# **About This Book**

Audience	This book is for anyone who uses Sybase® PowerBuilder® to connect to a database. It assumes that you are familiar with the database you are using and have installed the server and client software required to access the data.	
How to use this book	This book describes the database parameters and preferences you use to connect to a database in PowerBuilder.	
Related documents	For information about connecting to a database in the PowerBuilder development environment, see <i>Connecting to Your Database</i> .	
	For a complete list of PowerBuilder documentation, see the preface of <i>Getting Started</i> .	
Other sources of information	Use the Sybase Getting Started CD and the Sybase Product Documentation Web site to learn more about your product:	
	• The Getting Started CD contains release bulletins and installation guides in PDF format. It is included with your software. To read or print documents on the Getting Started CD, you need Adobe Acrobat Reader, which you can download at no charge from the Adobe Web site using a link provided on the CD.	
	• The Sybase Product Documentation Web site is accessible using a standard Web browser. In addition to product documentation, you will find links to EBFs/Maintenance, Technical Documents, Case Management, Solved Cases, newsgroups, and the Sybase Developer Network.	
	To access the Sybase Product Documentation Web site, go to Product Documentation at http://www.sybase.com/support/manuals/.	

### Conventions

The formatting conventions used in this manual are:

Formatting example	Indicates	
Retrieve and Update	When used in descriptive text, this font indicates:	
	Command, function, and method names	
	Keywords such as true, false, and null	
	Datatypes such as integer and char	
	<ul> <li>Database column names such as emp_id and f_name</li> </ul>	
	<ul> <li>User-defined objects such as dw_emp or w_main</li> </ul>	
variable or file name	When used in descriptive text and syntax descriptions, oblique font indicates:	
	• Variables, such as <i>myCounter</i>	
	• Parts of input text that must be substituted, such as <i>pblname</i> .pbd	
	• File and path names	
File>Save	Menu names and menu items are displayed in plain text. The greater than symbol (>) shows you how to navigate menu selections. For example, File>Save indicates "select Save from the File menu."	
dw_1.Update() Monospace font indicates:		
	• Information that you enter in a dialog box or on a command line	
	Sample script fragments	
	• Sample output fragments	

If you need help Each Sybase installation that has purchased a support contract has one or more designated people who are authorized to contact Sybase Technical Support. If you cannot resolve a problem using the documentation or online help, please have the designated person contact Sybase Technical Support or the Sybase subsidiary in your area.

# CHAPTER 1 Database Parameters

About this chapter	This chapter describes the syntax and use of each database parameter that you can set in PowerBuilder.
	<b>Setting database parameters in code</b> Use the Preview page of the Database Connection Profile dialog box to ensure that you are using the correct syntax in code. Most boolean database parameters can be turned on using any of the values true, Yes, or 1, and turned off using false, No, or 0. Numeric values for database parameters must not be enclosed in quotes.

# Database parameters and supported database interfaces

The following table lists each supported database interface and the database parameters you can use with that interface in PowerBuilder. The database parameters are described in alphabetical order after the table.

Database interface	DBParm parameters	
ADO.NET	ADORelease	Namespace
	BindSPInput	NCharBind (Oracle only)
	CommandTimeout	OJSyntax
	CommitOnDisconnect	PBCatalogOwner
	Database	PBMaxBlobSize
	DataLink	Provider
	DataSource	ProviderString
	DateFormat	RecheckRows
	DateTimeFormat	SPCache
	DBConfigSection	StaticBind
	DecimalSeparator	TimeFormat
	DefaultProcOwner	Timeout
	DelimitIdentifier	TrimSpaces
	DisableBind	TrustedConnection
	GenerateEqualsNull	
	IdentifierQuoteChar	
	Isolation

### **ADORelease**

Description

Specifies the version of the ADO.NET data provider that is in use on the client workstation.

When to specify ADORelease You must specify a value for ADORelease *before* connecting to the database.

#### Applies to ADO.NET

Syntax

ADORelease='value'

	Parameter	Description	
	value	Specifies the version of an ADO.NET data provider your application uses.	
		For Sybase Adaptive Server® Enterprise, the optional values are:	
		• <b>1.1.411.0</b> For Adaptive Server 12.5.x clients	
		• <b>1.15.50.0</b> For Adaptive Server 15.x clients	
		For Oracle, the optional values are:	
		• <b>9.2.0.401</b> For Oracle9 <i>i</i> clients	
		• <b>10.1.0.301</b> For Oracle 10g clients	
Default value	1.1.411.0 for Ac	daptive Server, 9.2.0.401 for Oracle.	
Usage		The ADORelease database parameter specifies the version of the ADO.NET database provider used for native connections to a database server using ADO.NET.	
	Database Profile	erver, specify Sybase.Data.AseClient as the Namespace in the e Setup dialog box for ADO.NET to display available versions SE ADO.NET Data Provider in the Release drop-down list.	
	Sybase.PowerB Sybase.PowerB	The database provider is supplied in the .NET assemblies <i>Sybase.PowerBuilder.Db.dll</i> (for Adaptive Server 12.5.x and Oracle9 <i>i</i> ) and <i>Sybase.PowerBuilder.DbExt.dll</i> (for Adaptive Server 15.x and Oracle 10 <i>g</i> ). You must deploy the appropriate version of this DLL with your application.	
	Database Profile	For Oracle, specify Oracle.DataAccessClient as the Namespace in the Database Profile Setup dialog box for ADO.NET to display available versions of the Oracle Data provider for .NET (ODP.NET) in the Release drop-down list.	

When you select a driver version, the ADO.NET interface attempts to load that driver. If the driver is redirected to a higher version of the driver, the higher driver is loaded, but only the features in the selected driver may be supported. For example with Oracle ODP.NET, if ADORelease is set to 9.2.0.401 but the policy file on your computer redirects the driver to version 10.1.0.301, the ODP.NET 10.1.0.301 driver is loaded. New features in ODP.NET 10.1.0.301 are not supported.

Examples To specify that your PowerBuilder application accesses an Adaptive Server 15 database using the ASE ADO.NET Data Provider:

- **Database profile** Select 1.1.50.0 from the ADORelease drop-down list on the Connection page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="ADORelease='1.15.50.0'"

### **AppDriverName**

Description	Allows you to set your own client driver name for the Oracle database connection.	
Applies to	ORA Oracle 11	g
Syntax	AppDriverName = <i>value</i>	
	Parameter	Description
	value	Specifies the name of the driver to use for an Oracle database connection.
Default value	None.	
Usage	The maximum length of the name is 8 characters. You can display the client driver name with the V\$SESSION_CONNECT_INFO or GV\$SESSION_CONNECT_INFO dynamic performance view queries.	
Examples	To specify a client driver name:	
		<b>profile</b> Type the driver name in the Application Driver Name in the System page of the Database Profile Setup dialog box.
		<b>n</b> Type the following in code where <i>myDriver</i> is a string for f the client driver:
	sqlca	a.dbparm="AppDriverName=' <i>myDriver</i> '"

## AppName

Description	If the DBMS supports it, specifies the application name you want to use wh connecting to the database in PowerBuilder.			
	When to specify AppName You must specify the AppName parameter <i>before</i> connecting to the database.			
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect SNC SQL Native Client for Microsoft SQL Server			
Syntax	AppName='application_name'			
Default value	For Adaptive Server and DirectConnect, PowerBuilder sets the CS_APPNAME connection property to PowerBuilder, as follows:			
	AppName='PowerBuilder'			
	For SQL Server, there is no default value for AppName.			
Usage	<i>Adaptive Server databases</i> It is useful to specify a different AppName value for each of your Adaptive Server applications. If you are an administrator, you can query the MASTER.DBO.SYSPROCESSES table to determine which applications are running on the database server. The value specified for AppName displays in the program_name column of the MASTER.DBO.SYSPROCESSES table, making it easy to identify the applications.			
Examples	<b>Example 1</b> To set the application name to Test:			
	• <b>Database profile</b> Type the following in the Application Name box on the Network or System page in the Database Profile Setup dialog box:			
	Test			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="AppName='Test'"			
	<b>Example 2</b> ( <i>Does not apply to DirectConnect</i> ) You can set the AppName and Host parameters in a single statement to specify both the application name and the host name. To set the application name to Sales and the host name to Fran:			
	• <b>Database profile</b> Type Sales in the Application Name box and Fran in the Workstation Name box on the Network page in the Database Profile Setup dialog box.			

	Applicatio	<b>n</b> Type the following in code:
	SQLCA	.DBParm="AppName='Sales',Host='Fran'"
See also	Host (applies o	nly to ASE and SYC Sybase Adaptive Server Enterprise)
Async		
Description	PowerBuilder. object or report another (non-da connection before	perform asynchronous operations on your database in If you have coded a RetrieveRow event for a DataWindow , you can cancel the current database retrieval operation or start atabase) operation that does not use the same database ore the current operation completes. You can also switch to ws process while the retrieval takes place.
	By default, Pow	verBuilder operates synchronously.
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect I10 Informix IN9 Informix JDB JDBC ODBC (if driver and back-end DBMS support this feature) O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	Async=value	
	Parameter	Description
	value	<ul> <li>A value specifying synchronous or asynchronous operation.</li> <li>Values are:</li> <li>• 0 (Default) Synchronous operation</li> <li>• 1 Asynchronous operation</li> </ul>
Default value	Async=0	
Usage	executing a con	hronous operation in PowerBuilder is useful when you are pplex SQL statement that takes several minutes to return results. rameter is set to 1, you can do either of the following while the is executing:
	• Work in an	other window
	Cancel the	statement before it retrieves the first row of data

*When to set Async* If you are communicating with the database in code, you can reset the Async value at any time before or after the Transaction object has connected to the database.

*How data is retrieved* When you retrieve data in a DataWindow object or report, the following steps occur in order:

- 1 The database server compiles and executes the SQL statement.
- 2 PowerBuilder retrieves (fetches) the first row of data.
- 3 PowerBuilder retrieves each subsequent row of data.

What happens before the first row is retrieved While the server is compiling and executing the SQL statement and before PowerBuilder retrieves the first row of data, you must have done *both* of the following to enable asynchronous operation (allowing you to cancel the current operation before it retrieves the first row of data):

- Coded a RetrieveRow event for the DataWindow object or report (the code can contain only a comment)
- Set the Async parameter to 1

*What happens after the first row is retrieved* After the first row of data is retrieved and between subsequent row fetches, you must have done only the following to enable asynchronous operation:

Coded a RetrieveRow event for the DataWindow object or report

After the first row is retrieved, PowerBuilder operates asynchronously *without your having to set the Async parameter to 1*, so you can cancel the current operation anytime after it retrieves the first row of data. Therefore, the Async parameter has no effect in PowerBuilder after the first row of data is retrieved.

Examples

**Example 1** To enable asynchronous operation:

- **Database profile** Select the Asynchronous check box on the Transaction page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="Async=1"

**Example 2** You can set the Async and DBGetTime parameters in a single statement. DBGetTime specifies the number of seconds you want PowerBuilder to wait for a response from the DBMS when you retrieve rows in a DataWindow object or report. To enable asynchronous operation and set the DBGetTime parameter to 20 seconds:

	• <b>Database profile</b> Select the Asynchronous check box and type 20 in the Number Of Seconds To Wait box on the Transaction page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Async=1,DBGetTime=20"
See also	DBGetTime

# BindSPInput

Description	1	werBuilder bind input parameters in dynamic SQL statements a stored procedure.
Applies to	ADO.NET O90 Oracle9 <i>i</i> O10 Oracle 10g SNC SQL Nativ	e Client for Microsoft SQL Server
Syntax	BindSPInput=value	
	Parameter	Description
	value	Specifies whether you want to bind input parameters in dynamic SQL statements when executing stored procedures. Values are:
		• <b>0</b> (Default) PowerBuilder does not bind parameters in dynamic SQL statements when executing stored procedures.
		• <b>1</b> PowerBuilder binds parameters in dynamic SQL statements when executing stored procedures.
Default value	BindSPInput=0	
Usage	a stored procedur interface. When	BindSPInput is set to 0, you can use the same syntax to declare re in a script as you can when using the PowerBuilder OLE DB BindSPInput is set to 1, the SNC interface supports SQL the datatypes as procedure IN/OUT parameters or function
	The syntax for d	eclaring a procedure with SNC is:
	[@rc=]pro {@param:	ogical_procedure_name PROCEDURE FOR cedure_name 1=value1 [OUTPUT], @param2=value2 [OUTPUT],} ansaction_object};
	[@rc=] indicates	that you want to get the procedure's return value.

Use the keyword OUTPUT or OUT to indicate an output parameter if you wan	t
to get the output parameter's value.	

If BindSPInput=0, *value1*, *value2*,... can be either PowerBuilder script variables or literal values. If BindSPInput=1, *value1*, *value2*,... must be PowerBuilder script variables. If you specify literal values, the interface returns a runtime error.

When you declare a dynamic SQL statement with a procedure, enter a question mark (?) for each IN/OUT parameter in the statement. Value substitution is positional. For examples, see Dynamic SQL Format 3 and 4 in the online Help.

For Oracle, set BindSPInput to 1 to ensure that CLOB, NCLOB, and BLOB parameters work correctly as stored procedure parameters.

For ADO.NET:

- When BindSPInput is set to 1, parameter values must be PowerBuilder script variables, not literal values.
- The IBM.Data.Informix driver (used to access an ADO.NET compliant Informix database) does not support the BindSPInput dbparm.
- The ADO.NET Microsoft SQL Server interface does not support Text, NText, or Image parameters. Use VarChar(max) or VarBinary(max) instead.

Examples Setting BindSPInput To specify that PowerBuilder should bind parameters in dynamic SQL statements when executing a stored procedure:

- **Database profile** Select the Bind Procedure Parameters check box on the Transaction page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="BindSPInput=1"

**Using the ADO.NET SQL Server interface** Consider the following two SQL statement fragments:

create procedure p\_1 (@inparm1 TEXT) AS

The preceding statement does not work if BindSPInput is set to 1, because the SQL Server interface does not support Text.

create procedure p\_2 (@inparm1 VARCHAR(MAX)) AS

The preceding statement can work with BindSPInput set to 1, because the SQL Server interface does support VARCHAR(MAX).

See also DisableBind

Description	Specifies that binary data or an ANSI string is to be submitted to or retrieved from a text column with UPDATEBLOB or SELECTBLOB.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise I10 Informix IN9 Informix OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SNC SQL Native Client for Microsoft SQL Server	
Syntax	BinTxtBlob= <i>value</i>	
	Parameter	Description
	value	<ul> <li>Specifies that a PowerBuilder blob that is submitted to a text column in a database with UPDATEBLOB or retrieved with SELECTBLOB contains binary data or an ANSI string. Values are:</li> <li>0 The blob contains a Unicode string.</li> <li>1 The blob contains any kind of data that is not regarded as a Unicode string.</li> </ul>
Default value	BinTxtBlob=0	
Usage	By default, when you use the UPDATEBLOB and SELECTBLOB SQL statements with a database column with a text datatype (long or clob for Oracle or text for Adaptive Server or OLE DB access to SQL Server), the PowerBuilder blob that is updated or selected is expected to contain a Unicode string. If the blob contains any other kind of data, such as binary data or an ANSI string, set the BinTxtBlob database parameter to 1 before calling SELECTBLOB or UPDATEBLOB. This prevents PowerBuilder or the database server from attempting to perform any conversion to or from Unicode.	
	<i>Oracle O90, O10, and ORA</i> The Oracle database interfaces use a Unicode database handle. With the default setting (BinTxtBlob=0) and UPDATEBLOB, they send the data directly to the Oracle server and inform the server that the binary data contains Unicode strings. Any conversion needed is performed by the server. For SELECTBLOB, they get a Unicode string from the server.	
	When BinTxtBlob is set to 1, the value of the NLS_LANC variable determines the binding character set. The ANSI set is transferred directly to or from the server as in PowerBui releases.	

To set BinTxtBlob to 1 with the O90 interface, you must use an Oracle 9.2 or later client, or you will receive an error.

*OLE DB, SNC, ASE, and SYC* If BinTxtBlob is set to 0, the OLE DB, SNC, ASE, and SYC interfaces perform any necessary conversion. If BinTxtBlob is set to 1, the data is passed to the server without conversion.

Examples In code, before calling SELECTBLOB or UPDATEBLOB with a PowerBuilder blob that contains ANSI string data or binary data, set the BinTxtBlob parameter to 1:

SQLCA.DBParm="BinTxtBlob=1"

Restore the default setting of 0 if an operation needs to be performed on a blob that contains Unicode string data.

For example, suppose a Unicode string "ABC" stored in client memory as "65 00 66 00 67 00" is updated to the database using UPDATEBLOB. If BinTxtBlob is set to 0, the data is converted to ANSI and stored in the database text column as "65 66 67". If BinTxtBlob is set to 1, no conversion occurs and the data is stored in its original form as "65 00 66 00 67 00".

### Block (ODBC, OLE DB, Oracle, and SNC)

Description	For those interfaces that support it, Block specifies the cursor blocking factor when connecting to a database. The blocking factor determines the number of rows that a DataWindow object can fetch from the database at one time.		
	Using the Block parameter can improve performance when accessing a database in PowerBuilder.		
Applies to	OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	nd back-end DBMS support this feature) Client for Microsoft SQL Server	
Syntax	Block=blocking_factor		
	Parameter	Description	
	blocking_factor	The number of rows you want the DataWindow object to fetch from the database at one time. The blocking factor can be a number from 1 to 1000, inclusive.	
		To turn off block fetching, set Block to 1.	

Default value The default value for the Block parameter depends on the DBMS you are accessing, as summarized in the following table:

	DBMS	Block default value		
	ODBC	For most DataWindow objects, the Block default value is the following <i>up to a maximum of 32K per column</i> :		
		Block=1000		
		If you specified that the DataWindow object should retrieve only as many rows as needed from the database (Retrieve.AsNeeded property), the Block default value is the following, <i>up to a maximum of 32K per column</i> :		
		Block=100		
	OLE DB	PowerBuilder sets the blocking factor to 1		
	Oracle	PowerBuilder sets the blocking factor dynamically if one row size is too large. By default the blocking factor is 300 rows.		
	You should	<b>default blocking factor</b> I not have to set a non-default value for Block. In most cases, the cking factor used by PowerBuilder should meet your needs.		
Usage	•	<i>Requirements for ODBC data sources</i> To use the Block database parameter with an ODBC data source, your ODBC driver must:		
	• Be OE	• Be ODBC Version 2.0 compliant or higher, and		
	• Suppo	rt the SQLExtendedFetch API call		
	-	anywhere® ODBC driver that comes with PowerBuilder meets both quirements.		
		For information about whether your ODBC driver meets these requirements, see the documentation that comes with your driver.		
	searches th	<i>Determining the Block value for ODBC data sources</i> PowerBuilder searches the following in this order to determine the Block value for ODBC data sources:		
		The section for your database profile in the registry or the value of the ransaction object property (in an application)		
	2 The se	ection for your ODBC driver in the PBODB125 initialization file		
		If PowerBuilder does not find a Block value in these locations, it uses the default Block value for the DBMS you are accessing.		

Turning off block fetching	To turn off block fetching for an ODBC data
source or Oracle database, s	set the Block parameter to 1.

*OLE DB and Microsoft SQL Server* When you use the OLE DB database interface with a Microsoft SQL Server database and retrieve data into a DataWindow or use an embedded SQL cursor in a SELECT statement, server-side cursors are used to support multiple command execution. If this has a negative impact on performance, try increasing the size of the Block database parameter to 500 or more, or adding the following line to the [Microsoft SQL Server] section in the *PBODB125.INI* file to turn off server-side cursors:

ServerCursor='NO'

*Oracle and MaxFetchBuffer* For Oracle, the Block parameter can be used in conjunction with the MaxFetchBuffer database parameter to improve performance when the size of a row is very large. The MaxFetchBuffer parameter has a default value of 5000000 bytes, which is sufficient for most applications. The size of the actual fetch buffer is the product of the value of the blocking factor and the size of the row.

If the fetch buffer required by the blocking factor and the row size is greater than the value of MaxFetchBuffer, the value of the blocking factor is adjusted so that the buffer is not exceeded. For example, if block=500 and the row size is 10KB, the fetch buffer is 5000KB, which equals the default maximum buffer size.

Examples

To set the blocking factor for DataWindow objects to 50 rows:

- **Database profile** Type 50 in the Retrieve Blocking Factor box on the Transaction page in the Database Profile Setup dialog box:
- **Application** Type the following in code:

SQLCA.DBParm="Block=50"

See also

MaxFetchBuffer

### Block (DirectConnect and Adaptive Server Enterprise)

Description

Specifies the internal blocking factor used by the Sybase Client Library (CT-Lib) interface when declaring a cursor. The blocking factor determines the number of rows fetched from the database at one time when CT-Lib makes a physical request for data.

The Block DBParm parameter applies only to declared cursors and *not* to DataWindow objects.

Applies to	ASE, SYC, and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect		
Syntax	Block=blocking_factor		
	Parameter	Description	
	blocking_factor	The number of rows fetched from the database at one time when CT-Lib makes a physical request for data (default=100 rows)	
Default value	Block=100		
Examples	<b>Example 1</b> To set the blocking factor to 1000 rows:		
	• <b>Database profile</b> Type the following in the Retrieve Blocking Factor box on the Transaction page in the Database Profile Setup dialog box:		
	1000		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="Block=1000"		
	<b>Example 2</b> The following embedded SQL statements show how to set the blocking factor in code and use it to declare a cursor. These statements set the blocking factor to 1000 rows and declare a cursor that uses this internal blocking factor.		
	SQLCA.DBParm="Block=1000" DECLARE dept_cursor CURSOR FOR SELECT dept_id, dept_name FROM department USING SQLCA; OPEN dept_cursor;		

### CacheAuthentication

Description

Specifies whether the OLE DB data provider can cache sensitive authentication information, such as a password, in an internal cache.

### When to specify CacheAuthentication

You must specify the CacheAuthentication parameter *before* connecting to the database.

Applies to	OLE DB	
Syntax	CacheAuthentication='value'	
	Parameter	Description
	value	Specifies whether the OLE DB data provider can cache authentication information. Values are:
		• <b>True</b> Tells the OLE DB data provider to cache information.
		• <b>False</b> (Default) Tells the OLE DB data provider not to cache information.
Default value	CacheAuthentication='False'	
Examples	<ul> <li>To tell the OLE DB data provider to cache authentication information:</li> <li>Database profile Select the Cache Authentication check box on the Security page in the Database Profile Setup dialog box.</li> </ul>	
	Applicati	<b>ion</b> Type the following in code:
	SQLO	CA.DBParm="CacheAuthentication='True'"
See also	DataLink IntegratedSec	urity

### CacheName

Description	Allows PowerBuilder to specify an EAServer connection cache by name. This database parameter applies only when a PowerBuilder custom class user object is deployed as an EAServer component.
Applies to	JDB JDBC ODBC O90 Oracle9 <i>i</i> SYJ Sybase Adaptive Server Enterprise

	Using the SYJ interface Sybase EAServer uses a slightly different version of the CT-Lib software. Therefore, <i>at runtime</i> , you need to use the SYJ database interface rather than ASE and SYC to connect to an Adaptive Server Enterprise database. The SYJ Database Profile Setup dialog box provides a convenient way to set the appropriate connection parameters and then copy the syntax from the Preview page into the script for your Transaction object.		
	You cannot use the SYJ interface, however, to connect to the database in the PowerBuilder development environment. Therefore, <i>during the development phase</i> (before the component has been deployed to EAServer), you must use ASE or SYC to connect to the database.		
Syntax	CacheName='value'		
Default value	None		
Usage	When you create a PowerBuilder custom class user object that uses an EAServer connection cache, you must specify a user name, password, server name, and connectivity library. However, if the "enable cache-by-name access" option has been enabled on EAServer, you just need to enter the connection cache name to specify the connection cache.		
	For information on how to use PowerBuilder to build EAServer components, see <i>Application Techniques</i> .		
	This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.		
Examples	On the EAServer page in the Database Profile Setup dialog box, select the Access Cache By Name check box and enter the EAServer cache name in the Cache Name box. The PowerScript syntax for the CacheName DBParm parameter displays on the Preview page:		
	SQLCA.DBParm="CacheName='mydbcache'"		
	Copy the syntax from the Preview page into your script.		
See also	GetConnectionOption ReleaseConnectionOption UseContextObject		

CallEscape

Canescape			
Description	Controls whether the ODBC interface uses call escape syntax for stored procedure calls (the default) or converts the calls to driver-specific native SQL syntax before sending the command to the ODBC driver.		
Applies to	ODBC (if driver and back-end DBMS support this feature)		
Syntax	CallEscape='value'		
	Parameter	Description	
	value	Controls whether the ODBC interface uses call escape syntax for stored procedure calls or converts the calls to driver-specific native SQL syntax. Values are:	
		• Yes (Default) The ODBC interface uses call escape syntax for stored procedure calls	
		• No The ODBC interface converts stored procedure calls to driver-specific native SQL syntax before sending the command to the ODBC driver	
Default value	CallEscape='Yes'		
Usage	<i>When to use</i> Set CallEscape to No if the ODBC driver you are using expects to receive stored procedure calls in native (driver-specific) SQL syntax instead of in call escape syntax.		
	For information about the stored procedure call syntax your ODBC driver expects, see your vendor's driver documentation.		
	<i>Level 2 or higher ODBC driver required</i> To use the CallEscape parameter, your ODBC driver <i>must</i> meet Level 2 or higher API conformance requirements. CallEscape has no effect when you are using an ODBC driver that meets Core or Level 1 API conformance requirements.		
	<i>Example of stored procedure call escape syntax</i> The following example shows a call to a stored procedure named sp_test that uses call escape syntax:		
	{call sp_	_test(1,1) }	
Examples	To convert stored procedure calls to native SQL syntax before sending the command to your ODBC driver:		
	-	rofile Clear the Use Call Escape Syntax check box on the e in the Database Profile Setup dialog box.	
	Application	Type the following in code:	
	SQLCA	.DBParm="CallEscape='No'"	

### CharSet

Description	Specifies the character set you want the Sybase Open Client <sup>TM</sup> software to use when connecting to a Sybase Adaptive Server Enterprise database or a database accessed through DirectConnect.		
	When to specify CharSet You must specify the CharSet parameter <i>before</i> connecting to a database.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect		
Syntax	CharSet='character_set		
Default value	None		
Usage	When you specify a value for CharSet, PowerBuilder:		
	• Allocates a CS_LOCALE structure for this connection		
	• Sets the CS_SYB_CHARSET value to the character set you specify		
	• Sets the SQL Server CS_LOC_PROP connection property with the new locale information		
	<i>Overriding the Locale parameter</i> If you have previously set a value for the Locale parameter that includes settings for the language and character set you want to use, you can override the character set value by specifying a new value for the CharSet parameter and reconnecting to the database.		
	<i>Unicode data access</i> PowerBuilder can access Unicode data in an Adaptive Server Enterprise (ASE) 12.5 or later Unicode database or in Unicode columns in ASE 12.5 or later. PowerBuilder converts between double-byte character set (DBCS) data and Unicode automatically, provided that the CharSet and Language parameters are set with DBCS values (or the Locale parameter is set with DBCS values). For example:		
	CharSet='big5' Language='tchinese'		
Examples	To set the character set to iso_1:		
	• <b>Database profile</b> Type the following in the Character Set box on the Connection page or Regional Settings page in the Database Profile Setup dialog box:		
	iso_1		

	Application	Type the following in code:
	SQLCA	.DBParm="CharSet='iso_1'"
See also	Language Locale	
Client_Locale		
Description	Client_Locale id	lentifies the locale that the client application uses.
	When to specify You must specify	<b>y Client_Locale</b> y the Client_Locale parameter <i>before</i> connecting to a database.
Applies to	I10 Informix	
Syntax	Client_locale='la	nguage_territory.codeset
	Parameter	Description
	language	Two character name that represents the language for a specific locale, for example "en" for English.
	territory	Two character name that represents the cultural conventions for a specific territory, for example "AU" for Australia.
	codeset	Name of the code set that the locale supports, for example "utf8."
Default value	Based on the operating system's locale.	
Usage	The I10 native interface uses the Informix GLS (Global Language Support) API for global language support. Client_Locale specifies the value of the Informix environment variable CLIENT_LOCALE. The I10 interface uses this setting to access string data in an Informix database and to process SQL statements. If you do not set the DBParm, the default client locale value is based on the OS locale.	
	For example, to access a database that has a Japanese SJIS locale, Client_Locale should be set to ja_jp.sjis on the client system. For more information about the Informix CLIENT_LOCALE and DB_LOCALE environment variables, see the <i>IBM Informix GLS User's Guide</i> , currently available at the Informix library Web site at http://publib.boulder.ibm.com/epubs/pdf/25122820.pdf.	

Examples	To set the client locale to 'en_us.utf8':	
		<b>rofile</b> Type the following in the Client Locale box on the trings page in the Database Profile Setup dialog box:
	en_us.	utf8
	Application	Type the following in code:
	SQLCA.	DBParm="Client_Locale='en_us.utf8'"
See also	Db_Locale StrByCharset	
CnnPool		
Description	Specifies whether Oracle should maintain connections in a pool. An Oracle connection pool is a group of reusable physical connections spanning several sessions and managed by the Oracle Call Interface (OCI). The CNNPool DBParm is maintained in the ORA driver for backward compatibility only. It is ignored if you use the Pooling DBParm.	
	deployed to EAS	ameter cannot be used for PowerBuilder components erver, and external users cannot participate in a connection connection pooling is not used.
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	CnnPool=' <i>value</i> '	
	Parameter	Description
	value	Values are: • Yes • No (Default)
Default value	No	
Usage	If CnnPool='Yes', the Oracle client creates a connection pool and can connect to Oracle9 <i>i</i> , and Oracle 10 <i>g</i> Server. The pool contains physical connections to Oracle Server and is managed by the OCI. The pool persists until PowerBuilder terminates or <i>OCI.dll</i> is unloaded.	

PowerBuilder can connect to 10 different Oracle servers, as distinguished by service name, concurrently. There can be no more than 20 connections per pool. Each pool is created by the Oracle9*i* or later client and might also contain connections to Oracle8 and Oracle8*i* servers. Once a connection pool has been created, PowerBuilder maintains the physical connections until it terminates or OCI.DLL is unloaded.

Examples

To use connection pooling:

- **Database profile** Enter values in the following fields of the Connection page in the Database Profile Setup dialog box:
  - Profile Name Example value: 08i-pool
  - Server Provide the full net service name created by Oracle Net. Example value: adcora8i.sybase.com
  - Login ID Example value: scott
  - Password
  - *Connect as* Choose an item from the drop-down menu. Example value: Normal

Make sure Use Connection Pool is selected.

• **Application** Type the following in code where *password*, *server\_name*, and *login* are the appropriate values for your connection:

```
SQLCA.DBMS="090 Oracle9i (9.0.1)"
SQLCA.LogPass=<password>
SQLCA.ServerName="server_name"
SQLCA.LogId="login"
SQLCA.AutoCommit=False
```

SOLCA.DBParm="CnnPool='Yes'"

StatementCache

### CommandTimeout

Description

Specifies the number of seconds the interface should wait for a command to execute.

#### When to specify CommandTimeout

You must specify a value for CommandTimeout *before* connecting to the database.

Applies to	ADO.NET	
Syntax	CommandTimeout= <i>value</i>	
	Parameter	Description
	value	The number of seconds the interface waits for a command to execute.
Default value	None	
Usage	The default value for the CommandTimeout parameter is driver-specific.	
	•	his parameter with an AdoTransaction object in DataWindow value for this parameter in the second argument of the constructor.
Examples	<ul> <li>To set the CommandTimeout value to wait 60 seconds for a command to execute:</li> <li>Database profile Type 60 in the Command Timeout box on the System page in the Database Profile Setup dialog box.</li> </ul>	
	Application	Type the following in code:
	SQLCA	.DBParm="CommandTimeout=60"
	Add the foll constructor:	lowing to the second argument of the AdoTransaction
	Commar	ndTimeout=60

## CommitOnDisconnect

Description

Specifies whether PowerBuilder should commit (the default) or roll back all previously uncommitted database updates before disconnecting from a data source.

### When to specify CommitOnDisconnect

You must specify a value for CommitOnDisconnect *before* connecting to the database.

Applies to	All database interfaces except SYJ		
Syntax	CommitOnDisconnect='value'		
	Parameter	Description	
	value	<ul> <li>Specifies whether PowerBuilder should commit or roll back all previously uncommitted database updates before disconnecting from a data source. Values are:</li> <li>Yes (Default) PowerBuilder commits all uncommitted database updates when an application closes or when an explicit DISCONNECT statement is issued in code.</li> </ul>	
		• No PowerBuilder rolls back all uncommitted database updates when an application closes or when an explicit DISCONNECT statement is issued in code. With this setting, PowerBuilder does not automatically commit updates when you disconnect from the database.	
Default value	CommitOnDisconnect='Yes'		
Usage	Set CommitOnDisconnect to No if you want PowerBuilder to roll back uncommitted database updates (instead of automatically committing them when you disconnect from the database).		
Examples	<ul> <li>To tell PowerBuilder to roll back uncommitted database updates instead of committing them when disconnecting from the database:</li> <li>Database profile Clear the Commit On Disconnect check box on the Connection page in the Database Profile Setup dialog box.</li> </ul>		
	Applicatio	<b>n</b> Type the following in code:	
	SQLCA	.DBParm="CommitOnDisconnect='No'"	
ConnectAs			
Description	Allows the user	to connect to the Oracle Server with SYSOPER or SYSDBA	

Description	Allows the user to connect to the Oracle Server with SYSOPER or SYSDBA system privileges. Supports proxy authentication with additional user names (ORA driver only) when connecting to Oracle 10.2 or higher database servers.
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>
Syntax	ConnectAs='value'

	Parameter	Description
	value	Values are:
		• <i>EndUser</i> (ORA driver only) Type the proxy user name you want to use for your connection
		• SYSDBA
		• SYSOPER
		• Normal (Default)
Default value	Normal	
Usage	If ConnectAs='Normal', this parameter is not used. If ConnectAs ='SYSDBA or ConnectAs ='SYSOPER', Oracle allows the user to connect with SYSDBA or SYSOPER privileges, respectively, provided that these privileges have bee granted the user. If you connect using ConnectAs ='SYSDBA', Oracle uses the SYS schema instead of the schema that might already be associated with the user ID. If you connect using ConnectAs ='SYSOPER', Oracle uses the PUBLIC schema. The PowerBuilder ORA driver supports the proxy authentication feature that was introduced in Oracle 10.2. With proxy authentication, the end user typically authenticates to a middle tier (such as a firewall), that in turn logs in the database on the user's behalf as a proxy user. After logging into the database, the proxy user can switch to the end user's identity and perform operations using the authorization accorded to that user. The ConnectAs DBParm parameter allows you to take advantage of this prox connection feature. For example, if the user's Transaction object LogID is "Scott" and you set the ConnectAs DBParm parameter to "John", the OCI client logs in to database as the proxy user ("Scott"), then switches to the en- user identity ("John").	
	If you are using connection or session pooling, the proxy user name is the connection or session pooling creator (which you can provide in the PoolCreator and PoolPwd DBParm parameters), and the Transaction object's LogID is ignored. No proxy session can be created if pooling is set to homogeneous session mode.	
	-	<b>CnnPool='Yes'</b> ing cannot be used with this parameter. Do not select Use in the Database Profile Setup dialog box or set CnnPool to

**Example 1** To use the SYS schema instead of the schema associated with the User ID:

- **Database profile** Select SYSDBA from the Connect As drop-down list on the Connection page in the Database Profile Setup dialog box, and make sure Use Connection Pool is deselected.
- Application Type the following in code:

SQLCA.DBParm="ConnectAs='SYSDBA'"

**Example 2** To connect as a proxy user (Scott) for the end user named John:

- **Database profile** Type John in the Login ID text box on the Connection page in the Database Profile Setup dialog box, and type Scott in the Connect As drop-down list.
- **Application** Type the following in code:

```
sqlca.logid = "scott"
sqlca.dbparm="ConnectAs='john'"
```

### **ConnectOption**

Description

Examples

Sets driver-specific connection options when you are accessing an ODBC data source in PowerBuilder. These options specify the following:

- How the ODBC driver prompts for additional connection information
- What type of security to use for a Microsoft SQL Server connection
- Whether the ODBC Driver Manager Trace is on or off and what trace file it uses
- Whether cursors are closed or left open on a SQLTransact call
- How temporary stored procedures are treated for a SQLPrepare call

Certain ConnectOption parameters apply to all ODBC drivers, whereas others apply only to particular ODBC drivers.

For information on each ConnectOption parameter and whether you can use it with your ODBC driver, see the table in the Syntax section.

### When to specify ConnectOption

You must specify the ConnectOption parameter *before* connecting to an ODBC data source. The ConnectOption settings take effect when you connect to the database.

Applies to	ODBC (if driver and back-end DBMS support this feature)
Syntax	ConnectOption=' SQL_DRIVER_CONNECT, value; SQL_INTEGRATED_SECURITY, value; SQL_OPT_TRACE, value; SQL_OPT_TRACEFILE, value; SQL_PRESERVE_CURSORS, value; SQL_USE_PROCEDURE_FOR_PREPARE, value '
	The following table lists the applicable ODBC drivers, purpose, and values for

The following table lists the applicable ODBC drivers, purpose, and values for each ConnectOption parameter.

Parameter	Description	
SQL_DRIVER_CONNECT	<ul> <li>Driver Any ODBC driver that supports the SQLDriverConnect API call.</li> <li>Purpose Specifies how the ODBC driver prompts for additional connection information (such as the user ID and password) when connecting to an ODBC data source.</li> <li>Values The values you can specify are:</li> </ul>	
	• <b>SQL_DRIVER_COMPLETE</b> (Default) If the connection string contains correct and sufficient information to connect, the driver connects to the specified data source. If any information is incorrect or missing, the driver displays one or more dialog boxes to prompt for the required connection parameters. The driver then connects to the specified data source.	
	• <b>SQL_DRIVER_COMPLETE_REQUIRED</b> The driver takes the same actions as it does when SQL_DRIVER_COMPLETE is set. In addition, the driver disables the controls for any information not required to connect to the data source.	
	• <b>SQL_DRIVER_PROMPT</b> The driver displays one or more dialog boxes to prompt for the required connection parameters. The driver then connects to the specified data source and builds a connection string from the information specified in the dialog boxes.	
	• <b>SQL_DRIVER_NOPROMPT</b> If the connection string contains correct and sufficient information to connect, the driver connects to the specified data source. If any information is incorrect or missing, the driver returns an error.	

Parameter	Description
SQL_INTEGRATED_ SECURITY	<b>Driver</b> Microsoft SQL Server ODBC driver (not supplied with PowerBuilder).
	<b>Purpose</b> Specifies the type of connection to the Microsoft SQL Server database server.
	Values The values you can specify are:
	• <b>SQL_IS_OFF</b> (Default) Request a normal (nontrusted) connection to SQL Server using standard security. If you specify SQL_IS_OFF, you cannot request a trusted connection to SQL Server using integrated security.
	• <b>SQL_IS_ON</b> Request a trusted connection to SQL Server using integrated security regardless of the login security currently in use on the database server.
	For more about security mechanisms in Microsoft SQL Server, see the Microsoft documentation.
SQL_OPT_TRACE	Driver Any ODBC driver.
	<ul> <li>Purpose Turns on or turns off the ODBC Driver Manager Trace in PowerBuilder to troubleshoot a connection to an ODBC data source. The ODBC Driver Manager Trace provides detailed information about the ODBC API function calls that PowerBuilder makes when connected to an ODBC data source.</li> <li>Values The values you can specify are:</li> </ul>
	• SQL_OPT_TRACE_OFF (Default) Turns off the ODBC Driver Manager Trace.
	SQL_OPT_TRACE_ON     Turns on the ODBC Driver Manager Trace.
	For instructions on using the ODBC Driver Manager Trace, see "About ODBC Driver Manager" in <i>Connecting to Your Database</i> .
SQL_OPT_TRACEFILE	Driver Any ODBC driver.
	<b>Purpose</b> Specifies the name of the trace file where you want PowerBuilder to send the output of the ODBC Driver Manager Trace. PowerBuilder appends the output to the trace file you specify until you stop the trace. To display the trace file, you can use the File Editor (in PowerBuilder) or any text editor (outside PowerBuilder).
	<b>Values</b> You can specify any filename for the trace file, following the naming conventions of your operating system. By default, if tracing is on and you have not specified a trace file, PowerBuilder sends ODBC Driver Manager Trace output to the file \SQL.LOG.

