object that is added to the WorkSpace Navigator, such as a project, mobile business object, or WSDL file.

When you modify a resource in the WorkSpace Navigator, such as copy, move, rename, or delete it, the resource maintains its referential integrity. This means that the path to its referenced files is updated to reflect the change.

### See also

- *Views* on page 203
- *Detaching a View* on page 204
- *Floating a View* on page 205
- *Creating a Fast View* on page 205
- *WorkSpace Navigator* on page 207

- *Enterprise Explorer* on page 209
- *Editors* on page 209

### **Renaming a Resource**

You can rename a resource while maintaining integrity with its referenced files.

This means that the path to the modified resource is updated to reflect the change. If the change results in an error, the service referencing the renamed file is marked with a Problem marker.

1. Right-click the resource you want to rename in the WorkSpace Navigator and select **Rename**.
2. Type a new name in the text box using the following naming conventions:
  - Begin the name with a letter. Do not begin the name with a number or an underscore.
  - Use alphabetic or numeric characters and underscores after the initial letter.
  - Do not use spaces in project or folder names.
3. Click anywhere outside the text box to save the changes.

---

**Note:** If you are renaming a Java file, only the file is renamed, the underlying class is not changed. You must manually change the class name in the source.

---

### **Moving a Resource**

You can move a resource from one project to another in the WorkSpace Navigator and maintain its integrity with its referenced files.

This means that the path to the modified resource is updated to reflect the change. If the change results in an error, the service referencing the moved file is marked with a Problem marker.

1. Select the resource you want to move in the WorkSpace Navigator.
2. Drag and drop the resource onto the target project.

### **Exporting a Resource**

Export projects, file system resources, schemas, or zip files to an external file system.

When you export a resource, a copy of the resource is made for the external file system and the original resource remains unaltered; however, caution should be exercised when exporting resources at the file level. Referential integrity may be lost as referenced files are not automatically exported.

---

**Note:** Using an external tool to process an exported resource can cause the export and subsequent import to be incomplete and unsuccessful.

---

1. Select **File > Export** from the main menu bar.  
The Export wizard opens.
2. Expand **General**, select **File System**, and click **Next**.

The File System dialog opens.

3. In the left pane, select the project or folder that contains the resource you want to export.

Its contents display in the right pane.

4. In the right pane, select the resources that you want to export.
5. In the **To directory** field, browse for the destination directory that you want to export the file into.
6. Select any of the following options:
  - Overwrite existing files without warning
  - Create directory structure for files
  - Create only selected directories
7. Click **Finish** to export the specified resources to the destination location.

### **Importing a Resource**

Use the Import wizard to import projects, file system resources, PowerDesigner models, schemas, or zip files.

When you import a resource, a copy of the resource is made and brought into Sybase WorkSpace, while the original resource remains unaltered. However, when importing at the file level, referential integrity may be lost as any referenced files are not automatically imported.

1. Select **File > Import** from the main menu bar.
2. Select **File System** and click **Next**.
3. Browse for the following:

**Table 49. File system**

| <b>Field</b>   | <b>Description</b>                                                                                                                                                                                                                 |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| From directory | <ol style="list-style-type: none"><li>1. Browse for a folder that contains the resource you want to import.</li><li>2. Expand the folder to display its contents, then select the specific resources you want to import.</li></ol> |
| Into folder    | Browse for the project into which you want to import the resource.                                                                                                                                                                 |

4. Select any of the following options:
  - Overwrite existing resources without warning.
  - Create complete folder structure.
  - Create selected folders only.
5. Click **Finish** to import the specified resources to the destination location.

### **Deleting a Resource**

When you delete a resource, any referenced files are also deleted.

If the change results in an error, the service referencing the deleted file is marked with a Problem marker.

1. Right-click the resource you want to delete in the WorkSpace Navigator and select **Delete**.

A message appears asking you to confirm the deletion.

2. Click **OK**.

## **Introduction to Sybase Help**

Online help topics are contained in several documentation collections that appear in the left pane of the Help Contents. The source of a help topic is identified in the title bar above the content window.

## **Help Features**

Familiarize yourself with online help features.

**Table 50. Online help features**

| <b>Feature</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                             |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preferences    | Using the Preferences dialog box, specify how you want help to display: <ul style="list-style-type: none"> <li>• Using an external browser.</li> <li>• Displaying context-sensitive topic selections in a Help view or through a pop-up window.</li> <li>• Opening context-sensitive topics in the Help view or in the editor area.</li> </ul> |

| Feature                                  | Description                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Opening the online help bookshelf        | <p>You can open the online help in an embedded Web browser from a variety of locations. You can also use an external Web browser.</p> <p>See Online Help Access below for more information.</p>                                                                                                                                                    |
| Opening the Help view                    | <p>A dynamic Help view provides context-sensitive help for the current task. In wizards, preference windows, launch configurations, searches and other multi-page dialog boxes, press F1 or select the help icon. While the Help view is open, the contents will update automatically as you progress from page to page in the user interface.</p> |
| Printing a single help topic             | <p>Print selected topics by clicking the Print Page icon in the Help Contents toolbar (right pane).</p> <p>You can also select the Print Topics icon in the Table of Contents toolbar (left pane) and select Print Selected Topic.</p>                                                                                                             |
| Printing a group or collection of topics | <p>Print a group or collection of topics by clicking the Print Topics icon in the table of Contents toolbar (left pane) and select Print Selected Topic and All Subtopics.</p> <p>If you have PDF capabilities, you can choose to print the group of topics to the PDF-designated printer to create a PDF.</p>                                     |
| Searching for a topic                    | <p>Use the Search feature to locate topics based on key words. You can perform a help search directly from the bookshelf or using the dynamic Help view.</p>                                                                                                                                                                                       |
| Collections                              | <p>The online help is organized into collections of topics in the online bookshelf. To identify a topic, view the topic title bar.</p>                                                                                                                                                                                                             |
| Glossaries                               | <p>Each collection has its own glossary. To access a glossary, expand the collection category in the Table of Contents (left pane). The glossary is the last topic of each collection.</p>                                                                                                                                                         |

| Feature                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Breadcrumbs                                | <p>A hierarchy displays at the top of each topic. You can review the hierarchical sequence of the topic you are viewing in the collection, and you can also select a category and move up the hierarchy.</p> <p>To return to your original topic, click the Back arrow in the tool bar.</p>                                                                                                                                             |
| Tutorials, Samples, and Quick Start Videos | <p>You can access information by:</p> <ul style="list-style-type: none"> <li>• Clicking the Tutorials, Samples, or Quick Start Videos icons on the WorkSpace Welcome page.</li> <li>• Selecting Help from the main menu bar.</li> <li>• Reviewing the appropriate online help topic for Tutorials, Samples, or Quick Start Videos.</li> </ul> <hr/> <p><b>Note:</b> Tutorials, Samples, or Quick Start videos may not be available.</p> |

For additional information about Eclipse Help system features, see the Eclipse *Workbench User Guide* located at the main level of the online help bookshelf. This documentation is also available on the Eclipse Web site at <http://www.eclipse.org/documentation/>.

## Searching the Help

Use the navigator capabilities to search for help.

The help navigator enables you to navigate through help topics, launch general and specific search queries, search from the toolbar, and search using key combinations from the keyboard.

1. Select **Help > Help Contents** from the main menu bar to open the help.
2. Determine the type of search to launch. For example, you may know exactly what you want, or you may want to start with a broad search across several components, and then narrow the search once you see the results.
3. Launch the search.
4. Review the search results, and then refine it if necessary.

### Searching for Help Topics From the Bookshelf

You can search for help across all bookshelf documentation sets or narrow your search to selected documentation sets.

To perform a search in Google or Eclipse.org, use the dynamic Help View.

1. To open the bookshelf, select **Help > Help Contents** from the main menu bar.
2. Define the search scope by clicking **Search Scope** in the toolbar.

The Select Search Scope dialog box opens.

3. Select **Search only the following topics** and click **New**.

The New Search List dialog box opens.

4. Define the search scope:

- a) Enter a descriptive name for your search in the **List name** field.
- b) Select the topics you want to search in the **Topics to search** list box.
- c) Click **OK**.

The Select Search Scope dialog box opens with your selection highlighted.

5. Click **OK** to return to the bookshelf.

---

**Note:** Selecting a top-level checkbox extends the scope of the search to all subtopics. Use the plus and minus sign to the left of a topic to expand and collapse associated subtopics.

---

6. Type a query in the **Search** field and click **Go**.

The search results display in the Search Results pane.

---

**Note:** The narrowed search scope remains in effect for future searches until it is changed.

---

7. To search across all documentation sets, type a query in the **Search** field and click **Go**.

The search results display in the Search Results pane.

### **Searching for Help Topics From the Help View**

You can perform a topic search in the online help, Google, or Eclipse.org using the dynamic Help view.

To specify a documentation set in which to search in the help, perform your search directly from the bookshelf.

1. Select **Help > Search** or **Help > Help Contents** from the from the main menu bar.
2. Type a query in the **Search** field, then click **Go**.
3. To refine your search scope, click **Search Scope** in the Help window, or click **Default** in the Help dialog box.

## **Navigating the Help**

Select a documentation set and use the navigator to view its topics.

Use the navigator to locate a topic and navigate through related topics. Key combinations are also available for navigation.

**To navigate the help:**

1. Select **Help > Help Contents** from the main menu bar to open the help.
2. From the online help bookshelf, select the documentation set that you want to view.
3. Expand the documentation set to find the topic that you want to see.
4. To view the topic, click its link.
5. Use the **Go Forward** and **Go Back** buttons to return to topics you have previously viewed.
6. To synchronize the navigator with the current topic, click **Show in Table of Contents**

Synchronizing is useful if you follow several links or perform a search and you want to match the navigation tree with the current topic.

## Opening the Online Help Bookshelf

The bookshelf is organized into documentation sets.