Parameter		Description	
SQL_PRESERVE_CURSORS		<b>Driver</b> Microsoft SQL Server ODBC driver (not supplied with PowerBuilder).	
		<b>Purpose</b> Specifies whether cursors are closed or left open on a SQLTransact call.	
		Values The values you can specify are:	
		• SQL_PC_OFF (Default) Close all cursors on a SQLTransact call.	
		• SQL_PC_ON Keep server cursors open on a SQLTransact call.	
SQL_USE_PROCEDURE_ FOR_PREPARE		<b>Driver</b> Microsoft SQL Server ODBC driver (not supplied with PowerBuilder).	
		<b>Purpose</b> Specifies how temporary stored procedures are treated for a SQLPrepare call.	
		Values The values you can specify are:	
		• SQL_UP_ON (Default) Generate temporary stored procedures for a SQLPrepare call.	
		• <b>SQL_UP_OFF</b> Do not generate temporary stored procedures for a SQLPrepare call. The SQL statement is stored, compiled, and run at execution time. Syntax error checking does not occur until execution time.	
		• <b>SQL_UP_ON_DROP</b> Explicitly drop temporary stored procedures for a subsequent SQLPrepare call or when a statement handle (hstmt) is freed for reuse.	
Default value	ConnectOption='SQL_DRIVER_CONNECT, SQL_DRIVER_COMPLETE; SQL_INTEGRATED_SECURITY,SQL_IS_OFF; SQL_OPT_TRACE,SQL_OPT_TRACE_OFF; SQL_PRESERVE_CURSORS,SQL_PC_OFF; SQL_USE_PROCEDURE_FOR_PREPARE,SQL_UP_ON'		
Usage	<i>Microsoft Server ODBC driver</i> The ConnectOption parameter applies only if you are accessing a SQL Server database with the Microsoft ODBC SQL Server driver.		
	You must obtain the Microsoft SQL Server ODBC driver from Microson Corporation. This driver is <i>not</i> supplied with PowerBuilder.		
Examples	To specify nondefault options for the ConnectOption parameter:		

• **Database profile** Complete the Options page in the Database Profile Setup - ODBC dialog box. Each ConnectOption parameter corresponds to an option in the dialog box, as follows:

ConnectOption parameter	Corresponding option
SQL_DRIVER_CONNECT	Connect Type
SQL_INTEGRATED_SECURITY	Integrated Security
SQL_OPT_TRACE	Trace ODBC API Calls
SQL_OPT_TRACEFILE	Trace File
SQL_PRESERVE_CURSORS	Preserve Cursors
SQL_USE_PROCEDURE_FOR_PREPARE	Use Procedure for Prepare

• **Application** Type the following in code:

SQLCA.DBParm="ConnectOption ='SQL\_DRIVER\_CONNECT, SQL\_DRIVER\_NOPROMPT;SQL\_INTEGRATED\_SECURITY, SQL\_IS\_ON;SQL\_OPT\_TRACE,SQL\_OPT\_TRACE\_ON; SQL\_OPT\_TRACEFILE,C:\PB\odbctrce.log; SQL\_PRESERVE\_CURSORS,SQL\_PC\_ON; SQL\_USE\_PROCEDURE\_FOR\_PREPARE,SQL\_UP\_OFF'"

# ConnectString

Description	Specifies the parameters required to connect to an ODBC data source. PowerBuilder uses these parameters to connect to the database.		
Applies to	ODBC		
Syntax	The ConnectString syntax displays of ConnectString in single quotes and ConnectString with semicolons.	on a single line. You must enclose the entire separate parameters within the	
	ConnectString='DSN= <i>data_source_name</i> ; {UID= <i>user_ID</i> ; PWD= <i>password</i> ; <i>driver_specific_parameters</i> }'		
	Parameter	Description	

Parameter	Description
data_source_name	A name that identifies the data source.
user_ID	(Optional) The user ID required to connect to
	the data source.
password	(Optional) The password required by
	<i>user_ID</i> to connect to the data source.
driver_specific_parameters	(Optional) Any other driver-specific
	parameters required to connect.

Default value

Usage	PowerBuilder generates the ConnectString automatically when you define an ODBC data source and copies it to the Preview box in the Database Profile Setup dialog box. This happens before you connect to the data source in PowerBuilder.		
	Therefore, <i>you do not have to enter the ConnectString yourself</i> when defining an ODBC data source. However, you might need to edit the ConnectString value in the Database Profile Setup dialog box.		
	You can change the ConnectString parameter if necessary by editing it in the Database Profile Setup dialog box. For example, if you change the name of an existing ODBC data source, edit its database profile to update the connect string with the new DSN (data source name) value.		
Examples	<b>Example 1</b> This example shows a connect string for an ODBC data source that contains the data source name (DSN=Sales), user ID (UID=dba), and password (PWD=sql). Parameters within the connect string are separated by semicolons.		
	• <b>Database profile</b> On the Connection page in the Database Profile Setup dialog box, select Sales from the Data Source drop-down list, select the User ID check box and type dba, and select the Password check box and type sql.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="ConnectString ='DSN=Sales;UID=dba;		

# CSIncr

Description	Specifies an integer for database connection increments per session.	
Applies to	ORA Oracle 11g and Oracle 9.2 or later databases	
Syntax	CSIncr =value	
	Parameter	Description
	value	Specifies an increment for the number of database connections in a connection or session pool.
Default value	1	
Usage	This value is ignored when the SessionHomogeneous DBParm is set to false.	
Examples	The following example sets the increment for the number of database connections in a session pool to 10:	

	• <b>Database profile</b> Select Session Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box, select the Homogeneous Session Pooling check box, and type 10 in the Increment text box on the same page.
	• <b>Application</b> Type the following in code:
	<pre>my_trans.dbparm="Pooling='session',csincr = 10"</pre>
See also	CSMax CSMin

## **CSMax**

Description	Specifies the maximum number of database connections in a connection or session pool.		
Applies to	ORA Oracle 11g and Oracle 9.2 or later databases		
Syntax	CSMax = <i>value</i>		
	Parameter	Description	
	value	Specifies the maximum number of database connections in a connection or session pool.	
Default value	100		
Usage	This value is ignored when the SessionHomogeneous DBParm is set to false.		
Examples	<ul> <li>The following example limits the number of database connections in a connection pool to 15:</li> <li>Database profile Select Connection Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box, and type 15 in the Maximum Number of Sessions text box on the same page.</li> <li>Application Type the following in code:</li> </ul>		
	my_tr	rans.dbparm="pooling='connection',csmax = 15"	
See also	CSIncr CSMin		

# **CSMin**

Description Specifies the minimum number of database connections in a connection or session pool.

Applies to	ORA Oracle $11g$ and Oracle 9.2 or later databases		
Syntax	CSMin = <i>value</i>		
	Parameter	Description	
	value	Specifies the minimum number of database connections in a connection or session pool.	
Default value	1		
Usage	This value is ignored when the SessionHomogeneous DBParm is set to false.		
Examples	The following code keeps a minimum of 5 database connections open in a connection pool:		
	• <b>Database profile</b> Select Connection Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box, and type 5 in the Minimum Number of Sessions text box on the same page.		
	• Application Type the following in code: my_trans.dbparm="pooling='connection',csmin = 5"		
See also	CSIncr CSMax		
	Specifies the co	uncer library to use when connecting to an ODPC data source	
Description	Specifies the cursor library to use when connecting to an ODBC data source.		

ODBC (if driver and back-end DBMS support this feature)

Applies to Syntax

CursorLib='value'

Parameter	Description
value	The cursor library to use when connecting to an ODBC data source. Values are:
	• <b>ODBC_Cur_Lib</b> Use the ODBC Version 2.0 or higher cursor library.
	• <b>If_Needed</b> Use the ODBC Version 2.0 or higher cursor library if your ODBC driver does not support cursors.
	• <b>Driver_Cursors</b> (Default) Use your data source's native cursor support.

Default value

CursorLib='Driver\_Cursors'

Examples To specify use of the ODBC Version 2.0 or higher cursor library when connecting to an ODBC data source:

- **Database profile** Select Cursor Library from the Cursor Library dropdown list on the Transaction page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="CursorLib='ODBC\_Cur\_Lib'"

## CursorLock

Description

When used with the CursorScroll parameter, specifies locking options for cursors in ODBC data source.

The values you can set for CursorLock control two aspects of cursor locking:

- **Concurrent access.** Ensures that multiple users can simultaneously access data that is accurate and current.
- **Collision detection.** Detects collisions that occur when multiple users update the same data at the same time.

ODBC (if driver and back-end DBMS support this feature)

Syntax

Applies to

CursorLock='lock\_value'

	Parameter	Description
	lock_value	Specifies the type of locking you want to use for ODBC cursors. Values are:
		• Lock Use the lowest level of locking sufficient to allow updates on table rows.
		• <b>Opt</b> Use <b>optimistic concurrency control</b> . This means that table rows are not locked against updates by other users. To detect collisions, compare row versions or timestamps.
		• <b>OptVal</b> Use optimistic concurrency control. This means that table rows are not locked against updates by other users. To detect collisions, compare selected values with their previous values.
		• <b>ReadOnly</b> Prohibit updates on table rows by any user.
		For more about how the ODBC standard defines lock values, see your ODBC documentation.
	• 1	ecify a value for CursorLock, PowerBuilder defaults to the ng specified by your ODBC driver.

Examples	To set scrolling and locking options for cursors in an ODBC data source:		
	• <b>Database profile</b> On the Transaction page in the Database Profile Setup dialog box, select Dynamic Scrolling from the Scrolling Options drop-down list, and Optimistic Using Values from the Locking drop-down list.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm = "CursorScroll='Dynamic',CursorLock='OptVal'"		
See also	CursorScroll		

### CursorScroll

Description	When used with the CursorLock parameter, specifies scrolling options for cursors in an ODBC data source.	
		cursor indicates the current position in the result set produced nt. <b>Scrolling</b> allows a cursor to move through the data in a at a time.
Applies to	ODBC (if driver and back-end DBMS support this feature)	
Syntax	CursorScroll='scroll_value'	
	Parameter	Description
	scroll_value	Specifies the type of scrolling you want to use for ODBC cursors. Values are:

•	Forward	The cursor only scrolls forward through the result
	set.	

- Static The data in the result set does not change.
- **KeySet** Specifies that the cursor is **keyset-driven**. When a keyset-driven cursor is opened, the driver saves keys for the *entire result set*. As the cursor scrolls through the result set, the driver uses the keys in this **keyset** to retrieve the current values for each row.
- **Dynamic** The driver saves and uses only the keys for the rows specified in the rowset.
- Default value If you do not specify a value for CursorScroll, PowerBuilder defaults to the cursor scroll settings specified for your ODBC data source driver.

Usage	For large result sets, it might be impractical to use a keyset-driven cursor that requires the driver to save keys for the entire result set. Instead, you can use a <b>mixed cursor</b> by specifying a 32-bit integer value that is the number of rows in your keyset (see Example 2). This number is typically smaller than the result set. The default keyset size is 0.			
	A mixed cursor uses KeySet scrolling within the specified keyset and Dynamic scrolling outside the keyset.			
Examples	<b>Example 1</b> To set scrolling and locking options for cursors in an ODBC data source:			
	• <b>Database profile</b> Select Dynamic Scrolling from the Scrolling Options drop-down list and Optimistic Using Values from the Locking drop-down list on the Transaction page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="CursorScroll='Dynamic', CursorLock='OptValue'"			
	<b>Example 2</b> This example sets the number of rows in the keyset to 100. Assume that the entire result set has 1000 rows. When the cursor is opened, the driver saves keys for the first 100 rows of the result set. It then retrieves the next block of 100 keys until the entire result set is retrieved.			
	• <b>Database profile</b> Type 100 in the Scrolling Options box on the Transaction page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="CursorScroll=100"			
See also	CursorLock			
CursorType				
Description	Supports the scrollable cursor feature introduced in Adaptive Server Enterprise 15.0, including directional scrolling (forwards and backwards) and sensitivity towards independent changes to table.			
Applies to	ASE, SYC Sybase Adaptive Server Enterprise (15.0 and later)			

CursorType='value'

Syntax

	Parameter	Description
	value	A string that specifies whether database cursors are scrollable and whether they are sensitive to modifications in data. Values are:
		• <b>NonScrollable</b> (Default) Non-scrollable forward-only cursor. Supports the PowerScript FETCH NEXT syntax.
		• ScrollInsensitive Scrollable insensitive cursor that ignores any data modifications when scrolling in either direction. Supports the PowerScript FETCH NEXT, FETCH PRIOR, FETCH FIRST, and FETCH LAST syntaxes.
		• ScrollSemiSensitive Scrollable semi-sensitive cursor that presents data modifications when scrolling forwards but ignores them when scrolling backwards. Supports the PowerScript FETCH NEXT, FETCH PRIOR, FETCH FIRST, and FETCH LAST syntaxes.
Default value	CursorType='No	nScrollable'
Usage	cursors, which ca that you can scroor ather than one r scrollable cursor	Enterprise 15.0 allows both scrollable and nonscrollable an be either semi-sensitive or insensitive. "Scrollable" means all through the cursor result set by fetching any, or many, rows, ow at a time; you can also scan the result set repeatedly. A allows you to set the position of the cursor anywhere in the for as long as the cursor is open.
	SQL statement to PowerBuilder D	ble cursor, you must use a DECLARE <i>CursorName</i> CURSOR o declare it with a suitable SELECT statement, such as the ynamic SQL Format 3 and Dynamic SQL Format 4 you must have the query engine provided in Adaptive Server
		olling to work correctly, the table must have a clustered index ique constraint, such as a clustered primary key.
	CursorUpdate da cursor, set the Cu	rsors are read-only and can only be used when the value of the atabase parameter is 0 (the default). If you need an updatable ursorUpdate parameter to 1. When CursorUpdate is set to 1, sorType is ignored. All update cursors are nonscrollable.
	row, SQLCA.SQL	rsor is moved to a position before the first row or after the last Code returns 100 and no data is returned. However, users can a data by using a suitable FETCH statement after receiving this
	Both client and s	server must be Adaptive Server 15.0 or higher.

Examples	To specify support for semi-sensitive scrollable cursors (data modifications are presented when scrolling forwards):
	• <b>Database profile</b> Select Cursor Scrollable SemiSensitive from the Read Only Cursor Type drop-down list on the Transaction page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="CursorType='ScrollSemiSensitive'"
See also	CursorUpdate

# CursorUpdate

Description		ces that support it, CursorUpdate specifies whether cursors in base are declared read-only or updatable.
Applies to	DIR Sybase DirectConnect ASE, SYC, and SYJ Sybase Adaptive Server Enterprise	
Syntax	CursorUpdate=value	
	Parameter	Description
	value	A number that specifies whether database cursors are declared read-only or updatable. Values are:
		• <b>0</b> (Default) Cursors are declared read-only. Sybase Client Library cursor declarations include the CS_READ_ONLY option.
		• 1 Cursors are declared updatable. Sybase Client Library cursor declarations include the CS_FOR_UPDATE option. This option applies to all updatable columns in the table.
Default value	CursorUpdate=0	
Usage	Set the CursorUpdate parameter to 1 to declare updatable cursors if you plan to use either of the following SQL statements in your application ( <i>table</i> represents the table name and <i>cursor</i> represents the cursor name):	
		OM table WHERE CURRENT OF cursor ole SET set_clause WHERE CURRENT OF cursor
	•	unicating with the database in a PowerBuilder script, you can Jpdate value anytime before or after the Transaction object has database.

When you declare cursors updatable in a database accessed through DirectConnect, the cursor declaration you code must include a FOR UPDATE OF *column\_list* clause.

When you use updatable cursors with the DIR interface and a Gatewayless connection to the mainframe, you must set Block=1 before executing the cursor. You can reset the Block parameter to its default of 100 after you close the cursor within your code.

Examples To specify that database cursors are declared updatable:

- **Database profile** Select the Cursors Declared Updatable check box on the Transaction page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="CursorUpdate=1"

### Database

Description Specifies the name of the database you want to connect to.

When to specify Database You must specify the Database parameter *before* connecting to the database.

Applies to	ADO.NET SNC SQL Native Client for Microsoft SQL Server
Syntax	DataBase='database_name'
Default value	None
Examples	To connect to the database "mydb":
	• <b>Database profile</b> Enter mydb in the Database box on the Connection page in the Database Profile Setup dialog box.

• **Application** Type the following in code:

SQLCA.DBParm="Database='mydb'"

# DataLink

Description	Specifies that you want to create a file or use an existing file containing your connection information to connect to your data source.		
	When to specify DataLink You must specify the DataLink parameter <i>before</i> connecting to the database.		
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server		
Syntax	DataLink=' <i>file_name</i> '		
Default value	None		
Usage	The Data Link option allows you to access Microsoft's Data Link API. The Data Link API allows you to define a file or use an existing file that contains your connection information. A Data Link file is identified with the suffix <i>.udl</i> .		
	To launch the API, double-click on Manage Data Links under OLE DB Utilities in the Installed Database Interfaces list or select the File Name check box on the Connection page in the Database Profile Setup dialog box and click the button next to the File Name box.		
	For more information on using the Data Link API, see Microsoft's Universal Data Access Web site.		
	<i>Using a Data Link file versus setting other database parameters</i> If you use a Data Link file to connect to your data source with the ADO.NET or OLE DB interface, all other settings you make in the Database Profile Setup dialog box are ignored.		
	If you use a Data Link file to connect to your data source with the SNC interface, the setting in the ProviderString database parameter still takes effect. The SNC interface gets a connection string from the data link file, and then copies the contents of the ProviderString parameter into the connection string so that it contains the connection parameters from both the data link file and the ProviderString parameter. You might want to take advantage of this feature if you do not want to save the user name and password in the UDL file. You can specify them in the ProviderString parameter instead.		
Examples	To use the file <i>oledb.udl</i> to connect to an OLE DB data provider:		
	• <b>Database profile</b> Select the File Name check box on the Connection page in the Database Profile Setup dialog box and enter a name for a new file or select an existing file.		

• **Application** Type the following in code:

SQLCA.DBParm="DataLink='oledb.udl'"

DataSource	
Description	Identifies the data source to which you want to connect. The data source can be a file, a database, or an ODBC data source depending on the OLE DB data provider you are using.
	When to specify DataSource You must specify the DataSource parameter <i>before</i> connecting to the database.
Applies to	ADO.NET OLE DB
Syntax	DataSource='datasource_name'
Default value	None
Usage	For the SNC interface for SQL Server 2005, specifying a value for Server on the Connection page or specifying a value for SQLCA.ServerName in code is equivalent to setting this parameter.
	The value of the Data Source parameter varies depending on the type of data source connection you are making. For example, if you are using Microsoft's OLE DB Provider for ODBC, you would enter the actual ODBC data source name for the Data Source value. If you are using Microsoft's OLE DB Provider for SQL Server, you would enter the actual Microsoft SQL Server server name for the Data Source value.
	For more information, see the documentation provided by your OLE DB data provider.
Examples	<b>Example 1</b> To use the Microsoft OLE DB Provider for ODBC to connect to the EAS Demo DB:
	• <b>Database profile</b> Enter EAS Demo DB in the Data Source box on the Connection page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="DataSource='EAS Demo DB'"

DataLink Provider

Example 2 To use the Microsoft OLE DB Provider for Oracle to connect to an Oracle 8 database:
Database profile Enter the Oracle 8 server name in the Data Source box on the Connection page in the Database Profile Setup dialog box.
Application Type the following in code:

SQLCA.DBParm="DataSource='Or8server'"

See also

### Date

Description	When you update data in the DataWindow painter, PowerBuilder builds a SQL UPDATE statement in the background. The Date parameter determines how PowerBuilder specifies a date datatype when it builds the SQL UPDATE statement.
Applies to	JDB JDBC ODBC O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>
Syntax	The syntax you use to specify the Date parameter differs slightly depending on the database.
	The Database Profile Setup dialog box inserts special characters (quotes and backslashes) where needed, so you can specify just the date format.
	In a PowerBuilder application script, you must use the following syntax:
	<b>JDBC and ODBC syntax</b> PowerBuilder parses the backslash followed by two single quotes (\'') as a single quote when it builds the SQL UPDATE statement.
	Date=' \"date_format\" '
	<b>Oracle syntax</b> PowerBuilder parses each set of four consecutive single quotes ('''') as a single quote when it builds the SQL UPDATE statement.
	Date=' ""date_format"" '

Parameter	Description
· \"	JDBC and ODBC syntax Type a single quote, followed by one space, followed by a backslash, followed by two single quotes. There is no space between the two single quotes and the beginning of the date format.
	<b>Oracle syntax</b> Type a single quote, followed by one space, followed by four single quotes. There is no space between the four single quotes and the beginning of the date format.
date_format	The date format you want PowerBuilder to use when it builds a SQL UPDATE statement to update a data source in the DataWindow painter.
	For more on display formats, see the Users Guide.
\"''	<b>JDBC and ODBC syntax</b> Type a backslash, followed by two single quotes, followed by one space, followed by a single quote. There is no space between the end of the date format and the backslash.
<i>m</i> ,	<b>Oracle syntax</b> Type four single quotes, followed by one space, followed by a single quote. There is no space between the end of the date format and the four single quotes.

### Default value

The default value for Date depends on the DBMS you are accessing, as summarized in the following table:

DBMS	Date default value
JDBC	If no value is specified for the Date database parameter, PowerBuilder looks for a date format in the section for your JDBC driver in the registry. If no date format is found in the registry, PowerBuilder uses the JDBC date format escape sequence.
ODBC	If no value is specified for the Date database parameter, PowerBuilder looks for a date format in the section for your ODBC driver in the PBODB125 initialization file. If no date format is found in the initialization file, PowerBuilder uses the ODBC date format escape sequence.
Oracle	The default Oracle date format.
	For information, see your Oracle documentation.

Examples About these examples Assume you are updating a table named Employee by setting the Startdate column to 2006-04-23. This date is represented by the following date format:

yyyy-mm-dd

**Example 1 (JDBC and ODBC syntax)** To specify that PowerBuilder should use this format for the date datatype when it builds the SQL UPDATE statement:

• **Database profile** Type the following in the Date Format box on the Syntax page in the Database Profile Setup dialog box:

yyyy-mm-dd

• **Application** Type the following in code:

```
SQLCA.DBParm="Date=' \''yyyy-mm-dd\'' '"
```

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

```
UPDATE EMPLOYEE
SET STARTDATE='2006-04-23'
```

**Example 2 (Oracle syntax)** To specify that PowerBuilder should use this format for the date datatype when it builds the SQL UPDATE statement:

• **Database profile** Type the following in the Date format box on the Syntax page in the Database Profile Setup dialog box:

yyyy-mm-dd

• **Application** Type the following in code:

SQLCA.DBParm="Date=' '''yyyy-mm-dd'''' '"

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

```
UPDATE EMPLOYEE
SET STARTDATE='2006-04-23'
```

DateTime Time

### DateFormat

Description	When you update data in the DataWindow painter, PowerBuilder builds a SQL UPDATE statement in the background. The DateFormat parameter determines how PowerBuilder specifies a date datatype when it builds the SQL UPDATE statement.
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server

Syntax	DateFormat='date_format'		
	Parameter	Description	
	date_format	The date format you want PowerBuilder to use when it builds a SQL UPDATE statement to update a data source in the DataWindow painter.	
		For more on display formats, see the <i>Users Guide</i> .	
		For more on display formats, see the User's Guide.	
Default value	If no value is specified for the DateFormat parameter, PowerBuilder does not use a date datatype.		
Usage	When you call stored procedures, the database server might not accept the date format built by PowerBuilder. If this occurs, you can try to use another format. For example, for Microsoft SQL Server, try this format:		
	DateFormat='\'	уууу-mm-dd\'''	
Examples	Assume you are updating a table named Employee by setting the Startdate column to 2006-04-23. This date is represented by the date format yyyy-mm-dd.		
	To specify that PowerBuilder should use this format for the date datatype when it builds the SQL UPDATE statement:		
		Type the following in the Date Format box on the Database Profile Setup dialog box:	
	yyyy-mm-dd		
	Application Type	the following in code:	
	SQLCA.DBPar	m="DateFormat='yyyy-mm-dd'"	
	<i>What happens</i> PowerE update the table:	Builder builds the following SQL UPDATE statement to	
	UPDATE EMPLOYEE SET STARTDATE=		
See also	DateTimeFormat TimeFormat		

# DateTime

Description	UPDATE statement how PowerBuilder	lata in the DataWindow painter, PowerBuilder builds a SQL in the background. The DateTime parameter determines specifies a DateTime datatype when it builds the SQL . (A DateTime datatype contains both a date value and a

	four single quotes and the beginning of the date format.
DateTime_format	The DateTime format you want PowerBuilder to use when it
	builds a SQL UPDATE statement to update a data source in the

For more on display formats, see the Users Guide.

	Parameter	Description	
	\"'	<b>JDBC and ODBC syntax</b> Type a backslash, followed by two single quotes, followed by one space, followed by a single quote. There is no space between the end of the date format and the backslash.	
	<i></i> ,	<b>Oracle syntax</b> Type four single quotes, followed by one space, followed by a single quote. There is no space between the end of the DateTime format and the four single quotes.	
Default value	ault value       The default value for DateTime depends on the DBMS you are accessing, as summarized in the following table:         DBMS       Date default value		
	JDBC	If no value is specified for the DateTime database parameter, PowerBuilder looks for a DateTime format in the section for your JDBC driver in the registry. If no DateTime format is found in the registry, PowerBuilder uses the JDBC DateTime format escape sequence.	
	ODBC	If no value is specified for the DateTime database parameter, PowerBuilder looks for a DateTime format in the section for your ODBC driver in the <i>PBODB125</i> initialization file. If no DateTime format is found in the initialization file, PowerBuilder uses the ODBC DateTime format escape sequence.	
	Oracle	The default Oracle DateTime format.	
		For information, see your Oracle documentation.	
Examples	setting the T	<b>e examples</b> Assume you are updating a table named Files by imestamp column to 4/2/06 3:45 pm. This DateTime is represented wing DateTime format:	

i.

m/d/yy h:mm am/pm

**Example 1 (JDBC, ODBC, and OLE DB syntax)** To specify that PowerBuilder should use this format for the DateTime datatype when it builds the SQL UPDATE statement:

• **Database profile** Type the following in the DateTime Format box on the Syntax page in the Database Profile Setup dialog box:

m/d/yy h:mm am/pm

• **Application** Type the following in code:

SQLCA.DBParm="DateTime=' ''m/d/yy h:mm am/pm\'' '"

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

UPDATE FILES SET TIMESTAMP='4/2/06 3:45 pm'

**Example 2 (Oracle syntax)** To specify that PowerBuilder should use this format for the DateTime datatype when it builds the SQL UPDATE statement:

• **Database profile** Type the following in the DateTime Format box on the Syntax page in the Database Profile Setup dialog box:

m/d/yy h:mm am/pm

• Application Type the following in code:

```
SQLCA.DBParm="DateTime=' '''m/d/yy h:mm am/pm''''
```

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

UPDATE FILES SET TIMESTAMP='4/2/06 3:45 pm'

Date Time

## DateTimeAllowed

Description

For those interfaces that support it, DateTimeAllowed controls whether columns having a DateTime datatype can appear as unique key columns in the WHERE clause of a SQL UPDATE or DELETE statement. PowerBuilder generates an UPDATE statement or a DELETE statement followed by an INSERT statement to update the database from a DataWindow object.

When you are working in the DataWindow painter, you specify which columns to include in the WHERE clause by selecting them from the Unique Key Columns list in the Specify Update Properties dialog box.

By default, DateTimeAllowed is set to 0 to prohibit DateTime columns from displaying in the Unique Key Columns list and consequently from appearing in the WHERE clause of an UPDATE or DELETE statement. When you set DateTimeAllowed to 1, any DateTime columns in your database table display in the Unique Key Columns list and can be selected to appear in the WHERE clause of an UPDATE or DELETE statement.

	When to specify DateTimeAllowed You must specify a value for DateTimeAllowed <i>before</i> connecting to the database.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect I10 Informix IN9 Informix	
Syntax	DateTimeAllowed=value	
	Parameter	Description
	value	<ul> <li>Specifies whether you can use DateTime columns as unique key columns in a WHERE clause of a SQL UPDATE or DELETE statement generated by PowerBuilder to update the database. Values are:</li> <li>0 (Default) Prohibit the use of DateTime columns in the WHERE clause of an UPDATE or DELETE statement. When DateTimeAllowed is set to 0, DateTime columns <i>do not display</i> in the Unique Key Columns list in the Specify Update Properties dialog box. You can also specify 'No' or 'False' to set this value.</li> <li>1 Allow the use of DateTime columns in the WHERE clause of an UPDATE or DELETE statement. When DateTimeAllowed is set to 1, DateTime columns <i>do display</i> in the Unique Key Columns list in the Specify Update Properties dialog box so you can select one or more to appear in the WHERE clause. You can also specify 'Yes' or 'True' to set this value.</li> </ul>
Default value	DateTimeAllowed=0	
Usage	<i>When to set</i> To allow the use of DateTime columns as unique key columns in the WHERE clause of an UPDATE or DELETE statement when you are updating the database from a DataWindow object, set DateTimeAllowed to 1.	
	For instructions on using the Specify Update Properties dialog box to specify update characteristics for a DataWindow object, see the chapter on controlling updates in the <i>Users Guide</i> .	
	What happens when you save the DataWindow object When you set DateTimeAllowed to 1, select a DateTime column to appear in the WHERE clause, and then save the DataWindow object, this column continues to display in the Unique Key Columns list even if you set DateTimeAllowed to 0 on a subsequent connection.	

Examples

To allow the use of DateTime columns in the WHERE clause of an UPDATE or DELETE statement:

- **Database profile** Select the DateTime Datatype Allowed check box on the Syntax page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="DateTimeAllowed=1"

## DateTimeFormat

Description	When you update data in the DataWindow painter, PowerBuilder builds a SQL UPDATE statement in the background. The DateTimeFormat parameter determines how PowerBuilder specifies a DateTime datatype when it builds the SQL UPDATE statement. (A DateTime datatype contains both a date value and a time value.)		
Applies to	ADO.NET OLE DB SNC SQL Native Client	for Microsoft SQL Server	
Syntax	DateTimeFormat='datetime_format '		
	Parameter	Description	
	datetime_format	The datetime format you want PowerBuilder to use when it builds a SQL UPDATE statement to update a data source in the DataWindow painter.	
		For more on display formats, see the Users Guide.	
Default value	If no value is specified for not use a datetime dataty	or the DateTimeFormat parameter, PowerBuilder does /pe.	
Usage	When you call stored procedures, the database server might not accept the DateTime format built by PowerBuilder. If this occurs, you can try to use another format. For example, for Microsoft SQL Server, try this format:		
	DateTimeFormat=	'\''yyyy-mm-dd hh:mm:ss.fff\'''	
	PowerBuilder parses th a single quote.	he backslash followed by two single quotes (\") as	
Examples	Assume you are updating a table named Files by setting the Timestamp column to 4/2/06 3:45 pm. This DateTime is represented by the following DateTime format:		
	m/d/yy h:mm am/	'pm	

To specify that PowerBuilder should use this format for the DateTime datatype when it builds the SQL UPDATE statement:

• **Database profile** Type the following in the Date Time Format box on the Syntax page in the Database Profile Setup dialog box:

m/d/yy h:mm am/pm

• Application Type the following in code:

```
SQLCA.DBParm="DateTimeFormat='\''m/d/yy h:mm am/pm\'''"
```

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

UPDATE FILES SET TIMESTAMP='4/2/06 3:45 pm'

DateFormat TimeFormat

### DBConfigSection

Description Specifies the section in a .NET configuration file to be used to specify custom configuration settings. When to specify DBConfigSection You must specify a value for DBConfigSection before connecting to the database. ADO.NET Applies to Syntax DBConfigSection='value' Parameter Description value A string that specifies the section in a .NET configuration file to be used to specify DBParm values and the syntax used to obtain the value of an identity column. The value is the name of a section you create in a .NET configuration file. None. Default value Usage You can use the standard select @@identity syntax to obtain the value of an identity column. You can also use an alternative syntax, such as select scope identity(), by adding sections to a .NET configuration file for your application.

	The configuration file resides in the same directory as the application and has the same name as the application with the extension <i>.config</i> . It can contain multiple custom configuration sections. Each has two attributes: dbParm and getIdentity. You can set either or both of these attributes. For Web applications, add the settings to the <i>web.config</i> file.
	The dbParm value sets the value of the DBParm parameter of the transaction object. It has a maximum length of 1000 characters. If you set a value for a parameter in the configuration file, any value that you set in code or in the Database Profile Setup dialog box is overridden.
	The getIdentity value specifies the syntax used to retrieve the value of an identity column. It has a maximum length of 100 characters. If you do not specify a value for getIdentity, the select @@identity syntax is used.
	For more information about creating the configuration file, see the chapter on ADO.NET in <i>Connecting to Your Database</i> .
Examples	To specify that your PowerBuilder application uses the custom configuration file called myconfig1:
	• <b>Database profile</b> Specify myconfig1 in the ConfigSection Name in Configuration File box on the System tabpage in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="DBConfigSection='myconfig1'"
	This sample configuration file for PowerBuilder is called <i>pb125.exe.config</i> . It contains three custom configurations. The <myconfig> element sets both the dbParm and getIdentity attributes. <myconfig1> sets getIdentity only, and</myconfig1></myconfig>

config2> sets dbParm only. The <runtime> section is in the configuration file that ships with PowerBuilder but would not be included in the configuration file that you ship with your application, which would have the same name as your application with the extension *exe.config*. For .NET Web Forms targets, you add the custom configurations to the *web.config* file. The <configSections> section should be added before any other application settings.

```
<configuration>
  <configSections>
    <sectionGroup name="dbConfiguration">
        <section name="myconfig"
        type="Sybase.PowerBuilderDataWindow.Db.DbConf
iguration,
        Sybase.PowerBuilderDataWindow.Db"
        />
```

```
<section name="myconfig1"</pre>
         type="Sybase.PowerBuilderDataWindow.Db.DbConf
iguration,
         Sybase.PowerBuilderDataWindow.Db"
        />
        <section name="myconfig2"</pre>
         type="Sybase.PowerBuilderDataWindow.Db.DbConf
iguration,
         Sybase.PowerBuilderDataWindow.Db"
        />
      </sectionGroup>
   </configSections>
<runtime>
      <assemblyBinding xmlns=
       "urn:schemas-microsoft-com:asm.v1">
         <dependentAssembly>
            <assemblyIdentity name=

             Runtime.dll"/>
         </dependentAssembly>
         <probing privatePath="DotNET/bin" />
      </assemblyBinding>
   </runtime>
   <dbConfiguration>
      <myconfig dbParm="disablebind=0"
```

```
getIdentity="select scope_identity()"
```

## **DBGetTime**

Description	Specifies the number of seconds PowerBuilder waits for a response from DBMS when you retrieve rows in a DataWindow object or query. When set the Async parameter to 1 to enable asynchronous operation, you can set the DBGetTime parameter for those DBMSs that support this parameter			
	DBMS response (	set to 0 (the default), PowerBuilder waits indefinitely for a the request never times out). If the DBGetTime value expires w is retrieved, your request is automatically canceled.		
Applies to	ASE, SYC Sybase	e Adaptive Server Enterprise		
	DIR Sybase Direc	ctConnect		
	I10 Informix			
	IN9 Informix			
	JDB JDBC			
	ODBC (if driver a	and back-end DBMS support this feature)		
	O90 Oracle9i			
	O10 Oracle 10g			
	ORA Oracle 11g			
Syntax	DBGetTime=value			
	Parameter	Description		
	value	The number of seconds PowerBuilder waits for a DBMS		
		response while waiting to retrieve the first row of a DataWindow		
		object, query, or report		
Default value	DBGetTime=0			

Usage	Requirements for must do both of	0	To use the DBGetTime parameter, you
	• Set the Asyr in the Exam	-	able asynchronous operation, as shown
	• Code a Retr	ieveRow event for a D	DataWindow object or report.
Examples	To enable asynch seconds:	nronous operation and	set the DBGetTime parameter to 20
	Number Of		nchronous check box and type 20 in the on the Transaction page in the Database
	Application	Type the following	in code:
	SQLCA.	DBParm="Async=1,	DBGetTime=20"
See also	Async		
Db_Locale			
Description	Db_Locale ident	ifies the locale of the	data in the database.
	When to specify You must specify		rameter <i>before</i> connecting to a database.
Applies to	I10 Informix		
Syntax	Db_Locale='language_territory.codeset		
	Parameter	Description	
	language	Two character name the locale, for example "en	at represents the language for a specific " for English.
	territory		at represents the cultural conventions for a kample "AU" for Australia.
	codeset	Name of the code set th	hat the locale supports, for example "utf8."
Default value	Client_Locale value.		
Usage	The I10 native interface uses the Informix GLS (Global Language Support) API for global language support. Db_Locale specifies the value of the Informix environment variable DB_LOCALE. If you do not set the DBParm, the default Db_Locale value is the Client_Locale value.		

	Db_Locale specifies the language, territory, and code set that the database server needs to correctly interpret locale-sensitive datatypes such as NChar and NVarChar in a specific database. The code set specified in DB_LOCALE determines which characters are valid in any character column, as well as in the names of database objects such as databases, tables, columns, and views.
	For more information about the Informix CLIENT_LOCALE and DB_LOCALE environment variables, see the <i>IBM Informix GLS User's Guide</i> , currently available at the Informix library Web site at http://publib.boulder.ibm.com/epubs/pdf/25122820.pdf.
Examples	To set the database locale to 'en_us.utf8':
	• <b>Database profile</b> Type the following in the Database Locale box on the Regional Settings page in the Database Profile Setup dialog box:
	en_us.utf8
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Db_Locale='en_us.utf8'"
See also	Client_Locale Locale
DBTextLimit	
Description	Specifies the maximum length of a text field that is returned when you include the text field in a SQL SELECT statement.
	Ven een eet the DDT-ut in: terementer if een ment te include a lange tert stein e

You can set the DBTextLimit parameter if you want to include a long text string in a DataWindow object without treating the text as a binary large object (blob) datatype.

ASE, SYC, and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect SNC SQL Native Client for Microsoft SQL Server

DBTextLimit='value'

Parameter	Description
value	The maximum length in bytes of a text field that is returned when you include the text field in a SQL SELECT statement. The range of valid values is from 0 bytes to 2 GB.
	When you set DBTextLimit to 0, the server returns the maximum length text field.