In addition to application-specific documentation sets, the bookshelf may also display other documentation sets:

- Sybase server documentation collections, such as for EAServer, SQL Anywhere, and Adaptive Server Enterprise, are displayed if the servers are installed on the same machine as the application.
- Documentation sets provided by Eclipse, such as the Workbench User Guide and the Java Development User Guide, are also available.

You can open, review, and search all of these documentation sets from the bookshelf.

1. Select **Help > Help Contents** from the main menu bar to open the bookshelf in a Web browser.
2. In the bookshelf, expand the documentation set you want to view.
3. Click a topic to display its contents in the right pane.
4. Do any of the following:
  - Click the **Go Back** and **Go Forward** arrows to return to a previous topic and sequence forward again.
  - Click **Show in Table of Contents** to synchronize the Contents pane with the current topic.

Synchronization is useful if you follow several links or if you perform a search and want to match the navigation tree with the current topic.

## Searching all Documentation Sets

Use search queries to launch a search across multiple documentation sets.

1. Select **Help > Help Contents** from the main menu bar to open the help.

### 2. Enter a query in the **Search** field.

Use the following rules to enter a query:

- Use **AND** to require the term on each side of the **AND** operator be present in the topic. There is an implied **AND** between search terms. Topics that contain every term in the query are listed in the search. For example, if you enter `database service`, topics that contain both the term `database` and the term `service` display. Topics that contains only the term `service` or only the term `database` do not display.
- Use **OR** before optional terms. For example, if you enter `database OR service`, topics that contain either the term `database` or the term `service` display.
- Use **NOT** before a term that you want to exclude from the search results. For example, `database NOT service` displays topics that contain the term `database`, but do not contain the term `service`.
- Use **?** to match any single character. For example, `plu?` displays topics that contain `plug`.
- Use **\*** to match any set of characters, including an empty string. For example, `plu*` displays topics that contain `plug` or `plugin`.
- Use double quotation marks to enclose a term that is to be treated as a phrase. For example, `"edit menu"` displays topics with this entire term, not topics with only the term `edit` or the term `menu`.
- Case is ignored. For example, `database service` displays `database service`, `Database Service`, and `DATABASE SERVICE`.
- Punctuation acts as a term delimiter. For example, `web.xml` displays topics that contain `web.xml`, `web`, and `xml`. To display only topics that contain `web.xml`, enclose the term in double quotes.
- In a search query, if you enter `create`, topics that contain `create`, `creates`, `creating`, and `creation` are displayed. To only see the term `create`, enclose the term in double quotes.
- The following English words are ignored in search queries: `a`, `and`, `are`, `as`, `at`, `be`, `but`, `by`, `in`, `into`, `is`, `it`, `no`, `not`, `of`, `on`, `or`, `s`, `such`, `t`, `that`, `the`, `their`, `then`, `there`, `these`, `they`, `to`, `was`, `will`, `with`.

### 3. Click **Go**.

The search results display in the Search Results pane.

## Narrowing a Search

Use search queries to narrow a search.

The help navigator enables you to narrow your search.

1. Select **Help > Help Contents** from the main menu bar to open the help.
2. Click **Search Scope**.
3. Select **Search only the following topics**.

4. Click **New**.
5. Type a descriptive name for your search in the **List name** field.
6. Select the topics you want to search in the **Topics to search** section.

Selecting a top-level checkbox extends the scope of the search to all subtopics. Use the plus and minus signs to the left of topics to expand and collapse the associated subtopics.

7. Click **OK**.

The Select Search Scope dialog box appears with your selection highlighted.

8. Click **OK**.
9. Click **Go**.

The search results display in the Search Results pane.

---

**Note:** The narrowed search scope remains in effect for future searches until it is changed.

---

## **Search Keyboard Shortcuts**

Use keyboard shortcuts to launch search queries.

**Table 51. Keyboard Shortcuts**

| <b>Keyboard Shortcut</b>        | <b>Action</b>                            |
|---------------------------------|------------------------------------------|
| Press Tab inside a frame (page) | Move to the next link, button, or topic. |
| Press Right/Left arrows         | Expand or collapse a tree node.          |
| Press Down arrow or Tab         | Move to the next topic node.             |
| Press Up arrow or Shift+Tab     | Move to the previous topic node.         |
| Press Home or End               | Scroll all the way up or down.           |
| Press Alt+Left arrow            | Go back.                                 |
| Press Alt+Right arrow           | Go forward.                              |
| Press Ctrl+Tab                  | Go to the next topic.                    |
| Press Shift+Ctrl+Tab            | Move to previous topic.                  |
| Press Ctrl+p.                   | Print the current page or active topic.  |

## **Setting Help Display Preferences**

Define how you want to display help topics from an Eclipse-based product to appear.

1. Select **Window | Preferences** from the main menu bar.
2. In the left pane, select **Help**.

The Help options appear in the right pane.

## Eclipse Basics

3. Specify how to display help topics.
4. Click **OK**.

# Troubleshoot

Use troubleshooting tips to isolate and resolve common issues.

See *Troubleshooting Sybase Unwired Platform* for information about troubleshooting issues with the Eclipse - based user interface or other Sybase Unwired Platform components.

# API Documentation

You can use Sybase Unwired Platform APIs to develop and customize mobile applications, data handling, error handling, and system functionality programmatically.

- **Client Object API** – generated business object classes that represent the mobile business object model built and designed in the Unwired WorkSpace development environment. Use the API to synchronize and retrieve data and invoke mobile business object operations. See the developer references, and the Javadocs included in the installation directory:
  - *Developer Guide: Android Object API Applications*
  - *Developer Guide: BlackBerry Native Applications*
  - *Developer Guide: iOS Native Applications*
  - *Developer Guide: Windows and Windows Mobile Native Applications*
  - *Developer Guide: Mobile Workflow Packages*
- **Unwired Server API** – custom Java classes used to implement advanced data handling features in Unwired Server. See *Mobile Data Models: Using Mobile Business Objects* and the Javadocs included in the installation directory.
- **Administration API** – custom Java classes used to integrate Sybase Unwired Platform system management tools with your enterprise system. See *Developer Guide for Unwired Server Management APIs* and the Javadocs included in the installation directory.

Check the Sybase Product Documentation Web site regularly for updates: access <http://sybooks.sybase.com/nav/summary.do?prod=1289>, then navigate to the most current version.

# Glossary: Sybase Unwired Platform

Defines terms for all Sybase Unwired Platform components.

**administration perspective** – Or administration console. The Unwired Platform administrative perspective is the Flash-based Web application for managing Unwired Server. *See* Sybase Control Center.

**administrators** – Unwired Platform users to which an administration role has been assigned. A user with the "SUP Administrator" role is called a "platform administrator" and a user with the "SUP Domain Administrator" role is called a "domain administrator". These administration roles must also be assigned SCC administration roles to avoid having to authenticate to Sybase Control Center in addition to Unwired Server:

- A domain administrator only requires the "sccUserRole" role.
- A platform administrator requires both the "sccAdminRole" and "sccUserRole" roles.

**Adobe Flash Player** – Adobe Flash Player is required to run Sybase Control Center. Because of this player, you are required to run Sybase Control Center in a 32-bit browser. Adobe does not support 64-bit browsers.

**Advantage Database Server**<sup>®</sup> – A relational database management system that provides the messaging database for Sybase Unwired Platform. *See* messaging database.

**Afaria**<sup>®</sup> – An enterprise-grade, highly scalable device management solution with advanced capabilities to ensure that mobile data and devices are up-to-date, reliable, and secure. Afaria is a separately licensed product that can extend the Unwired Platform in a mobile enterprise. Afaria includes a server (Afaria Server), a database (Afaria Database), an administration tool (Afaria Administrator), and other runtime components, depending on the license you purchase.

**application** – In Unwired Server (and visible in Sybase Control Center), an application is the runtime entity that can be directly correlated to a native or mobile workflow application. The application definition on the server establishes the relationship among packages used in the application, domain that the application is deployed to, user activation method for the application, and other application specific settings.

**APNS** – Apple Push Notification Service.

**application connection** – A unique connection to the application on a device.

**application connection template** – a template for application connections that includes application settings, security configuration, domain details, and so forth.

**application node** – In Sybase Control Center, this is a registered application with a unique ID. This is the main entity that defines the behavior of device and backend interactions.

**application registration** – The process of registering an application with Sybase Unwired Platform. Registration requires a unique identity that defines the properties for the device and backend interaction with Unwired Server.

**artifacts** – Artifacts can be client-side or automatically generated files; for example: .xml, .cs, .java, .cab files.

**availability** – Indicates that a resource is accessible and responsive.

**BAPI** – Business Application Programming Interface. A BAPI is a set of interfaces to object-oriented programming methods that enable a programmer to integrate third-party software into the proprietary R/3 product from SAP®. For specific business tasks such as uploading transactional data, BAPIs are implemented and stored in the R/3 system as remote function call (RFC) modules.

**BLOB** – Binary Large Object. A BLOB is a collection of binary data stored as a single entity in a database management system. A BLOB may be text, images, audio, or video.

**cache** – The virtual tables in the Unwired Server cache database that store synchronization data. *See* cache database.

**cache group** – Defined in Unwired WorkSpace, MBOs are grouped and the same cache refresh policy is applied to their virtual tables (cache) in the cache database

**cache partitions** – Partitioning the cache divides it into segments that can be refreshed individually, which gives better system performance than refreshing the entire cache. Define cache partitions in Unwired WorkSpace by defining a partition key, which is a load argument used by the operation to load data into the cache from the enterprise information system (EIS).

**cache database** – Cache database. The Unwired Server cache database stores runtime metadata (for Unwired Platform components) and cache data (for MBOs). *See also* data tier.

**CLI** – Command line interface. CLI is the standard term for a command line tool or utility.

**client application** – *See* mobile application.

**client object API** – The client object API is described in the *Developer Guide: BlackBerry Native Applications*, *Developer Guide: iOS Native Applications*, and *Developer Guide: Windows and Windows Mobile Native Applications*.

**cluster** – Also known as a server farm. Typically clusters are setup as either runtime server clusters or database clusters (also known as a data tier). Clustering is a method of setting up redundant Unwired Platform components on your network in order to design a highly scalable and available system architecture.