Applies to

Syntax

Default value	The default value for DBTextLimit is the default specified for the DBTEXTLIMIT DB-Library or CS_TEXTLIMIT CT-Library connection property.
Usage	The text field length that DB-Library or CT-Library returns is the lesser of the DBTextLimit value and the setting for the global variable TEXTSIZE.
	If the setting for TEXTSIZE is less than the value you specify for DBTextLimit, DB-Library or CT-Library returns the TEXTSIZE value.
Examples	To have DB-Library or CT-Library return a text field that is up to 32,000 bytes long when you include the text field in a SQL SELECT statement:
	• <b>Database profile</b> Type 32000 in the Text Limit in SQL box (when using the ASE, or SYC, or SYJ interface), or Maximum Length of Long VarChar box (when using the DirectConnect interface) on the Syntax page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:

SQLCA.DBParm="DBTextLimit='32000'"

# DecimalSeparator

Description	Specifies the decimal separator setting used by the back-end DBMS that you are accessing in PowerBuilder. If your DBMS uses a decimal separator other than period (.), which is the default, set DecimalSeparator to the value for your DBMS to ensure that PowerBuilder correctly handles numeric strings returned from your database.
Applies to	ADO.NET DIR Sybase DirectConnect ODBC (if driver and back-end DBMS support this feature) OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SNC SQL Native Client for Microsoft SQL Server
Syntax	DecimalSeparator='value'

	Parameter	Description
	value	The decimal separator setting used by the back-end DBMS that you are accessing in PowerBuilder. Values are:
		• '.' (Default) Specifies that your back-end DBMS uses a period (.) as the decimal separator. If you do not specify DecimalSeparator or if you specify a value other than period (.) or comma (,), PowerBuilder uses period (.) as the decimal separator.
		• ',' Specifies that your back-end DBMS uses a comma (,) as the decimal separator.
Default value	DecimalSepara	tor='.'
Usage	supports period separator settin DecimalSepara	<i>cimalSeparator</i> The DecimalSeparator parameter currently (.) and comma (.) as valid values. Therefore, if the decimal g for your DBMS is a comma, you should set the tor parameter to ',' (comma) to make sure PowerBuilder es numeric strings returned from your database.
	PowerBuilder a to PowerBuilde	<i>Oracle</i> Assume you are accessing an Oracle database in and the decimal separator setting is a comma (,). Oracle returns er the numeric string '123,50' containing a comma instead of a eximal separator. PowerBuilder then sends this string to its rsion routines.
	the decimal sep	PowerBuilder decimal conversion routines expect a period as parator. If you set the DecimalSeparator parameter to ',' erBuilder correctly handles this string and returns it as
Examples	To specify that	your DBMS uses a comma (,) as the decimal separator setting:
		<b>profile</b> Type a comma (,) in the Decimal Separator box on the ge in the Database Profile Setup dialog box.
	Applicatio	<b>n</b> Type the following in code:
	SQLCA	A.DBParm="DecimalSeparator=','"
See also	NumericForma	ıt

## DefaultProcOwner

Description	The DefaultProcOwner parameter lets you set a default owner for a stored procedure. The parameter takes effect only when the stored procedure is not qualified. For ODBC, the PBNewSPInvocation parameter must also be set.		
Applies to	ADO.NET ODBC		
Syntax	DefaultProcOwner='value'		
	Parameter	Description	
	value	A string specifying the name of the default owner of the stored procedure	
Usage	You can also set it data into a DataW	the beset dynamically at runtime after connecting to a database. in your <i>PBODB125.INI</i> file if you want to create and retrieve vindow with a stored procedure data source in the atter. The runtime setting overrides the setting in	
	current user as the	el the setting at runtime. If you do so, PowerBuilder uses the e owner of a non-qualified stored procedure when it obtains the stored procedure.	
Examples	To set the default	owner to proms in PBODB125.INI:	
	[SQL Anywh DefaultPro	nere] pcOwner='proms'	
	In code:		
	SQLCA.DBPa	<pre>urm="DefaultProcOwner='proms'";</pre>	
	To cancel the sett	ing:	
	SQLCA.DBF	<pre>Parm="DefaultProcOwner=''";</pre>	
	Note that the singl a space.	e quotes in the previous example contain an empty string, not	
See also	PBNewSPInvoca	tion	

## DelimitIdentifier

Description	columns, inde	exes, and constrai	werBuilder to enclose the names of tables, nts in double quotes when it generates SQL navior of any PowerBuilder painter that
Applies to	DIR Sybase I I10 Informix IN9 Informix JDB JDBC ODBC (if dri OLE DB O90 Oracle9 <i>i</i> O10 Oracle 1 ORA Oracle	ver and back-end 0g 11g	erver Enterprise DBMS support this feature) icrosoft SQL Server
Syntax	DelimitIdentifi	ier=' <i>value</i> '	
	Parameter	Description	
	value	<ul><li>column names in</li><li>Yes Use doub</li></ul>	you want PowerBuilder to enclose table and double quotes. Values are: ble quotes e double quotes
Default value		alue for the Delin sing, as follows:	nitIdentifier parameter depends on the DBMS
	DBMS		DelimitIdentifer default value
	ADO.NET		DelimitIdentifier='Yes' for SQL Anywhere, Oracle, and DB2, 'No' for all other DBMSs.
	Informix		DelimitIdentifier='No'
	JDBC		Depends on the DelimitIdentifer setting in the registry
	ODBC		Depends on the DelimitIdentifer setting in the PBODB125 initialization file
	Oracle		DelimitIdentifier='Yes'
	OLE DB		Depends on the DelimitIdentifer setting in the PBODB125 initialization file
	SNC		DelimitIdentifier='No'

	DBMS	DelimitIdentifer default value
	Sybase DirectConnect	DelimitIdentifier='No'
	Sybase Adaptive Server Enterprise	DelimitIdentifier='No'
Usage	in either ASCII or non-ASCII log, the setting of the DelimitIon	ervers can create a log of database transactions format. If the database is creating a non-ASCII dentifier is optional. If the database is creating limitIdentifier='Yes' to make the SQL syntax have as expected.
	the "set quoted_identifier on" of Server to adjust your database	<i>brise</i> When you set DelimitIdentifier to 'Yes', command is automatically sent to Adaptive connection on the server. Otherwise, the "set ad is sent to the server. This feature occurs with d OLE DB interfaces.
	quoted_identifier on" commandom to adjust your database connect	you set DelimitIdentifier to 'Yes', the "set d is automatically sent to Microsoft SQL Server tion on the server when you use ODBC or OLE d_identifier off" command is sent to the server.
	commands to fail if the SQL co PowerBuilder from sending the	off" to the server can cause some SQL ode contains quotation marks. To prevent is instruction to the server, set the eter to 'No' in the PBODB initialization file or
		nitIdentifier parameter setting overrides the ried for your JDBC driver in the registry and for DB125 initialization file.
	DelimitIdentifier='Yes'. Also,	o use mixed-case identifier names, you must set you must set LowerCaseIdent='No' to preserve tored in the DB2 system catalog.
Examples	To specify that PowerBuilder s double quotes when it generate	should not enclose table and column names in es SQL statements:
	-	the Enclose Table And Column Names In yntax page in the Database Profile Setup dialog
	• <b>Application</b> Type the following	llowing in code:
	SQLCA.DBParm="De	limitidentifier='No'"

See also

DelimitIdentifierToDB LowerCaseIdent

#### DelimitIdentifierToDB

Description	Specifies whether PowerBuilder should send a "set quoted_identifier off" instruction to the server when the DelimitIdentifier parameter is not set.		
Applies to	ODBC (if driver and back-end DBMS support this feature) OLE DB		
Syntax	DelimitIdentifi	erToDB=' <i>value</i> '	
	Parameter	Description	
	value	Specifies whether PowerBuilder sends a "set quoted_identifier off" instruction to the server when the DelimitIdentifier parameter is not set. Values are:	
		• Yes Send set quoted_identifier off to the server	
		• No Do not send set quoted_identifier off to the server	
Default value	'No'		
Usage	When you set DelimitIdentifier to 'Yes', the "set quoted_identifier on" command is automatically sent to the database server to adjust your database connection on the server when you use ODBC or OLE DB. Otherwise, the "set quoted_identifier off" command is sent to the server.		
	commands to PowerBuilder	quoted_identifier off" to the server can cause some SQL fail if the SQL code contains quotation marks. To prevent r from sending this instruction to the server, set the fierToDB parameter to 'No' in the PBODB initialization file or n string.	
Examples	instruction to	at PowerBuilder should not send a set quoted_identifier the server, add the following to the appropriate section of your alization file or your connection string:	
	"Delimi	tIdentifierToDB='No'"	
See also	DelimitIdenti	fier	

## DisableBind

Disabicalita		
Description	parameters to a c	s that support bind variables, PowerBuilder can bind input ompiled SQL statement by default. The DisableBind you to specify whether you want to disable this binding.
	•	sableBind to 1 to disable the binding, PowerBuilder replaces with the value entered by the application user or specified in
Applies to	110 Informix IN9 Informix JDB JDBC ODBC (if driver OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	se Adaptive Server Enterprise and back-end DBMS support this feature) e Client for Microsoft SQL Server
Syntax	DisableBind= <i>value</i>	
	Parameter	Description
	value	Specifies whether you want to disable the binding of input parameters to a compiled SQL statement. Values are:
		• <b>0</b> PowerBuilder binds input parameters to a compiled SQL statement.
		• <b>1</b> PowerBuilder does <i>not</i> bind input parameters to a compiled SQL statement.
Default value	DisableBind=1 for other interfac	or ADO.NET, ASE, SYC, SNC, and OLE DB, DisableBind=0 es
Usage	column value. By	In a SQL statement, a <b>bind variable</b> is a placeholder for a default, PowerBuilder associates (binds) data from a variable pplication to the bind variable each time the SQL statement
		<i>bles in SQL statements</i> For example, the following SQL es those rows in the Books table about books written by
	statement retriev Hemingway:	

Suppose that you want to execute this statement to get information about books written by other authors. Instead of compiling and executing a new statement for each author, you can define a bind variable that represents the author's name. The user then supplies the author's actual name when the application executes. By using bind variables, you ensure that the statement is compiled only once and executed repeatedly with new values supplied by the user.

If your database supports bind variables and DisableBind is set to 0 to enable binding (the default for all database interfaces except ADO.NET, ASE, SYC, SNC, and OLE DB), PowerBuilder generates the statement with parameter markers (:bind\_param) and passes the actual parameter value at execution time. For example:

SELECT \* FROM books WHERE author=:bind\_param

*Bind variables and cached statements* Using bind variables in conjunction with cached statements can improve the performance of most applications, depending on the application. In general, applications that perform a large amount of transaction processing benefit the most from using bind variables and cached statements.

In order to use cached statements, make sure that DisableBind is set to 0. This enables the binding of input variables to SQL statements in PowerBuilder. (For more about using cached statements, see the description of the SQLCache parameter.)

*Performance improvements* For SQL Anywhere and Oracle databases, bind variables improve performance by allowing PowerBuilder to insert and modify strings that exceed 255 characters.

*Bind variables and default column values* When DisableBind is set to 0 to enable the use of bind variables, the DataWindow painter does both of the following to get maximum performance improvement from using bind variables when you add rows to a DataWindow object:

- Generates a SQL INSERT statement that includes all columns (except identity and SQL Server timestamp)
- Reuses this SQL INSERT statement for each row you add to the DataWindow object

For example, if a table named Order\_T contains three columns named Order\_ID, Order\_Date, and Customer\_ID, the DataWindow painter generates the following SQL INSERT statement when DisableBind is set to 0 (default binding enabled):

```
INSERT INTO Order_T(Order_ID, Order_Date, Customer_ID)
VALUES(:bind_param1, :bind_param2, :bind_param3)
```

If one of these columns is null, the DataWindow painter sets a null value indicator for this column parameter and executes the statement. This behavior is important to understand if you want your back-end DBMS to set a default value for any columns in your DataWindow object.

To illustrate, suppose that your application users do not enter a value for the Order\_Date column because they expect the back-end DBMS to set this column to a default value of TODAY. Then, they retrieve the row and find that a null value has been set for Order\_Date instead of its default value. This happens because the SQL INSERT statement generated by the DataWindow painter specified a null value indicator, so the DBMS set the column value to null instead of to its default value as expected.

Setting a default column value when binding is enabled If you are using bind variables (DisableBind set to 0) and want the back-end DBMS to set a column to its default value when your application user does not explicitly enter a value in a new row, you should set an initial value for the DataWindow object column that mirrors the DBMS default value for this column.

In the DataWindow painter, you can set or modify a column's initial value in the Column Specifications dialog box.

For more about the Column Specifications dialog box, see the Users Guide.

*Setting a default column value when binding is disabled* If you are *not* using bind variables (DisableBind set to 1) and want the back-end DBMS to set a column to its default value when your application user does not explicitly enter a value in a new row, you do *not* need to set an initial value for the DataWindow column.

This is because with bind variables disabled, the DataWindow painter generates a SQL INSERT statement for each row added to the DataWindow object. If a column does not contain an explicit value, it is not included in the SQL INSERT statement.

Using the Order\_T table example, if your application user enters 123 as the value for the Order\_ID column and A-123 as the value for the Customer\_ID column, the DataWindow painter generates the following SQL INSERT statement when DisableBind is set to 1 (binding disabled):

Your back-end DBMS would then set the Order\_Date column to its default value as expected, since a value for Order\_Date is not explicitly set in the SQL INSERT statement generated by the DataWindow painter.

Examples	To specify that PowerBuilder should disable the binding of input parameters to a compiled SQL statement:		
	• <b>Database profile</b> Select the Disable Bind check box on the Transaction or System page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="DisableBind=1"		
See also	SQLCache		
Driver			
Description	The JDBC driver your application uses to connect to the database.		
	When to specify Driver You must specify the Driver database parameter <i>before</i> connecting to the database.		
Applies to	JDB JDBC		
Syntax	Driver='driver_name'		
Default value	None		
Usage	The driver name identifies the Java class name for the particular driver you are using to connect to the database.		
Examples	<b>Example 1</b> To set the driver name of a Sybase jConnect driver:		
	• <b>Database profile</b> Type the following in the Driver Name box on the Connection page in the Database Profile Setup dialog box:		
	com.sybase.jdbc.SybDriver		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="Driver='com.sybase.jdbc.SybDriver'"		
	<b>Example 2</b> To set the driver name of an Oracle JDBC Driver:		
	• <b>Database profile.</b> Type the following in the Driver Name box on the Connection page in the Database Profile Setup dialog box.		
	oracle.jdbc.driver.OracleDriver		
	• Application. Type the following in code:		
	SQLCA.DBParm="Driver='oracle.jdbc.driver.OracleDriv er'"		

See also URL

DS_Alias
----------

Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, DS\_Alias is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)

Some directory service providers and drivers support the creation of alias entries. An **alias entry** provides a link to a primary directory entry in a hierarchy, thereby giving users multiple ways to access the primary entry while searching the directory structure for a particular network entity.

For those directory service providers and drivers that support aliases, DS\_Alias specifies whether the provider is allowed to follow links for (expand) alias entries while searching the directory hierarchy. The default behavior is to allow expansion of alias entries for providers that support this feature.

You must specify a value for DS\_Alias *before* connecting to the database in PowerBuilder.

#### Using third-party directory service providers

For information about the third-party directory service providers and operating system platforms that Sybase has tested with Open Client directory services, see the Open Client documentation.

Applies to

ASE, SYC Sybase Adaptive Server Enterprise

Syntax

DS\_Alias=value

	Parameter	Description
	value	For those directory services providers and drivers that support aliases, specifies whether the provider is allowed to expand alias entries while searching a directory hierarchy. Values are:
		• <b>0</b> Prohibit provider from expanding alias entries during a directory search. You can also specify 'No' or 'False' to set this value.
		• 1 (Default) Allow provider to expand alias entries during a directory search. You can also specify 'Yes' or 'True' to set this value.
Default value	DS_Alias=1	

Usage	<i>When to use</i> To prevent access to your data through directory alias entries, set DS_Alias to 0. This prohibits directory service providers that support aliases from expanding alias entries during a directory search.
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
	<i>Requirements for use</i> To use DS_Alias or any other parameter supporting Open Client directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your</i> <i>Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for DS_Alias sets the corresponding Sybase CT-Lib connection property named CS_DS_EXPANDALIAS.
Examples	To prohibit directory service providers that support aliases from expanding alias entries during a directory search:
	• <b>Database profile</b> Clear the Directory Alias Entries check box on the Directory Services page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="DS_Alias=0"
See also	DS_Copy DS_DitBase DS_Failover DS_Password DS_Principal DS_Provider DS_TimeLimit
	Release

DS_Copy			
Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, DS_Copy is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)		
	Some directory service providers and drivers support the use of caching. <b>Caching</b> allows a directory service provider to use cached information while searching a directory instead of making a request to the directory server agent for information.		
	DS_Copy specifie during a directory	or those directory service providers and drives that support caching, S_Copy specifies whether the provider is allowed to use cached information uring a directory search. The default behavior is to allow providers that upport this feature to use cached information.	
	You must specify a value for DS_Copy <i>before</i> connecting to the database i PowerBuilder. Using third-party directory service providers For information about the third-party directory service providers and operat system platforms that Sybase has tested with Open Client directory service see the Open Client documentation.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	DS_Copy= <i>value</i>		
	Parameter	Description	
	value	<ul> <li>For those directory services providers and drivers that support caching, specifies whether the provider is allowed to use cached information when making a directory search. Values are:</li> <li>O Prohibit provider from using cached information during a</li> </ul>	
		directory search. You can also specify 'No' or 'False' to set this value.	
		<ul> <li>1 (Default) Allow provider to use cached information when making a directory search. You can also specify 'Yes' or 'True' to set this value.</li> </ul>	
Default value	DS_Copy=1		
Usage	<i>When to use</i> Allowing providers to use cached information during directory searches makes the searches faster, but does not ensure that the provider is using the most up-to-date directory information.		

	To ensure that the application gets the most recent changes to directory entries when it requests directory information, set DS_Copy to 0 to prohibit providers that support caching from using cached information during a directory search.
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
	<i>Requirements for use</i> To use DS_Copy or any other parameter supporting Open Client directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your</i> <i>Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for DS_Copy sets the corresponding Sybase CT-Lib connection property named CS_DS_COPY.
Examples	To prohibit directory service providers that support caching from using cached information during a directory search:
	• <b>Database profile</b> Clear the Use Caching check box on the Directory Services page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="DS_Copy=0"
See also	DS_Alias DS_DitBase DS_Failover DS_Password DS_Principal DS_Provider DS_TimeLimit Release

#### **DS** DitBase

DS_DitBase		
Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, DS_DitBase is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)	
	When you use Open Client directory services, a default (active) directory information tree base (DIT base) is specified in the Open Client/Server <sup>TM</sup> Configuration utility. The <b>DIT base</b> is the directory node where directory searches start. This is analogous to the current working directory in MS-DOS file systems.	
	DS_DitBase lets you specify the name of the directory node where you want searches for directory entries to start. The DS_DitBase value you specify must be a fully qualified name that uses the syntax required by your directory service provider and driver (see the Examples section for illustrations).	
	The default value for DS_DitBase is the DIT base currently specified as active in the Open Client/Open Server Configuration utility.	
	You must specify a value for DS_DitBase <i>before</i> connecting to the database in PowerBuilder.	
	<b>Using third-party directory service providers</b> For information about the third-party directory service providers and operating system platforms that Sybase has tested with Open Client directory services,	

s and operating system platforms that Sybase has tested with Open Client directory services, see the Open Client documentation.

Applies to	ASE, SYC Sybase Adaptive Server I	Enterprise
/ ipplies to	TISE, STC Sybase Maphive Server I	Sincipiise

DS\_DitBase='dit\_base'

Syntax

Parameter	Description
dit_base	The name of the directory node where you want directory searches to start. By default, this is the DIT base currently specified as active in the Open Client/Open Server Configuration utility.
	The value for <i>dit_base</i> must be a fully qualified name that uses the syntax required by your directory service provider and driver. The syntax for specifying the DIT base varies for different providers; see your provider's documentation for details.
	For examples of how to specify <i>dit_base</i> for different directory service providers, see the Examples section.

Default value	The default value for DS_DitBase is the DIT base currently specified as active in the Open Client/Open Server Configuration utility.		
Usage	<i>When to use</i> Set DS_DitBase to specify a starting node for directory searches <i>other than</i> the DIT base node specified as active in the Open Client/Open Server Configuration utility. For instructions on using the Open Client/Open Server Configuration utility, see your Sybase Open Client/Server configuration guide.		
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.		
	<i>Requirements for use</i> To use DS_DitBase or any other parameter supporting Open Client directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your Database.</i>		
	<i>Corresponding CT-Lib connection property</i> Specifying a value for DS_DitBase sets the corresponding Sybase CT-Lib connection property named CS_DS_DITBASE.		
Examples	<b>About these examples</b> The examples that follow show how to specify a DS_DitBase value for different directory service providers.		
Examples			
Examples	DS_DitBase value for different directory service providers. See your directory service provider's documentation for complete information		
Examples	<ul><li>DS_DitBase value for different directory service providers.</li><li>See your directory service provider's documentation for complete information about the format your provider requires for specifying the DIT base.</li><li>Example 1 (Windows NT Registry) This example shows the syntax for</li></ul>

Do not</li> </ul>		
Examples	<ul> <li>DS_DitBase value for different directory service providers.</li> <li>See your directory service provider's documentation for complete information about the format your provider requires for specifying the DIT base.</li> <li>Example 1 (Windows NT Registry) This example shows the syntax for DS_DitBase if your directory service provider is the Windows NT Registry: Node name: SALES:software\sybase\server\SYS11NT DS_DitBase: SALES:software\sybase\server</li> <li>To set DS_DitBase:</li> <li>Database profile Type the following in the DIT Base box on the Directory Services page in the Database Profile Setup dialog box. Do not end the DS_DitBase value with a backslash (\):</li> </ul>		

**Example 2 (DCE/CDS)** This example shows the syntax for DS\_DitBase if your directory service provider is Distributed Computing Environment Cell Directory Services (DCE/CDS):

Node name: /.../boston.sales/dataservers/sybase/SYS11 DS\_DitBase: /.../boston.sales/dataservers

To set DS\_DitBase:

• **Database profile** Type the following in the DIT Base box on the Directory Services page in the Database Profile Setup dialog box. Do *not* end the DS\_DitBase value with a slash (/):

/.../boston.sales/dataservers

• **Application** Type the following in code. Do *not* end the DS\_DitBase value with a slash (/):

SQLCA.DBParm =
"DS DitBase='/.../boston.sales/dataservers'"

**Example 3 (Novell NDS)** This example shows the syntax for DS\_DitBase if your directory service provider is Novell NetWare Directory Services (NDS):

Node name: CN=SYS11.OU=miami.OU=sales.O=sybase DS\_DitBase: OU=miami.OU=sales.O=sybase

To set DS\_DitBase:

• **Database profile.** Type the following in the DIT Base box on the Directory Services page in the Database Profile Setup dialog box:

```
OU=miami.OU=sales.O=sybase
```

• **Application** To specify DS\_DitBase in code, type the following:

```
SQLCA.DBParm =
"DS DitBase='OU=miami.OU=sales.O=sybase'"
```

DS\_Alias DS\_Copy DS\_Failover DS\_Password DS\_Principal DS\_Provider DS\_TimeLimit Release

### **DS\_Failover**

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, DS_Failover is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)		
	Sybase Open Client Client-Library (CT-Lib) requires a directory to map logical server names to network addresses. The source for this directory can be either the Sybase Interfaces file or a network-based directory service provider (such as DCE Cell Directory Services or the Windows Registry).		
	If you want an application to use a directory source <i>other than</i> the Interfaces file, CT-Lib must be able to load the appropriate directory driver. If CT-Lib cannot load the required driver, you can set DS_Failover to specify whether CT-Lib should silently default (fail over) to using the Interfaces file as the directory source.		
	By default, DS_Failover specifies that CT-Lib should use the Interfaces file as the directory source if it cannot load the requested directory driver.		
	You must specify a value for DS_Failover <i>before</i> connecting to the database in PowerBuilder.		
	Using third-party directory service providers For information about the third-party directory service providers and operating system platforms that Sybase has tested with Open Client directory services, see the Open Client documentation.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	DS_Failover= <i>value</i>		
	Parameter	Description	
	value	<ul> <li>Specifies whether Sybase CT-Lib should silently default (fail over) to using the Interfaces file as the directory source if it cannot load the requested directory driver. Values are:</li> <li>O Prohibit CT-Lib from using the Interfaces file as the</li> </ul>	
		directory source if it cannot load the requested directory driver. You can also specify 'No' or 'False' to set this	

value.
1 (Default) Allow CT-Lib to use the Interfaces file as the directory source if it cannot load the requested directory driver. You can also specify 'Yes' or 'True' to set this value.

Default value	DS_Failover=1		
Usage	<i>When to use</i> To prevent CT-Lib from using the Interfaces file as the directory source if it cannot load the requested directory driver, set DS_Failover to 0.		
	If DS_Failover is set to 0 to prevent use of the Interfaces file and CT-Lib cannot load the requested directory driver, the connection's directory source is undefined. This causes certain operations requiring directory access to fail.		
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.		
	<i>Requirements for use</i> To use DS_Failover or any other parameter supporting Open Client directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your Database</i> .		
	<i>Corresponding CT-Lib connection property</i> Specifying a value for DS_Failover sets the corresponding Sybase CT-Lib connection property named CS_DS_FAILOVER.		
Examples	To prohibit CT-Lib from using the Interfaces file as the directory source if it cannot load the requested directory driver:		
	• <b>Database profile</b> Clear the Enable Failover check box on the Directory Services page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="DS_Failover=0"		
See also	DS_Alias DS_Copy DS_DitBase DS_Password DS_Principal DS_Provider DS_TimeLimit Release		

**Connection Reference** 

#### DS\_Password

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client 12.5 or higher software, DS_Password is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)		
	Some directory service providers and drivers require an authenticated principal (user ID) name and password to control an application's access to directory entries. For those providers and drivers, DS_Principal and DS_Password specify the principal name and password your application should use to identify you to the directory service provider.		
	You must specify a value for DS_Password <i>before</i> connecting to the database in PowerBuilder.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	DS_Password='pa	ssword	
	Parameter	Description	
	password	The password associated with the principal (user ID) name you specified in the DS_Principal parameter.	
Default value	None		
	PowerBuilder does not set DS_Password or the corresponding Sybase Op Client Client-Library (CT-Lib) connection parameter CS_DS_PASSWOR you do not specify a value.		
Usage	<i>When to use</i> If your directory service provider requires an authenticated principal name for directory access, set DS_Password to the password that goes with your directory service principal name.		
	Set Release parameter For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.		
	<i>Requirements for use</i> To use DS_Password or any other parameter supporting Open Client 12.5 directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your Database</i> .		

	<i>Corresponding CT-Lib connection property</i> Specifying a value for DS_Password sets the corresponding Sybase CT-Lib connection property named CS_DS_PASSWORD.		
Examples	To specify MYPASS as your application's password:		
	• <b>Database profile</b> Type the following in the Password box on the Directory Services page in the Database Profile Setup dialog box:		
	MYPASS		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="DS_Password='MYPASS'"		
	To specify MYPASS as your application's password, type MYPASS in the Password box on the Directory Services page in the Database Profile Setup dialog box.

#### **DS\_Principal**

Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, DS\_Principal is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)

Some directory service providers and drivers require an authenticated principal (user ID) name to control an application's access to directory entries. For those providers and drivers, DS\_Principal and DS\_Password specify the principal name and password your application should use to identify you to the directory service provider.

You must specify a value for DS\_Principal *before* connecting to the database in PowerBuilder.

	Using third-party directory service providers For information about the third-party directory service providers and operating system platforms that Sybase has tested with Open Client directory services, see the Open Client documentation.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise	
Syntax	DS_Principal='principal_name'	
	Parameter	Description
	principal_name	The principal (user ID) name your application should use to identify you to the directory service provider.
Default value	None	
	PowerBuilder does not set DS_Principal or the corresponding Sybase Open Client Client-Library (CT-Lib) connection parameter CS_DS_PRINCIPAL if you do not specify a value.	
Usage	geWhen to useIf your directory service provider requires an authenticat principal name for directory access, set DS_Principal to the principal (us name that goes with your directory service password.Set Release parameterFor this parameter to take effect, you must also Release parameter to 11or higher to specify that your application should u appropriate version of Sybase Open Client Client-Library (CT-Lib) beh See the description of the Release parameter for more information.Requirements for useTo use DS_Principal or any other parameter supp Open Client directory services, you must meet certain requirements for directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in Connecting to Database.	
<i>Corresponding CT-Lib connection property</i> Specifying a DS_Principal sets the corresponding Sybase CT-Lib connect named CS_DS_PRINCIPAL.		the corresponding Sybase CT-Lib connection property
Examples	To specify JSMIT	H as your application's principal name:
	• <b>Database profile</b> Type the following in the Principal Name box on the Directory Services page in the Database Profile Setup dialog box: JSMITH	
		Type the following in code:
	SQLCA.DBParm="DS_Principal='JSMITH'"	

DS\_Alias DS\_Copy DS\_DitBase DS\_Failover DS\_Password DS\_Provider DS\_TimeLimit Release

#### **DS\_Provider**

Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, DS\_Provider is one of several parameters that you can set to enable network-based directory services in your application. (For other directory services parameters, see the See Also section.)

When you use Open Client directory services, you must specify your directory service provider names in the Open Client/Open Server Configuration utility so that the required drivers can be loaded for each provider. The default directory service provider is the one currently specified as active in the Configuration utility.

DS\_Provider lets you specify a directory service provider name listed in the Open Client/Open Server Configuration utility *other than* the default (active) provider. The default value for DS\_Provider is the provider name currently specified as active in the Configuration utility.

You must specify a value for DS\_Provider *before* connecting to the database in PowerBuilder.

#### Using third-party directory service providers

For information about the third-party directory service providers and operating system platforms that Sybase has tested with Open Client directory services, see the Open Client documentation.

 Applies to
 ASE, SYC Sybase Adaptive Server Enterprise

 Syntax
 DS\_Provider='provider\_name'

	Parameter	Description	
	provider_name	The directory service provider name you want to use for directory services.	
		The provider name is case sensitive. You must specify it <i>exactly as it appears</i> in the Open Client/Open Server Configuration utility.	
Default value	The default value for DS_Provider is the provider name currently specified as active in the Open Client/Open Server Configuration utility.		
Usage	the Open Client/C (active) provider.	DS_Provider to use a directory service provider specified in Open Server Configuration utility <i>other than</i> the default For instructions on using the Open Client/Open Server ity, see your Sybase Open Client/Server configuration guide.	
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.		
	<i>Requirements for use</i> To use DS_Provider or any other parameter supporting Open Client directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your</i> <i>Database</i> .		
		<i>T-Lib connection property</i> Specifying a value for the corresponding Sybase CT-Lib connection property ROVIDER.	
Examples	To specify NTRE	GISTRY as the directory service provider name:	
		ofile Type the following in the Provider box on the vices page in the Database Profile Setup dialog box:	
	NTREGIS	STRY	
	Application	Type the following in code:	
	SQLCA.I	DBParm="DS_Provider='NTREGISTRY'"	
		GISTRY as the directory service provider name, type e Provider box on the Directory Services page in the Setup dialog box.

DS\_Alias DS\_Copy DS\_DitBase DS\_Failover DS\_Password DS\_Principal DS\_TimeLimit Release

#### **DS\_TimeLimit**

Description	PowerBuilder to parameters that	ess a Sybase Adaptive Server Enterprise database in hrough Open Client, DS_TimeLimit is one of several you can set to enable network-based directory services in your or other directory services parameters, see the See Also section.)	
	Some directory service providers and drivers support the use of time limits for a directory search. For those providers and drivers, DS_TimeLimit specifies the maximum number of seconds that a directory search lasts.		
	By default, DS_TimeLimit specifies that there is no time limit for a directory search.		
	You must specify a value for DS_TimeLimit <i>before</i> connecting to the database in PowerBuilder.		
	<b>Using third-party directory service providers</b> For information about the third-party directory service providers and operating system platforms that Sybase has tested with Open Client directory services, see the Open Client documentation.		
Applies to	ASE, SYC Syb	base Adaptive Server Enterprise	
Syntax	DS_TimeLimit='value'		
	Parameter	Description	
	value	Specifies the maximum number of seconds that you want a directory search to last. You can also specify 'no_limit' (the default) to indicate that there is no time limit for the directory search.	
		If the specified time limit expires and the target has not been found, the directory search is unsuccessful and the PowerBuilder connection fails.	

Default value	DS_TimeLimit='no_limit'
Usage	<i>Set Release parameter</i> For DS_TimeLimit to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
	<i>Requirements for use</i> To use DS_TimeLimit or any other parameter supporting Open Client directory services, you must meet certain requirements for using directory services in your PowerBuilder application. For details, see "Requirements for using Open Client directory services" in <i>Connecting to Your Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for DS_TimeLimit sets the corresponding Sybase CT-Lib connection property named CS_DS_TIMELIMIT.
Examples	To specify that you want the directory search to last a maximum of 120 seconds (2 minutes):
	• <b>Database profile</b> Type 120 in the Directory Search Time Limit box on the Directory Services page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="DS_TimeLimit=120"
See also	DS_Alias DS_Copy DS_DitBase DS_Failover DS_Password DS_Principal DS_Provider Release
Encrypt	
Description	Specifies that data should be encrypted before sending it over the network.
	When to specify Encrypt You must specify the Encrypt parameter <i>before</i> connecting to the database.
Applies to	SNC SQL Native Client for Microsoft SQL Server
Syntax	Encrypt=value

	Parameter	Description
	value	Specifies whether data should be encrypted. This parameter is used in conjunction with the TrustServerCertificate DBParm. Values are:
		• <b>0</b> (Default) No encryption occurs.
		• 1 If TrustServerCertificate is not set, encryption occurs only if there is a verifiable server certificate. If TrustServerCertificate is set, encryption always occurs, but may use a self-signed server certificate.
Default value	Encrypt=0	
Usage	to the server. If a	5 always encrypts network packets associated with logging in no certificate is provided on the server when it starts up, SQL s a self-signed certificate that is used to encrypt login packets.
	Client to request (SSL), and to ac request encrypti Native Client co used when a cer	figuration Manager can be used to configure the SQL Native t an encrypted connection using the Secure Sockets Layer cept a self-signed certificate without validation. You can also on by setting the Encrypt DBParm to 1, which sets the SQL nunection string keyword Encrypt. To enable encryption to be tificate has not been provided on the server, set both Encrypt Certificate. The value of TrustServerCertificate is ignored if et.
Examples	To specify that I	PowerBuilder should encrypt data:
	-	<b>rofile</b> Select the Encrypt Data check box on the System page base Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA	.DBParm="Encrypt=1"
See also	TrustServerCert	ificate

#### **EncryptionPass**

Specifies a password for encrypting and decrypting data. Description

When to specify EncryptionPass You must specify the EncryptionPass parameter *before* connecting to the database.

Applies to	I10 Informix		
Syntax	EncryptionPass='value'		
	Parameter	Description	
	value	A string that will be used as the password for encrypting and decrypting data.	
Default value	None.		
Usage	In IDS 10.0 and later, the SQL statement SET ENCRYPTION PAS improve the confidentiality of data and support data integrity by resetting a password for encryption and decryption of data at the		
	page in the Datab password and an password does no encrypted in the	EncryptionPass and Hint static DBParms on the System tab base Profile Setup dialog box for I10 connections to specify a optional hint to help you remember the password. The ot display in the database Profile Setup dialog box and is database profile in the registry. The application uses built-in ns to encrypt and decrypt character data.	
Examples		medes as the password for data encryption and Eureka as the remember the password:	
	-	<b>Tofile</b> Enter Archimedes in the Encryption Password box n the Hint box on the System page in the Database Profile box.	
	Application	Type the following in code:	
		DBParm="EncryptionPass='Archimedes', Eureka'"	
See also	Hint		
EncryptPasswor	d		

Description	Specifies whether you want PowerBuilder to encrypt your password automatically when connecting to an OLE DB data provider.		
	When to specify EncryptPassword You must specify the EncryptPassword parameter <i>before</i> connecting to the database.		
Applies to	OLE DB		
Syntax	EncryptPassword='value'		

	Parameter	Description
	value	Specifies whether you want PowerBuilder to encrypt your password. Values are:
		• True Tells PowerBuilder to encrypt the password
		• <b>False</b> (Default) Tells PowerBuilder not to encrypt the password
Default value	EncryptPassw	vord='False'
Examples	To tell PowerBuilder to encrypt your password when connecting to Micros SQL Server or an OLE DB data provider:	
		<b>e profile</b> Select the Encrypt Password check box on the page in the Database Profile Setup dialog box.
	Applicat	ion Type the following in code:
	SQLO	CA.DBParm="EncryptPassword='True'"
See also	DataLink IntegratedSec MaskPasswor PersistEncryp	rd

#### FailoverPartner

Description Specifies the name of a mirror server, allowing you to maintain database availability if a failover event occurs.

Applies to	SNC SQL Native Client for Microsoft SQL Server			
Syntax	FailoverPartner = <i>value</i>			
	Parameter	Description		
	value	Specifies the name of a mirror server.		
Default value	None	None		
Usage	When failover occurs, the existing PowerBuilder connection to SQL Server is lost. The SNC driver releases the existing connection and tries to reopen it. If reconnection succeeds, PowerBuilder triggers the DBNotification event.			
	The following conditions must be satisfied for PowerBuilder to trigger the failover event:			
	• The FailoverPartner DBParm is supplied at connect time			
	• The SQL Server database is configured for mirroring			
	• PowerBuilder is able to reconnect successfully when the existing connection is lost			
	When failover occurs:			
	• PowerBuilder returns an error code (998) and triggers the DBNotification event with notification type DBFailover!			
	• Existing cursors cannot be used and should be closed			
	• Any failed database operation can be tried again			
	• Any uncommitted transaction is lost. New transactions must be started			
Examples	The following example sets the name of a mirror server for failover events:			
	• <b>Database profile</b> Type the mirror server name in the Failover Partner text box on the System page of the Database Profile Setup dialog box.			
	Applicatio	<b>n</b> Type the following in code:		

my\_trans.dbparm="FailoverPartner='myMirrorServer'"

FoDelay		
Description	Specifies the amount of time (in milliseconds) you want PowerBuilder to wait between attempts to fail over to another database server if the current database server goes down.	
	When to specify You must specify	<b>FoDelay</b> the FoDelay parameter <i>before</i> connecting to the database.
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	FoDelay=' <i>value</i> '	
	Parameter	Description
	value	Specifies the amount of time in milliseconds you want PowerBuilder to wait between attempts to fail over to an another database server.
Default value	FoDelay='10'	
Usage	You can enter a failover delay value only if you have enabled failover.	
	-	nnot be set dynamically. The value set when the connection n effect until it is disconnected.
Examples	To tell PowerBuil	der to wait 20 milliseconds between attempts to fail over:
	-	ofile Type 20 in the Delay box on the Network page in the file Setup dialog box.
	Application	Type the following in code:
	SQLCA.1	DBParm="FoDelay='20'"
See also	SvrFailover	
FoDialog		
Description	Specifies whether a failover occurs.	PowerBuilder displays a runtime dialog box indicating when

When to specify FoDialog You must specify the FoDialog parameter *before* connecting to the database.

Applies to	ASE, SYC Sybas O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	e Adaptive Server Enterprise
Syntax	FoDialog=' <i>value</i> '	
	Parameter	Description
	value	Specifies whether you want PowerBuilder to display a runtime dialog box indicating when a failover occurs. Values are:
		• No (Default) PowerBuilder should not display a dialog box.
		• <b>Yes</b> PowerBuilder should display a dialog box.
Default value	FoDialog='No'	
Usage	You can display a runtime dialog box only if you have enabled failover. Th dialog box does not display in EAServer or COM+.	
		nnot be set dynamically. The value set when the connection n effect until it is disconnected.
Examples	To tell PowerBuil	der to display a runtime dialog box when a failover occurs:
		<b>ofile</b> Select the Display Runtime Dialog When Failing Over the Network page in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.I	DBParm="FoDialog='Yes'"
See also	SvrFailover	
FoRetryCount		

Description	Specifies the number of times you want PowerBuilder to try to fail over to an another database server if the current database server goes down.
	When to specify FoRetryCount You must specify the FoRetryCount parameter <i>before</i> connecting to the database.
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>
Syntax	FoRetryCount=' <i>value</i> '

	Parameter	Description
	value	Specifies the number of times you want PowerBuilder to try to
		fail over.
Default value	FoRetryCount='1	0'
Usage	You can enter a failover retry value only if you have enabled failover.	
	-	nnot be set dynamically. The value set when the connection n effect until it is disconnected.
Examples	To tell PowerBuil	der to try 20 times to fail over:
		ofile Enter the value 20 in the Retry Count box on the e in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.I	DBParm="FoRetryCount='20'"
See also	SvrFailover	

# FormatArgsAsExp

Description	Controls whether PowerBuilder converts a DataWindow object retrieval argument of decimal datatype to scientific (exponential) notation if the argument exceeds 12 digits but has fewer than 16 digits. If FormatArgsAsExp is set to Yes (the default), PowerBuilder performs this conversion.		
	When to specify FormatArgsAsExp You must specify a value for FormatArgsAsExp <i>before</i> connecting to the database.		
Applies to	ASE, SYC, and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect JDB JDBC ODBC interface O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>		
Syntax	FormatArgsAsExp= ' <i>value</i> '		

	Parameter	Description	
	value	Specifies whether you want PowerBuilder to convert a DataWindow or report retrieval argument of decimal datatype to scientific (exponential) notation if the argument exceeds 12 digits but has fewer than 16 digits. Values are:	
		• Yes PowerBuilder converts a retrieval argument of decimal datatype to scientific notation if it exceeds 12 digits but has fewer than 16 digits.	
		• No (Default) PowerBuilder leaves the retrieval argument as a decimal and does not perform the default conversion to scientific notation if it exceeds 12 digits but has fewer than 16 digits.	
Default value	FormatArgsAsExp='No'		
Usage	<i>When to use</i> The setting of FormatArgsAsExp might affect the speed of data retrieval in your DataWindow objects, especially if you are accessing large databases.		
	If FormatArgsAsExp is set to Yes, PowerBuilder converts retrieval arguments of type decimal to scientific notation if the argument exceeds 12 digits but has fewer than 16 digits. Some DBMS optimizers might interpret the resulting scientific notation as a different datatype and scan all rows in the table to find it. This can slow data retrieval if, for example, you are accessing a DB2 database with many large tables.		
	Setting FormatArgsAsExp to No tells PowerBuilder to leave the retrieval argument as a decimal and not convert it to scientific notation. This speeds data retrieval for large databases.		
	<b>Retrieval argument size limited</b> The FormatArgsAsExp parameter is relevant only if a retrieval argument of type decimal has fewer than 16 digits.		
Examples	To tell PowerBuilder to convert a retrieval argument exceeding 12 digits but with fewer than 16 digits to scientific notation:		
	• <b>Database profile</b> Check the Format Arguments in Scientific Notation check box on the Syntax page (or Transaction page in the case of the DIR interface) in the Database Profile Setup dialog box.		
	Application	Type the following in code:	
	SQLCA.I	DBParm="FormatArgsAsExp='Yes'"	

Description	Specifies how DataWindows generates =null and <> null expressions in retrieval arguments.		
Applies to	All database interfaces		
Syntax	GenerateEqualsNull= ' <i>value</i> '		
	Parameter Description		
	<ul> <li>Yes Does not change =null or &lt;&gt; null expressions.</li> <li>No Converts =null expression to IS NULL, &lt;&gt; null to IS NOT NULL.</li> </ul>		
Default value	GenerateEqualsNull='No'		
Usage	When to use When a DataWindow retrieves data from tables that contain n columns, most DBMS interfaces expect expressions of the form, IS NULL a IS NOT NULL. Expressions that reference null data as values, such as Where column = NULL, can cause the DBMS to reject the retrieval. For this reason such expressions in DataWindows are normally converted to the standard ANSI syntax during retrieval.		
	If your DataWindow retrieves null data from a DBMS that supports expressions of the =null or <> null form, and you want to suppress the conversion of those expressions to standard syntax, you can set the GenerateEqualsNull DBParm to true.		
Examples	Consider these two statements:		
	SELECT "al"."c1" FROM "a1" WHERE "a1"."c2" = :p1 SELECT "a1"."c1" FROM "a1" WHERE "a1"."c2" <> :p1		
	If GenerateEqualsNull is set to false, the statements are generated as:		
	SELECT "al"."cl" FROM "al" WHERE "al"."c2" is null SELECT "al"."c1" FROM "a1" WHERE "al"."c2" is not null		
	If GenerateEqualsNull is set to true, the statements are generated as:		
	SELECT "al"."c1" FROM "al" WHERE "al"."c2" = null SELECT "al"."c1" FROM "a1" WHERE "a1"."c2" <> null		

#### GenerateEqualsNull

#### GetConnectionOption

Description

Specifies how EAServer should behave if all connections in a cache are being used. This parameter applies *only* when a PowerBuilder custom class user object is deployed as an EAServer component.