**cluster database** – A data tier component that holds information pertaining to all Unwired Platform server nodes. Other databases in the Unwired Platform data tier includes the cache, messaging, and monitoring databases.

**connection** – Includes the configuration details and credentials required to connect to a database, Web service, or other EIS.

**connection pool** – A connection pool is a cache of Enterprise Information System (EIS) connections maintained by Unwired Server, so that the connections can be reused when Unwired Server receives future requests for data.

For proxy connections, a connection pool is a collection of proxy connections pooled for their respective back-ends, such as SAP Gateway.

**connection profile** – In Unwired WorkSpace, a connection profile includes the configuration details and credentials required to connect to an EIS.

**context variable** – In Unwired WorkSpace, these variables are automatically created when a developer adds reference(s) to an MBO in a mobile application. One table context variable is created for each MBO attribute. These variables allow mobile application developers to specify form fields or operation parameters to use the dynamic value of a selected record of an MBO during runtime.

**data change notification (DCN)** – Data change notification (DCN) allows an Enterprise Information System (EIS) to synchronize its data with the cache database through a push event.

**data refresh** – A data refresh synchronizes data between the cache database and a back-end EIS so that data in the cache is updated. *See also* scheduled data refresh.

**data source** – In Unwired WorkSpace, a data source is the persistent-storage location for the data that a mobile business object can access.

**data tier** – The data tier includes Unwired Server data such as cache, cluster information, and monitoring. The data tier includes the cache database (CDB), cluster, monitoring, and messaging databases.

**data vault** – A secure store across the platform that is provided by an SUP client.

**deploy** – (Unwired Server) Uploading a deployment archive or deployment unit to an Unwired Server instance. Unwired Server can then make these units accessible to users via a client application that is installed on a mobile device.

There is a one-to-one mapping between an Unwired WorkSpace project and a server package. Therefore, all MBOs that you deploy from one project to the same server are deployed to the same server package.

**deployment archive** – In Unwired WorkSpace, a deployment archive is created when a developer creates a package profile and executes the **build** operation. Building creates an archive that contains both a deployment unit and a corresponding descriptor file. A deployment archive can be delivered to an administrator for deployment to a production version of Unwired Server.

**deployment descriptor** – A deployment descriptor is an XML file that describes how a deployment unit should be deployed to Unwired Server. A deployment descriptor contains role-mapping and domain-connection information. You can deliver a deployment descriptor and a deployment unit—jointly called a deployment archive—to an administrator for deployment to a production version of Unwired Server.

**deployment mode** – You can set the mode in which a mobile application project or mobile deployment package is deployed to the target Unwired Server.

**deployment profile** – A deployment profile is a named instance of predefined server connections and role mappings that allows developers to automate deployment of multiple packages from Sybase Unwired WorkSpace to Unwired Server. Role mappings and connection mappings are transferred from the deployment profile to the deployment unit and the deployment descriptor.

**deployment unit** – The Unwired WorkSpace build process generates a deployment unit. It enables a mobile application to be effectively installed and used in either a preproduction or production environment. Once generated, a deployment unit allows anyone to deploy all required objects, logical roles, personalization keys, and server connection information together, without requiring access to the whole development project. You can deliver a deployment unit and a deployment descriptor—jointly called a deployment archive—to an administrator for deployment to a production version of Unwired Server.

**development package** – A collection of MBOs that you create in Unwired WorkSpace. You can deploy the contents of a development package on an instance of Unwired Server.

**device application** – *See also* mobile application. A device application is a software application that runs on a mobile device.

**device notification** – Replication synchronization clients receive device notifications when a data change is detected for any of the MBOs in the synchronization group to which they are subscribed. Both the change detection interval of the synchronization group and the notification threshold of the subscription determine how often replication clients receive device notifications. Administrators can use subscription templates to specify the notification threshold for a particular synchronization group.

**device user** – The user identity tied to a device.

**DML** – Data manipulation language. DML is a group of computer languages used to retrieve, insert, delete, and update data in a database.

**DMZ** – Demilitarized zone; also known as a perimeter network. The DMZ adds a layer of security to the local area network (LAN), where computers run behind a firewall. Hosts running in the DMZ cannot send requests directly to hosts running in the LAN.

**domain administrator** – A user to which the platform administrator assigns domain administration privileges for one or more domain partitions. The domain administrator has a restricted view in Sybase Control Center, and only features and domains they can manage are visible.

**domains** – Domains provide a logical partitioning of a hosting organization's environment, so that the organization achieves increased flexibility and granularity of control in multitenant environments. By default, the Unwired Platform installer creates a single domain named "default". However the platform administrator can also add more domains as required.

**EIS** – Enterprise Information System. EIS is a back-end system, such as a database.

**Enterprise Explorer** – In Unwired WorkSpace, Enterprise Explorer allows you to define data source and view their metadata (schema objects in case of database, BAPIs for SAP, and so on).

**export** – The Unwired Platform administrator can export the mobile objects, then import them to another server on the network. That server should meet the requirement needed by the exported MBO.