Applies to	JDB JDBC ODBC O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SYJ Sybase Adap	ptive Server Enterprise	
Syntax	GetConnectionOption='value'		
	Parameter	Description	
	value	Specifies how EAServer should behave if all connections in a cache are being used. Values are:	
		• JAG_CM_FORCE (Default) Allocates and opens a new connection. The new connection is not cached and is deallocated when the connection is explicitly or implicitly closed by the component.	
		• JAG_CM_NOWAIT Fails with an error if no connection can be made.	
		• <b>JAG_CM_WAIT</b> Does not return until a connection is available.	
Default value	GetConnectionOption='JAG_CM_FORCE'		
Usage	This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.		
	<b>Using the SYJ interface</b> Sybase EAServer uses a slightly different version of the CT-Lib software. Therefore, <i>at runtime</i> , you need to use the SYJ database interface rather than ASE or SYC to connect to an Adaptive Server Enterprise database. The SYJ Database Profile Setup dialog box provides a convenient way to set the appropriate connection parameters and then copy the syntax from the Preview page into the script for your Transaction object.		
	PowerBuilder de <i>phase</i> (before the	the SYJ interface, however, to connect to the database in the velopment environment. Therefore, <i>during the development</i> e component has been deployed to EAServer), you must use connect to the database.	
	For information of see <i>Application 1</i>	on how to use PowerBuilder to build EAServer components, <i>Fechniques</i> .	

Examples	On the EAServer page in the Database Profile Setup dialog box, select JAG_CM_NOWAIT from the Get Connection Option drop-down list. The PowerScript syntax for the GetConnectionOption parameter displays on the Preview page:
	SQLCA.DBParm="GetConnectionOption='JAG_CM_NOWAIT'"
	Copy the syntax from the Preview page into your script.
See also	CacheName ReleaseConnectionOption UseContextObject

## **HANotification**

Description	Specifies whether a High Availability (HA) client connected to an RAC database will be notified if the database server shuts down.	
Applies to	O10 Oracle 10g	
Syntax	HANotification=value	
	Parameter	Description
	value	A value specifying whether the client will be notified if the database server shuts down. Values are:
		<ul> <li>No (Default) Do not notify the client if the server shuts down.</li> <li>Yes Notify the client if the server shuts down.</li> </ul>
Default value	HANotification="No"	
Usage	Oracle Real Application Clusters (RAC) is a cluster database that uses a shared cache architecture. In Oracle $10g$ Release 2, a High Availability (HA) client connected to an RAC database can register a callback to indicate that it wants the server to notify it in case of a database failure event that affects a connection made by the client. The DBNotification event on the Transaction object is triggered when the client is notified that such an event has occurred.	
	The HANotification database parameter must be set to "Yes" for the DBNotification event to be triggered when the database server shuts down. If HANotification is set to "Yes", the Oracle client and server must both be Oracle 10g version 10.2.0.1.0 or higher or the connection will fail.	
	This database parameter is not supported by EAServer and MTS/COM+ and will be ignored in PowerBuilder component connections on EAServer and MTS/COM+.	

Examples

To specify that the HA client should be notified when the database server shuts down:

- **Database profile** Select the HANotification check box on the System page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

```
SQLCA.DBParm="HANotification='Yes'"
```

### HighSeverityError

Description	Determines whether the first error or the highest severity error is reported when more than one error is raised during the connection or attempted connection to the database	
Applies to	SNC SQL Native Client for Microsoft SQL Server	
Syntax	HigSeverityError= <i>value</i>	
	Parameter	Description
	value	<ul> <li>Specifies the error to be reported when multiple errors are raised. Values are:</li> <li>0 (Default) The first error raised is the reported error.</li> <li>1 The error with the highest severity code is the reported error.</li> </ul>
Default value	HighSeverityError=0	
Usage	When you set this DBParm to 1, PowerBuilder chooses the error with the highest severity code to pass back to the caller.	
Examples	To have PowerBuilder report the error with the highest severity code, use the following DBParm setting:	
	SQLCA.DBI	Parm="HighServerityError=1"

### Hint

Description	Specifies a hint to assist in remembering the password specified for encrypting
	and decrypting data.

#### When to specify Hint

You must specify the Hint parameter before connecting to the database.

Applies to	I10 Informix		
Syntax	Hint=' <i>value</i> '		
	Parameter	Description	
	value	A string that will be used as a hint to help you remember the password used for encrypting and decrypting data.	
Default value	None.		
Usage	In IDS 10.0 and later, the SQL statement SET ENCRYPTION PASSWORD can improve the confidentiality of data and support data integrity by defining or resetting a password for encryption and decryption of data at the column level.		
	page in the Data password and an password does n encrypted in the	EncryptionPass and Hint static DBParms on the System tab base Profile Setup dialog box for I10 connections to specify a optional hint to help you remember the password. The ot display in the database Profile Setup dialog box and is database profile in the registry. The application uses built-in ns to encrypt and decrypt character data.	
Examples	To specify Archimedes as the password for data encryption and Eureka as the hint to help you remember the password:		
	• <b>Database profile</b> Enter Archimedes in the Encryption Password box and Eureka in the Hint box on the System page in the Database Profile Setup dialog box.		
	Application	Type the following in code:	
		DBParm="EncryptionPass='Archimedes', Eureka'"	
See also	EncryptionPass		

# Host

Description	If your DBMS supports it, specifies the workstation name when connecting to the database in PowerBuilder. The Host parameter lets you assign any 10-character label to identify the process you are about to create when you connect to the database. This label helps you distinguish your process from others running on the database server.			
	When to specify Host You must specify the Host parameter <i>before</i> connecting to the database in PowerBuilder.			
Applies to	ASE, SYC Sybase Adaptive Server Enterprise SNC SQL Native Client for Microsoft SQL Server			
Syntax	Host='workstation_name'			
Default value	None			
Usage	For Adaptive Server, when you specify a value for Host, PowerBuilder sets the CS_HOSTNAME connection property to the workstation name you specify.			
	The value you specify for the Host parameter displays in the hostname column of the MASTER.DBO.SYSPROCESSES table in a SQL Server database. How you use the Host parameter depends on the design of your PowerBuilder application.			
	For example, many sites want to secure their production tables so that updates are possible only through a specific application. To do this, you can grant explicit authority to the PowerBuilder application but <i>not</i> to users. The application prompts the user for an authorization ID and password, verifies it, and then connects to the database through a single application login ID. Only this application login ID has authorization to update production tables.			
	In this scenario, you can use the Host parameter to store the name of the user running the application.			
Examples	<b>Example 1</b> To set the host name to Alan:			
	• <b>Database profile</b> Type the following in the Workstation Name box on the Network page in the Database Profile Setup dialog box:			
	Alan			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="Host='Alan'"			

**Example 2** You can use the Host and AppName parameters together to specify both the host name and the application name. To set the host name to Jane and the application name to Sales:

- **Database profile** Type Jane in the Workstation Name box and Sales in the Application Name box on the Network page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="Host='Jane', AppName='Sales'"

**Example 3** The Host name in the preceding examples is hard coded. You can get the name dynamically using the Windows GetComputerNameW function. There is no PowerScript equivalent for this function. Here is the external function declaration:

```
FUNCTION boolean GetComputerNameW(ref string cname,ref long nbuf) LIBRARY "Kernel32.dll"
```

The following code in the Open event of the application uses an external function call to get the host name and set its value in the Host parameter. You must allocate sufficient space for the returned host name:

```
string ls_compname
long ll_buf
ll_buf=25
ls_compname=space(ll_buf)
GetComputerNameA(ls_compname, ll_buf)
// Profile mysyb
SQLCA.DBMS="SYC Adaptive Server Enterprise"
SQLCA.Database="mydata"
SQLCA.LogPass="mylogpass"
SQLCA.LogId="mylogid"
SQLCA.LogId="mylogid"
SQLCA.AutoCommit=False
SQLCA.DBParm="Host='" + ls_compname + "'"
```

Connect using SQLCA;

See also

AppName

## HostReqOwner

Description	Specifies the name of the host request library defined in a DB2/MVS database.		
	When to specify HostReqOwner You must specify the HostReqOwner parameter <i>before</i> connecting to the database.		
Applies to	DIR Sybase DirectConnect (applies only to Access Service for DB2/MVS and Open ServerConnect <sup>TM</sup> )		
Syntax	HostReqOwner='owner_id		
Default value	HostReqOwner='Sybase'		
Usage	The host request library is a special DB2 table that stores host-resident requests. A host-resident request is a SQL statement that a client applicatio can execute as a procedure. If you do not use Sybase as the owner name for th host request library, you should set the HostReqOwner parameter to an appropriate name for your site.		
	<b>TRS Support</b> The HostReqOwner parameter is not applicable to DirectConnect TRS connections.		
Examples	To set the name of your host request library to Stratus:		
	• <b>Database profile</b> Type Stratus in the Host Request Lib Owner box on the System page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="HostReqOwner='Stratus'"		
See also	TRS UseProcSyntax		

## IdentifierQuoteChar

Description	the names of ident generates SQL stat	e quote character you want PowerBuilder to use to delimit ifiers (tables, columns, indexes, and constraints) when it tements. PowerBuilder uses the quote character you specify ult quote character returned by your driver or data provider.	
	<b>DelimitIdentifier must be set to Yes</b> In order for IdentifierQuoteChar to take effect, the DelimitIdentifier parameter must be set to Yes. Otherwise, PowerBuilder's default behavior is <i>not</i> to delimit identifiers in SQL statements and to ignore any value specified for IdentifierQuoteChar.		
Applies to	ADO.NET JDB JDBC ODBC (if driver and back-end DBMS support this feature) OLE DB		
Syntax	IdentifierQuoteCha	ar = 'quote_character'	
	Parameter	Description	
	quote_character	The single character you want PowerBuilder to use instead of your driver's or data provider's default quote character to delimit the names of identifiers in SQL statements.	
Default value	None		
	PowerBuilder searches the following in this order to determine the IdentifierQuoteChar value:		
	1 The section for your database profile in the PowerBuilder initialization file (in the development environment) or the value of the Transaction object DBParm property (in a PowerBuilder application)		
	2 The section for your ODBC driver in the PBODB125 initialization file or the section for your JDBC driver in the registry		
	If PowerBuilder does not find an IdentifierQuoteChar value in these locations, it makes a SQLGetInfo call to your driver to return the default SQL_IDENTIFIER_QUOTE_CHAR value.		
	When using the C If no value is speci does not use a quo	ified for the IdentifierQuoteChar parameter, PowerBuilder	

Usage	By default, some drivers return quote characters that do not work with PowerBuilder's parsing routines, such as the backquote character (`). As a result, delimiting is turned off for these drivers in PowerBuilder.		
	However, if you paint SQL statements containing identifiers that require delimiters, syntax errors can occur if you are using a driver for which delimiting is turned off. To avoid such errors, set IdentifierQuoteChar to override the driver's default quote character.		
Examples	To specify $c$ as the quote character you want PowerBuilder to use to delimit identifiers in SQL statements:		
	• <b>Database profile</b> Type c in the Identifier Quote Character box on the Syntax page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="IdentifierQuoteChar='c'"		
See also	DelimitIdentifier		
Idontity			
Identity			
Description	Specifies the syntax the SNC database interface uses to obtain the identity		

Server table that of the SNC interface Identity database implemented.	dow update request inserts a new row into a Microsoft SQL contains an IDENTITY column, the DataWindow engine calls e to obtain the identity value of the newly inserted row. The parameter allows you to define how this request is	
SNC SQL Native	Client for Microsoft SOL Server	
	SNC SQL Native Client for Microsoft SQL Server	
Identity=value		
Parameter	Description	
value	A value specifying the syntax for obtaining the identity value of a newly inserted row. Values are:	
	• <b>@@IDENTITY</b> (Default) Use the syntax SELECT @@identity.	
	• <b>IDENT_CURRENT()</b> Use the syntax SELECT IDENT CURRENT('tablename').	
	• <b>SCOPE_IDENTITY()</b> Use the syntax SELECT scope_identity().	
	Identity= <i>value</i> Parameter	

Default value

Identity="@@IDENTITY"

Usage	By default, the SNC interface issues SELECT @@identity to obtain the IDENTITY column value of the newly inserted row. It returns the last IDENTITY value produced on a connection, regardless of the table that produced the value, and regardless of the scope of the statement that produced the value.			
	SELECT IDENT_CURRENT('tablename') returns the last IDENTITY value produced in a table, regardless of the connection that created the value, and regardless of the scope of the statement that produced the value.			
	$\label{eq:select_scope_identity} \end{tabular} select \end{tabular} scope_identity () returns the last IDENTITY value produced on a table and by a statement in the same scope, regardless of the table that produced the value.$			
	Because Identity is a dynamic database parameter, it can be set and reset at any time during an application.			
Examples	To specify the syntax for obtaining the identity value of a newly inserted row:			
	• <b>Database profile</b> Select SCOPE_IDENTITY() from the DataWindow Identity Value drop-down list on the Syntax page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="Identity='SCOPE_IDENTITY()'"			

### ImpersonationLevel

 Description
 Specifies the level of impersonation that the data server is allowed to use when impersonating its OLE DB data provider and PowerBuilder. This parameter applies only to network connections other than Remote Procedure Call (RPC) connections.

 When to specify ImpersonationLevel You must specify the ImpersonationLevel parameter before connecting to the database.

 Applies to
 OLE DB

Syntax

ImpersonationLevel='value'

	Parameter	Description
	value	Specifies the level of impersonation. Values are:
		• Not set No level of impersonation is selected.
		• <b>Anonymous</b> The client is anonymous to the server and the server process cannot obtain identification information about the client and cannot impersonate the client.
		• <b>Delegate</b> The process can impersonate the client's security context while acting on behalf of the client. The server process can also make outgoing calls to other servers while acting on behalf of the client.
		• <b>Identify</b> The server can obtain the client's identity. The server can impersonate the client for ACL checking but cannot access system objects as the client.
		• <b>Impersonate</b> The server process can impersonate the client's security context while acting on behalf of the client. This information is obtained when the connection is established, not on every call.
Default value	ImpersonationLevel='Not set'	
Examples	To set a level of impersonation to anonymous:	
		<b>profile</b> On the Security page in the Database Profile Setup x, select Anonymous from the Impersonation Level drop-down
	Applicat	<b>ion</b> Type the following in code:
	SQL( YMOU	CA.DBParm="IMPERSONATIONLEVEL='DB_IMP_LEVEL_ANON JS'"
See also	DataLink	
INET_DBPATH		
Description	identifies a lis typically spec	Informix DBPATH setting. The DBPATH environment variable t of directories that contain Informix databases. INET_DBPATH ifies the location of Informix databases if this is <i>other</i> than in a he database server.
Applies to	I10 Informix IN9 Informix	

	Parameter	Description
	server_db_path	The name of the directory containing Informix databases
Default value	•	Builder uses the value specified for DBPATH in the ACHINE\SOFTWARE\Informix\Environment registry key.
Examples	<b>Example 1</b> To sp databases:	becify that the directory /HOME/Informix contains Informix
		file Type the following in the Database Path box on the in the Database Profile Setup dialog box:
	/home/I	nformix
	Application	Type the following in code:
	SQLCA.D	BParm="INET_DBPATH='/home/Informix'"
	INET_PROTOCO directory /Informix	can specify values for INET_DBPATH, DL, and INET_SERVICE together. To specify that the x contains Informix databases, and that you want to connect rvice and the olsoctcp network protocol:
	Service Name	<b>file</b> Type / <i>Informix</i> in the Database Path box, turbo in the box, and olsoctcp in the Protocol Type box on the Network atabase Profile Setup dialog box.
	Application	Type the following on a single line in code:
		BParm="INET_DBPATH='/Informix',INET_SERVICE= ,INET_PROTOCOL='olsoctcp'"
See also	INET_PROTOCO INET_SERVICE	DL

## INET\_PROTOCOL

Description	Specifies the network protocol that the Informix client software uses to communicate with a remote Informix database server.
Applies to	I10 Informix IN9 Informix
Syntax	INET_PROTOCOL='network_protocol'

	Parameter	Description
	network_protocol	A string that specifies the name of the network protocol used by the Informix client software.
		For information about the correct network protocol for your site, see your Informix system administrator.
Default value	•	ilder uses the network protocol specified in the CHINE\SOFTWARE\Informix\SqlHosts registry key.
Examples	<b>Example 1</b> To spec network protocol:	ify that Informix client software uses the Novell IPX/SPX
		<b>e</b> Type ipx in the Protocol Type box on the Network base Profile Setup dialog box.
	Application T	ype the following in code:
	SQLCA.DBE	Parm="INET_PROTOCOL='ipx'"
	INET_PROTOCOL, directory /Informix c	n specify values for INET_DBPATH, and INET_SERVICE together. To specify that the ontains Informix databases, and that you want to connect ce and the olsoctcp network protocol:
	Service Name b	<b>e</b> Type / <i>Informix</i> in the Database Path box, turbo in the ox, and olsoctcp in the Protocol Type box on the Network base Profile Setup dialog box.
	Application T	ype the following on a single line in code:
		Parm="INET_DBPATH='/Informix',INET_SERVICE= ENET_PROTOCOL='olsoctcp'"
See also	INET_DBPATH INET_SERVICE	

# INET\_SERVICE

Description	Specifies the name of the service that a remote Informix database server uses to listen to all incoming requests from client applications.
Applies to	I10 Informix IN9 Informix
Syntax	INET_SERVICE='service_name'

	Parameter	Description
	service_name	A string that specifies the name of the service that a remote Informix database server uses to listen to incoming requests
		For information about the correct service name for your site, see your Informix system administrator.
Default value	•	rBuilder uses the service name specified in the MACHINE\SOFTWARE\Informix\SqlHosts registry key.
Examples	<b>Example 1</b> To s service name:	pecify that your Informix database server uses the sqlexec
		ofile Type sqlexec in the Service Name box on the e in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.I	DBParm="INET_SERVICE='sqlexec'"
	INET_PROTOCO directory /Informi	can specify values for INET_DBPATH, DL, and INET_SERVICE together. To specify that the ix contains Informix databases, and that you want to connect rvice and the olsoctcp network protocol:
	Service Name	<b>ofile</b> Type / <i>Informix</i> in the Database Path box, turbo in the e box, and olsoctcp in the Protocol Type box on the Network Database Profile Setup dialog box.
	Application	Type the following on a single line in code:
		DBParm="INET_DBPATH='/Informix',INET_SERVICE= ',INET_PROTOCOL='olsoctcp'"
See also	INET_DBPATH INET_PROTOCO	DL
Init_Prompt		
Description	Specifies whether	you want to be prompted during initialization.
	When to specify You must specify	Init_Prompt the Init_Prompt parameter <i>before</i> connecting to the database.
Applies to	OLE DB	
Syntax	Prompt='value'	

	Parameter Descri	ption
	-	s whether you want to be prompted during initialization.
	Values a	
		<ul><li>Set Do not prompt.</li><li>ys Always prompt for initialization information.</li></ul>
		eded Prompt only if more information is needed.
	• If ne	<b>eded (required)</b> Prompt only if more information is needed. ot allow the user to enter optional information.
	• Neve	er Do not prompt.
Default value	Init_Prompt='Not set'	
Examples	To specify that you wa	ant always to be prompted during initialization:
	=	Select Always from the Prompt drop-down list on the e Database Profile Setup dialog box.
	Application Type	be the following in code:
	SQLCA.DBPa	rm="INIT_PROMPT='DBPROMPT_PROMPT'"
See also	DataLink	
InsertBlock		
Description	-	of rows that you want the Data Pipeline in PowerBuilder to a table in the destination database.
	For instructions on us	ng the Data Pipeline, see the Users Guide.
Applies to	ODBC (only in Data I feature)	Pipeline if driver and back-end DBMS support this
Syntax	InsertBlock=insert_block	ocking_factor
	Parameter	Description
	insert_blocking_factor	The number of rows that you want the Data Pipeline to insert at one time into a table in the destination database, up to a maximum of 100 rows (Default=100 rows).
		To turn off block inserting for an ODBC data source in the Data Pipeline, set InsertBlock to 1 or DisableBind to 1 in the database profile of the destination database.
Default value	InsertBlock=100	

*Requirements for using InsertBlock* To use the InsertBlock parameter, *all* of the following must be true:

- You are using an ODBC driver to access the destination database in the Data Pipeline.
- The destination database supports the use of bind variables. (For more about bind variables, see DisableBind.)
- The DisableBind parameter is not set to 1 (the default is 0) in the database profile of the destination database. This enables the default binding of input parameters to a compiled SQL statement in PowerBuilder.
- Maximum Errors is set to 1 in the Data Pipeline.

The SQL Anywhere ODBC driver meets the first two requirements.

To determine whether your ODBC driver meets these requirements, see the documentation that comes with your driver.

*Determining the InsertBlock value* PowerBuilder searches the following in this sequence to determine the value for InsertBlock:

- 1 The section for your database profile in the PowerBuilder initialization file
- 2 The section for your ODBC driver in the PBODB125 initialization file

If PowerBuilder does not find an InsertBlock value in these locations, it defaults to an insert blocking factor of 100 rows.

*What happens* When PowerBuilder finds a value for InsertBlock, the Data Pipeline batches the specified number of rows and inserts them with a single call to the ODBC driver you are using to access the destination database.

If you specify an InsertBlock value or Data Pipeline commit factor of fewer than 100 rows, the Data Pipeline batches and inserts the specified number of rows into the destination database. If you specify more than 100 rows, the Data Pipeline batches and inserts at most only 100 rows at one time.

The insert blocking factor that the Data Pipeline actually uses depends on the size of the data in each column inserted in the destination database. In addition, the Data Pipeline does not exceed 64K of data in the buffer for any one column.

*Turning off block inserting* To turn off block inserting for an ODBC data source in the Data Pipeline, you can do any of the following in the database profile of the destination database:

- Set the InsertBlock parameter to 1
- Set the DisableBind parameter to 1 (to disable default binding of input parameters to a compiled SQL statement)

Usage

	• In the Data Pipeline, set Maximum Errors to a value other than 1
Examples	To set the insert blocking factor in the Data Pipeline to 50 rows:
	• <b>Database profile</b> Type 50 in the Insert Blocking Factor box on the Transaction page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="InsertBlock=50"
	To set the insert blocking factor in the Data Pipeline to 50 rows, type 50 in the Insert Blocking Factor box on the Transaction page in the Database Profile Setup dialog box.
See also	DisableBind

# IntegratedSecurity

5			
Description	Specifies the name of the authentication service used by the data server to identify the user.		
	parameters (C	If this parameter is specified, none of the other OLE DB authentication parameters (CacheAuthentication, EncryptPassword, MaskPassword, PersistEncrypted, and PersistSecurityInfo) are needed and are ignored if specified.	
		<b>cify IntegratedSecurity</b> cify the IntegratedSecurity parameter <i>before</i> connecting to the	
Applies to	OLE DB	OLE DB	
Syntax	IntegratedSecurity='value'		
	Parameter	Description	
	value	A string specifying the name of the authentication service. If NULL, the default authentication service is used.	
Default value	None		
Examples	To use an authentication service such as the Security Support Provider Interface (SSPI) for Windows NT:		
		<b>e profile</b> Type the name of the authentication service in the d Security box on the Security page in the Database Profile Setup bx.	

• **Application** Type the following in code:

SQLCA.DBParm="IntegratedSecurity='SSPI'"

### Isolation

Description

Sets the isolation level to use when connecting to the database.

In multiuser databases, transactions initiated by different users can overlap. If these transactions access common data in the database, they can overwrite each other or collide.

To prevent concurrent transactions from interfering with each other and compromising the integrity of your database, you can set the isolation level when you connect to the database. Isolation levels are used by .NET Framework data providers when performing a transaction.

PowerBuilder uses the Isolation database parameter to allow you to set various database lock options. Each value corresponds to an isolation level defined in the .NET Framework.

#### When to specify the Isolation value

You must set the Isolation value *before* you connect to the database. The Isolation value takes effect only when the database connection occurs. Changes made to the Isolation value after the connection occurs have no effect on the current connection.

#### Applies to ADO.NET

Syntax

#### ADO.NET

Isolation='value'

Parameter	Description	
value	A string specifying the isolation level. Values correspond to members of the .NET Framework IsolationLevel enumeration:	
	• TC – Chaos	
	<ul> <li>None specified – The default isolation level for the DBMS (Default)</li> </ul>	
	• RC – Read Committed	
	• RU – Read Uncommitted	
	• RR – Repeatable Read	
	• TS – Serializable Transactions	

Default value		ek value depends on how your database is configured. For be your DBMS documentation.	
Examples	<b>Example 1</b> To set the Isolation value to RC (Read Committed):		
	• <b>Development environment</b> Select Read Committed from the Isolation Level drop-down list in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following:		
	SQLCA.DBParm="Isolation='RC'"		
	the Preview pa	<b>mple in code</b> Isolation Level in your database profile, the syntax displays on ge in the Database Profile Setup dialog box. You can copy the e Preview page into your code.	
KeepAlive			
Description	Determines whether packets are sent to the database to ensure that the connection is still active.		
	When to spec You must spec	ify KeepAlive ify the KeepAlive parameter <i>before</i> connecting to the database.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	KeepAlive= <i>value</i>		
	Parameter	Description	
	value	Specifies whether the Open Client/Server CS_CON_KEEPALIVE property is set for your connection. Values are:	
		<ul> <li>1 (Default) CS_CON_KEEPALIVE property is set.</li> </ul>	
		• <b>0</b> CS_CON_KEEPALIVE property is not set.	
Default value	KeepAlive=1		
Usage	CS_CON_KE connection is a idle. Set the va	s the value of the Sybase CT-Lib connection property EPALIVE to true or false. The default setting ensures that your live by sending packets to the database when the connection is lue of this property to false for mobile clients that do not ant connections.	

Examples To set the KeepAlive value to 0 when you do not want to maintain a connection:

- **Database profile** Clear the Keep Connection Alive check box on the Network page.
- **Application** Type the following in code:

SQLCA.DBParm="KeepAlive=0"

### Language

Description	For those interfaces that support it, specifies the language you want to use when connecting to your target database.		
	When to specify Language You must specify the Language parameter <i>before</i> connecting to the database. The Language setting takes effect when you connect to the database.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect		
Syntax	Language=' <i>language_name</i> '		
Default value	None		
Usage	When you specify a value for Language, PowerBuilder:		
	Allocates a CS_LOCALE structure for this connection		
	• Sets the CS_SYB_LANG value to the language you specify		
	• Sets the SQL Server CS_LOC_PROP connection property with the new locale information		
	If you have previously set a value for the Locale parameter, which includes settings for the language and character set you want the Open Client software to use, you can override the language value by specifying a new value for the Language parameter and reconnecting to the database.		
	<i>Unicode data access</i> PowerBuilder can access Unicode data in an Adaptive Server Enterprise (ASE) 12.5 or higher Unicode database or in Unicode columns in ASE 12.5 or higher. PowerBuilder converts between double-byte character set (DBCS) data and Unicode automatically, provided that the Language and CharSet parameters are set with DBCS values (or the Locale parameter is set with DBCS values).		

	For example:
	Language='tchinese' CharSet='big5'
Examples	To set the Language parameter to French:
	• <b>Database profile</b> Type French in the Language box on the Connection page or Regional Settings page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Language='French'"
See also	CharSet Locale
LCID	
Description	Specifies the locale identifier that you want the OLE DB data provider to use.
	When to specify LCID You must specify the LCID parameter <i>before</i> connecting to the database.
Applies to	OLE DB
Syntax	LCID='Icid_name'
Default value	None
Usage	You specify the locale identifier at initialization. This provides a way for the data server to determine PowerBuilder's preferred locale language and character set. However, setting this parameter does not guarantee that all text returned to PowerBuilder is translated according to the locale ID.
Examples	To set the locale to US English:
	• <b>Database profile.</b> Type 1033 in the LCID box on the System page in the Database Profile Setup dialog box.
	• <b>Application.</b> Type the following in code:
	SQLCA.DBParm="LCID='1033'"
See also	CharSet Language

# Locale

Description	Specifies the locale name that you want the Sybase Open Client software to us when connecting to a Sybase Adaptive Server Enterprise database or a database accessed through DirectConnect in PowerBuilder.				
	When to specify Locale You must specify the Locale parameter <i>before</i> connecting to the database.				
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect				
Syntax	Locale=' <i>locale_name</i> '				
Default value	The default locale defined in your LOCALES.DAT file				
Usage	<i>Locales</i> Locales are stored as entries in a file named <i>LOCALES.DAT</i> . The <i>LOCALES.DAT</i> file contains information about the languages and character sets you are using with the Sybase Open Client software. The Sybase Open Client installation places the <i>LOCALES.DAT</i> file in the <i>\$SYBASE\LOCALES</i> directory.				
	An entry in the LOCALES.DAT file has the following format:				
	locale=locale_name, language_name, character_set_name				
	For example:				
	locale=default, us_english, cp850 locale=enu, us_english, cp850 locale=fra, french, cp850				
	<i>Why set Locale parameter</i> Setting a value for the Locale parameter lets you use a locale <i>other than the default locale</i> when accessing an Adaptive Server Enterprise or DirectConnect database. If you do not set a value for Locale, Sybase Open Client uses the default locale defined in your <i>LOCALES.DAT</i> file.				
	<i>What happens</i> When you specify a value for the Locale parameter, PowerBuilder:				
	Allocates a CS_LOCALE structure for this connection				
	• Sets the CS_LC_ALL value to the locale name you specify				
	Sets the SQL Server CS_LOC_PROP connection property with the new locale information				

	<i>Overriding Locale parameter</i> If you have previously set a value for the Locale parameter that includes settings for the language and character set you want to use, you can override the language or character set values by specifying new values for the Language or CharSet parameter and reconnecting to the database.
	<i>Unicode data access</i> PowerBuilder can access Unicode data in an ASE 12.5 or later Unicode database or in Unicode columns in ASE 12.5 or later. PowerBuilder converts between double-byte character set (DBCS) data and Unicode automatically, provided that the Locale parameter is set with DBCS values. For example, the Locale parameter should be set to chs or cht.
Examples	To set the locale to <i>fra</i> :
	• <b>Database profile</b> Type the following in the Locale box on the Regional Settings page in the Database Profile Setup dialog box:
	fra
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Locale='fra'"
	<i>What happens</i> Setting the Locale parameter to <i>fra</i> has the same effect as individually setting both the Language and CharSet parameters as follows:
	Language='French' CharSet='cp850'
See also	CharSet Language
Location	
Description	Specifies the location of the data source to which you want your OLE DB data provider to connect. Typically the location is the database server name.
	When to specify Location You must specify the Location parameter <i>before</i> connecting to the database.
Applies to	OLE DB
Syntax	Location='location_name'
Default value	None

Usage	Implementation of the Location parameter varies depending on the OLE DB data provider you are using. For specific information, see the data provider documentation provided by the OLE DB vendor.	
Log		
Description	Specifies whether the database server should log updates of text and image data in the transaction log. By default, the database server logs updates of text and image data in the transaction log.	
Applies to	ASE, SYC and S	SYJ Sybase Adaptive Server Enterprise
Syntax	Log= <i>value</i>	
	Parameter	Description
	value	A value that specifies whether the database server should log updates of text and image data in the transaction log. Values are:
		• <b>0</b> Do not log text and image updates in the transaction log. Specify this value only if your database server allows you to disable logging.
		• 1 (Default) Log text and image updates in the transaction log.
Default value	Log=1	
Usage	You should set the Log parameter to 0 only if your database server allows you to disable logging.	
Examples	<ul> <li>To specify that PowerBuilder should <i>not</i> log text and image updates in the transaction log:</li> <li>Database profile Clear the Log Text and Image Updates check box on the System page or Transaction page in the Database Profile Setup dialog box.</li> </ul>	
	Application	. Type the following in code:
	SQLCA.	DBParm="Log=0"
	To specify that PowerBuilder should <i>not</i> log text and image updates in the transaction log, clear the Log Text and Image Updates check box on the System page or Transaction page in the Database Profile Setup dialog box.	

# LoginTimeOut

Description	Specifies the number of seconds the JDBC or ODBC driver should wait for a login request to a JDBC database or an ODBC data source.	
Applies to	JDB JDBC ODBC (if driver and back-end DBMS support this feature)	
Syntax	LoginTimeOut= <i>value</i>	
	Parameter	Description
	value	The number of seconds you want the driver to wait for a login request
Default value	ODBC: LoginTimeOut=15; JDBC: LoginTimeOut=0	
Usage	If you set LoginTimeOut to 0, PowerBuilder does not call the JDBC or ODBC driver to set the LoginTimeOut value and instead waits the number of seconds specified by the JDBC or ODBC driver's client software. If you set LoginTimeOut to a value greater than 0, PowerBuilder does call the JDBC or ODBC driver to set the LoginTimeOut value.	
Examples	To set the Login	TimeOut value to wait 60 seconds for a login request:
	=	<b>rofile</b> Type 60 in the Login Timeout box on the Network Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.	DBParm="LoginTimeOut=60"

### LowerCaseIdent

Description	Specifies whether PowerBuilder displays identifier names in lowercase.	
Applies to	DIR Sybase DirectConnect (applies only to DB2/MVS)	
Syntax	LowerCaseIdent=' <i>value</i> '	
	Parameter	Description
	value	Specifies whether you want PowerBuilder to display identifier names in lowercase. Values are:
		• Yes Display identifier names in lowercase
		• No (Default) Do not display identifier names in lowercase
Default value	LowerCaseIdent	='No'

Usage	PowerBuilder displays identifier names in uppercase (the way they are stored in the database). The LowerCaseIdent parameter can be set only if the DelimitIdentifier parameter is set to No, indicating that PowerBuilder should not enclose table and column names in double quotes. If you try to enclose a table and column names in double quotes with identifier names in lowercase, the LowerCaseIdent parameter value is reset to the default value, and you receive a warning message.
	Migrating PBMDI and PBNET applications to PBDIR If you are migrating an application that previously used the InformationConnect DB2 Gateway or Net-Gateway for DB2 interface to the DirectConnect for DB2/MVS database interface, you should set the LowerCaseIdent parameter value to Yes. This enables you to continue to use the Select painter to edit DataWindows.
Examples	To have PowerBuilder display identifier names in lowercase:
	• <b>Database profile</b> Select the Display Identifiers In Lower Case check box on the Syntax page in the Database Profile Setup dialog box.
	• Application Type the following in code:
	SQLCA.DBParm="LowerCaseIdent='Yes'"

### **MapDateToDateTime**

Description	Maps the Oracle Date datatype to the DateTime datatype to enable the time part of the data to be retrieved.	
Applies to	JDB JDBC	
Syntax	MapDateToDateTime= <i>value</i>	
	Parameter	Description
	value	<ul> <li>Specifies whether the Oracle Date datatype is mapped to the DateTime datatype. Values are:</li> <li>0 (Default) The Oracle Date datatype is not mapped to the DateTime datatype. The time part of the Date column is not retrieved.</li> <li>1 The Oracle Date datatype is mapped to the DateTime datatype. The time part of the DateColumn is retrieved.</li> </ul>
Default value	MapDateToDate	Time=0

Usage	The Oracle Date datatype stores both date and time data. When you connect to Oracle using the Oracle JDBC Thin Driver, only the date part of the data is retrieved. To retrieve the time part of the data, set the MapDateToDateTime database parameter to map the datatype of Oracle Date columns to the DateTime datatype.		
Examples	To retrieve bo	th date and time data from an Oracle Date column:	
		<b>profile</b> Select the Map Date to DateTime check box on the on page in the Database Profile Setup dialog box.	
	Applicati	<b>on</b> Type the following in code:	
	SQLO	A.DBParm="MapDateToDateTime=1"	
MaskPassword			
Description	Specifies whether you want PowerBuilder to mask your password automatically when connecting to an OLE DB data provider.		
	When to specify MaskPassword You must specify the MaskPassword parameter <i>before</i> connecting to the database.		
Applies to	OLE DB		
Syntax	MaskPassword='value'		
	Parameter	Description	
	value	Specifies whether you want PowerBuilder to mask your password. Values are:	
		• <b>True</b> Tells PowerBuilder to mask the password	
		• False (Default) Tells PowerBuilder not to mask the password	
Default value	MaskPassword='False'		
Examples	To tell Powerl data provider:	Builder to mask your password when connecting to an OLE DB	
		e profile Select the Mask Password check box on the Security the Database Profile Setup dialog box.	
	Applicati	<b>on</b> Type the following in code:	
	SQLO	A.DBParm="MaskPassword='True'"	

See also DataLink

EncryptPassword
IntegratedSecurity
PersistEncrypted

### MaxConnect

Description	Sets the maximu when accessing	m number of simultaneous connections you want to make a database.
	setting MaxConi	is simultaneous connections. You can override this default by nect up to the maximum number of simultaneous connections e database server.
	When to specify You must specify the database.	<b>y MaxConnect</b> y a value for the MaxConnect parameter <i>before</i> connecting to
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect	
Syntax	MaxConnect=value	
	Parameter	Description
	value	The maximum number of simultaneous connections you want to make when accessing a database
Default value	MaxConnect=25	
Usage	connection prop	ASE, and SYC MaxConnect sets the Sybase CT-Lib erty CS_MAX_CONNECT to the number of simultaneous tions you specify for a single CT-Lib context.
Examples	To set the MaxC connections:	onnect value to a maximum of 50 simultaneous database
	box (when u	<b>rofile</b> Type 50 in the Maximum Client Library Connections sing the ASE or SYC interface) or the Maximum Connections ntext box (when using the DIR interface). This check box is ork page.
	Application	Type the following in code:
	SQLCA.	DBParm="MaxConnect=50"

## MaxFetchBuffer

Description	Sets the maximum size of the buffer into which theDataWindow object can fetch rows from the database. Using the MaxFetchBuffer parameter with the Block parameter can improve performance when accessing a database in PowerBuilder.		
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>		
Syntax	MaxFetchBuffer=b	ouffersize	
	Parameter	Description	
	buffersize	The number of bytes the fetch buffer can hold.	
Default value	5000000 (bytes)		
		<b>buffer size</b> ve to set a non-default value for MaxFetchBuffer. In most puffer size should meet your needs.	
Usage	You can use the MaxFetchBuffer database parameter in conjunction with the Block database parameter to improve performance when the size of a row invery large. The size of the actual fetch buffer is the product of the value of the blocking factor and the size of the row. If the fetch buffer required by the blocking fact and the row size is greater than the value of MaxFetchBuffer, the value of the blocking factor is adjusted so that the buffer is not exceeded. For example, if block=500 and the row size is 10KB, the fetch buffer is 5000KB, which equals the default maximum buffer size.		
		and MaxFetchBuffer dynamically in code after connecting axFetchBuffer cannot be set in the Database Profile Setup	
Examples	The following example the following factor to	mple sets the maximum fetch buffer size to 6000KB and the 500:	
	SQLCA.DBPa:	rm="MaxFetchBuffer=6000000,block=500"	
See also	Block (ODBC, OLE DB, Oracle, and SNC)		

MixedCase		
Description	Specifies whether you want connections to an Oracle database to be case sensitive or case insensitive.	
	connection and	edCase is set to 0. This setting specifies a case-insensitive assumes that all identifiers are uppercase. To make the Oracle sensitive, set the MixedCase parameter to 1.
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	MixedCase= <i>value</i>	
	Parameter	Description
	value	Specifies whether an Oracle database connection is case sensitive or case insensitive. Values are:
		• <b>0</b> (Default) The Oracle database connection is case insensitive. It assumes that all identifiers are uppercase.
		• 1 The Oracle database connection is case sensitive. It supports mixed case, uppercase, and lowercase identifiers.
Default value	MixedCase=0	
Usage	-	e MixedCase parameter to 1 and define a primary key for a le database, all of the following must contain only uppercase
	• The name of	f the primary key
	• The name of	f the table containing the primary key
	• The names	of any foreign keys that reference the primary key
Examples	To make an Ora	cle database connection case sensitive:
		<b>Trofile</b> Select the Case Sensitive check box on the Connection Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA	.DBParm="MixedCase=1"

MiyodCaso

### Mode

Description

Specifies access permission to the OLE DB data provider.

	When to specify Mode You must specify the Mode parameter <i>before</i> connecting to the da	tabase.	
Applies to	OLE DB		
Syntax	Mode='value'		
	Parameter Description		
	<i>value</i> Specifies access permission to the OLE DB data provider	. Values are:	
	• <b>Deny read share</b> Prevents other users from opening mode.	in read	
	• <b>Deny write share</b> Prevents other users from opening mode.	g in write	
	• <b>Exclusive share</b> Prevents other users from opening i mode.	n read/write	
	• <b>No share deny</b> Neither read nor write access can be other users.	denied to	
	• <b>Read/Write</b> Allows read/write access.		
	• <b>Read-only</b> Allows read access.		
	• Write-only Allows write access.		
Default value	None		
Examples	To allow other users read/write access to the OLE DB data provid	er:	
	• <b>Database profile</b> On the Transaction page in the Database Padialog box, select Read/Write from the Mode list box.	rofile Setup	
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="MODE='DB_MODE_READWRITE'"		
See also	DataLink		

# MsgTerse

Description	Specifies whether PowerBuilder should display terse error messages for JDBC or ODBC drivers. A terse error message is one without the SQLSTATE= <i>nnnn</i> prefix, where <i>nnnn</i> is the number of the error message.		
	•	Builder displays JDBC and ODBC error messages with the x. To display error messages without the SQLSTATE prefix, Yes '.	
Applies to	JDB JDBC ODBC		
Syntax	MsgTerse=' <i>value</i> '		
	Parameter	Description	
	value	Specifies whether PowerBuilder should display error messages without the SQLSTATE prefix. Values are:	
		• Yes Display error messages <i>without</i> the SQLSTATE prefix	
		• No (Default) Display error messages <i>with</i> the SQLSTATE prefix	
Default value	MsgTerse='No'		
Usage	You can set the MsgTerse parameter to 'Yes' to display shorter JDBC or ODBC error messages in PowerBuilder. This might be useful if space on your screen is limited.		
	For example, suppose you are using the Data Pipeline in PowerBuilder to pipe data to a SQL Anywhere ODBC database, and errors occur while you are executing the pipeline. If MsgTerse is set to 'No' (the default value), pipeline errors display in an Error dialog box <i>with</i> the SQLSTATE prefix (for example, SQLSTATE=23000).		
	If you specify MsgTerse='Yes' in the database profile of the SQL Anywhere destination database, the Data Pipeline displays terse ODBC error messages <i>without</i> the SQLSTATE prefix.		
	For instructions on using the Data Pipeline, see the PowerBuilder Users Guide.		
Examples	amplesTo specify that PowerBuilder should display terse error messSQLSTATE prefix:		
	-	ofile Select the Display Terse Error Messages check box on age in the Database Profile Setup dialog box.	
	Application	Type the following in code:	
	SQLCA.I	DBParm="MsgTerse='Yes'"	

### Namespace

Description Specifies the .NET Framework data provider to be used to access data.

		When to specify Namespace You must specify the Namespace parameter <i>before</i> connecting to the database. ADO.NET		
Applies to	ADO.NET			
Syntax	Namespace='va	Namespace='value'		
	Parameter	Description		
	value	Specifies a namespace to be used as the data provider for an ADO.NET connection. Supported namespaces can be selected from the drop-down list.		
Default value	None			
Usage		The .NET Framework data provider for a given DBMS describes a collection of classes used to access a data source in that format in the managed space.		
Examples		To specify that PowerBuilder should use the System.Data.OleDb namespace to connect to a database:		
		<b>profile</b> Select System.Data.OleDb from the Namespace drop- on the General page in the Database Profile Setup dialog box.		
	Applicatio	<b>n</b> Type the following in code:		
	SQLCA	.DBParm="Namespace='System.Data.OleDb'"		
NCharBind				
Description	Specifies whether PowerBuilder binds input string parameters to the Char or NChar datatype.			
Applies to	ADO.NET (Oracle.DataAccess.Client only) O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SNC SQL Native Client for Microsoft SQL Server			

NCharBind=value

Syntax

	Parameter	Description	
	value	Specifies whether PowerBuilder binds string input parameters to the Char or NChar datatype. Values are:	
		• <b>0</b> Binds string input parameters to the Char datatype.	
		• 1 Binds string input parameters to the NChar datatype.	
Default value	NCharBind=1 fo	or SNC, NCharBind=0 for other interfaces	
Usage	Varchar, Long a	efault NcharBind=0 setting is recommended for binding Char, nd Clob data. NcharBind=1 is recommended for binding 2 and Nclob data.	
	For SNC, the default NcharBind=1 is recommended for binding Nchar, Nvarchar, Ntext and Nvarchar(max) data. It encodes the string data as Unicode. NcharBind=0 is recommended for binding Char, Varchar, Text and Varchar(max) data. This setting converts the data to the ANSI string determined by the current operating system code page.		
		<b>ust be set to 0</b> o take effect, the DisableBind parameter must be set to 0. overrides the NcharBind setting.	
Examples	To specify that s	tring arguments should be bound as the NChar datatype:	
	-	<b>rofile</b> Select the NCharBind box on the Transaction page in e Profile Setup dialog box.	
	Application	Type the following in code:	
	SQLCA	.DBParm="NCharBind=1"	
See also	BindSPInput DisableBind RPCRebind UnicharBind		

# **NCharLiteral**

Description	Specifies whether the NChar literal replacement feature in the Oracle client is enabled. This feature replaces string literals on the client that are prefaced with the letter N with an internal format. The internal format is decoded to Unicode by the database server when the statement is executed.			
	When to speci You must speci database.	fy NCharLiteral fy the NCharLiteral parameter <i>before</i> connecting to the		
Applies to		O10 Oracle 10g ORA Oracle 11g		
Syntax	NCharLiteral=v	alue		
	Parameter	Description		
	value	Specifies whether PowerBuilder replaces string literals prefaced with the letter N in SQL command text. Values are:		
		• <b>'No'</b> (Default) The text of any literal is encoded in the same character set as the rest of the statement on the client.		
		• <b>'Yes'</b> The text of any literal prefixed by N is replaced with an internal format.		
Default value	NCharLiteral="	NCharLiteral='No'		
Usage	The NCharLiteral database parameter requires Oracle 10.2 or higher on both the client and the database server.			
	By default, in a SQL statement, the text of any literal is encoded in the same character set as the rest of the statement. The character set on the client is determined by the client character set defined in NLS_LANG. When the statement is executed, the character set on the client is converted to the character set on the database server.			
	Data in string literals is lost in the conversion if the character set on the database server does not contain the characters used on the client. NChar string literals are most affected by this issue because they are designed to be independent of the character set on the database server.			
	replaced with a to 'Yes'. This s with N in staten	ata loss, add the letter N before string literals that should be n internal format and set the NCharLiteral database parameter etting causes the Oracle client to encode all literals prefixed nents on the client with an internal format. The database server rals to Unicode when the statement is executed.		

For example, when NCharLiteral is set to "Yes", the string "some unicode data" in the following SQL statement is transferred from the client to the server with no data loss:

insert into table1 (id, ncharcol) values(1, N'some
unicode data')

Setting NCharLiteral to 'Yes' has no effect on DataWindow functions.

Examples To specify that string literals prefixed by the letter N should be replaced with an internal format on the client:

• **Database profile** Select the NChar Literal box on the Connection page in the Database Profile Setup dialog box.

• **Application** Type the following in code:

SQLCA.DBParm="NCharLiteral=1"

### NLS\_Charset

Description	Specifies the client-side character set for the current environment handle.
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>
Syntax	NLS_Charset='value'

	Parameter	Description
	value	Specifies the client-side character set for the current environment handle. Values are:
		• <b>Unicode</b> (Default) The OCI client uses the UTF-16 character set. When connecting to EAServer with a connection cache, the cache's database driver type must be OCI_9U.
		• Local The OCI client uses the current character set defined by the NLS_LANG parameter on the local computer. When connecting to EAServer with a connection cache, the cache's database driver type must be OCI_9.
		• ValidCharsetName Any valid character set name except AL16UTF16. To specify a value in the Database Profile Setup dialog box, type the name of the character set into the NLS Charset drop-down list box on the System page.
Default value	NLS_Charset='Unicode'	
Usage	When you specify a value for NLS_Charset, PowerBuilder sets the OCI NLS_CHARACTERSET property in the current connection. NLS_CHARACTERSET is a database parameter that specifies the character set encoding used to store CHAR, VARCHAR2, LONG, and CLOB datatypes. The value you set corresponds to the character set defined by the NLS_LANG client-side parameter. NLS_LANG defines the character set encoding of text that OCI gets from or sends to applications in bind or define variables or as SQL statements to be executed by the server.	

	For the national character set NLS_NCHAR_CHARACTERSET, the Oracle database interfaces always use the UTF-16 character set. If you are using pooling with the ORA driver, and two Oracle connections are connected to the same Oracle server but use different character sets, the connections must reside in different connection or session pools. All pooling-related DBParm parameters must be set before the initial database connection.		
	For EAServer connections, you can use only Unicode or Local. For COM+ connections, you can use only Local.		
Examples	To specify that the OCI client should use the current character set defined by the NLS_LANG parameter on the local computer to store string datatypes:		
	• <b>Database profile</b> Select Local from the NLS Charset drop-down list on the System page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="NLS_Charset='Local'"		
See also	StrByCharset		

# NumbersInternal

Description	internal 21-byte strings. The Nur	Sumbers should be retrieved from the database using Oracle's binary NUMBER datatype format instead of using OCI nbersInternal parameter is relevant <i>only</i> when you are acle database configured with an EBCDIC character set or I character set.	
		<b>y NumbersInternal</b> y the NumbersInternal parameter <i>before</i> connecting to the	
Applies to	0	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	NumbersInterna	l=value	
	Parameter	Description	
	value	<ul> <li>Specifies that numbers should be retrieved using Oracle's internal 21-byte binary NUMBER datatype format. Values are:</li> <li>0 (Default) Do not retrieve numbers in internal format.</li> <li>1 Retrieve numbers in internal format.</li> </ul>	

Default value	NumbersInternal=0		
Usage	In addition to specifying that numbers be retrieved from the database using Oracle's internal 21-byte binary NUMBER datatype format, the NumbersInternal parameter also provides an internal algorithm for deciphering the result.		
Examples	To specify that you want numbers to be retrieved using Oracle's internal format:		
	• <b>Database profile.</b> Select the Retrieve Numbers in Internal Format check box on the Syntax page in the Database Profile Setup dialog box.		
	• Application. Type the following in code:		

SQLCA.DBParm="NumbersInternal=1"

# NumericFormat

Description	If supported by the DBMS or back-end database, setting NumericFormat tells the driver to do special formatting of numeric strings in SQL syntax. This formatting affects how PowerBuilder generates numeric values in the SQL syntax it internally builds in DataWindow objects and sends to your database.		
Applies to	JDB JDBC ODBC		
Syntax	The syntax you use depends on the back-end DBMS you are accessing and how you want to format the numeric string.		
	The following are typical syntax examples for Oracle databases that format a numeric string with a comma as the decimal separator. (See the Examples section for information about how PowerBuilder generates numeric values in the SQL syntax it builds and sends to the database.)		
	In the PowerBuilder development environment, the Database Profile Setup dialog box inserts special characters (quotes) where needed, so you can specify just the NumericFormat value (%s in this example).		
	In code, you must use the following syntax:		
	<b>IBM DB2 syntax</b> If you are accessing an IBM DB2 database through the ODBC interface, use the following syntax for NumericFormat. Note the use of <i>one single quote</i> at the beginning and end of the string:		
	NumericFormat='%s,%s'		

**Oracle JDBC or ODBC syntax** If you are accessing an Oracle database through the JDBC or ODBC interface, use the following syntax for NumericFormat. Note the use of *three single quotes* at the beginning and end of the string:

NumericFormat='''%s,%s'''

Parameter	Description
1	<b>IBM DB2 syntax</b> Type a single open quote. PowerBuilder
	returns no open quote in the SQL syntax it builds and sends to the
	database, as required by IBM DB2 databases.
	Oracle, JDBC, or ODBC syntax Type three single open quotes.
	PowerBuilder parses the second and third quotes as one single
	open quote in the SQL syntax it builds and sends to the database
% s	Represents one or more digits to the left of the decimal in the
	numeric string. PowerBuilder substitutes this value with the digits
	to the left of the decimal when it builds the SQL syntax.
3	Represents the decimal separator character (in this case a comma)
% s	Represents one or more digits to the <i>right of the decimal</i> in the
	numeric string. PowerBuilder substitutes this value with the digits
	to the right of the decimal when it builds the SQL syntax.
	<b>IBM DB2 syntax</b> Type one single closed quote. PowerBuilder
	returns no closed quote in the SQL syntax it builds and sends to
	the database, as required by IBM DB2 databases.
	Oracle, JDBC, or ODBC syntax Type three single closed
	quotes. PowerBuilder parses the first and second quotes as one
	single closed quote in the SQL syntax it builds and sends to the
	database.
None	
None	
When to set Nu	<i>umericFormat</i> In general, you should <i>not</i> need to set the
NumericForma	at parameter. Most back-end DBMSs do not require that the
driver do specia	al formatting of numeric strings in SQL syntax. However, som
databases migh	nt require special formatting, such as an IBM DB2/MVS
	r configured to use a comma as the decimal separator.

In these cases, setting NumericFormat allows you to generate numeric values with special formatting in the SQL syntax that PowerBuilder builds in DataWindow objects and sends to your database. For example, if the decimal separator for your DBMS is a comma, you might want to set NumericFormat as shown in the Examples section below to use a comma as the decimal delimiter in the SQL syntax sent to your database.

Default value

Usage

Examples

**Example 1 (IBM DB2 syntax)** This example shows how to specify that you want PowerBuilder to generate two numeric values in the format *125,50* and *4,0*. PowerBuilder uses the comma as a decimal separator in the SQL syntax it builds in DataWindow objects and sends to an IBM DB2 database.

• **Database profile** Type the following in the Numeric Format box on the Syntax page in the Database Profile Setup dialog box:

%s,%s

• **Application** Type the following in code:

```
SQLCA.DBParm="NumericFormat='%s,%s'"
```

*What happens* PowerBuilder internally builds the following SQL INSERT statement in the DataWindow object and sends the syntax to your database. PowerBuilder returns no quotes in the SQL syntax.

```
INSERT INTO MYTABLE (a, b)
VALUES (125,50, 4,0)
```

**Example 2 (Oracle, JDBC, or ODBC syntax)** This example shows how to specify that you want PowerBuilder to generate two numeric values in the format '125,50' and '4,0'. PowerBuilder uses the comma as a decimal separator in the SQL syntax it builds in DataWindow objects and sends to an Oracle database.

• **Database profile** Type the following in the Numeric Format box on the Syntax page in the Database Profile Setup dialog box:

%s,%s

• **Application** Type the following in code:

SQLCA.DBParm="NumericFormat='''%s,%s'''"

*What happens* PowerBuilder internally builds the following SQL INSERT statement in the DataWindow object and sends the syntax to your database. PowerBuilder returns single quotes in the SQL syntax.

```
INSERT INTO MYTABLE (a, b)
VALUES ('125,50', '4,0')
```

DecimalSeparator

Objectineae		
Description	Allows PowerBuilder to turn off the Oracle Call Interface (OCI) object mode. By default, PowerBuilder sets the mode parameter of OCIInitialize(), the first OCI call in any OCI application, to OCI_OBJECT. When object mode is on, your application can define and use new database object types.	
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	ObjectMode=val	lue
	Parameter	Description
	value	Specifies whether object mode is enabled or not. Values are:
		• Yes (Default) Use object mode.
		• No Do not use object mode.
Default value	Yes	
Usage	To turn ObjectMode off, clear the ObjectMode check box on the Connection page of the Database Profile Setup dialog box, or set ObjectMode to "No" in a script.	
Examples	To specify that you want ObjectMode disabled:	
	• <b>Database profile</b> Deselect the ObjectMode check box on the Connection page of the Database Profile Setup dialog box.	
	• <b>Application</b> Type the following in code:	
	SQLCA.DBParm="ObjectMode='No'"	
	1 * *	ou want ObjectMode disabled, clear the ObjectMode check ection page of the Database Profile Setup dialog box.

# ObjectMode

# ODBCU\_CONLIB

Description	Specifies whether EAServer establishes an ODBC connection cache in ANSI or Unicode mode.	
	This parameter applies <i>only</i> when a PowerBuilder custom class user object is deployed to EAServer.	
Applies to	ODBC	
Syntax	ODBCU_CONLIB =value	

	Parameter	Description
	value	Specifies whether EAServer establishes an ODBC connection cache in ANSI or Unicode mode. Values are:
		• <b>0</b> (Default) Establish a connection in ANSI mode
		• 1 Establish a connection in Unicode mode
Default value	ODBCU_CONLIB=0	
Usage	Set this parameter to 1 to specify that the EAServer JAG_CM_CONLIB connection cache property should be set to ODBCU to establish an ODBC connection in Unicode mode.	
Examples	To specify that you want a Unicode connection cache:	
		<b>rofile</b> Select the Enable Unicode Connection check box on er/COM+ page of the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.	DBParm="ODBCU_CONLIB=1"

# **OJSyntax**

Description	Specifies how PowerBuilder formats the SQL syntax for outer joins for the database back end you are accessing.	
Applies to	ADO.NET ASE, SYC Sybase Adaptive Server Enterprise 110 Informix IN9 Informix JDB JDBC ODBC OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> SNC SQL Native Client for Microsoft SQL Server	
Syntax	OJSyntax= <i>value</i>	

	Parameter	Description
	value	<ul> <li>Specifies how you want SQL syntax to be formatted. Values are:</li> <li>ANSI_Escape Apply ANSI standards and enclose the outer joins in escape notation { oj } that is parsed by the driver and replaced with DBMS-specific grammar.</li> <li>ANSI Apply ANSI standards.</li> <li>PB Maintain rules that applied to PowerBuilder 7.</li> </ul>
Default value	•	SI for IN9, SNC, ASE, and SYC, OJSyntax=ANSI_ESCAPE JDBC, ODBC, and OLE DB, OJSyntax=PB for O90 and O10.
Usage	<ul> <li>All PowerBuilder database interfaces provide support for ANSI SQL-92 out join SQL syntax generation. PowerBuilder supports both left and right outer joins in graphics mode and full outer and inner joins in syntax mode.</li> <li>You must set the OJSyntax parameter to indicate the version of outer join SQ syntax you want PowerBuilder to generate. For ADO.NET, JDBC, ODBC, at OLE DB, the default is ANSI_Escape and can be reset to ANSI or PB (native For IN9, SNC, ASE, and SYC, the default is ANSI and can be reset to PB. F O90 and O10, the default is PB, which means use Oracle native outer join syntax, and can be reset to ANSI.</li> <li>OJSyntax is a dynamic parameter in all database drivers that support it. It can therefore be changed at any time during the life of a database connection wir a statement such as:</li> </ul>	
	SQLCA.DB	Parm="OJSyntax='ANSI_ESCAPE' "
	define an outer the DataWindov join syntax is ge	<i>ins in the SQL Select painter for portability</i> When you join SELECT statement graphically in the SQL Select painter, w object stores the SQL in pseudocode. At runtime, the outer enerated based on the current OJSyntax parameter setting. This degree of portability for DataWindow objects among multiple
	DataWindow ol	he an outer join SELECT statement in syntax mode, the oject stores the SQL as syntax. This syntax is used without runtime. The OJSyntax parameter setting does <i>not</i> affect the
	syntax. It is ava PBOuterJoinOp	<i>tter join syntax</i> The option PB generates native outer join ilable for ODBC and OLE DB only if PBOuterJoin and perator syntax entries are set in the appropriate SYNTAX DBMS in the <i>Sybase\Shared\PowerBuilder\pbodb125.ini</i> file.

	The PB option is available for JDBC only if PBOuterJoin and PBOuterJoinOperator syntax entries are set in the Windows registry in the appropriate key for your DBMS in the <i>HKEY_CURRENT_USER\Software\Sybase\PowerBuilder\11.0\pbjdbc</i> key. This key is not installed by default. See the <i>egreg.txt</i> file in <i>Sybase\Shared\PowerBuilder</i> for an example of a registry file you could execute to add or change PowerBuilder JDBC settings for your DBMS.			
	When you migrate applications from PowerBuilder 7 and earlier versions of PowerBuilder, using ANSI outer join syntax might produce errors, depending on how the joins were defined in the painter. If a table is joined to multiple other tables with right outer joins, a valid ANSI outer join statement cannot be generated.			
	For more information about outer joins, see the section on using ANSI outer joins in the PowerBuilder <i>Users Guide</i> .			
	<i>OJSyntax does not apply to DIR</i> For one database interface, DIR, the database connection always uses ANSI outer join SQL syntax.			
Examples	To set the value of OJSyntax:			
	• <b>Database profile</b> Select the appropriate value from the Outer Join Syntax drop-down list on the Syntax page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="OJSyntax='ANSI'"			

# Description Specifies that the Database painter should use the ONLINE keyword when you create or drop an index on a table so that the index can be created or dropped without locking the table. When to specify OnlineIndex<br/>You must specify the OnlineIndex parameter before connecting to the database. Applies to I10 Informix Syntax OnlineIndex='value'

**OnlineIndex** 

	Parameter	Description	
	value	Specifies that the Database painter should use the ONLINE keyword when you create or drop an index. Values are:	
		• <b>0</b> The Database painter does not use the ONLINE keyword.	
		• 1 The Database painter uses the ONLINE keyword.	
Default value	OnlineIndex=0		
Usage	In IDS 10.0 and later, the SQL syntax of CREATE INDEX and DROP I supports the ONLINE keyword to create or drop an index in an online environment where the database and its tables are continuously availa When you use the ONLINE keyword to create or drop an index, data de language (DDL) operations execute without applying an exclusive loc table on which the specified index is defined.		
	If you use CREATE INDEX ONLINE to create an index on a table that other users are accessing, the index is not available until no users are updating the table. If you issue DROP INDEX ONLINE to drop an index, no users can reference the index, but concurrent data manipulation language (DML) operations can use the index until the operations terminate. Dropping the index is deferred until no users are using the index.		
	You can set the OnlineIndex static DBParm on the System tab page in the Database Profile Setup dialog box for I10 connections to specify that the Database painter should use the ONLINE keyword when you create or drop an index.		
	Clustered index You cannot creat supported by ID:	te a clustered index using online mode because it is not	
Examples		ne Database painter use the ONLINE keyword when you create or ne Database painter:	
	Without Dro	<b>rofile</b> Select the Create or Drop Non-Clustered Indexes opping Tables check box on the System page in the Database p dialog box.	
	Application	Type the following in code:	
	SQLCA.	DBParm="OnlineIndex=1"	

# **OraMTSConFlgs**

OramisConFigs			
Description	Specifies the behavior of a transactional PowerBuilder component deployed to COM+. This parameter applies <i>only</i> when a PowerBuilder custom class user object is deployed as a COM+ component and is connecting to an Oracle 8.1.5 or higher database.		
	<b>Deprecated DBParm</b> You can no longer deploy components from PowerBuilder to COM+ servers. The OraMTSConFlgs DBParm is maintained for backward compatibility to existing PowerBuilder components on COM+ servers. For new development, deploy components as .NET projects instead.		
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>		
Syntax	OraMTSConFlgs=	'value'	
	Parameter	Description	
	value	Specifies the behavior of a transactional component deployed to COM+. Values are:	
		• All Default (Default) Obtains a pooled connection and enlists the connection in any COM+ transaction, if one exists (ORAMTS_CFLG_ALLDEFAULT).	
		• No Implicit Enlistment Obtains a pooled connection but does not enlist the resource in any COM+ transaction even if the component is transactional (ORAMTS_CFLG_NOIMPLICIT).	
		• Unique Server Session Requests a single OCI session per OCI Server. Since multiplexing is not supported in Version 8.1.5, this option is always used (ORAMTS_CFLG_UNIQUESRVR).	
		• <b>SYSDBA Login</b> Required if connecting as SYSDBA (ORAMTS_CFLG_SYSDBALOGN).	
		• <b>SYSOPER Login</b> Required if connecting as SYSOPER (ORAMTS_CFLG_SYSOPRLOGN).	
		• <b>Preliminary INTERNAL Login</b> Required if connecting as INTERNAL (ORAMTS_CFLG_PRELIMAUTH).	
Default value	OraMTSConFlgs=	='ORAMTS_CFLG_ALLDEFAULT'	

Usage	If a transactional PowerBuilder component deployed to COM+ uses a PowerBuilder native interface to connect to an Oracle 8.1.5 or higher database, COM+ attempts to obtain a pooled connection and enlist the connection in a transaction. You can specify different behavior by selecting one or more of the available options.			
	<ul><li>When the Oracle database interface is running under COM+, ThreadSafe mode is enabled by default and the value of the ThreadSafe parameter is ignored.</li><li>This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.</li><li>These values are not mutually exclusive. They are chained using the pipe character in the parameter.</li></ul>			
	<b>Requirements for COM+ transactional support</b> Oracle Services for COM+ must be installed and configured.			
Examples	To obtain an enlisted connection using the INTERNAL account:			
	• <b>Database profile</b> Select the Preliminary INTERNAL Login check box on the EAServer/COM+ page in the Database Profile Setup dialog box. The All Default check box is selected by default.			
	• <b>Application</b> Type the following in code (use   to signify a logical OR of the flags):			
	SQLCA.DBParm="OraMTSConFlgs='ORAMTS_CFLG_ALLDEFAULT  ORAMTS_CFLG_PRELIMAUTH'"			
PackageProcs				
Description	Specifies that the stored procedures and functions encapsulated in an Oracle database package should be appended to the lists of Oracle standalone stored procedures and functions displayed in the DataWindow object and Database painters.			
	When to specify PackageProcs You must specify the PackageProcs parameter <i>before</i> connecting to the database.			

Applies to

O90 Oracle9*i* O10 Oracle 10*g* ORA Oracle 11*g* 

Syntax	PackageProcs=value	
	Parameter	Description
	value	Specifies that package-stored procedures and functions should be appended to the lists of stored procedures and functions. Values are:
		• <b>0</b> (Default) Do not append package-stored procedures and functions.
		• 1 Append package-stored procedures and functions.
Default value	PackageProcs=0	
Usage	procedures, func database. Listing performance per the DataWindow SELECT stateme	encapsulated collection of related program objects (such as etions, variables, and cursors) stored together in an Oracle g the objects contained in a package might impose a halty on your Oracle database connection. When displayed in y painter, only those objects that contain a REF CURSOR or ent parameter are listed. When displayed in the Database ets are listed. The text source displayed is that of the entire
Examples	To specify that y procedures and f	ou want Oracle package objects appended to the lists of stored functions:
		<b>rofile</b> Select the List Package Subprograms check box on the e in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA	.DBParm="PackageProcs=1"

# PacketSize (ODBC)

Description

Specifies the network packet size in bytes when you access an ODBC data source in PowerBuilder.

Many back-end DBMSs either do not support the PacketSize option or can return only the current network packet size. For information about whether the DBMS you are accessing supports PacketSize, see your DBMS documentation.

#### When to specify PacketSize

If your back-end DBMS supports it, you must specify the PacketSize parameter before connecting to the database.

Applies to	ODBC (if ODBC 2.0 or higher driver and back-end DBMS support this feature)		
Syntax	PacketSize=value		
	Parameter	Description	
	value	A 32-bit integer value that specifies the network packet size in bytes	
Default value	The default va	lue for PacketSize is the default for your back-end DBMS.	
Usage	If the PacketSize value you specify is larger than the maximum network packet size or smaller than the minimum network packet size, your ODBC driver substitutes the maximum or minimum value for the value you specified.		
Examples	To set the network packet size for an ODBC data source to 2048 bytes:		
	• <b>Database profile</b> Type the following in the Packet Size box on the Network page in the Database Profile Setup dialog box:		
	2048		
	• <b>Application</b> Type the following in code:		
	SQLC	A.DBParm="PacketSize=2048"	

# PacketSize (ASE, DIR, SNC, SYC)

Description	When connecting to a database, specifies the packet size in bytes that you want the server to set for transferring data to and from your PowerBuilder application. A <b>packet</b> is a fixed-size chunk of data for sending information over a network.		
	If the server has space limitations, it sets the packet size to less than the specified PacketSize value. Otherwise, it sets the size equal to the PacketSize value. The default value is 512 bytes.		
	When to specify PacketSize You must specify the PacketSize parameter <i>before</i> connecting to the database.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect SNC SQL Native Client for Microsoft SQL Server		
Syntax	PacketSize= <i>value</i>		

	Parameter	Description	
	value	A value specifying the packet size in bytes that a database server sets for transferring data to and from your application. The value must be a multiple of 512 bytes (default=512 bytes).	
Default value	PacketSize=5	12 (4096 for SNC)	
Usage	amounts of tex larger than the	If your PowerBuilder application sends or receives large at or image data from the server, setting the PacketSize value default 512 bytes might speed performance by causing fewer and write operations.	
	Adaptive Server Enterprise and DirectConnect for use with an Adaptive Server Enterprise or D your system administrator must set the followin the server for PacketSize to take effect:		
		al netmem Sets the maximum size of additional memory that ed for network packets larger than the default size.	
		<b>n network packet size</b> Sets the maximum network packet size abase users.	
	For instruction documentation	ns on setting these configuration variables, see your database	
Examples	To specify tha than 2048 byte	t the database server should set the packet size equal to or less es:	
		<b>profile</b> Type the following in the Packet Size box on the page in the Database Profile Setup dialog box:	
	2048		
	Applicati	<b>on</b> Type the following in code:	
	SQLC	A.DBParm="PacketSize=2048"	

## **PBCatalogOwner**

Description

Specifies a nondefault owner for the extended attribute system tables. These five tables contain default extended attribute information for your database.

When you specify a PBCatalogOwner name that is different from the default owner for your DBMS, PowerBuilder creates a new set of tables with the owner name you specify.

	When to specify	y PBCatalogOwner		
	You must specify database.	y the PBCatalogOwner parameter <i>before</i> connecting to the		
Applies to	ADO.NET			
	ASE, SYC and S	ASE, SYC and SYJ Sybase Adaptive Server Enterprise		
	DIR Sybase DirectConnect			
	I10 Informix	I10 Informix		
	JDB JDBC			
	ODBC			
	OLE DB			
	O90 Oracle9i			
	O10 Oracle 10g			
	ORA Oracle 11g			
	SNC SQL Nativ	SNC SQL Native Client for Microsoft SQL Server		
Syntax	PBCatalogOwne	er='owner_name'		
	Parameter	Description		
	owner_name	Specifies the owner of the extended attribute system tables.		
		<b>For DB2 databases</b> If you use the DB2SYSPB.SQL script to create the extended attribute system tables in a DB2 database and replace all instances of PBOwner in the script with the name of a nondefault table owner, <i>owner_name</i> must be the same as the owner specified in the DB2SYSPB.SQL script.		
Default value	The default valu accessing, as fol	e for PBCatalogOwner depends on the DBMS you are lows:		
	DBMS	PBCatalogOwner default value		
	ADO.NET	If a value for PBCatalogOwner is not specified in the database profile or in the registry, the default value is the user ID specified in the database profile.		
	Informix	PBCatalogOwner='informix'		
	JDBC	If a value for PBCatalogOwner is not specified in the database profile or in the registry, the default value is the user ID specified in the database profile.		
	ODBC	If a value for PBCatalogOwner is not specified in the database profile or in the PBODB <i>n</i> 0 initialization file, the default value is the user ID specified in the database profile.		

DBMS	PBCatalogOwner default value
OLE DB	If a value for PBCatalogOwner is not specified in the database profile or in the registry, the default value is the user ID specified in the database profile.
Oracle	PBCatalogOwner='SYSTEM'
SNC	PBCatalogOwner='dbo'
Sybase Adaptive Server Enterprise	PBCatalogOwner='dbo'
Sybase DirectConnect	PBCatalogOwner='sqlca.logid'

Usage

*When to set* When you specify a nondefault owner for the extended attribute system tables, you are in effect creating alternative tables. This is useful if you want to test new validation rules or display formats without overwriting the extended attributes currently in the default tables.

*Informix databases* For ANSI-compliant databases, the owner name that you specify must be unique but the table name does not have to be unique. You can create multiple sets of catalog tables prefaced with different user names. However, if the database is not ANSI-compliant, the table name must be unique, so that only one set of catalog tables can be created with an assigned owner name.

*JDBC databases* When you connect to a JDBC database and a value for PBCatalogOwner is set in both the database profile and the registry, the setting in the profile overrides the setting in the registry.

*ODBC data sources* When you connect to an ODBC data source and a value for PBCatalogOwner is set in both the database profile and the PBODB125 initialization file, the setting in the profile overrides the setting in the PBODB125 initialization file.

*DB2 databases* When you connect to a DB2 database, you can use the DB2SYSPB.SQL script to create the extended attribute system tables. If you use the DB2SYSPB.SQL script, keep the following in mind:

• You can edit the script to change all instances of PBOwner to another name, or leave the table owner as PBOwner in the script (the default).

#### Specifying SYSIBM is prohibited

DB2 prohibits you from specifying SYSIBM as the table owner.

• You can set the PBCatalogOwner parameter to the owner you specified in this script or to PBOwner if you did not edit the script.

This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.

Examples This example shows how to create a new set of extended attribute system tables with the owner TEST. The names of the new tables have the prefix TEST, such as TEST.pbcatcol, TEST.pbcatedt, and so on.

• **Database profile** Type the following in the PB Catalog Table Owner box on the System page in the Database Profile Setup dialog box:

TEST

• **Application** Type the following in code:

SQLCA.DBParm="PBCatalogOwner='TEST'"

## **PBMaxBlobSize**

Description	Specifies the maximum blob size that PowerBuilder can read into memory.		
	When to specify PBMaxBlobSize You must specify a value for the PBMaxBlobSize parameter <i>before</i> connecting to the database.		
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server		
Syntax	PBMaxBlobSize= <i>value</i>		
Default value	PBMaxBlobSize=1024000		
Usage	PowerBuilder does not restrict the maximum blob size. Instead, the maximum blob size is determined by the machine on which the application is running. If the blob size exceeds the available memory on the machine on which the application is running, PowerBuilder reads the blob in chunks if the data provider supports the ISequentialStream interface. If the blob size exceeds the default value and the data provider does not support the ISequentialStream interface, PowerBuilder truncates it and reports an out-of-memory error. Use the PBMaxBlobSize parameter to specify larger maximum blob sizes.		

Examples

To set the PBMaxBlobSize value to 200000:

• **Database profile** Type the following in the Maximum In-Memory Blob Size box on the Transaction page in the Database Profile Setup dialog box:

200000

• **Application** Type the following in code:

SQLCA.DBParm="PBMaxBlobSize=200000"

## **PBMaxTextSize**

Description	Specifies the maximum length of text or large value datatypes returned when you include them in a DataWindow.	
		PBMaxTextSize parameter if you want to include a long text /indow object without treating the text as a binary large object
Applies to	SNC SQL Native	e Client for Microsoft SQL Server
Syntax	PBMaxTextSize=' <i>value</i> '	
	Parameter	Description
	value	The maximum length in bytes of text or large value datatypes returned when you include them in a DataWindow. The DataWindow can be created by a procedure. The range of valid values is from 10,000 bytes to 1,000,000 bytes.
Default value	PBMaxTextSize=32767	
Usage	The SQL Native Client OLE DB Provider for SQL Server automatically sets the SQL Server TEXTSIZE property to 2147483647 when connecting. The size of data fetched depends on the PBMaxTextSize parameter. If a result set includes a large value type, the blocking factor will be set to 1.	
Examples	To have SQLServer return text or large datatypes that are up to 48,000 bytes long when you include them in a SQL SELECT statement:	
	-	<b>rofile</b> Type 48000 in the Maximum String Size in w box on the Transaction page in the Database Profile Setup
	Application	Type the following in code:
	SQLCA.	DBParm="PBMaxTextSize='48000'"

# **PBNewSPInvocation**

Description	Uses an alternative method to invoke a stored procedure.	
Applies to	ODBC	
Syntax	PBNewSPInvocation='value'	
	Parameter	Description
	value	Specifies whether the standard method or an alternative method is used to invoke a stored procedure. Values are:
		• <b>No</b> (Default) Use the standard method to invoke a stored procedure.
		• <b>Yes</b> Use the alternative method to invoke a stored procedure.
Default value	PBNewSPInvocation='No'	
Usage	command to call a to use an alternati PowerBuilder OE	is might not be returned when you use an embedded SQL a stored procedure. You can set PBNewSPInvocation to 'Yes' ve method to invoke a stored procedure. The behavior of the DBC driver when this parameter is set is consistent with the of the OLE DB and JDBC drivers.
	retrieve data into	cation is set to 'Yes', the alternative method is used when you a DataWindow object that uses a stored procedure. This effect when you use RPC to invoke a stored procedure.
		Invocation is set to 'Yes', the values of the PBUseProcOwner arameters are ignored.
Examples	relevant section (	ter for all connections, add the following line to every such as ; IBM DB2/NT 2.1 DB2CLI for a DB2 connection your <i>pbodb125.ini</i> file:
	PBNewSPInv	vocation='Yes'
	For more informa Connecting to You	tion about editing <i>pbodb125.ini</i> , see the Appendix in <i>ur Database</i> .
	You can also set t	he parameter at runtime. For example:
	SQLCA.DBPa	arm="PBNewSPInvocation='Yes'"
	The value that is	set at runtime overrides the value in the <i>pbodb125.ini</i> file.
		e of the stored procedure's output parameter, use the keyword. For example:
	-	D_test PROCEDURE FOR SP1 VAR0=:ARGIN, DUT OUTPUT USING SQLCA;

If the stored procedure contains result sets, you must fetch the result sets first. If the stored procedure has a return value and you want to obtain it, use the format RC=SP1:

DECLARE sp\_test PROCEDURE FOR RC=SP1 VAR0=:ARGIN, VAR1=:ARGOUT OUTPUT USING SQLCA;

DefaultProcOwner

# **PBNoCatalog**

Description	Specifies that PowerBuilder will not check for the existence of catalog tables when creating a DataWindow object at runtime.		
	When to specif You must specif database.	y <b>PBNoCatalog</b> y the PBNoCatalog parameter <i>before</i> connecting to the	
Applies to	O90 Oracle9 <i>i</i> O10 Oracle 10g ORA Oracle 11g		
Syntax	PBNoCatalog='	/alue'	
	Parameter	Description	
	value	Specifies that PowerBuilder will not check for the existence of catalog tables when creating a DataWindow object at runtime.	
Default value	PBNoCatalog='	NO'	
Usage	and modified so for the PowerBu PowerBuilder lo DataWindow cro PBCatalogOwne under the owner	ndow object is created dynamically using SyntaxFromSQL that it can use stored procedure updates, PowerBuilder looks tilder catalog tables. If PBCatalogOwner is not set, tooks for the catalog tables under the owner SYSTEM. The eated may be different depending on whether er was set, and errors may be generated if the tables do not exist SYSTEM. To prevent PowerBuilder from using the catalog BNoCatalog parameter to true.	
	This parameter can also be set in the PBODB initialization file for connection to Oracle through the ODBC and OLE DB drivers.		
	-	This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.	