**hostability** – *See* multitenancy.

**IDE** – Integrated Development Environment.

**JDE** – BlackBerry Java Development Environment.

**key performance indicator (KPI)** – Used by Unwired Platform monitoring. KPIs are monitoring metrics that are made up for an object, using counters, activities, and time which jointly for the parameters that show the health of the system. KPIs can use current data or historical data.

**keystore** – The location in which encryption keys, digital certificates, and other credentials in either encrypted or unencrypted keystore file types are stored for Unwired Server runtime components. *See also* truststore.

**LDAP** – Lightweight Directory Access Protocol.

**local business object** – Defined in Unwired WorkSpace, local business objects are not bound to EIS data sources, so cannot be synchronized. Instead, they are objects that are used as local data store on device.

**logical role** – Logical roles are defined in mobile business objects, and mapped to physical roles when the deployment unit that contain the mobile business objects are deployed to Unwired Server.

**matching rules** – A rule that triggers a mobile workflow application. Matching rules are used by the mobile workflow email listener to identify e-mails that match the rules specified by the administrator. When emails match the rule, Unwired Server sends the e-mail as a mobile workflow to the device that matches the rule. A matching rule is configured by the administrator in Sybase Control Center.

**MBO** – Mobile business object. The fundamental unit of data exchange in Sybase Unwired Platform. An MBO roughly corresponds to a data set from a back-end data source. The data can come from a database query, a Web service operation, or SAP. An MBO contains both concrete implementation-level details and abstract interface-level details. At the

implementation-level, an MBO contains read-only result fields that contain metadata about the data in the implementation, and parameters that are passed to the back-end data source. At the interface-level, an MBO contains attributes that map to result fields, which correspond to client properties. An MBO may have operations, which can also contain parameters that map to arguments, and which determines how the client passes information to the enterprise information system (EIS).

You can define relationships between MBOs, and link attributes and parameters in one MBO to attributes and parameters in another MBO.

**MBO attribute** – An MBO attribute is a field that can hold data. You can map an MBO attribute to a result field in a back-end data source; for example, a result field in a database table.

**MBO binding** – An MBO binding links MBO attributes and operations to a physical data source through a connection profile.

**MBO operation** – An MBO operation can be invoked from a client application to perform a task; for example, create, delete, or update data in the EIS.

**MBO relationship** – MBO relationships are analogous to links created by foreign keys in a relational database. For example, the account MBO has a field called *owner\_ID* that maps to the *ID* field in the owner MBO.

Define MBO relationships to facilitate:

- Data synchronization
- EIS data-refresh policy

**messaging based synchronization** – A synchronization method where data is delivered asynchronously using a secure, reliable messaging protocol. This method provides fine-grained synchronization (synchronization is provided at the data level—each process communicates only with the process it depends on), and it is therefore assumed that the device is always connected and available. *See also* synchronization.

**messaging database** – The messaging database allows in-flight messages to be stored until they can be delivered. This database is used in a messaging based synchronization environment. The messaging database is part of the Unwired Platform data tier, along with the cache, cluster, and monitoring databases.

**mobile application** – A Sybase Unwired Platform mobile application is an end-to-end application, which includes the MBO definition (back-end data connection, attributes, operations, and relationships), the generated server-side code, and the client-side application code.

**Mobile Application Diagram** – The Mobile Application Diagram is the graphical interface to create and edit MBOs. By dragging and dropping a data source onto the Mobile Application Diagram, you can create a mobile business object and generate its attribute mappings automatically.

**Mobile Application Project** – A collection of MBOs and client-side, design-time artifacts that make up a mobile application.

**mobile workflow packages** – Mobile workflow packages use the messaging synchronization model. The mobile workflow packages are deployed to Unwired Server, and can be deployed to mobile devices, via the Unwired Platform administrative perspective in Sybase Control Center.

**monitoring** – Monitoring is an Unwired Platform feature available in Sybase Control Center that allows administrators to identify key areas of weakness or periods of high activity in the particular area they are monitoring. It can be used for system diagnostic or for troubleshooting. Monitored operations include replication synchronization, messaging synchronization, messaging queue, data change notification, device notification, package, user, and cache activity.

**monitoring database** – A database that exclusively stores data related to replication and messaging synchronization, queues status, users, data change notifications, and device notifications activities. By default, the monitoring database runs in the same data tier as the cache database, messaging database and cluster database.

**monitoring profiles** – Monitoring profiles specify a monitoring schedule for a particular group of packages. These profiles let administrators collect granular data on which to base domain maintenance and configuration decisions.

**multitenancy** – The ability to host multiple tenants in one Unwired Cluster. Also known as hostability. *See also* domains.

**node** – A host or server computer upon which one or more runtime components have been installed.

**object query** – Defined in Unwired WorkSpace for an MBO and used to filter data that is downloaded to the device.

**onboarding** – The enterprise-level activation of an authentic device, a user, and an application entity as a combination, in Unwired Server.

**operation** – *See* MBO operation.

**package** – A package is a named container for one or more MBOs. On Unwired Server a package contains MBOs that have been deployed to this instance of the server.