Examples	To tell PowerBuilder not to use catalog tables, type the following in code:		
	SQLCA.DBParm="PBNoCatalog='Yes'"		
See also	PBCatalogOwner		

# PBTrimCharColumns

Description	Specifies whether PowerBuilder should trim trailing spaces from data values retrieved from the following datatypes: Char, Char for Bit Data, VarChar, and VarChar for Bit Data.		
Applies to	ODBC OLE DB		
Syntax	PBTrimCharColumns= <i>value</i>		
	Parameter	Description	
	value	Specifies whether PowerBuilder should trim trailing spaces from data of type Char, Char for Bit Data, and VarChar for Bit Data. Values are:	
		• NO (Default) Do not trim trailing spaces.	
		• <b>YES</b> Trim trailing spaces.	
Default value	'NO'		
Usage	This parameter can only be set in the <i>pbodb125.ini</i> file. For ODBC, you can set the TrimSpaces parameter in the Database Profile Setup dialog box or in code to perform the same function.		
	By default, PowerBuilder trims spaces from the following datatypes: Char, Char for Bit Data, VarChar, and VarChar for Bit Data.		
	If your DBMS makes a distinction between Char data with trailing spaces and Char data without trailing spaces when evaluating a WHERE clause expression, you might receive the message Row changed between retrieve and update when your DataWindow object's update properties are set to "Key and updateable columns." To prevent this, change your DataWindow object's update properties. In embedded SQL, you can check Sqlca.Sqlnrows after each update to determine if the update took place. Avoid using Char data columns in the WHERE clause of an UPDATE or DELETE statement when PBTrimCharColumns='YES'.		
Examples		owerBuilder should trim trailing spaces, add the following n for the database you are accessing:	
	PBTrimCha	rColumns='YES'	

See also

TrimSpaces

## **PBUseProcOwner**

Description

When you access a database through the ODBC interface and define a DataWindow object that uses a stored procedure as its data source, PBUseProcOwner specifies whether PowerBuilder should qualify the stored procedure with the owner name in the SQL EXECUTE statement passed to the driver.

PowerBuilder qualifies the stored procedure with an owner only if the owner associated with the stored procedure is different from the ID of the current user (the developer building the DataWindow object or the user running the application containing the DataWindow object).

Applies to

Syntax

PBUseProcOwner='value'

ODBC

	Parameter	Description	
	value	Specifies whether PowerBuilder should qualify the stored procedure with its owner name in the SQL EXECUTE statement built by the DataWindow object and passed to the driver. Values are:	
		• Yes If the owner associated with the stored procedure is different from the current user ID, PowerBuilder qualifies the stored procedure with its owner name in the SQL EXECUTE statement and passes this information to the driver. This allows users to execute stored procedures they do not own. For example:	
		EXECUTE FRAN.MYPROCEDURE	
		• No (Default) PowerBuilder does not qualify the stored procedure with its owner name in the SQL EXECUTE statement passed to the driver. For example:	
		EXECUTE MYPROCEDURE	
Default value	PBUseProcOwner=	='No'	
Usage	•	BUseProcOwner value PowerBuilder searches the reder to determine the PBUseProcOwner value:	
	1 The section for your database profile in the PowerBuilder initialization file (in the development environment) or the value of the transaction object's DBParm property (in an application).		

If PowerBuilder does not find a PBUseProcOwner value in these locations, it defaults to a value of "No".

*If DBA owns the SQL Anywhere*® *stored procedure* DBA (database administrator) is a reserved word in SQL Anywhere syntax.

If you define a DataWindow object with a SQL Anywhere stored procedure as its data source and DBA owns the stored procedure, the painter passes the following SQL EXECUTE statement to the ODBC driver if PBUseProcOwner is set to "Yes":

EXECUTE DBA.MYPROCEDURE

This statement generates a syntax error because it includes the DBA reserved word.

If DBA owns the SQL Anywhere stored procedure you are using, you can avoid this syntax error by setting PBUseProcOwner to No so that PowerBuilder does not qualify the stored procedure with DBA.

In some situations, however, you *must* qualify the stored procedure with the DBA owner. For example, the DBA might want to grant execute permission to another user ID. In this case, you can avoid errors by editing the SQL EXECUTE syntax to enclose DBA in quotes, like this:

EXECUTE "DBA".MYPROCEDURE

#### Examples

To specify that PowerBuilder should qualify the stored procedure with its owner name in the SQL EXECUTE statement:

- **Database profile** Select the Qualify Stored Procedures With Owner Name check box on the Transaction page in the Database Profile Setup dialog box.
- Application Type the following in code:

SQLCA.DBParm="PBUseProcOwner='Yes'"

## PersistEncrypted

Description

Specifies whether the data source you are accessing through the OLE DB interface is allowed to save your encrypted password.

	When to specify PersistEncrypted You must specify the PersistEncrypted parameter <i>before</i> connecting to the database.		
Applies to	OLE DB		
Syntax	PersistEncrypted=' <i>value</i> '		
	Parameter	Description	
	value	Specifies whether the data source can save your encrypted password. Values are:	
		• <b>True</b> Tells the data source it can save your password.	
		• <b>False</b> (Default) Tells the data source it cannot save your password.	
Default value	PersistEncrypted='False'		
Examples	To tell the data source you are accessing through OLE DB that it can save your password:		
	• <b>Database profile</b> Select the Persist Encrypted check box on the Security page in the Database Profile Setup dialog box.		
	Applicati	ion Type the following in code:	
	SQLO	CA.DBParm="PersistEncrypted='True'"	
See also	DataLink MaskPasswor EncryptPassw PersistSensiti	vord	
PersistSensitive			
Description	Specifies whether the data source you are accessing through the OLE DB interface is allowed to save sensitive authentication information, such as a password, along with other authentication information.		
	When to specify PersistSensitive You must specify the PersistSensitive parameter <i>before</i> connecting to the database.		
Applies to	OLE DB		

Syntax	PersistSensitive='value'		
	Parameter	Description	
	value	Specifies whether the data source can save your authentication information. Values are:	
		• <b>True</b> Tells the data source it can save your authentication information.	
		• <b>False</b> (Default) Tells the data source it cannot save your authentication information.	
Default value	PersistSensiti	ve='False'	
Examples	To tell the data source you are accessing through OLE DB that it can save your authentication information:		
		<b>e profile</b> Select the Persist Security Info check box on the page in the Database Profile Setup dialog box.	
	Applicati	<b>on</b> Type the following in code:	
	SQLO	CA.DBParm="PersistSensitive='True'"	
See also	MaskPasswor	d	
	EncryptPassword		
	PersistEncryp	ted	
PoolCreator			
Description	Specifies the	user name used to create a connection or session pool.	
Applies to	ORA Oracle 11g		
Syntax	PoolCreator =	value	
	Parameter	Description	
	value	String to specify the name of the connection or session pooling creator.	
Default value	None.		
Usage	•	ction with the PoolPWD DBParm. If no value is provided for this LogID value is used to create the connection or session pool.	

Examples The following example sets the name for a connection pool creator to Scott:

- **Database profile** Select Connection Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box, type Scott in the Pool Creator text box, and Scott's password in the Password text box on the same page.
- **Application** Type the following in code:

```
my_trans.dbparm =
    "pooling='connection',poolcreator=
    'Scott',poolpwd='scottspass'"
```

See also

```
Pooling
PoolPwd
```

# Pooling

Description	Specifies the type of pooling to use with an Oracle database.		
Applies to	ORA Oracle 11g		
Syntax	Pooling = <i>value</i>		
	Parameter	Description	
	value	Specifies whether to use pooling, and if so, what kind of pooling. Values are:	
		• Session For session pooling.	
		• <b>Connection</b> For connection pooling.	
		• None (Default) For no pooling.	
Default value	No pooling.		
Usage	With the ORA driver you specify the type of pooling you want with the Pooling DBParm. The O90 and O10 database drivers that you can use in PowerBuilder to connect to the 9.x and 10.x versions of the Oracle DBMS support connection pooling with the DBParm parameter CNNPool. For backward compatibility purposes, the CNNPool parameter is also supported by the ORA driver. However, if you set the Pooling parameter with the ORA driver, the CNNPool parameter is ignored.		
	If you are using connection or session pooling, the proxy user name is the connection or session pooling creator (which you can provide in the PoolCreator and PoolPwd DBParm parameters), and the Transaction object's LogID is ignored.		

	If you select session pooling, you can enter a value for the SessionHomogeneous DBParm to authenticate all sessions in the pool with the user name and password in effect when the session pool was created. No proxy session can be created if pooling is set to homogeneous session mode.		
Examples	The following example creates a connection pool:		
	• <b>Database profile</b> Select Connection Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	<pre>my_trans.dbparm="pooling='connection'"</pre>		
See also	PoolCreator PoolPwd		

# PoolPwd

Description	Specifies the password used to create a connection or session pool.		
Applies to	ORA Oracle 11g		
Syntax	PoolCreator = <i>value</i>		
	Parameter	Description	
	value	String to specify the name of the connection or session pooling creator.	
Default value	None		
Usage	Use in conjunction with the PoolCreator DBParm. If no value is provided for this DBParm, the LogPass value of the Transaction object is used to create the connection or session pool.		
Examples	The following example creates a session pool with the user name "Scott", and the password "mypass":		
	drop-down box, type s	<b>profile</b> Select Session Pooling from the Pooling Type list on the Pooling page in the Database Profile Setup dialog scott in the Pool Creator text box, and mypass in the Password in the same page.	
	Applicatio	<b>n</b> Type the following in code:	
	_	cans.dbparm = "pooling='session',poolcreator= cott',poolpwd='mypass'"	

See also

PoolCreator Pooling

# **Properties**

Description	Sets properties specific to the particular JDBC driver you are using to connect to the database.
Applies to	JDB JDBC
Syntax	Properties='property_value'
Default value	None
Usage	The Driver-Specific Properties box allows you to set properties specific to a particular driver.
	For information about the properties supported by your JDBC driver, see the vendor's documentation.
	<b>Define User ID and Password</b> If properties are defined, you <i>must</i> also define the user ID and password in the properties box.
Examples	To set a property for the Sybase jConnect driver:
	• <b>Database profile</b> Type the following in the Driver-Specify Properties box on the Connection page in the Database Profile Setup dialog box:
	SQLINITSTRING=set TextSize 32000; user=sa;password=manager
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Properties='SQLINITSTRING=set TextSize 32000;user=sa;password=manager'"
See also	Driver URL

# ProtectionLevel

Description

Specifies the level of protection applied to data sent between PowerBuilder and the data server through the OLE DB data provider. This parameter applies only to network connections other than Remote Procedure Call (RPC) connections. Similar levels of protection can be specified for authenticated RPC connections.

#### When to specify ProtectionLevel

You must specify the ProtectionLevel parameter *before* connecting to the database.

### Applies to OLE

Syntax

OLE DB

#### ProtectionLevel='value'

	Parameter	Description
	value	Specifies the level of protection applied to data sent between PowerBuilder and the data server. Values are:
		• Not set No level of protection is selected.
		• <b>Call</b> Authenticates the source of the data at the beginning of each request from the client to the server.
		• <b>Connect</b> Authenticates only when the client establishes the connection with the server.
		• None Performs no authentication of data.
		• <b>Packet</b> Authenticates that all data received is from the client.
		• <b>Packet (Integrity)</b> Authenticates that all data received is from the client and that it has not been changed in transit.
		• <b>Packet (Privacy)</b> Authenticates that all data received is from the client, that it has not been changed in transit, and that it protects the privacy of the data by encrypting it.
Default value	Not set	
Examples	To set a level server:	of protection for the data sent between PowerBuilder and the data
		<b>e profile</b> On the Security page in the Database Profile Setup ox, select Connect from the Protection Level drop-down list.
	Applicat	ion Type the following in code:
	~	CA.DBParm= DTECTIONLEVEL='DB_PROT_LEVEL_CONNECT'"
See also	DataLink	

# Provider

Description	Identifies the data provider you want to use to connect to your data source.		
	When to specify Provider You must specify the Provider parameter <i>before</i> connecting to the database.		
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server		
Syntax	Provider=' <i>provider_name</i> '		
Default value	None		
Usage	Select a data provider from the list of installed data providers displayed in the Provider drop-down list. For example, if you are using Microsoft's OLE DB Provider for ODBC, select MSDASQL as the Provider value. If you are using Microsoft's OLE DB Provider for SQL Server, select SQLOLEDB as the Provider value.		
	For more information, see the documentation provided by your OLE DB or ADO.NET data provider.		
	<b>SNC SQL Native Client driver</b> The Provider DBParm parameter for the Microsoft SQL Native Client (SNC) interface allows you to select the SNC version that you want to use for a database connection. You can set this parameter in script to SQLNCLI (for the SNC 9.0 driver that connect to SQL Server 2005) or to SQLNCLI10 (for the SNC 10.0 driver that connects to SQL Server 2008). Otherwise, you can select one of these providers on the Connection tab of the Database Profile Setup dialog box for the SNC interface.		
	If you do not set or select a provider, the default selection is SQLNCLI (SNC 9.0 for SQL Server 2005). This allows existing SNC interface users to be able to migrate to the current release of PowerBuilder without any modifications. If PowerBuilder fails to connect with the SQLNCLI provider, it will attempt to connect to SQLNCLI10 provider. However, if you explicitly set the provider and the connection fails, PowerBuilder displays an error message.		
Examples	<b>Example 1</b> To use the Microsoft OLE DB Provider for ODBC to connect to the EAS Demo DB:		

- **Database profile** Select MSDASQL from the Provider drop-down list on the Connection page in the Database Profile Setup dialog box for OLE DB.
- Application Type the following in code:

SQLCA.DBParm="Provider='MSDASQL'"

**Example 2** To use the Microsoft OLE DB Provider for Oracle to connect to an Oracle 8 database:

- **Database profile** Select MSDAORA from the Provider drop-down list on the Connection page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="Provider='MSDAORA'"

**Example 3** To use the Sybase Oracle8 ADO Provider to connect to an Oracle 8 database:

- **Database profile** Select Sybase.Oracle8ADOProvider from the Provider drop-down list on the Connection page in the Database Profile Setup dialog box for ADO.NET.
- **Application** Type the following in code:

SQLCA.DBParm="PROVIDER='Sybase.Oracle8ADOProvider'"

**Example 4** To use the Microsoft SNC Provider to connect to a Microsoft SQL Server 2008 database:

- **Database profile** Select SQLNCLI10 from the Provider drop-down list on the Connection page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="Provider='SQLNCLI10'"

See also

DataLink DataSource

## ProviderString

Description

A string containing provider-specific extended connection information. Use of this database parameter requires that you know how this string will be interpreted and used by the provider. You should use this parameter only for provider-specific connection information that cannot be explicitly described by other database parameters.

	When to specify ProviderString You must specify the ProviderString parameter <i>before</i> connecting to the database.		
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server		
Syntax	ProviderString='value'		
Default value	None		
Usage	OLE DB applications can initialize data source objects using two methods: IDBInitialize::Initialize and IDataInitialize::GetDataSource.		
	Using IDBInitialize::Initialize, a provider string can be used to initialize connection properties by setting the DBPROP_INIT_PROVIDERSTRING property in the DBPROPSET_DBINIT property set. An initialization string can also be passed to the IDataInitialize::GetDataSource method to initialize connection properties.		
	For the OLE DB interface, the ProviderString parameter is used with IDBInitialize::Initialize. For the SNC interface, the ProviderString parameter is used with IDataInitialize::GetDataSource.		
	Both methods initialize the same OLE DB connection properties, but they use different sets of keywords. For lists of keywords, see the information about OLE DB provider connection string keywords in the Microsoft documentation at http://msdn.microsoft.com/en-us/library/ms130822.aspx.		
Examples	Since Microsoft SQL Server supports multiple instances of a database on a single server, you must identify the specific database to which you want to connect by entering the database name. For the ADO.NET and SNC interfaces, you should set the Database parameter on the Connection page in the Database Profile Setup dialog box. For OLE DB, you can use the ProviderString parameter.		
	To identify a specific Microsoft SQL Server database named ts3:		
	• <b>Database profile</b> Enter the following in the Extended Properties box on the Connection page in the Database Profile Setup dialog box for OLE DB:		
	Database=ts3		
	• <b>Application</b> Type the following in code for an OLE DB connection:		
	SQLCA.DBParm="ProviderString='database=ts3'"		

See also URL

ProxyUserName			
Description	Specifies that you want EAServer to retrieve a connection from a connec cache by proxy.		
	This parameter applies <i>only</i> when a PowerBuilder custom class user object is deployed as an EAServer component.		
Applies to	JDB JDBC ODBC SYJ Sybase Adaptive Server Enterprise		
Syntax	ProxyUserName=' <i>value</i> '		
	Parameter	Description	
	value	Specifies the alternate login name that can use a connection.	
Default value	None		
Usage	Regardless of whether you access a cache by user or name, you can retrieve a connection by proxy. Retrieving a connection by proxy means that you can assume the identity and privileges of another user by providing an alternative login name.		
	set session author parameter to assur permission to exec must have DBA a	e used with any database that recognizes the SQL command <b>rization</b> . In order for user A to use the ProxyUserName me the identity of another user B, user A must have cute this statement. For example, for SQL Anywhere, user A uthority, and for Adaptive Server Enterprise, user A must I permission to execute <b>set session authorization</b> by a Officer.	

#### Using the SYJ interface

	Sybase EAServer uses a slightly different version of the CT-Lib software. Therefore, <i>at runtime</i> , you need to use the SYJ database interface rather than ASE or SYC to connect to an Adaptive Server Enterprise database. The SYJ Database Profile Setup dialog box provides a convenient way to set the appropriate connection parameters and then copy the syntax from the Preview page into the script for your Transaction object.
	You cannot use the SYJ interface, however, to connect to the database in the PowerBuilder development environment. Therefore, <i>during the development phase</i> (before the component has been deployed to EAServer), you must use ASE or SYC to connect to the database.
	For information on how to use PowerBuilder to build EAServer components and enable set-proxy support, see <i>Application Techniques</i> .
Examples	On the EAServer page in the Database Profile Setup dialog box, enter the alternative login name in the Proxy User Name box. The PowerScript syntax for the ProxyUserName parameter displays on the Preview page:
	SQLCA.DBParm="ProxyUserName='pikachu'"
	Copy the syntax from the Preview page into your script.
See also	CacheName

PWDialog	
Description	Controls whether a Password Expired dialog box displays in an application at runtime if a user's password has expired.
	When PWDialog is set to 1, the Password Expired dialog box prompts users to change their passwords if they attempt to log in to the database with an expired password. By default, PWDialog is set to 0 to specify that the Password Expired dialog box does not display in your application at runtime.
	The setting of PWDialog affects applications only at runtime. It has no effect in the development environment because, regardless of the PWDialog setting, the Change Password dialog box displays in the development environment to prompt users to change an expired password.
	When to specify PWDialog You must specify a value for PWDialog <i>before</i> connecting to the database.

Applies to	ASE, SYC Sybase O90 Oracle9 <i>i</i> O10 Oracle 10g ORA Oracle 11g	e Adaptive Server Enterprise
Syntax	PWDialog=value	
	Parameter	Description
	value	<ul> <li>Specifies whether the Password Expired dialog box displays in an application at execution time to prompt the user to change an expired login password. Values are:</li> <li><b>0</b> (Default) Do not display the Password Expired dialog box at execution time.</li> </ul>
		• 1 Display the Password Expired dialog box at execution

Default value PWDialog=0

Usage When to use Setting PWDialog to 1 to display the Password Expired dialog box in your application provides a convenient way for you to notify your users that a password has expired and allow them to change it.

> *What happens* When the Password Expired dialog box displays in your application at runtime, it notifies users that the password for their login ID has expired and prompts them to supply a new password. For example, for Adaptive Server Enterprise, the sp\_password system stored procedure runs to set the new password. Once the password has been changed, the database connection succeeds.

time to prompt the user to change an expired password.

If the user clicks Cancel to close the Password Expired dialog box without changing the password, the database connection fails and a message displays indicating that the password has expired.

Examples To display the Password Expired dialog box when needed in your application:

- **Database profile** Although the setting of PWDialog has no effect in the development environment, you might want to set it in your database profile to generate connection syntax on the Preview page that you can copy into your code. Select the Display Runtime Dialog When Password Expires check box (for ASE or SYC connections) or the Password Expiration Dialog check box (for Oracle connections) on the Connection page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SOLCA.DBParm="PWDialog=1"

# PWEncrypt

Description	your passwor	PWEncrypt specifies whether you want Open Client to automatically encrypt your password when connecting to a Sybase Adaptive Server Enterprise database in PowerBuilder.				
		When to specify PWEncrypt You must specify the PWEncrypt parameter <i>before</i> connecting to the database.				
Applies to	ASE, SYC Sy	ASE, SYC Sybase Adaptive Server Enterprise				
Syntax	PWEncrypt='	value'				
	Parameter	Description				
	value	Specifies whether you want the Open Client software to encrypt your password. Values are:				
		• Yes (Default) Tells Open Client to encrypt the password by setting the CS_SEC_ENCRYPTION connection property to CS_TRUE.				
		• No Tells Open Client not to encrypt the password by setting the CS_SEC_ENCRYPTION connection property to CS_FALSE.				
Default value	PWEncrypt="	PWEncrypt='Yes'				
Examples	_	To tell Open Client not to encrypt your password when connecting to a Sybase Adaptive Server Enterprise database in PowerBuilder:				
		<b>e profile</b> Clear the Encrypt Password check box on the Network he Database Profile Setup dialog box.				
	Applicat	ion Type the following in code:				
	SQL	CA.DBParm="PWEncrypt='No'"				

# **PWExpDialog**

Description

Controls whether an informational dialog box displays in an application at runtime if a user's password is about to expire.

When PWExpDialog is set to 1, a dialog box displays advising users that their passwords will expire in a given number of days. By default, PWExpDialog is set to 0 to specify that the dialog box does not display in your application at runtime.

	When to specify You must specify	<b>PWExpDialog</b> a value for PWExpDialog <i>before</i> connecting to the database.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise O90 Oracle9 <i>i</i>		
Syntax	PWExpDialog= <i>v</i> a	lue	
	Parameter	Description	
	value	Specifies whether an informational dialog box displays in an application at runtime to advise the user that a login password will expire in a given number of days. Values are:	
		• <b>0</b> (Default) Do not display the dialog box at runtime.	
		• 1 Display the dialog box at runtime.	
Default value	PWExpDialog=0		
Usage	When this parameter is set to 1, the Oracle ORA-28002 and ORA-28011 and the Adaptive Server 4023 informational messages display.		
Examples	To display the dialog box when needed in your application, type the following in code:		
	SQLCA.DBPa	arm="PWExpDialog=1"	
QualifyPublic			
Description	Specifies that the PUBLIC qualifier prepended to Oracle synonyms belonging to the public schema or user group is retained in the SQL Select table list.		
	When to specify You must specify database.	<b>QualifyPublic</b> the QualifyPublic parameter <i>before</i> connecting to the	
Applies to	O90 Oracle9 <i>i</i>		
	O10 Oracle 10g		
	ORA Oracle $11g$		
Syntax	QualifyPublic=val	lue	

	Parameter	Description
	value	Specifies that the PUBLIC qualifier should be retained in the SQL Select table list. Values are:
		• <b>0</b> (Default) Do not retain the PUBLIC qualifier.
		• 1 Do retain the PUBLIC qualifier.
Default value	QualifyPublic=0	
Usage	that the object re facilitating the d instance to a pro the absence of th with its extended	default behavior has been to discard the PUBLIC qualifier so ofference is generalized in the generated SQL statement, eployment of an application from a development database duction database. However, in certain DataWindow objects, he PUBLIC qualifier breaks the association of the synonym d attributes, preventing these attributes from being used. The arameter allows you to specify whether the PUBLIC qualifier ed.
Examples	To specify that y table list:	ou want the PUBLIC qualifier to be retained in the SQL Select
	-	<b>rofile</b> Select the Qualify Public Synonyms check box on the e in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.	DBParm="QualifyPublic=1"

## RecheckRows

Description	Rechecks the number of rows affected by an INSERT, UPDATE, or DELETE command and returns it in the SQLNRows property of the Transaction object.	
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server	
Syntax	RecheckRows= <i>value</i>	
	Parameter	Description
	value	<ul> <li>Specifies whether the value of the Microsoft SQL Server</li> <li>@@rowcount property is checked and returned in the SQLNRows property of the Transaction object. Values are:</li> <li>0 (Default) Do not recheck the count of affected rows.</li> <li>1 Recheck the count of affected rows.</li> </ul>

Default value	RecheckRows=0		
Usage	In Microsoft SQL server, if a table has an insert, update, or delete trigger, the number of affected rows returned to the SQLNRows property of the Transaction object after an INSERT, UPDATE, or DELETE command depends on the driver. With an ADO.NET driver, the value returned is the sum of the rows affected by the command itself and the trigger.		
	When you are connected to Microsoft SQL Server using ADO.NET or OLE DB, you can set the RecheckRows runtime database parameter to 1 to recheck how many rows of data were affected by the INSERT, UPDATE, or DELETE command itself and return that value in the SQLNRows property.		
	Setting RecheckRows to 1 before issuing an INSERT, UPDATE, or DELETE command causes a SELECT @@ROWCOUNT command to be executed. To improve performance, you should set it only when required, and reset it to the default value of 0 after use.		
Examples	To set RecheckRows to 1, type the following in code:		
	SQLCA.DBParm="RecheckRows=1"		
Release			
Description	Specifies what version of Sybase Open Client Client-Library (CT-Lib) software is in use on the client workstation.		
	When to specify Release You must specify a value for Release <i>before</i> connecting to the database.		

Applies to

ASE, SYC Sybase Adaptive Server Enterprise

Syntax

Release='value'

	Parameter	Description	
	value	Specifies the version of Open Client Client-Library your application uses.	
		The value corresponds to the value of the CS_VERSION property that is used to allocate a context structure for the client. Multiple values that specify the same client context are provided for backwards compatibility. Release number 15 or higher for ASE. Release number 15 or lower for SYC:	
		• <b>10.x</b> CS_VERSION_100	
		• <b>11</b> CS_VERSION_110	
		• <b>11.5</b> CS_VERSION_110	
		• <b>12</b> CS_VERSION_110	
		• <b>12.5</b> CS_VERSION_125	
		• <b>12.5.1</b> CS_VERSION_125	
		• <b>15</b> CS_VERSION_15	
		• <b>15.5</b> CS_VERSION_155	
Default value	Release='15' for ASE, Release='11' for SYC		
Usage	installed on the cl	meter must correspond to the version of Open Client software lient workstation. For example, do not specify 12.5 or 12.5.1 ent version is 12.0, even if your Adaptive Server version is	
	To use Adaptive Server 15, you must install Open Client version 15 on the client computer and set the Release parameter to 15 to establish an Open Client 15 client context.		
	connection. This <i>PBSYC125.DLL</i>	context is allocated by the first <i>PBSYC125.DLL</i> database context acts as the parent context for all subsequent connections. Therefore, you must specify the same value for neter for all your connections.	
	If the client library is not loaded, the version that corresponds to the value of Release is loaded. If the value of Release is 15 and that version is not available on the client, the library fails to load. If the value of Release is less than 15 and that version is not available, <i>PBSYC125.DLL</i> attempts to load version 15 of the client library and fails only if neither the requested version nor version 15 is available. If there is no active client context, <i>PBSYC125.DLL</i> connects using the value of the Release parameter. If there is an active client context, the new connection fails if the value of the Release parameter is higher than the current client context. The new connection succeeds if the value of the Release parameter is the same as or lower than the current client context.		

The SYC driver links to the appropriate version of the client libraries dynamically and the Open Client context is released when all connections are closed. If you open multiple connections, the first Open Client context established is used for all of them. If you need to establish a new Open Client context in the development environment, close all open connections and establish a new connection with the Release parameter set to the context you require.

During each database login, *PBSYC125.DLL* automatically determines the version of Adaptive Server being accessed. It customizes its behavior to optimize performance and features for the combination of the Adaptive Server version and the Open Client context specified in the Release parameter. Specifying a value for Release that does not correspond to the Open Client software on the client can cause unpredictable results.

The values 12.5 and 12.5.1 both open an Open Client 12.5 context. However, you should always specify Release='12.5' if you are using Open Client 12.5 and Release='12.5.1' if you are using Open Client 12.5.1. This ensures that *PBSYC125.DLL* correctly handles the following scenarios that require Open Client 12.5.1 and Adaptive Server 12.5.1:

- Use the Date and Time datatypes introduced in Adaptive Server 12.5.1 in RPC calls that explicitly call for these datatypes in the stored procedure argument list.
- Use the Date and Time datatypes in Update where current of and Delete where current of statements.

Retrieval, insert, update, and delete processing work correctly against Date and Time datatypes using any Open Client software and Adaptive Server 12.5.1 or later. In the Database painter, the Date and Time datatypes display in the list of metadata types when you are connected to an Adaptive Server 12.5.1 server in any Open Client context.

Certain other features are supported only when you access a specified version of a SQL Server 10/11 or Adaptive Server Enterprise database using its associated Open Client software. For example, you must:

- Set the Release parameter to 11 or higher and use Open Client 11.x or higher and Adaptive Server 11.x or higher to take advantage of network-based security and directory services in your application.
- Set Release to 12.5 and use Open Client 12.5 or higher and Adaptive Server 12.5 or higher to access Char and VarChar columns with more than 255 characters.

•	Set Release to 15 and use Open Client 15 or higher and Adaptive Server
	15 or higher to access the UniText and 64-bit integer (BigInt) SQL datatypes
	added in version 15 of Adaptive Server.

• Set Release to 15.5 and use Open Client 15.5 or higher to access the BIGTIME and BIGDATETIME SQL datatypes added in version 15.5 of Adaptive Server.

ExamplesTo specify that your PowerBuilder application accesses an Adaptive Server<br/>Enterprise 15 database using an Open Client Client-Library 15 context:

- **Database profile** Select 15 from the Release drop-down list on the Connection page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

```
SQLCA.DBParm="Release='15'"
```

## ReleaseConnectionOption

Description	connection. This	Server should behave when it releases control of a parameter applies <i>only</i> when a PowerBuilder custom class loyed as an EAServer component.
Applies to	JDB JDBC ODBC O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SYJ Sybase Adap	otive Server Enterprise
Syntax	ReleaseConnecti	onOption=' <i>value</i> '
	Parameter	Description
	value	Specifies how EAServer should behave when it releases control of a connection. Values are:
		• JAG_CM_UNUSED (Default) A connection taken from a cache is placed back in the cache and a connection created outside of a cache is closed and destroyed.
		• JAG_CM_DROP The connection is forced to close and is deallocated. If the connection came from a cache, a new connection is created in its place.
Default value	ReleaseConnectionOption='JAG_CM_UNUSED'	

Usage	Use JAG_CM_DROP to destroy a connection when errors have made it unusable. This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.
	<b>Using the SYJ interface</b> Sybase EAServer uses a slightly different version of the CT-Lib software. Therefore, <i>at runtime</i> , you need to use the SYJ database interface rather than ASE or SYC to connect to an Adaptive Server Enterprise database. The SYJ Database Profile Setup dialog box provides a convenient way to set the appropriate connection parameters and then copy the syntax from the Preview page into the script for your Transaction object.
	You cannot use the SYJ interface, however, to connect to the database in the PowerBuilder development environment. Therefore, <i>during the development phase</i> (before the component has been deployed to EAServer), you must use ASE or SYC to connect to the database.
	For information on how to use PowerBuilder to build EAServer components, see <i>Application Techniques</i> .
Examples	On the EAServer page in the Database Profile Setup dialog box, select JAG_CM_DROP from the Release Connection Option drop-down list. The PowerScript syntax for the ReleaseConnectionOption parameter displays on the Preview page:
	SQLCA.DBParm="ReleaseConnectionOption='JAG_CM_DROP'"
	Copy the syntax from the Preview page into your script.
See also	CacheName GetConnectionOption UseContextObject
Descored	

## Request

Description	Specifies whether to allocate new transaction resources each time the client
	application sends a request and then release those resources after each request.
Applies to	DIR Sybase DirectConnect (applies only to Access Service for DB2/MVS)
Syntax	Request= <i>value</i>

	Parameter	Description	
	value	Specifies whether you want to release transaction resources after each request. Values are:	
		• <b>0</b> (Default) Maintain resources for the duration of the database connection.	
		• 1 Release resources after each request.	
Default value	Request=0		
Usage		<i>r using the Request parameter</i> Setting the Request release resources has an effect only when you do both of the	
	• Set the AutoCommit database preference to True to specify that PowerBuilder should issue SQL statements outside the scope of a transaction. (See the description of AutoCommit.)		
	• Specify the	value for Request before connecting to a database.	
	resources are allo This might slow	When you set the Request parameter to 1, transaction ocated for each request and released when the request finishes. the performance of your application, but it allows more ers of the system.	
Examples	To specify that y	ou want to release resources after each request:	
		<b>rofile</b> Select the Release Transaction Resources After Each ck box on the Transaction page in the Database Profile Setup	
	Application	Type the following in code:	
	SQLCA.	DBParm="Request=1"	
See also	AutoCommit		
RPCRebind			
Description	Specifies whether (RPC) parameter	er you want PowerBuilder to rebind Remote Procedure Call rs.	
		<b>/ RPCRebind</b> DBMS supports it, you must specify the RPCRebind connecting to the database.	
Applies to	ODBC		

Syntax	RPCRebind=value	
	Parameter	Description
	value	Specifies whether you want PowerBuilder to rebind RPC parameters. Values are:
		• <b>0</b> (Default) Use the bound variable to determine all required binding information.
		• 1 Rebind the parameters and use the parameter information returned from the database to bind the parameter.
Default value	RPCRebind=0	
Usage	For those DBMSs that support RPC calls, PowerBuilder binds the parameters for the call based on the size of the variables bound to the parameters.	
	returned from Failure to do the However, som The RPCRebin	require rebinding of the parameters so the parameter size (as the back-end database) is used instead of the variable size. his might result in an error or truncation for string parameters. e drivers always expect the binding to reflect the variable size. hd parameter allows you to specify whether you want to rebind when RPCs are executed.
Examples	To specify that	t PowerBuilder should rebind RPC parameters:
		<b>profile.</b> Select the RPC Rebind check box on the Transaction e Database Profile Setup dialog box.
	Application	<b>on</b> Type the following in code:
	SQLC	A.DBParm="RPCRebind=1"

## ReturnCommandHandle

Description	-	Specifies whether you want PowerBuilder to return a handle to a session object or a data source object when you call the DBHandle function.	
Applies to	OLE DB	OLE DB	
Syntax	ReturnComma	ReturnCommandHandle =value	
	Parameter	Parameter Description	
	value	Specifies whether you want PowerBuilder to return a handle to a session object or a data source object. Values are:	
		• <b>0</b> (Default) Return a data source object pointer.	

• 1 Return a session object pointer.

Default value	ReturnCommandHandle=0
Usage	DBHandle takes a transaction object as a parameter and returns a long variable that is an interface pointer to a data source object or a session object. By default the OLE DB interface returns the handle of a data source object. If ReturnCommandHandle is set to 1, the OLE DB interface returns the handle of a session object. This handle can then be passed to an external program and instantiated for use in enlisting the connection in a Microsoft DTC (Distributed Transaction Coordinator) transaction.
Examples	For an example, see "DBHandle, OLE DB example" in the online Help.

# RTConnBalancing

Description	Supports the runtime connection load balancing feature.		
Applies to	ORA Oracle 11g		
Syntax	RTConnBalancing = <i>value</i>		
	Parameter	Description	
	value	Specifies whether the load balancing feature is used. Values are:	
		• <b>True</b> (Default) The load balancing feature is used if session	
		pooling is set.	
		• <b>False</b> The load balancing feature is not used.	
Default value	True, but this va	alue is ignored if session pooling is not set.	
Usage	Runtime connection load balancing routs work requests to the sessions in a session pool that best serve the work. Runtime connection load balancing is enabled by default when an Oracle 11.1 or higher client is connected to a release 10.2 or higher Oracle server using OCI session pooling.		
Examples	The following o	code disables the load balancing feature in a session pool:	
	• <b>Database profile</b> Select Session Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box and clear the Runtime Connection Load Balancing for Session Pooling check box on the same page.		
	Applicatio	<b>n</b> Type the following in code:	
		ans.dbparm ="pooling='session', connbalancing='No'"	
See also	Pooling		

### Scroll

Description	Informix database	Specifies whether you want to use a scroll cursor when connecting to an Informix database in PowerBuilder. When you fetch rows in an Informix table, using a scroll cursor enables you to fetch the next row, previous row, first row, or last row.	
	By default, Power connection.	Builder does not use scroll cursors in an Informix database	
Applies to	I10 Informix IN9 Informix		
Syntax	Scroll=value		
	Parameter	Description	
	value	Specifies whether you want to use a scroll cursor when connecting to an Informix database in PowerBuilder. Values are:	
		<ul> <li>0 (Default) Do not use a scroll cursor.</li> <li>1 Use a scroll cursor.</li> </ul>	
Default value	Scroll=0		
Examples	To specify that yo database in Power	u want to use a scroll cursor when connecting to an Informix Builder:	
	• <b>Database profile</b> Select the Use A Scroll Cursor check box on the Transaction page in the Database Profile Setup dialog box.		
	Application	Type the following in code:	
	SQLCA.I	DBParm="Scroll=1"	

### Sec\_Channel\_Bind

Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Channel\_Bind is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)

Sec\_Channel\_Bind controls whether your connection's security mechanism performs channel binding. When Sec\_Channel\_Bind is set to 1, both Sybase Open Client Client-Library (CT-Lib) and the server provide a network channel identifier to the security mechanism before connecting. The channel identifier contains the network addresses of the client and server.

When Sec\_Channel\_Bind is set to 0 (the default), no channel binding is performed.

You must specify a value for Sec\_Channel\_Bind before connecting to the database.

#### Using third-party security mechanisms

For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.

#### Applies to ASE, SYC Sybase Adaptive Server Enterprise

Syntax

Sec\_Channel\_Bind=value

	Parameter	Description
	value	Specifies whether your connection's security mechanism performs channel binding. Values are:
		• <b>0</b> (Default) Do <i>not</i> perform channel binding. You can also specify 'No' or 'False' to set this value.
		• 1 Perform channel binding. Both CT-Lib and the server provide a channel identifier to the connection's security mechanism. You can also specify 'Yes' or 'True' to set this value.
Default value	Sec_Channel_	Bind=0
Usage	<i>Not supported with CyberSafe Kerberos</i> Sec_Channel_Bind is <i>r supported</i> if your security mechanism is CyberSafe Kerberos.	
	Release param the appropriate	<i>rameter</i> For this parameter to take effect, you <i>must</i> also set the eter to 11or higher to specify that your application should use e version of Sybase Open Client Client-Library (CT-Lib) he description of the Release parameter for more information.
	supporting Op services in you	<i>for use</i> To use Sec_Channel_Bind or any other parameter en Client, you must meet certain requirements for using security in PowerBuilder application. For details, see "Requirements for ient security services" in <i>Connecting to Your Database</i> .
	Sec_Channel_	<i>g CT-Lib connection property</i> Specifying a value for Bind sets the corresponding Sybase CT-Lib connection property C_CHANBIND.