**palette** – In Unwired WorkSpace, the palette is the graphical interface view from which you can add MBOs, local business objects, structures, relationships, attributes, and operations to the Mobile Application Diagram.

**parameter** – A parameter is a value that is passed to an operation/method. The operation uses the value to determine the output. When you create an MBO, you can map MBO parameters to data-source arguments. For example, if a data source looks up population based on a state abbreviation, the MBO gets the state from the user, then passes it (as a parameter/argument) to the data source to retrieve the information. Parameters can be:

- Synchronization parameters – synchronize a device application based on the value of the parameter.
- Load arguments – perform a data refresh based on the value of the argument.
- Operation parameters – MBO operations contain parameters that map to data source arguments. Operation parameters determine how the client passes information to the enterprise information system (EIS).

**personalization key** – A personalization key allows a mobile device user to specify attribute values that are used as parameters for selecting data from a data source. Personalization keys are also used as operation parameters. Personalization keys are set at the package level. There are three type of personalization keys: Transient, client, server.

They are most useful when they are used in multiple places within a mobile application, or in multiple mobile applications on the same server. Personalization keys may include attributes such as name, address, zip code, currency, location, customer list, and so forth.

**perspective** – A named tab in Sybase Control Center that contains a collection of managed resources (such as servers) and a set of views associated with those resources. The views in a perspective are chosen by users of the perspective. You can create as many perspectives as you need and customize them to monitor and manage your resources.

Perspectives allow you to group resources ways that make sense in your environment—by location, department, or project, for example.

**physical role** – A security provider group or role that is used to control access to Unwired Server resources.

**Problems view** – In Eclipse, the Problems view displays errors or warnings for the Mobile Application Project.

**provisioning** – The process of setting up a mobile device with required runtimes and device applications. Depending on the synchronization model used and depending on whether or not the device is also an Afaria client, the files and data required to provision the device varies.

**pull synchronization** – Pull synchronization is initiated by a remote client to synchronize the local database with the cache database. On Windows Mobile, pull synchronization is supported only in replication applications.

**push synchronization** – Push is the server-initiated process of downloading data from Unwired Server to a remote client, at defined intervals, or based upon the occurrence of an event.

**queue** – In-flight messages for a messaging application are saved in a queue. A queue is a list of pending activities. The server then sends messages to specific destinations in the order that they appear in the queue. The depth of the queue indicates how many messages are waiting to be delivered.

**relationship** – *See* MBO relationship.

**relay server** – *See also* Sybase Hosted Relay Service.

**resource** – A unique Sybase product component (such as a server) or a subcomponent.

**REST web services** – Representational State Transfer (REST) is a style of software architecture for distributed hypermedia systems such as the World Wide Web.

**RFC** – Remote Function Call. You can use the RFC interface to write applications that communicate with SAP R/3 applications and databases. An RFC is a standalone function. Developers use SAP tools to write the Advanced Business Application Programming (ABAP) code that implements the logic of a function, and then mark it as "remotely callable," which turns an ABAP function into an RFC.

**role** – Roles control access to Sybase Unwired Platform resources. *See also* logical role and physical role.

**role mapping** – Maps a physical (server role) to a logical (Unwired Platform role). Role mappings can be defined by developers, when they deploy an MBO package to a development Unwired Server, or by platform or domain administrators when they assign a security configuration to a domain or deploy a package to a production Unwired Server (and thereby override the domain-wide settings in the security configuration).

**RSOE** – Relay Server Outbound Enabler. An RSOE is an application that manages communication between Unwired Server and a relay server.

**runtime server** – An instance of Unwired Server that is running. Typically, a reference to the runtime server implies a connection to it.

**SAP** – SAP is one of the EIS types that Unwired Platform supports.

**SCC** – Sybase Control Center. A Web-based interface that allows you to administer your installed Sybase products.

**schedule** – The definition of a task (such as the collection of a set of statistics) and the time interval at which the task must execute in Sybase Control Center.

**scheduled data refresh** – Data is updated in the cache database from a back-end EIS, based on a scheduled data refresh. Typically, data is retrieved from an EIS (for example, SAP) when a device user synchronizes. However, if an administrator wants the data to be preloaded for a mobile business object, a data refresh can be scheduled so that data is saved locally in a cache. By preloading data with a scheduled refresh, the data is available in the information server when a user synchronizes data from a device. Scheduled data refresh requires that an administrator define a cache group as "scheduled" (as opposed to "on-demand").

**security configuration** – Part of the application user and administration user security. A security configuration determines the scope of user identity, authentication and authorization checks, and can be assigned to one or more domains by the platform administrator in Sybase Control Center. A security configuration contains:

- A set of configured security providers (for example LDAP) to which authentication, authorization, attribution is delegated.
- Role mappings (which can be specified at the domain or package level)

**security provider** – A security provider and its repository holds information about the users, security roles, security policies, and credentials used by some to provide security services to Unwired Platform. A security provider is part of a security configuration.

**security profile** – Part of the Unwired Server runtime component security. A security profile includes encryption metadata to capture certificate alias and the type of authentication used by server components. By using a security profile, the administrator creates a secured port over which components communicate.

**server connection** – The connection between Unwired WorkSpace and a back-end EIS is called a server connection.

**server farm** – *See also* cluster. Is the relay server designation for a cluster.

**server-initiated synchronization** – *See* push synchronization.

**SOAP** – Simple Object Access Protocol. SOAP is an XML-based protocol that enables applications to exchange information over HTTP. SOAP is used when Unwired Server communicates with a Web service.

**solution** – In Visual Studio, a solution is the high-level local workspace that contains the projects users create.

**Solution Explorer** – In Visual Studio, the Solution Explorer pane displays the active projects in a tree view.

**SSO** – Single sign-on. SSO is a credential-based authentication mechanism.

**statistics** – In Unwired Platform, the information collected by the monitoring database to determine if your system is running as efficiently as possible. Statistics can be current or historical. Current or historical data can be used to determine system availability or performance. Performance statistics are known as key performance indicators (KPI).

**Start Page** – In Visual Studio, the Start Page is the first page that displays when you launch the application.

**structured data** – Structured data can be displayed in a table with columns and labels.

**structure object** – Defined in Unwired WorkSpace, structures hold complex datatypes, for example, a table input to a SAP operation.

**subscription** – A subscription defines how data is transferred between a user's mobile device and Unwired Server. Subscriptions are used to notify a device user of data changes, then these updates are pushed to the user's mobile device.

**Sybase Control Center** – Sybase Control Center is the Flash-based Web application that includes a management framework for multiple Sybase server products, including Unwired Platform. Using the Unwired Platform administration perspective in Sybase Control Center, you can register clusters to manage Unwired Server, manage domains, security configurations, users, devices, connections, as well as monitor the environment. You can also deploy and MBO or workflow packages, as well as register applications and define templates

for them. Only use the features and documentation for Unwired Platform. Default features and documentation in Sybase Control Center do not always apply to the Unwired Platform use case.

**Sybase Control Center X.X Service** – Provides runtime services to manage, monitor, and control distributed Sybase resources. The service must be running for Sybase Control Center to run. Previously called Sybase Unified Agent.

**Sybase Hosted Relay Service** – The Sybase Hosted Relay Service is a Web-hosted relay server that enables you to test your Unwired Platform development system.

**Sybase Messaging Service** – The synchronization service that facilitates communication with device client applications.

**Sybase Unwired Platform** – Sybase Unwired Platform is a development and administrative platform that enables you to mobilize your enterprise. With Unwired Platform, you can develop mobile business objects in the Unwired WorkSpace development environment, connect to structured and unstructured data sources, develop mobile applications, deploy mobile business objects and applications to Unwired Server, which manages messaging and data services between your data sources and your mobile devices.

**Sybase Unwired WorkSpace** – Sybase Unwired Platform includes Unwired WorkSpace, which is a development tool for creating mobile business objects and mobile applications.

**synchronization** – A synchronization method where data is delivered synchronously using an upload/download pattern. For push-enabled clients, synchronization uses a "poke-pull" model, where a notification is pushed to the device (poke), and the device fetches the content (pull), and is assumed that the device is not always connected to the network and can operate in a disconnected mode and still be productive. For clients that are not push-enabled, the default synchronization model is pull. *See also* messaging based synchronization.

**synchronization group** – Defined in Unwired WorkSpace, a synchronization group is a collection of MBOs that are synchronized at the same time.

**synchronization parameter** – A synchronization parameter is an MBO attribute used to filter and synchronize data between a mobile device and Unwired Server.

**synchronization phase** – For replication based synchronization packages, the phase can be an upload event (from device to the Unwired Server cache database) or download event (from the cache database to the device).

**synchronize** – *See also* data refresh. Synchronization is the process by which data consistency and population is achieved between remote disconnected clients and Unwired Server.

**truststore** – The location in which certificate authority (CA) signing certificates are stored. *See also* keystore.

**undeploy** – Running **undeploy** removes a domain package from an Unwired Server.

**Unwired Server** – The application server included with the Sybase Unwired Platform product that manages mobile applications, back-end EIS synchronization, communication, security, transactions, and scheduling.

**user** – Sybase Control Center displays the mobile-device users who are registered with the server.

**view** – A window in a perspective that displays information about one or more managed resources. Some views also let you interact with managed resources or with Sybase Control Center itself. For example, the Perspective Resources view lists all the resources managed by the current perspective. Other views allow you to configure alerts, view the topology of a replication environment, and graph performance statistics.

**Visual Studio** – Microsoft Visual Studio is an integrated development environment product that you can use to develop device applications from generated Unwired WorkSpace code.

**Welcome page** – In Eclipse, the first set of pages that display when you launch the application.

**workspace** – In Eclipse, a workspace is the directory on your local machine where Eclipse stores the projects that you create.

**WorkSpace Navigator** – In Eclipse, the tree view that displays your mobile application projects.

**WSDL file** – Web Service Definition Language file. The file that describes the Web service interface that allows clients to communicate with the Web service. When you create a Web service connection for a mobile business object, you enter the location of a WSDL file in the URL.