Examples To specify that your connection's security mechanism performs channel binding:

- **Database profile** Select the Enable Channel Binding check box on the Security page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="Sec\_Channel\_Bind=1"

See also

Sec\_Cred\_Timeout Sec\_Delegation Sec\_Keytab\_File Sec\_Mechanism Sec\_Mutual\_Auth Sec\_Network\_Auth Sec\_Server\_Principal Sec\_Sess\_Timeout

#### Sec\_Confidential

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec_Confidential is one of several parameters that support per-packet security for network-based security services. (For other per-packet security parameters, see the See Also section.)
	Sec_Confidential controls whether transmitted data is encrypted. When Sec_Confidential is set to 1, all requests sent to the server and all results returned by the server are encrypted.
	When Sec_Confidential is set to 0 (the default), transmitted data is not encrypted.
	You must specify a value for Sec_Confidential <i>before</i> connecting to the database in PowerBuilder.
	Using third-party security mechanisms For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.
Applies to	ASE, SYC Sybase Adaptive Server Enterprise Sec Confidential= <i>value</i>
Syntax	

	Parameter	Description
	value	Specifies whether transmitted data is encrypted. Values are:
		• <b>0</b> (Default) Do <i>not</i> encrypt transmitted data. You can also specify 'No' or 'False' to set this value.
		• 1 Encrypt transmitted data. Requests sent to the server and results returned by the server are encrypted. You can also specify 'Yes' or 'True' to set this value.
Default value	Sec_Confidential=	=0
Usage	public network to want to set Sec_C	cryption can protect your data if you are sending it over a a nonsecure server. In a networked environment, you might onfidential to 1 to ensure that all requests sent to the server urned by the server are encrypted.
	Release parameter appropriate versio	<i>teter</i> For this parameter to take effect, you <i>must</i> also set the to 11 or higher to specify that your application should use the n of Sybase Open Client Client-Library (CT-Lib) behavior. n of the Release parameter for more information.
	supporting Open C for using security	<i>use</i> To use Sec_Confidential or any other parameter Client security services, you must meet certain requirements services in your PowerBuilder application. For details, see r using Open Client security services" in <i>Connecting to Your</i>
	Sec_Confidential	<i>T-Lib connection property</i> Specifying a value for sets the corresponding Sybase CT-Lib connection property CONFIDENTIALITY.
Examples	To specify that tra	nsmitted data is encrypted:
	=	ofile Select the Encrypt All Results check box on the in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.I	DBParm="Sec_Confidential=1"
See also	Release Sec_Data_Integrin Sec_Data_Origin Sec_Replay_Dete Sec_Seq_Detection	ction

# Sec\_Cred\_Timeout

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec_Cred_Timeout is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)		
	Some security mechanisms allow applications to set credential timeout values for connections that use network-based login authentication. Sec_Cred_Timeout specifies the number of seconds remaining before a user's network credentials expire and become invalid. Users obtain network credentials when they log in to the network.		
	By default, Sec_Cred_Timeout specifies that there is no credential timeout limit—the credentials do not expire.		
	You must specify a value for Sec_Cred_Timeout <i>before</i> connecting to the database in PowerBuilder.		
	For information a	<i>y</i> security mechanisms bout the third-party security mechanisms and operating that Sybase has tested with Open Client security services, see ocumentation.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	Sec_Cred_Timeout= <i>value</i>		
	Parameter	Description	
	value	Specifies the number of seconds remaining before a user's network credentials expire and become invalid. You can also specify 'no_limit' (the default) to specify that the credentials not expire.	
		A credential timeout value set by the security system's administrator supersedes any value you specify for Sec_Cred_Timeout.	
Default value	Sec_Cred_Timeout='no_limit'		
Usage		<i>ros</i> If your security mechanism is CyberSafe Kerberos, ut cannot override the installation default value set for t.	

<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
<i>Requirements for use</i> To use Sec_Cred_Timeout or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .
<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Cred_Timeout sets the corresponding Sybase CT-Lib connection property named CS_SEC_CREDTIMEOUT.
To specify 120 seconds (2 minutes) remaining before a user's network credentials expire:
• <b>Database profile.</b> Type 120 in the Credential Timeout box on the Security page in the Database Profile Setup dialog box.
• <b>Application.</b> Type the following in code:
SQLCA.DBParm="Sec_Cred_Timeout=120;Release=15"
Release Sec_Channel_Bind Sec_Delegation Sec_Keytab_File Sec_Mechanism Sec_Mutual_Auth Sec_Network_Auth Sec_Server_Principal Sec_Sess_Timeout

### Sec\_Data\_Integrity

Description When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Data\_Integrity is one of several parameters that support per-packet security for network-based security services. (For other per-packet security parameters, see the See Also section.)

Sec_Data_Integrity controls whether your connection's security mechanism checks the integrity of data transmitted to and from the server. When Sec_Data_Integrity is set to 1, the security mechanism analyzes all packets to ensure that their content was not modified during transmission.
When Sec_Data_Integrity is set to 0 (the default), no integrity checking is performed.
We are a first of the first of the first of the first of the

You must specify a value for Sec\_Data\_Integrity *before* connecting to the database in PowerBuilder.

#### Using third-party security mechanisms

For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.

#### Applies to ASE, SYC Sybase Adaptive Server Enterprise

Sec\_Data\_Integrity=value

Syntax

<b>e</b> j mast			
	Parameter	Description	
	value	Specifies whether your connection's security mechanism performs integrity checking on data transmitted to and from the server. Values are:	
		• <b>0</b> (Default) Do <i>not</i> check data integrity. You can also specify 'No' or 'False' to set this value.	
		• 1 Check data integrity by analyzing all packets to ensure that their content was not modified during transmission. You can also specify 'Yes' or 'True' to set this value.	
Default value	Sec_Data_Integri	ity=0	
Usage	<i>When to use</i> Your connection's security mechanism can check data inte only when your connection is also using network-based login authentica For information, see your Sybase Open Client/Server documentation.		
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.		
	<i>Requirements for use</i> To use Sec_Data_Integrity or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .		

	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Data_Integrity sets the corresponding Sybase CT-Lib connection property named CS_SEC_INTEGRITY.
Examples	To specify that your connection's security mechanism checks data integrity:
	• <b>Database profile</b> Select the Ensure Data Integrity check box on the Security page in the Database Profile Setup dialog box.
	• Application Type the following in code:
	SQLCA.DBParm="Sec_Data_Integrity=1;Release=15"
See also	Release Sec_Confidential Sec_Data_Origin Sec_Replay_Detection Sec_Seq_Detection

## Sec\_Data\_Origin

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec_Data_Origin is one of several parameters that support per-packet security for network-based security services. (For other per-packet security parameters, see the See Also section.)
	Sec_Data_Origin controls whether your connection's security mechanism performs data origin stamping. When Sec_Data_Origin is set to 1, the security mechanism attaches a digital signature to each packet that verifies the packet's origin and contents.
	When Sec_Data_Origin is set to 0 (the default), no data origin stamping is performed.
	You must specify a value for Sec_Data_Origin <i>before</i> connecting to the database in PowerBuilder.
	<b>Using third-party security mechanisms</b> For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.
Applies to	ASE, SYC Sybase Adaptive Server Enterprise
Syntax	Sec_Data_Origin= <i>value</i>

Parameter	Description
value	Specifies whether your connection's security mechanism performs data origin stamping. Values are:
	• <b>0</b> (Default) Do <i>not</i> perform data origin stamping. You can also specify 'No' or 'False' to set this value.
	• 1 Perform data origin stamping by attaching a digital signature to each packet that verifies the packet's origin and contents. You can also specify 'Yes' or 'True' to set this value.
Sec_Data_Origin	=0
~ ~	th CyberSafe Kerberos Sec_Data_Origin is not supported echanism is CyberSafe Kerberos.
Release parameter appropriate version	<i>neter</i> For this parameter to take effect, you <i>must</i> also set the r to 11or higher to specify that your application should use the on of Sybase Open Client Client-Library (CT-Lib) behavior. n of the Release parameter for more information.
supporting Open of for using security	<i>use</i> To use Sec_Data_Origin or any other parameter Client security services, you must meet certain requirements services in your PowerBuilder application. For details, see r using Open Client security services" in <i>Connecting to Your</i>
	<i>T-Lib connection property</i> Specifying a value for sets the corresponding Sybase CT-Lib connection property DATAORIGIN.
To specify that yo stamping:	our connection's security mechanism performs data origin
-	ofile Select the Verify Packet Origin check box on the e in the Database Profile Setup dialog box.
Application	Type the following in code:
SQLCA.I	DBParm="Sec_Data_Origin=1;Release=15"

	value Sec_Data_Origina Not supported win if your security m Set Release param Release parameter appropriate versio See the descriptio Requirements for supporting Open of for using security "Requirements for Database. Corresponding C Sec_Data_Origin named CS_SEC To specify that you stamping: • Database pro- Security page • Application SQLCA.I Release Sec_Confidential Sec_Data_Integri Sec_Replay_Deter

### Sec\_Delegation

<u>-</u> <b>-</b>			
Description	PowerBuilder thro parameters that su	a Sybase Adaptive Server Enterprise database in ough Open Client, Sec_Delegation is one of several apport login authentication for network-based security er login authentication parameters, see the See Also section.)	
	to a Sybase Open gateway server is credentials. When remote server usin	hat are using network-based login authentication to connect Server gateway, Sec_Delegation controls whether the allowed to connect to a remote SQL Server using delegated Sec_Delegation is set to 1, the gateway can connect to a ng the client's delegated credentials. The remote server must work-based authentication and an identical security	
	When Sec_Delegation is set to 0 (the default), the gateway server cannot connect to a remote server using delegated credentials.		
	You must specify a in PowerBuilder.	a value for Sec_Delegation <i>before</i> connecting to the database	
	For information a	<b>security mechanisms</b> bout the third-party security mechanisms and operating that Sybase has tested with Open Client security services, see ocumentation.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	Sec_Delegation= <i>value</i>		
	Parameter	Description	
	value	Specifies whether the Sybase Open Server gateway is allowed to connect to a remote SQL Server using the client's delegated credentials. Values are:	
		<ul> <li>0 (Default) Prohibit the gateway from connecting to a remote server using delegated credentials. You can also specify 'No' or 'False' to set this value.</li> </ul>	
		• 1 Allow the gateway to connect to a remote server using delegated credentials. You can also specify 'Yes' or 'True' to set this value.	
Default value	Sec_Delegation=0	)	
Usage	<i>Not supported with CyberSafe Kerberos</i> Sec_Delegation is <i>not supported</i> if your security mechanism is CyberSafe Kerberos.		

	Set Release parameter For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
	<i>Requirements for use</i> To use Sec_Delegation or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Delegation sets the corresponding Sybase CT-Lib connection property named CS_SEC_DELEGATION.
Examples	To allow the Open Server gateway to connect to a remote server using delegated credentials:
	• <b>Database profile</b> Select the Use Delegated Credentials check box on the Security page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Sec_Delegation=1;Release=15"

### Sec\_Keytab\_File

Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Keytab\_File is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)

	Environment (DC network-based log	applies only to connections using Distributed Computing E) Kerberos as their security mechanism and requesting gin authentication. For those connections, Sec_Keytab_File e of the keytab file containing the security key for the DCE
		Keytab_File if the login ID specified in the database profile <i>different</i> from the user name of the DCE user currently eation.
	You must specify database in Power	a value for Sec_Keytab_File <i>before</i> connecting to the Builder.
	For information al	<b>security mechanisms</b> bout the third-party security mechanisms and operating hat Sybase has tested with Open Client security services, see ocumentation.
Applies to	ASE, SYC Sybase	e Adaptive Server Enterprise
Syntax	Sec_Keytab_File=	='keytab_filename'
	Parameter	Description
	Farameter	Description
	keytab_filename	The name of the keytab file containing the security key for the DCE user
Default value		The name of the keytab file containing the security key for the
Default value	keytab_filename None PowerBuilder doe	The name of the keytab file containing the security key for the DCE user s not set Sec_Keytab_File or the corresponding Sybase Open ary (CT-Lib) connection parameter CS_SEC_KEYTAB if
Default value Usage	keytab_filename None PowerBuilder doe Client Client-Libr you do not specify Supported only wi Computing Enviro	The name of the keytab file containing the security key for the DCE user s not set Sec_Keytab_File or the corresponding Sybase Open ary (CT-Lib) connection parameter CS_SEC_KEYTAB if y a value. <i>The Distributed Computing Environment</i> Only Distributed poment (DCE) security servers and clients support the use of efore, Sec_Keytab_File is supported only when your security

	Set Release parameter For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
	<i>Requirements for use</i> To use Sec_Keytab_File or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Keytab_File sets the corresponding Sybase CT-Lib connection property named CS_SEC_KEYTAB.
Examples	To specify $C: \ DCE\_KEY$ as the name of the DCE keytab file:
	• <b>Database profile</b> Type the following in the Keytab File box on the Security page in the Database Profile Setup dialog box:
	C:\DCE_KEY
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Sec_Keytab_File='C:\DCE_KEY';Release= 15"
See also	Release
	Sec_Channel_Bind
	Sec_Cred_Timeout Sec_Delegation

	Sec_Mutual_Auth
	Sec_Network_Auth
	Sec_Server_Principal
	Sec_Sess_Timeout

### Sec\_Mechanism

Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Mechanism is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)

	security mechanism Configuration utility	Client security services, you must specify the name of the you want to use in the Open Client/Open Server y so that the required drivers can be loaded. The default is the one currently specified as active in the Configuration
		s you specify a security mechanism name listed in the Open Configuration utility <i>other than</i> the default (active)
	You must specify a database in PowerB	value for Sec_Mechanism <i>before</i> connecting to the uilder.
	For information abo	<b>Security mechanisms</b> but the third-party security mechanisms and operating at Sybase has tested with Open Client security services, see cumentation.
Applies to	ASE, SYC Sybase	Adaptive Server Enterprise
Syntax	Sec_Mechanism='n	nechanism_name'
	Parameter	Description
	mechanism_name	The security mechanism name you want to use to establish a connection.
		The security mechanism name is case sensitive. You must specify it <i>exactly as it appears</i> in the Open Client/Open Server Configuration utility.
Default value	The default value for Sec_Mechanism is the security mechanism name currently specified as active in the Open Client/Open Server Configuration utility. If there is no security mechanism specified, no security service is used to establish the connection.	
Usage	<i>When to use</i> Set Sec_Mechanism to use a security mechanism specified in the Open Client/Open Server Configuration utility <i>other than</i> the default (active) security mechanism. For instructions on using the Open Client/Open Server Configuration utility, see your Sybase Open Client/Server configuration guide.	
	Release parameter to appropriate version	<i>ter</i> For this parameter to take effect, you <i>must</i> also set the o 11or higher to specify that your application should use the of Sybase Open Client Client-Library (CT-Lib) behavior. of the Release parameter for more information.

	<i>Requirements for use</i> To use Sec_Mechanism or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Mechanism sets the corresponding Sybase CT-Lib connection property named CS_SEC_MECHANISM.
Examples	To specify KERBEROS as your security mechanism name:
	• <b>Database profile</b> Type the following in the Security Mechanism box on the Security page in the Database Profile Setup dialog box:
	KERBEROS
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Sec_Mechanism='KERBEROS';Release=15"
See also	Release Sec_Channel_Bind Sec_Cred_Timeout Sec_Delegation Sec_Keytab_File Sec_Mutual_Auth Sec_Network_Auth Sec_Server_Principal Sec_Sess_Timeout

## Sec\_Mutual\_Auth

#### Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Mutual\_Auth is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)

Sec\_Mutual\_Auth controls whether your connection's security mechanism performs mutual authentication. When Sec\_Mutual\_Auth is set to 1, the server must prove its identity to the client before connecting by sending a credential token containing the server's principal name and proof that this name is authentic.

When Sec\_Mutual\_Auth is set to 0 (the default), no mutual authentication is performed.

You must specify a value for Sec\_Mutual\_Auth *before* connecting to the database in PowerBuilder.

	For information system platfor	arty security mechanisms on about the third-party security mechanisms and operating ms that Sybase has tested with Open Client security services, see nt documentation.	
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	Sec_Mutual_Auth= <i>value</i>		
	Parameter	Description	
	value	Specifies whether your connection's security mechanism performs mutual authentication. Values are:	
		• <b>0</b> (Default) Does <i>not</i> perform mutual authentication. You can also specify 'No' or 'False' to set this value.	
		• 1 Performs mutual authentication. The server must prove its identity to the client before connecting by sending a credential token containing the server's principal name and proof that this name is authentic. You can also specify 'Yes' or 'True' to set this value.	
Default value	Sec_Mutual_Auth=0		
Usage	AgeSet Release parameterFor this parameter to take effect, you must also set Release parameter to 11or higher to specify that your application should use appropriate version of Sybase Open Client Client-Library (CT-Lib) behaving See the description of the Release parameter for more information.Requirements for useTo use Sec_Mutual_Auth or any other parameter supporting Open Client security services, you must meet certain requirement for using security services in your PowerBuilder application. For details, s "Requirements for using Open Client security services" in Connecting to Yo Database.		
	Sec_Mutual_A	g CT-Lib connection property Specifying a value for Auth sets the corresponding Sybase CT-Lib connection property C_MUTUALAUTH.	
Examples	To specify tha authentication	t your connection's security mechanism performs mutual :	
		<b>profile</b> Select the Mutual Authentication check box on the bage in the Database Profile dialog box.	
	Applicati	<b>on</b> Type the following in code:	

SQLCA.DBParm="Sec\_Mutual\_Auth=1;Release=15"

#### See also

Release Sec\_Channel\_Bind Sec\_Cred\_Timeout Sec\_Delegation Sec\_Keytab\_File Sec\_Mechanism Sec\_Network\_Auth Sec\_Server\_Principal Sec\_Sess\_Timeout

#### Sec\_Network\_Auth

#### Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Network\_Auth is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)

Sec\_Network\_Auth controls whether your connection uses network-based login authentication. When Sec\_Network\_Auth is set to 1, your connection uses network-based authentication when connecting to a secure SQL Server. **Network-based authentication** means that the security mechanism—not the application—confirms that the specified user name represents the authenticated user running the application.

Since the security mechanism rather than the application authenticates your user name (login ID), you need *not* supply a login password for authentication purposes in the database profile or Application if Sec\_Network\_Auth is set to 1.

When Sec\_Network\_Auth is set to 0 (the default), your connection does not use network-based login authentication to connect to the server. You must specify a value for Sec\_Network\_Auth *before* connecting to the database in PowerBuilder.

#### Using third-party security mechanisms

For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.

Applies to

ASE, SYC Sybase Adaptive Server Enterprise

Syntax	Sec_Network_Auth= <i>value</i>		
	Parameter	Description	
	value	Specifies whether your connection uses network-based login authentication when connecting to a secure SQL Server. Values are:	
		• <b>0</b> (Default) Does <i>not</i> use network-based login authentication when connecting to the server. You can also specify 'No' or 'False' to set this value.	
		• 1 Uses network-based login authentication when connecting to the server. Since the security mechanism rather than the application authenticates your user name (login ID), you need <i>not</i> supply a login password for authentication purposes in the database profile or Application. You can also specify 'Yes' or 'True' to set this value.	
Default value	Sec_Network	_Auth=0	
Usage	authentication because you d Application to • <b>Passwor</b>	Setting Sec_Network_Auth to 1 to enable network-based login a provides three important benefits for PowerBuilder users, o not have to specify a login password in the database profile or o authenticate the login ID when Sec_Network_Auth is set to 1: d not stored in registry file Since you do not specify a login , no login password is stored in the Windows registry.	
		<b>d not transmitted across network</b> Since you do not specify a sword, no login password is transmitted across the network to Server.	
	• Same user ID and password for different servers You can us same network user ID and password to connect to many different A Server database servers. You can change your password for the m security mechanism and have this change apply on all servers to your application connects.		
	Release param appropriate ve	<i>trameter</i> For this parameter to take effect, you <i>must</i> also set the neter to 11or higher to specify that your application should use the ersion of Sybase Open Client Client-Library (CT-Lib) behavior. ption of the Release parameter for more information.	
	for using secu	<i>for use</i> To use Sec_Network_Auth or any other parameter ben Client security services, you must meet certain requirements rity services in your PowerBuilder application. For details, see is for using Open Client security services" in <i>Connecting to Your</i>	
	Sec_Network	g CT-Lib connection property Specifying a value for _Auth sets the corresponding Sybase CT-Lib connection ed CS_SEC_NETWORKAUTH.	

Examples	To specify that your connection uses network-based login authentication when connecting to the server:			
	• <b>Database profile</b> Select the Network Based Authentication check box on the Security page in the Database Profile Setup dialog box.			
	• Application Type the following in code:			
	SQLCA.DBParm="Sec_Network_Auth=1;Release=15"

	Sec_Mutual_Auth			
	Sec Server Principal			

Sec Sess Timeout

### Sec\_Replay\_Detection

#### Description

When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec\_Replay\_Detection is one of several parameters that support per-packet security for network-based security services. (For other per-packet security parameters, see the See Also section.)

Sec\_Replay\_Detection controls whether your connection's security mechanism can detect and reject unauthorized attempts to capture and replay transmitted data. When Sec\_Replay\_Detection is set to 1, the security mechanism detects and subsequently rejects any unauthorized attempts by third parties to capture packets sent to the server and repeat (replay) the commands in the packets at a later time.

When Sec\_Replay\_Detection is set to 0 (the default), the security mechanism cannot detect unauthorized attempts to capture and replay data.

You must specify a value for Sec\_Replay\_Detection *before* connecting to the database in PowerBuilder.

#### Using third-party security mechanisms

For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.

Applies to	ASE, SYC Sy	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	Sec_Replay_I	Sec_Replay_Detection= <i>value</i>		
	Parameter	Description		
	value	Specifies whether your connection's security mechanism can detect and reject unauthorized attempts to capture and replay transmitted data. Values are:		
		• <b>0</b> (Default) Prohibits your security mechanism from detecting unauthorized attempts to capture and replay transmitted data. You can also specify 'No' or 'False' to set this value.		
		• 1 Allows your security mechanism to detect and reject unauthorized attempts to capture and replay transmitted data. You can also specify 'Yes' or 'True' to set this value.		
Default value	Sec_Replay_I	Detection=0		
Usage	capture the co commands at a server in the o P1, P3, P2, thi Sec_Replay_I and subsequer	In a nonsecure network, unauthorized third parties might mmands sent to a server in order to repeat (replay) these a later date. For example, if packets are sent from the client to the order P1, P2, P3 and the server receives the packets in the order is is considered an attempt to replay the data. Setting Detection to 1 ensures that your security mechanism can detect ntly reject all such unauthorized attempts to capture and replay ed over the network.		
	Release param appropriate ve	<i>arameter</i> For this parameter to take effect, you <i>must</i> also set the neter to 11 or higher to specify that your application should use the ersion of Sybase Open Client Client-Library (CT-Lib) behavior. ption of the Release parameter for more information.		
	<i>Requirements for use</i> To use Sec_Replay_Detection or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .			
	Sec_Replay_I	g CT-Lib connection property Specifying a value for Detection sets the corresponding Sybase CT-Lib connection ed CS_SEC_DETECTREPLAY.		
	Examples			
	To allow your security mechanism to detect and reject unauthorized attempts to capture and replay transmitted data:			

- **Database profile.** Select the Detect Replayed Commands check box on the Security page in the Database Profile Setup dialog box.
- **Application.** Type the following in code:

SQLCA.DBParm="Sec\_Replay\_Detection=1;Release=12.5"

Release Sec\_Confidential Sec\_Data\_Integrity Sec\_Data\_Origin Sec\_Seq\_Detection

### Sec\_Seq\_Detection

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec_Seq_Detection is one of several parameters that support per-packet security for network-based security services. (For other per-packet security parameters, see the See Also section.)
	Sec_Seq_Detection controls whether your connection's security mechanism can detect and reject transmitted packets that arrive at the server in a different order than was originally sent from the client. When Sec_Seq_Detection is set to 1, the security mechanism detects and rejects packets that arrive at the server out of sequence.
	When Sec_Seq_Detection is set to 0 (the default), the security mechanism cannot detect packets that arrive at the server out of sequence.
	You must specify a value for Sec_Seq_Detection <i>before</i> connecting to the database in PowerBuilder.
	<b>Using third-party security mechanisms</b> For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.
Applies to	ASE, SYC Sybase Adaptive Server Enterprise
Syntax	Sec_Seq_Detection= <i>value</i>

	Parameter	Description	
	value	Specifies whether your connection's security mechanism can detect and reject packets that arrive at the server in a different order than the one in which they were sent from the client. Values are:	
		<ul> <li>O (Default) Prohibit your security mechanism from detecting packets that arrive at the server out of sequence. You can also specify 'No' or 'False' to set this value.</li> </ul>	
		• 1 Allow your security mechanism to detect and reject packets that arrive at the server out of sequence. You can also specify 'Yes' or 'True' to set this value.	
Default value	Sec_Seq_Detection=0		
Usage	<i>When to use</i> When transmitting data over a network, commands sent to a server might arrive out of sequence. For example, if packets are sent from the client to the server in the order P1, P2, P3 and the server receives the packets in the order P1, P3, P2, this is considered an out-of-sequence error.		
	Setting Sec_Seq_Detection to 1 ensures that your security mechanism can detect and subsequently reject packets that arrive at the server out of sequence.		
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.		
	<i>Requirements for use</i> To use Sec_Seq_Detection or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .		
	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Seq_Detection sets the corresponding Sybase CT-Lib connection property named CS_SEC_DETECTSEQ.		
Examples	To allow your security mechanism to detect and reject packets that arrive at the server out of sequence:		
		ofile Select the Detect Sequence Errors check box on the e in the Database Profile Setup dialog box.	
	Application	Type the following in code:	
	SQLCA.I	DBParm="Sec_Seq_Detection=1;Release=15"	
See also	Release		

Sec\_Confidential Sec\_Data\_Integrity Sec\_Data\_Origin Sec\_Replay\_Detection

### Sec\_Server\_Principal

Description	When you access a Sybase Adaptive Server Enterprise database in PowerBuilder through Open Client, Sec_Server_Principal is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)				
		ecifies the principal name of the server that you want <b>ncipal name</b> is the name by which your security h server.			
	If the server name (specified in the database profile or Application) is <i>different</i> from the server principal name for the server you want to access, you <i>must</i> set Sec_Server_Principal to the correct server principal name in order to connect.				
	You must specify a value database in PowerBuilder	for Sec_Server_Principal <i>before</i> connecting to the r.			
	Using third-party security mechanisms For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.				
Applies to	ASE, SYC Sybase Adaptive Server Enterprise				
Syntax	Sec_Server_Principal='se	Sec_Server_Principal='server_principal_name'			
	Parameter	Description			
	server_principal_name	Specifies the principal name of the server you want to access			
Default value	None				
	If you do not specify a value, the security mechanism uses the server's directory entry name, which is the same as the server name specified in the database profile or Application.				

Usage	<i>When to use</i> When you use Open Client security services with PowerBuilder, the server's directory entry name (which you specify as the server name in the database profile or Application) might differ from the server principal name. In this case, you <i>must</i> set Sec_Server_Principal to the correct server principal name so that the security mechanism can identify the server you want to access.
	<i>Set Release parameter</i> For this parameter to take effect, you <i>must</i> also set the Release parameter to 11 or higher to specify that your application should use the appropriate version of Sybase Open Client Client-Library (CT-Lib) behavior. See the description of the Release parameter for more information.
	<i>Requirements for use</i> To use Sec_Server_Principal or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .
	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Server_Principal sets the corresponding Sybase CT-Lib connection property named CS_SEC_SERVERPRINCIPAL.
Examples	To specify SYS12NT as the principal name of the server you want to access:
	• <b>Database profile</b> Type SYS12NT in the Server Principal Name box on the Security page in the Database Profile Setup dialog box.
	• <b>Application</b> Type the following in code:
	SQLCA.DBParm="Sec_Server_Principal='SYS12NT';Releas e=12"
See also	Release Sec_Channel_Bind Sec_Cred_Timeout Sec_Delegation Sec_Keytab_File Sec_Mechanism Sec_Mutual_Auth Sec_Network_Auth Sec_Sess_Timeout

## Sec\_Sess\_Timeout

Description	•	ss a Sybase Adaptive Server Enterprise database in		
	PowerBuilder through Open Client, Sec_Sess_Timeout is one of several parameters that support login authentication for network-based security services. (For other login authentication parameters, see the See Also section.)			
	Some security mechanisms allow applications to set session timeout values for connections using network-based login authentication. For these connections, Sec_Sess_Timeout specifies the number of seconds remaining before a session expires. The session timeout period begins when the connection is opened.			
	By default, Sec_Sess_Timeout specifies that there is no session timeout limit; the session does not expire. You must specify a value for Sec_Sess_Timeout <i>before</i> connecting to the database in PowerBuilder.			
	Using third-party security mechanisms For information about the third-party security mechanisms and operating system platforms that Sybase has tested with Open Client security services, see the Open Client documentation.			
Applies to	ASE, SYC Sybase Adaptive Server Enterprise			
Syntax	Sec_Sess_Timeout=value			
	Parameter	Description		
	value	Specifies the number of seconds remaining before a session expires. You can also specify 'no_limit' (the default) to indicate that the session does not expire.		
		A session timeout value set by the security system's administrator supersedes any value you specify for Sec_Sess_Timeout.		
Default value	Sec_Sess_Timeout='no_limit'			
Usage	<i>CyberSafe Kerberos</i> If your security mechanism is CyberSafe Kerberos, Sec_Sess_Timeout cannot override the installation default value set for session timeout.			
	Release paramet appropriate vers	<i>ameter</i> For this parameter to take effect, you <i>must</i> also set the ter to 11 or higher to specify that your application should use the ion of Sybase Open Client Client-Library (CT-Lib) behavior.		

	<i>Requirements for use</i> To use Sec_Sess_Timeout or any other parameter supporting Open Client security services, you must meet certain requirements for using security services in your PowerBuilder application. For details, see "Requirements for using Open Client security services" in <i>Connecting to Your Database</i> .		
	<i>Corresponding CT-Lib connection property</i> Specifying a value for Sec_Sess_Timeout sets the corresponding Sybase CT-Lib connection property named CS_SEC_SESSTIMEOUT.		
Examples	To specify 14,400 seconds (4 hours) remaining before a session expires:		
	• <b>Database profile</b> Type 14400 in the Session Timeout box on the Security page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="Sec_Sess_Timeout=14400"		
See also	Release		
	Sec_Channel_Bind		
	Sec_Cred_Timeout		
	Sec_Delegation		
	Sec_Keytab_File		
	Sec_Mechanism		
	Sec_Mutual_Auth		
	Sec_Network_Auth		

Sec\_Server\_Principal

## ServerName

Description	Specifies the server name for Oracle client interface (OCI) pooling.	
Applies to	ORA Oracle 11g	
Syntax	ServerName = <i>value</i>	
	Parameter	Description
	value	Sets the name of the server to use for OCI pooling

Usage	Dracle client interface pooling for PowerBuilder applications is created when ou connect to an Oracle server for the first time. The pooling is identified by the server name and character set that are specified in the ServerName and JLS_Charset parameters, respectively. If two Oracle connections are onnected to the same Oracle server but use different character sets, the onnections must reside in different connection or session pools. All ooling-related DBParm parameters must be set before the initial database onnection.	
Examples	To specify the server name for OCI pooling:	
	• <b>Database profile</b> Type the server name you want to set in the Server text box on the Connection page in the Database Profile Setup dialog box.	
	• <b>Application</b> Type the following in code:	

my\_trans.Server = "myServerName"

# **ServiceComponents**

Description	Specifies the global services the OLE DB interface can use.			
	When to specify ServiceComponents You must specify the ServiceComponents parameter <i>before</i> connecting to the database.			
Applies to	OLE DB			
Syntax	ServiceComponents='servicecomponent_name'			
Default value	None			
Examples	To enable the resource pooling service component:			
	• <b>Database profile</b> Select Resource Pooling from the Service Component Support box on the System page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="ServiceComponents='DBPROPVAL_OS_RESOU RCEPOOLING'"			

# SessionHomogeneous

Description	Authenicates all sessions in a session pool with the user name and password in effect when the session pool was created.	
Applies to	ORA Oracle 11g	
Syntax	SessionHomogeneous = <i>value</i>	
	Parameter	Description
	value	Specifies restrictions on authentication values for a session pool. Values are:
		• <b>True</b> Sessions in the session pool can be authenticated only with the user name and password of the session pool creator.
		• <b>False</b> (Default) The sessions in the session pool can use the user name and password of a connection request even if they differ from the user name and password of the session pool creator.
Default value	False, but this value is meaningless if session pooling is not set.	
Usage	When set to True, all sessions in the session pool are authenticated with the user name and password in effect when the pool was created. The user name and password in later connection requests are ignored. Proxy sessions cannot be created in homogeneous session mode.	
Examples	<ul> <li>Database profile Select Session Pooling from the Pooling Type drop-down list on the Pooling page in the Database Profile Setup dialog box, select the Homogeneous Session Pooling check box on the same page.</li> </ul>	
	Applicatio	<b>n</b> Type the following in code:
		rans.dbparm="Pooling='session', sionHomogeneous='Yes'"
See also	Pooling	

# ShowTempTables

Description	Specifies whether temporary tables are displayed when you request a list of tables from the Database painter or SQL Select painter.
Applies to	ASE, SYC Sybase Adaptive Server Enterprise
Syntax	ShowTempTables= <i>value</i>

	Parameter	Description
	value	Specifies whether temporary tables are displayed when you request a list of tables. Values are:
		• 1 (Default) Display temporary tables.
		• <b>0</b> Do not display temporary tables.
Default value	ShowTempTable	es=1
Usage	connections from ShowTempTable painter causes be of these two resu sp_pb100table is	Tables database parameter applies only to database in within the development environment. When es=1, a request for a list of database tables from within a bit sp_pb100table and sp_pb100temptab to execute. The union all sets is displayed to the user. If ShowTempTables=0, only as executed. The behavior is the same if the stored procedures on the ASE server.
Examples		You want to display temporary tables, select the Show Temp on the System page in the Database Profile Setup dialog box.

# ShowWarnings

Description	Specifies whether warning message text can be concatenated to existing error messages.	
Applies to	DIR Sybase DirectConnect	
Syntax	ShowWarnings= <i>value</i>	
	Parameter	Description
	value	Specifies whether warning message text can be concatenated to existing error messages. Values are:
		• <b>0</b> (Default) Does not allow the concatenation of warning message text to existing error messages.
		• 1 Allows the concatenation of warning message text to existing error messages.
	<b>01 W</b>	

Default value

ShowWarnings=0

Usage	The ShowWarnings parameter allows the DirectConnect interface to use warning and error processing similar to that formerly available in the InformationConnect DB2 Gateway (MDI) interface. For example, if a single warning message appears on the DIR error queue, the default behavior is to discard warnings. If ShowMessages is set, sqlca.sqlcode=-1 and sqlca.sqlerrtext="text_of_warning_message" are returned to the application.			
	sqlca.sqlerrtext cannot exceed 254 characters. Consequently, if multiple warning messages are returned together, message text might be truncated.			
	For Access Service connections, must be issued before connecting to ensure its correct operation.			
Examples	To specify that you want to show warning messages as errors:			
	• <b>Database profile</b> Select the Show Warning Messages as Errors check box on the Syntax page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="ShowWarnings=1"			
SPCache				
Description	Specifies the number of stored procedures for which the driver caches information.			
	When to specify SPCache If you want to change the default value for SPCache, you must specify a new value <i>before</i> connecting to the database. The value cannot be changed at runtime.			
Applies to	ADO.NET			

ADO.NET OLE DB O90 Oracle9*i* O10 Oracle 10*g* ORA Oracle 11*g* SNC SQL Native Client for Microsoft SQL Server

Syntax	SPCache= <i>value</i>		
	Parameter	Description	
	value	A number that specifies how many stored procedures are added to a cache that contains information about each stored procedure's parameters. To turn off caching, specify 0.	
Default value	SPCache=50 (A)	DO.NET), SPCache=100 (others)	
Usage	By default, the driver retrieves information from the server about a stored procedure's parameters the first time the stored procedure is called and caches that information. The next time the procedure is called, the driver retrieves the information from the cache to improve performance. The information is retrieved based on the stored procedure's name. The name is case sensitive.		
If you call two different stored procedures with the same name off caching by setting the value of SPCache to 0.		-	
Examples	To turn off cachi	ng of stored procedure parameter information:	
		<b>rofile</b> Specify 0 in the Maximum Procedures to Cache box m page in the Database Profile Setup dialog box.	
	Application	Type the following in code:	
	SQLCA.	DBParm="SPCache=0"	
See also	BindSPInput		
SQLCache			
Description Specifies the number of SQL statements th default is 0, specifying an empty SQL cach		nber of SQL statements that PowerBuilder should cache. The ifying an empty SQL cache.	
	PowerBuilder caches:		
	• SQL statements generated by a DataWindow object or report		
	• Embedded S	SQL statements	
Applies to	ODBC		
Syntax	SQLCache=	value	
	Parameter	Description	
	value	The number of cursors you want to open in a script, plus the number of DataWindow-generated SELECT statements with retrieval arguments (default=0).	

Default value	SQLCache=0			
Usage	<i>Maintaining statements in the cache</i> Statements in the SQL cache are maintained on a least-recently-used ( <b>LRU</b> ) basis. In other words, if a statement must be removed from the cache to make room for another statement, PowerBuilder removes the statement that was least recently executed.			
	<i>SQLCache and bind variables</i> Caching SQL statements that you execute frequently improves their performance. Statements with bind variables are often the most frequently used. In fact, if your DBMS does not support bind variables, caching statements is of limited value.			
	<i>Setting DisableBind to use cached statements</i> In order to use cached statements, make sure the DisableBind parameter is set to 0 (the default). This enables the binding of input variables to SQL statements.			
	For more about using bind variables, see DisableBind.			
	<i>What happens</i> The first time you execute a SQL statement containing bind variables, PowerBuilder does the following in this sequence:			
	1 Parses the statement.			
	2 For SQL SELECT statements, calls the appropriate database function to get a description of the result set.			
	3 Allocates memory buffers for the bind variables.			
	4 Binds the allocated memory buffers to the parsed statement.			
	When you cache this SQL statement, PowerBuilder stores the parsed statement, result set description, and memory buffer allocation and binding in the SQL cache. The next time you execute this statement, PowerBuilder finds it in the cache and avoids the overhead of repeating these steps.			
	If PowerBuilder finds an exact match for this statement in the SQL cache, it simply copies the new values supplied for the bind variables to the preallocated memory buffers and executes the statement. This is much faster than having to process the statement from scratch.			
	<i>Determining the size of your SQL cache</i> To determine an appropriate size for your SQL cache, you can check the value of the SqlReturnData property of the Transaction object.			
	When you disconnect from the database, the number of hits, misses, and entries in the SQL cache is stored in SqlReturnData as follows:			
	• <b>Hits</b> The number of times PowerBuilder found a matching statement in the SQL cache			

	• Misses T	The number of times PowerBuilder did not find a matching	
		in the cache	
		The total number of statements in the SQL cache, which is 1 by your SQLCache setting	
Examples	To set the SQL	cache size to 25 statements:	
		<b>profile</b> Type 25 in the Number Of SQL Statements Cached Transaction page in the Database Profile Setup dialog box.	
	Applicatio	<b>n</b> Type the following in code:	
	SQLCA	A.DBParm="SQLCache=25"	
See also	DisableBind		
SQLQualifiers			
Description	<ul> <li>Sets the level of qualification for identifiers (table and column names) in SQL statements when you connect to a database. This affects behavior in DataWindow objects.</li> <li>When PowerBuilder <b>qualifies</b> a table or column name, it prefixes it with the name of the owner. For example, if a user named Fran owns a table named Sales, the qualified table name is Fran.Sales.</li> </ul>		
Applies to	DIR Sybase DirectConnect		
Syntax	SQLQualifiers= <i>value</i>		
	Parameter	Description	
	value	Sets the level of qualification for identifiers in SQL statements when you connect to a database. Values are:	
		• <b>0</b> (Default) Do not qualify identifiers with owner names in SQL statements.	
		• 1 Qualify identifiers with owner names in SQL statements.	
Default value	SQLQualifiers=0		
Usage	<i>When PowerBuilder qualifies identifiers</i> If the name of the table owner is the same as the name of the user logged in to the database, PowerBuilder does not qualify identifiers with owner names in the SQL statements it generates. If you set the SQLQualifiers parameter to 1, PowerBuilder qualifies identifiers with an owner name in SQL statements.		
Examples	To specify that you want PowerBuilder to qualify identifiers with owner names in SQL statements:		

- **Database profile.** Select the Qualify Identifiers With Owner Names check box on the Syntax page in the Database Profile Setup dialog box.
- Application. Type the following in code:

SQLCA.DBParm="SQLQualifiers=1"

### **StatementCache**

Description	Specifies whether statement caching is enabled and the maximum number of statements to cache.	
Applies to	O10 Oracle 10g ORA Oracle 11g	
Syntax	StatementCache='value'	
	Parameter	Description
	value	Specifies whether statement caching is enabled and the maximum number of statements to cache. Values are:
		• 0 Statement caching is disabled.
		• <i>n</i> Statement caching is enabled and <i>n</i> statements may be cached, where <i>n</i> is a positive integer.
Default value	StatementCache=0	
Usage	Statement caching in Oracle provides and manages a cache of statements for each session. On the server, cursors are ready to be used without the need to parse the statement again before execution. Statement caching can be used with connection or session pooling to improve performance and scalability.	
Examples	To enable statement caching and specify that five statements can be cached:	
	-	<b>rofile</b> Type 5 in the Number of Oracle Statements Cached ransaction page in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.	DBParm="StatementCache=5"
See also	CnnPool Pooling	

# **StaticBind**

otatioBind			
Description	When you retrieve data from a database into a DataWindow object or report, PowerBuilder does not get a result set description to validate the SELECT statement against the database server before retrieving the data. This means the retrieval should be faster, especially when you are accessing the database over a network. (This feature is called describeless retrieval.)		
	If you want to override the default behavior and have PowerBuilder get a description of the result set before retrieving data, set the StaticBind parameter to 0 or No.		
Applies to	ADO.NET ASE, SYC and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect JDB JDBC ODBC OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SNC SQL Native Client for Microsoft SQL Server		
Syntax	StaticBind=value		
	Parameter	Description	
	value	<ul> <li>Specifies whether you want PowerBuilder to get a result set description before retrieving data from a database into a DataWindow object or report. Values are:</li> <li>O Get a result set description before retrieving data. You can also specify 'No' to set this value.</li> <li>1 (Default) Skip getting a result set description before retrieving data. You can also specify 'Yes' to set this value.</li> </ul>	
Default value	StaticBind=1		
Usage	<i>Validation</i> When StaticBind is set to 1 (the default), PowerBuilder does not validate the SELECT statement against the database server before retrieving data. It assumes that the result set matches the column format of the DataWindow object or report into which it is being retrieved. If a mismatch occurs, PowerBuilder displays an error.		

*Troubleshooting tips* Problems can occur in your application if the result set description obtained by the DataWindow object or report is different from the current database description of the result set. This can occur for the following reasons:

- The database definition changes after you build the DataWindow object or report.
- You build the DataWindow object or report while connected to one DBMS and then run it against a different DBMS.

To fix problems caused by conflicting result set descriptions, you can correct your DataWindow object or report definition by doing either of the following:

- Export and edit your column definitions
- Force a recompile of the SQL statement in the Database painter's Interactive SQL (ISQL) view (see the *Users Guide* for instructions)

If your DataWindow object or report and DBMS result set descriptions do not match and you want to avoid errors, set StaticBind to 0 or No to specify that PowerBuilder should *always* get a result set description before retrieving data into a DataWindow object or report.

Examples To specify that you want PowerBuilder to get a result set description before retrieving data into a DataWindow object or report:

- **Database profile** Clear the Static Bind check box on the Transaction page (or System page in the case of the OLE DB interface) in the Database Profile Setup dialog box.
- Application To specify this statement in code, type the following:

SQLCA.DBParm="StaticBind=0"

StmtCache
-----------

Description

Specifies whether SQL statement caching is enabled on the client.

Applies to	I10 Informix		
Syntax	StmtCache='value'		
	Parameter	Description	
	value	Specifies whether SQL statement caching is enabled on the client. Values are:	
		• <b>0</b> SQL statement caching is disabled on the client.	
		• 1 SQL statement caching is enabled on the client.	
Default value	StmtCache=0		
Usage	to store SQL stat statement already not parse and opt The statement m	later, the database server uses the SQL statement cache (SSC) tements across user sessions. When any user executes a y stored in the SQL statement cache, the database server does imize the statement again, resulting in improved performance. ust be a SELECT, UPDATE, DELETE, or INSERT statement, ntain user-defined routines.	
	STATEMENT CA environment var must enable the configuration pa	l ways to configure caching on the server. The SET CHE statement takes precedence over the STMT_CACHE iable and the STMT_CACHE configuration parameter. You SQL statement cache, either by setting the STMT_CACHE rameter or by using the Informix onmode utility, <i>before</i> the T CACHE statement can execute successfully.	
	Profile Setup dia or off on the clie	StmtCache DBParm on the System tab page in the Database log box for I10 connections to turn SQL statement caching on nt. However, the server must be configured to support SQL g before you can access the cache from the client.	
	Informix Dynamic	ation about Informix SQL statement caching, see the IBM Server Performance Guide at der.ibm.com/epubs/pdf/25122960.pdf.	
Examples	To specify that the configured on the theorem of the second secon	ne client can access data from the SQL statement cache if it is e server:	
		<b>rofile</b> Select the Enable SQL Statement Cache check box on page in the Database Profile Setup dialog box.	
	Application	Type the following in code:	
	001.01		

SQLCA.DBParm="StmtCache=1"

StrByCharset
--------------

Description Specifies how to convert string data between PowerBuilder Unicode strings and multibyte strings on the client. Applies to **I10** Informix O90 Oracle9i O10 Oracle 10g ORA Oracle 11g Syntax StrByCharset='value' Description Parameter value Specifies how to convert string data between PowerBuilder Unicode strings and multibyte strings on the client. Values are: • **0** String conversion is based on the current OS code page, or, for UTF-8 code sets on Informix, on the UTF-8 code set. • 1 For Informix, string conversion is based on the code set specified in the Client\_Locale database parameter. For Oracle, string conversion is based on the Oracle character set specified in the NLS\_Charset database parameter. Default value StrByCharset=0 Informix The StrByCharset DBParm specifies how to convert string data Usage between PowerBuilder Unicode strings and Informix client multibyte strings. By default, string conversion for UTF-8 code sets is based on the UTF-8 code set, and string conversion for non-UTF-8 code sets is based on the current OS code page. If StrByCharset is set to 1 (true), string conversion is based on the code set specified in the DBParm Client Locale.

*Example 1* With these settings:

```
StrByCharset=0
Informix Server DB_LOCALE='EN_US.8859-1'
PowerBuilder Informix client CLIENT_LOCALE='EN_US.8859-
1'
OS code page=1252
```

The Informix client and server character sets match, so all string data from the client can be sent to the server and fetched back directly, even if some characters do not belong to the EN\_US.8859-1 character set but are within code page 1252, because no string conversion happens between the Oracle client and server. All string data can be displayed using the OS code page. If StrByCharset is set to 1, when string data is converted between the Informix client (ANSI) and PowerBuilder (Unicode), characters that are not in the EN\_US.8859-1 character set are not converted correctly.

Example 2

With these settings:

```
StrByCharset=0
Informix Server DB_LOCALE='DE_DE.ASCII'
PowerBuilder Informix client
CLIENT_LOCALE='DE_DE.ASCII'
OS code page=949 for Korean
```

The client and server character sets match. All string data, including Korean characters, are sent or received one byte at a time so no data is lost. Using the Korean OS code page, all Korean string data can be converted from ANSI to Unicode safely with StrByCharset set to 0.

#### Example 3

With these settings:

```
StrByCharset=1
Informix Server DB_LOCALE='ZH_TW.BIG5'
PowerBuilder Informix client CLIENT_LOCALE='ZH_TW.BIG5'
OS code page=1252
```

Because characters in the ZH\_TW.BIG5 character set do not belong to code page 1252, string data conversion must be based on the ZH\_TW.BIG5 character set.

**Oracle** The StrByCharset DBParm specifies how to convert string data between PowerBuilder Unicode and OCI client multibyte strings. By default, string conversion is based on the current OS code page or an Oracle character set. The StrByCharset database parameter is ignored if NLS\_Charset is set to Unicode because both PowerBuilder and the OCI client use the UTF-16 format. When NLS\_Charset is set to another value, you must set StrByCharset to 1 if the character set on the client is incompatible with the OS code page.

*Example 1* With these settings:

```
StrByCharset=0
Oracle Server NLS_CHARACTER='WE8ISO8859P1'
PowerBuilder OCI client NLS_CHARSET='WE8ISO8859P1'
OS code page=1252
```

The Oracle client and server character sets match, so all string data from the client can be sent to the server and fetched back directly, even if some characters do not belong to the WE8ISO8859P1 character set but are within code page 1252, because no string conversion happens between the Oracle client and server. All string data can be displayed using the OS code page. If StrByCharset is set to 1, when string data is converted between the OCI client (ANSI) and PowerBuilder (Unicode), characters that are not in the WE8ISO8859P1character set are not converted correctly.

*Example 2* With these settings:

```
StrByCharset=0
Oracle Server NLS_CHARACTER='US7ASCII'
PowerBuilder OCI client NLS_CHARSET='US7ASCII'
OS code page=949 for Korean
```

The client and server character sets match. All string data, including Korean characters, is sent or received one byte at a time so no data is lost. Using the Korean OS code page, all Korean string data can be converted from ANSI to Unicode safely with StrByCharset set to 0.

*Example 3* With these settings:

```
StrByCharset=1
Oracle Server NLS_CHARACTER='ZHT16BIG5'
PowerBuilder OCI client NLS_CHARSET='ZHT16BIG5'
OS code page=1252
```

Because characters in the ZHT16BIG5 character set do not belong to code page 1252, string data conversion must be based on the ZHT16BIG5 character set.

Examples To specify that the Informix client should use the fr\_FR.8859-1 character set defined by the Client\_Locale parameter to handle string datatypes:

- **Database profile** Specify fr\_FR.8859-1 in the Client Locale box and select the String Conversion Based on Client Locale box on the Regional Settings page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

```
SQLCA.DBParm="Client_Locale='fr_FR.8859-
1',StrByCharset=1"
```

To specify that the OCI client should use the character set defined by the NLS\_LANG parameter on the local computer to handle string datatypes:

- **Database profile** Select Local from the NLS Charset drop-down list and select the Use String Conversion Based on Oracle Character Set box on the System page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

```
SQLCA.DBParm="NLS_Charset='Local',StrByCharset=1"
```

Client\_Locale Db\_Locale NLS\_Charset

### StripParmNames

Description	Specifies that exp driver.	plicitly named parameters should not be passed to the ODBC
Applies to	ODBC	
Syntax	StripParmNames=' <i>value'</i>	
	Parameter	Description
	value	<ul> <li>Specifies that explicitly named parameters should not be passed to the ODBC driver. Values are:</li> <li>Yes Remove all parameter names from the generated call escape syntax.</li> <li>No (Default) Keep parameter names that are explicitly specified and include them in the generated call escape syntax.</li> </ul>
Default value	StripParmNames	s='No'
Usage	execution of a sto be generated and	erBuilder retains parameter names if explicitly specified in the bred procedure. As a result, syntax such as the following might I sent to the ODBC driver:

{call proc(a=?,b=?)}

	parameters to th	scape syntax. To prevent the passing of explicitly named the ODBC driver, set StripParmNames to Yes. This means that are passed in the order specified.
Examples	To strip explicit	ly stated parameter names from a stored procedure:
	-	<b>brofile</b> Select the Strip Parameter Names check box on the e in the Database Profile Setup dialog box.
	Application	n Type the following in code:
	SQLCA	.DBParm="StripParmNames='Yes'"
SvrFailover		
Description	-	er you want PowerBuilder to recognize and participate in ignated backup database server if the current database server
	When to specif You must specif	<b>y SvrFailover</b> y the SvrFailover parameter <i>before</i> connecting to the database.
Applies to	ASE, SYC or S database connec O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax SvrFailover='value'		lue'
	Parameter	Description
	value	<ul> <li>Specifies whether you want PowerBuilder to recognize and participate in failover to a designated backup database server if the current database server goes down. Values are:</li> <li>No (Default) PowerBuilder should not recognize or participate in failover.</li> <li>Yes PowerBuilder should recognize and participate in failover.</li> </ul>
Default value	SvrFailover='No	ס'

Some database vendors do not allow parameter names to be specified in the

Usage	Both Oracle and Sybase support database server failover in Oracle Version 8.1.5 or later and Adaptive Server 12 or later. For information about how to configure failover for these database servers, see your Oracle or Adaptive Server documentation. To avoid losing your PowerBuilder database connection (as the result of a timeout) when a failover takes place, set the SvrFailover parameter so that PowerBuilder recognizes and participates in the database server failover.		
	Oracle also allows you some control over the failover process. Three additional parameters allow you to specify the number of times you want the database server to which you are connected to attempt a failover, how long to wait between failover attempts, and whether PowerBuilder should display a runtime dialog box indicating when a failover occurs.		
	This parameter cannot be set dynamically. The value set when the connection is made remains in effect until it is disconnected.		
Examples	To tell PowerBuilder to recognize and participate in failover:		
	• <b>Database profile</b> Select the Allow Server Failover check box on the Network page in the Database Profile Setup dialog box.		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="SvrFailover='Yes'"		
See also	FoDelay FoDialog FoRetryCount		

# SystemOwner

Description	Specifies the owner of the IBM DB2 system tables that you want PowerBuilder to use. PowerBuilder accesses the DB2 system tables to get information about the tables and columns in your database.	
Applies to	DIR Sybase Dire	ectConnect
Syntax	SystemOwner='owner_name'	
	Parameter	Description
	owner_name	Specifies the owner of the DB2 system tables that you want PowerBuilder to use (default=SYSIBM)
Default value	SystemOwner='S	SYSIBM'

Usage	When you use the SystemOwner parameter to specify a nondefault system owner, PowerBuilder uses the set of system tables belonging to this owner instead of the default system tables owned by SYSIBM.			
	If your site has a large DB2 system catalog, it might be useful to create local copies of the catalog tables and populate them with a subset of the information in the default system catalog. These local copies are sometimes called <b>shadow catalogs</b> .			
	You can then set the value of SystemOwner to the owner of the shadow catalogs. This tells PowerBuilder to access the smaller shadow catalogs instead of the larger default system tables, resulting in faster performance. However, you must make sure to keep the shadow catalogs synchronized with the default system catalog owned by SYSIBM.			
	For more about creating shadow catalogs, see your DB2 system administrator or check whether there is a technical document that describes how to do it. Updated information about connectivity issues is available from the Sybase Customer Service and Support Web site at http://www.sybase.com/support.			
Examples	To specify MYAPP as the owner of the system tables that you want PowerBuilder to use:			
	• <b>Database profile</b> Type MYAPP in the CSP Catalog Qualifier box on the System page in the Database Profile Setup dialog box.			
	• <b>Application</b> Type the following in code:			
	SQLCA.DBParm="SystemOwner='MYAPP'"			

# **SystemProcs**

Description	Specifies whether you want PowerBuilder to display both system-stored procedures and user-defined stored procedures in the connected database when you request a list of stored procedures.		
	By default, PowerBuilder displays both system and user-defined stored procedures in the connected database. If you set SystemProcs to 0 or No, only user-defined stored procedures are displayed.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise		
Syntax	SystemProcs=value		

	Parameter	Description
	value	Specifies whether you want PowerBuilder to display both system- stored procedures and user-defined stored procedures in the connected database when you request a list of stored procedures. Values are:
		• <b>0</b> Display only user-defined stored procedures. You can also specify 'No' to set this value.
		• 1 (Default) Display both system-stored procedures and user- defined stored procedures. You can also specify 'Yes' to set this value.
Default value	SystemProcs=1	
Usage		Procs to 0 or No speeds response time if you want to work only ed stored procedures.
Examples	· ·	you want PowerBuilder to display only user-defined stored he connected database when you request a list of stored
		<b>profile</b> Clear the Display System Stored Procedures check System page in the Database Profile Setup dialog box.
	Applicatio	<b>n</b> To specify this statement in code, type the following:
	SQLCA	A.DBParm="SystemProcs=0"

# **TableCriteria**

Description	Lets you specify search conditions to limit the list of tables and views that displays in the Installed Database Interfaces Tables list in PowerBuilder. Setting this parameter can be useful if you are working with a very large database in the PowerBuilder development environment.		
	When to specify TableCriteria You must specify the TableCriteria parameter <i>before</i> connecting to the database.		
	The TableCriteria parameter has no effect in a PowerBuilder application script.		
Applies to	ASE, SYC Sybase Adaptive Server Enterprise DIR Sybase DirectConnect JDB JDBC ODBC		

following boxes:

	O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>
Syntax	You specify the TableCriteria search conditions on the System page in the Database Profile Setup dialog box.
Default value	None. If you do not specify any values, the TableCriteria parameter is not used.
	<b>Oracle</b> If you do not specify a value for TableCriteria, all Oracle tables, views, and synonyms that you have permission to access display in the Installed Database Interfaces Tables list by default.
Usage	To specify the TableCriteria search conditions, enter information in the

Field	Description
Table Name	Specifies the names of tables to display in the current database. You can use wildcard characters.
	<b>Default for DirectConnect interface</b> If you omit this value when connected through the DirectConnect interface, PowerBuilder displays all tables that you have permission to access in the current database, as defined in the DirectConnect server configuration file.
	<b>Default for Adaptive Server Enterprise interface</b> If you omit this value when connected through the Adaptive Server Enterprise interface, PowerBuilder displays all tables in the current database.
Table Owner	Displays only those tables belonging to the specified table owner. You can use wildcard characters.
	If you omit this value, PowerBuilder displays all tables matching the table name that you have permission to access.
Include Tables	Specifies that tables should be displayed.
Include Views	Specifies that views should be displayed.
Include System Tables	Specifies that system tables should be displayed.

*Adaptive Server Enterprise and DirectConnect* These Sybase database interfaces use stored procedures to create the table list:

• **DirectConnect interface** Uses the sp\_tables stored procedure.

	• Adaptive Server Enterprise interface Uses the version of the sp_pb125table stored procedure installed by you or your database administrator.
	For information about which version of sp_pb125table to install when connecting to an Adaptive Server Enterprise database, see "Installing PowerBuilder stored procedures in Adaptive Server Enterprise databases" in <i>Connecting to Your Database</i> .
	PowerBuilder uses the TableCriteria parameter to supply the arguments to sp_tables or sp_pb125table and build the table list based on your search criteria.
Examples	Type QADB% in the Table Name box and DWMC31 in the Table Owner box on the System page in the Database Profile Setup dialog box to set the Table Criteria property to:
	TableCriteria='QADB%,DWMC31'
ThreadSafe	
Description	Specifies whether your connection should take advantage of the database server threadsafe client libraries.
	By default, ThreadSafe is set to No to specify that your connection does not use the threadsafe client libraries. If you set ThreadSafe to Yes, your connection takes advantage of the threadsafe client libraries.
	When to specify ThreadSafe You must specify a value for ThreadSafe <i>before</i> connecting to the database.
Applies to	I10 Informix IN9 Informix O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>
Syntax	ThreadSafe=' <i>value</i> '

	Parameter	Description
	value	<ul> <li>Specifies whether a connection uses the database server threadsafe client libraries. Values are:</li> <li>Yes Your connection uses the threadsafe client</li> </ul>
		<ul> <li>libraries. Use this setting when building distributed applications that require a multi-threaded environment.</li> <li>No (Default) Your connection does not use the threadsafe client libraries. Use this setting when building</li> </ul>
		nondistributed applications that require a single-threaded environment.
Default value	ThreadSafe='No'	
Usage	client libraries. W to build multi-thro parameter to Yes effects among mu	acle and Informix provide support for thread safety in their 'hen you are using the Oracle or Informix database interface eaded applications in PowerBuilder, set the ThreadSafe to use threadsafe client libraries. This prevents possible side ltiple threads of execution making calls to the database cation might incur a performance penalty when you use the ibraries.
	building an applic threadsafe client l applications do no threadsafe librarie	ent software (and, thus, PowerBuilder) assumes that you are ation in a single-threaded environment that does not need the ibraries. This default ensures that single-threaded ot incur the performance penalty associated with using es. Therefore, if you are building single-threaded can leave the ThreadSafe parameter set to No (the default).
	-	nnot be set dynamically. The value set when the connection n effect until it is disconnected.
Examples	To specify that yo	our connection uses the threadsafe client libraries:
		ofile Select the Thread Safe check box on the Connection atabase Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.I	DBParm="ThreadSafe='Yes'"

# Time

Description	When you update data in the DataWindow painter, PowerBuilder builds a SQL UPDATE statement in the background. The Time parameter determines how PowerBuilder specifies a time datatype when it builds the SQL UPDATE statement.	
Applies to	JDB JDBC ODBC O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i>	
Syntax	The syntax you use the database.	to specify the Time parameter differs slightly depending on
		le Setup dialog box inserts special characters (quotes and needed, so you can specify just the time format.
	In code, you must u	se the following syntax:
		<b>Syntax</b> PowerBuilder parses the backslash followed by ") as a single quote when it builds the SQL UPDATE
	Time=' \" <i>time_t</i>	iormat\" '
	-	owerBuilder parses each set of four consecutive single le quote when it builds the SQL UPDATE statement:
	Time=' '''' <i>time_</i> i	format"" '
	Parameter	Description
	1.11	IDBC and ODBC syntax. Type a single quote followed by

Parameter	Description
'\"	<b>JDBC and ODBC syntax</b> Type a single quote, followed by one space, followed by a backslash, followed by two single quotes. There is no space between the two single quotes and the beginning of the time format.
	<b>Oracle syntax</b> Type a single quote, followed by one space, followed by four single quotes. There is no space between the four single quotes and the beginning of the time format.
time_format	The time format you want PowerBuilder to use when it builds a SQL UPDATE statement to update a data source in the DataWindow painter. For more on display formats, see the <i>Users Guide</i> .

	Parameter	Description		
	\"''	<b>JDBC and ODBC syntax</b> Type a backslash, followed by two single quotes, followed by one space, followed by a single quote. There is no space between the end of the time format and the backslash.		
		<b>Oracle syntax</b> Type four single quotes, followed by one space, followed by a single quote. There is no space between the end of the time format and the four single quotes.		
Default value	The default va	The default value for Time depends on the DBMS you are accessing:		
	DBMS	Date default value		
	JDBC	If no value is specified for the Time parameter, PowerBuilder looks for a time format in the section for your JDBC driver in the registry. If no time format is found in the registry, PowerBuilder uses the JDBC time format escape sequence.		
	ODBC	If no value is specified for the Time parameter, PowerBuilder looks for a time format in the section for your ODBC driver in the PBODB125 initialization file. If no time format is found in the PBODB125 initialization file, PowerBuilder uses the ODBC time format escape sequence.		
	Oracle	The default Oracle date format.		
		For information, see your Oracle documentation.		
Examples		<b>examples</b> Assume you are updating a table named Workhours Start column to 08:30. This time is represented by the following time format:		
	hh:mm			
		<b>DBC and ODBC syntax)</b> To specify that PowerBuilder should t for the time datatype when it builds the SQL UPDATE		
		<b>profile</b> Type the following in the Time Format box on the ge in the Database Profile Setup dialog box:		
	hh:m	m		
	Application	<b>on</b> Type the following in code:		

SQLCA.DBParm="Time=' \''hh:mm\'' '"

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

UPDATE WORKHOURS SET START='08:30' **Example 2 (Oracle syntax)** To specify that PowerBuilder should use this format for the time datatype when it builds the SQL UPDATE statement:

- **Database profile** Type hh:mm in the Time Format box on the Syntax page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="Time=' '''hh:mm'''' '"

*What happens* PowerBuilder builds the following SQL UPDATE statement to update the table:

UPDATE WORKHOURS SET START='08:30'

DateTime

Date

## **TimeFormat**

Description	When you update data in the DataWindow painter, PowerBuilder builds a SQL UPDATE statement in the background. The Time parameter determines how PowerBuilder specifies a time datatype when it builds the SQL UPDATE statement.	
Applies to	ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server	
Syntax	TimeFormat ='time_format	
	Parameter	Description
	time_format	The time format you want PowerBuilder to use when it builds a SQL UPDATE statement to update a data source in the DataWindow painter.
		For more on display formats, see the Users Guide.
Default value	If no value is specified for the TimeFormat parameter, PowerBuilder does not use a time datatype.	
Usage	When you call stored procedures, the database server might not accept the time format built by PowerBuilder. If this occurs, you can try to use another format. For example, for Microsoft SQL Server, try this format:	
	TimeFormat-!\!!bb.mm.ss\!!!	

TimeFormat='\''hh:mm:ss\'''

Examples	Assume you are updating a table named Workhours by setting the Start column to 08:30. This time is represented by the following PowerBuilder time format		
	To specify that PowerBuilder should use this format for the time datatype when it builds the SQL UPDATE statement:		
	• <b>Database profile</b> Type the following in the Time Format box on the Syntax page in the Database Profile Setup dialog box:		
	hh:mm		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="TimeFormat='hh:mm'"		
	<i>What happens</i> PowerBuilder builds the following SQL UPDATE statement to update the table:		
	UPDATE WORKHOURS SET START='08:30'		
See also	DateFormat DateTimeFormat		
Timeout			
Description	Specifies the number of seconds the interface should wait for a connection to the data provider to complete.		
	When to specify TimeOut You must specify a value for TimeOut <i>before</i> connecting to the database.		

Applies to

ADO.NET OLE DB SNC SQL Native Client for Microsoft SQL Server

Syntax	TimeOut= <i>value</i>	
	Parameter	Description
	value	The number of seconds the interface waits for a connection to complete.
Default value	None	
Usage	The default value for the TimeOut parameter is driver-specific.	
Examples	To set the TimeOut value to wait 10 seconds for a connection to complete:	
	-	<b>profile</b> Type 10 in the Timeout box on the System page in the rofile Setup dialog box.
	Application	n Type the following in code:
	SQLCA	.DBParm="TimeOut=10"

## **TimeStamp**

Description	Specifies whether the Oracle Times	er PowerBuilder should map DateTime and Time datatypes to Stamp datatype.
Applies to	OLE DB O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> ORA Oracle 11 <i>g</i> SQLNCLI10	r.
Syntax	TimeStamp= <i>value</i>	
	Parameter	Description
	value	<ul> <li>Specifies whether PowerBuilder should map DateTime and Time datatypes to the Oracle TimeStamp datatype. Values are:</li> <li><b>0</b> Map DateTime and Time datatypes to the Oracle Date datatype.</li> <li><b>1</b> (Default) Map DateTime and Time datatypes to the Oracle TimeStamp datatype.</li> </ul>
Default value	TimeStamp=1	

Usage

Oracle9*i* and later databases and the O90 and O10 interfaces support the Oracle timestamp datatype. This datatype includes the date and the time including milliseconds. The existing Oracle Date datatype does not include millisecond information. In a DataWindow object, both the Oracle Timestamp and Date datatypes are mapped to the PowerBuilder DateTime datatype, which supports millisecond information.

If you use the O90 or O10 interface with an Oracle9*i* or higher server, DateTime and Time datatypes are mapped to the Oracle TimeStamp datatype by default. If you want DateTime and Time to be mapped to the Oracle Date datatype, set the TimeStamp database parameter to 0.

In PowerBuilder 8 and earlier, millisecond information was truncated when used with the Oracle Date datatype. In PowerBuilder 9.0 and later, millisecond information is not truncated. As a result, when performing multiple updates to a DateTime field that maps to a Date column, the first update succeeds, but subsequent updates fail with a "row changed between retrieve and update error."

If you are using an interface with a database that uses only the TimeStamp datatype, PowerBuilder handles updates correctly. If the database uses the Oracle Date datatype only, set the DBParm TimeStamp to 0 to truncate millisecond information.

If you are using a database that uses both Date and TimeStamp datatypes, you must determine which columns use each datatype, and strip the milliseconds from the Date columns using code like the following:

```
datetime dt
dt=datetime (date(string( today() ,"dd/mm/yyyy")), &
   time(string ( today() ,"hh:mm:ss ")))
   dw_1.setitem(1,3,dt)
```

#### Examples

To set the TimeStamp value to treat DateTime and Time DataWindow datatypes as Oracle Date datatypes:

- **Database profile** Clear the Map DateTime/Time to Oracle Timestamp check box on the Syntax page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

```
SQLCA.DBParm="TimeStamp=0"
```

# TraceFile

Description	Specifies that the JDBC Driver Manager Trace tool should trace a connection to the database you access through the PowerBuilder JDBC interface.		
Applies to	JDB JDBC		
Syntax	TraceFile='tracefile_name'		
Default value	None		
Usage	The JDBC Driver Manager Trace logs errors and informational messages originating from the Driver object currently loaded (such as the Sybase jConnect JDBC driver) when PowerBuilder connects to a database through the JDBC interface. It writes this information to a log file (default is JDBC.LOG) or to a file you specify. The amount of trace output varies depending on the JDBC driver being used.		
	You can start and stop the JDBC Driver Manager Trace in the PowerBuilder development environment by editing the database profile for the connection you want to trace. You can also start and stop the JDBC Driver Manager Trace in a PowerBuilder application by specifying the TraceFile parameter in the appropriate script.		
	For more information about using the JDBC Driver Manager Trace tool, see <i>Connecting to Your Database</i> .		
Examples	To start the JDBC Driver Manager Trace and specify a log file:		
	• <b>Database profile</b> Select the Trace JDBC Calls check box and type the following in the Trace File box on the Options page in the Database Profile Setup dialog box:		
	c:\temp\jdbctrce.log		
	• <b>Application</b> Type the following in code:		
	SQLCA.DBParm="TraceFile='c:\temp\jdbctrce.log'"		
TrimSpaces			

•	
Description	Specifies whether PowerBuilder should trim trailing spaces from data values retrieved from the following datatypes: Char, Char for Bit Data, VarChar, and VarChar for Bit Data.
Applies to	ADO.NET ASE, SYC and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect

	I10 Informix IN9 Informix JDB JDBC ODBC O90 Oracle9 <i>i</i> O10 Oracle 10 <i>g</i> SNC SQL Native	e Client for Microsoft SQL Server
Syntax	TrimSpaces=valu	le
	Parameter	Description
	value	Specifies whether PowerBuilder should trim trailing spaces from data of type Char, Char for Bit Data, and VarChar for Bit Data. Values are:
		• 0 Do not trim trailing spaces.
		• 1 (Default) Trim trailing spaces.
Default value	ASE, and SYC). PBTrimCharColu depend on the PE PBTrimCharColu	ADO.NET, O90, O10, SNC, and IN9) or TrimSpaces=1 (DIR, For JDBC, the default values depend on the umns value in the registry. For ODBC, the default values 3 TrimCharColumns value in the PBODB <i>nnn</i> .INI file. (If the umns keyword is missing for a particular database connection, for the ODBC interface is TrimSpaces=0.)
Usage	•	erBuilder trims spaces from the following datatypes: Char, a, VarChar, and VarChar for Bit Data.
		<b>interface</b> vers, such as SQL Anywhere, trim trailing spaces before the fetch buffer—even when TrimSpaces is set to 0.
	If your DBMS makes a distinction between Char data with trailing spaces and Char data without trailing spaces when evaluating a WHERE clause expression, you might receive the message Row changed between retrieve and update when your DataWindow object's update properties are set to "Key and updateable columns." To prevent this, change your DataWindow object's update properties. In embedded SQL, you can check Sqlca.Sqlnrows after each update to determine if the update took place. Avoid using Char data columns in the WHERE clause of an UPDATE or DELETE statement when TrimSpaces=1.	
Examples	To specify that Po	owerBuilder should not trim trailing spaces:
	-	<b>rofile</b> Clear the Trim Trailing Spaces In CHAR Data check yntax page in the Database Profile Setup dialog box.

• **Application** Type the following in code:

SQLCA.DBParm="TrimSpaces=0"

## **TrustedConnection**

Description	Specifies whether the current Windows account credentials can be used for authentication.		
		<b>y TrustedConnection</b> y the TrustedConnection parameter <i>before</i> connecting to the	
Applies to	ADO.NET SNC SQL Nativ	ve Client for Microsoft SQL Server	
Syntax	TrustedConnection= <i>value</i>		
	Parameter	Description	
	value	<ul> <li>Specifies whether the current Windows account credentials can be used for authentication. Values are:</li> <li>0 (Default) The User ID and Password are specified in the connection.</li> <li>1 The current Windows account credentials are used for authentication. The User ID and Password supplied in the connection are ignored.</li> </ul>	
Default value	TrustedConnect	ion=0	
Examples	To specify that I	PowerBuilder should trust the connection:	
	• <b>Database profile</b> Select the Trusted Connection check box on the General page in the Database Profile Setup dialog box.		
	Application	Type the following in code:	
	SQLCA	.DBParm="TrustedConnection=1"	

### **TrustServerCertificate**

Description Specifies whether encryption occurs if there is no verifiable server certificate.

	When to specify You must specify database.	/ TrustServerCertificate the TrustServerCertificate parameter <i>before</i> connecting to the
Applies to	SNC SQL Native	e Client for Microsoft SQL Server
Syntax	TrustServerCertificate= <i>value</i>	
	Parameter	Description
	value	Specifies whether encryption occurs if there is no verifiable server certificate. The value of this parameter is ignored if the Encrypt DBParm is not set to 1. Values are:
		<ul> <li>0 (Default) Encryption occurs only if there is a verifiable server certificate, otherwise the connection attempt fails.</li> <li>1 Encryption always occurs, but may use a self-signed server certificate.</li> </ul>
Default value	TrustServerCerti	ficate=0
Usage	SQL Server 2005 always encrypts network packets associated with logging in to the server. If no certificate is provided on the server when it starts up, SQL Server generates a self-signed certificate that is used to encrypt login packets.	
	SQL Server Configuration Manager can be used to configure the SQL Native Client to request an encrypted connection using the Secure Sockets Layer (SSL), and to accept a self-signed certificate without validation.	
	sets the SQL Nat encryption to be set both Encrypt	uest encryption by setting the Encrypt DBParm to 1, which tive Client connection string keyword Encrypt. To enable used when a certificate has not been provided on the server, and TrustServerCertificate. The value of ficate is ignored if Encrypt is not set.
Examples	To specify that P certificate without	owerBuilder should encrypt data and accept the server ut validation:
	-	<b>rofile</b> Select the Encrypt Data and Trust Server Certificate on the System page in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA.	DBParm="Encrypt=1,TrustServerCertificate=1"
See also	Encrypt	

TRS		
Description	Specifies whether the DirectConner	er you want your application to connect to a database through ct server using:
		ect Access Service for DB2/MVS
	DirectConn Gatewayles	ect TRS s connection using OpenServerConnect
Applies to	DIR Sybase Dire	
Syntax	TRS=value	
	Parameter	Description
	value	Specifies how your application should connect to a database through the DirectConnect server. Values are:
		• <b>0</b> (Default) Use an Access Service connection.
		• 1 Use a TRS connection.
		• 2 Use a gatewayless or OpenServerConnect connection.
Default value	TRS=0	
Usage	set the UseProcs convert the synta	Syntax parameter to specify whether PowerBuilder should ax for invoking a Remote Stored Procedure (RSP) or host- before executing that procedure.
Examples	To specify that y	you want to connect to a database using OpenServerConnect:
	-	<b>rofile</b> Select Gatewayless from the Choose Gateway drop- the Connection page in the Database Profile Setup dialog box.
	Application	Type the following in code:
	SQLCA	.DBParm="TRS=2"
See also	UseProcSyntax HostReqOwner	

# UnicharBind

Description	Specifies wheth Unichar datatyr	her PowerBuilder binds string input parameters to the Char or be.
Applies to	ASE, SYC, and SYJ Sybase Adaptive Server Enterprise	
Syntax	UnicharBind=value	
	Parameter	Description
	value	Specifies whether PowerBuilder binds string input parameters to the Char or Unichar datatype. Values are:
		<b>0</b> Binds string input parameters as Char datatypes.
		<b>1</b> Binds string input parameters as Unichar datatypes.
Default value	UnicharBind=0	
Usage	Varchar, and Te determined by the recommended f DisableBind m For UnicharBin	ing, UnicharBind=0, is recommended for binding Char, xt data. This binding encodes the string data as ANSI strings e current client operating system's code page. UnicharBind=1 is for binding strings as Unichar, Univarchar, and Unitext data. <b>ust be set to 0</b> Id to take effect, the DisableBind parameter must be set to 0. overrides the UnicharBind setting.
Examples	To bind strings	to unichar:
	-	orofile Select the Bind String parameters as Unichar Type on the Transaction page in the Database Profile Setup dialog
	Applicatio	<b>n</b> Type the following in code:
	SQLCA	.DBParm="UnicharBind=1"
See also	DisableBind BindSPInput NCharBind RPCRebind	

# URL

Usage

Description

The location of the database to which you want to connect using the JDBC interface.

When to specify URL You must specify the URL parameter *before* connecting to the database.

Applies to	JDB JDBC

Syntax URL='URL\_address'

Default value None

The database URL is obtained from the database JDBC driver documentation. A list of registered Driver classes, with their URLs, is maintained by the driver's JDBC DriverManager class. When a connection request is made, the DriverManager attempts to locate a suitable driver from those listed.

The URL uses this general format:

jdbc:vendor.driverprotocol:servername:port/database

Argument	Description
jdbc	Driver
vendor	Database vendor (such as Sybase or Oracle)
driverprotocol	Database communications protocol
servername	DNS machine name or database host name
port	TCP/IP port number configured for accessing the database server
database	(optional) Name of a specific database

The database URL can also include the user ID and password as follows:

jdbc:vendor.driverprotocol:userid/password@servername:port.database

Examples

- **Example 1** To set the URL to a database accessed through jConnect:
  - **Database profile** Type the following in the URL box on the Connection page in the Database Profile Setup dialog box:

jdbc:sybase:Tds:199.93.178.151:5007/tsdata

• **Application** Type the following in code:

SQLCA.DBParm="URL='jdbc:sybase:Tds:199.93.178.151:5 007/tsdata'"

**Example 2** To set the URL to a database accessed through the Oracle JDBC driver:

• **Database profile** Type the following in the URL box on the Connection page in the Database Profile Setup dialog box:

```
jdbc:oracle:thin:@ora80nt:1521:orcl
```

• **Application** Type the following in code:

```
SQLCA.DBParm="URL='jdbc:oracle:thin:@ora80nt:1521:o rcl'"
```

**Example 3** To set the URL, which includes the user ID and password, to a database accessed through the Oracle JDBC driver:

• **Database profile** Type the following in the URL box on the Connection page in the Database Profile Setup dialog box:

jdbc:oracle:thin:system/manager@ora80nt:1521:orcl

• **Application** Type the following in code:

SQLCA.DBParm="URL='jdbc:oracle:thin:system/manager@ ora80nt:1521:orcl'"

Driver

## UseContextObject

Description	Specifies that PowerBuilder controls a transaction using the transaction service context object TransactionServer. This parameter applies <i>only</i> when a PowerBuilder custom class user object is deployed as an EAServer or COM+ component.
Applies to	JDB JDBC ODBC O90 Oracle9 <i>i</i> SYJ Sybase Adaptive Server Enterprise

Database interface re	estrictions
-----------------------	-------------

	<b>EAServer requires the SYJ interface</b> Sybase EAServer uses a slightly different version of the CT-Lib software. Therefore, <i>at runtime</i> , you need to use the SYJ database interface rather than ASE or SYC to connect to an Adaptive Server Enterprise database. The SYJ Database Profile Setup dialog box provides a convenient way to set the appropriate connection parameters and then copy the syntax from the Preview page into the script for your Transaction object.
	You cannot use the SYJ interface, however, to connect to the database in the PowerBuilder development environment. Therefore, <i>during the development phase</i> (before the component has been deployed to EAServer), you must use ASE or SYC to connect to the database.
Syntax	UseContextObject='value'
Default value	UseContextObject=No
Usage	PowerBuilder provides a transaction service context object called TransactionServer that gives you access to the transaction state primitives that influence whether EAServer or COM+ commits or aborts the current transaction. If you use the TransactionServer context object by setting the UseConnectObject parameter to Yes, COMMIT and ROLLBACK statements called on the Transaction object result in a runtime error.
	By default, the TransactionServer context object is not used. Instead, you can use COMMIT and ROLLBACK statements to manage transactions. In this case, COMMIT is interpreted as a SetComplete function and ROLLBACK is interpreted as a SetAbort function. This approach is recommended only when you want to migrate PowerBuilder 6.x or prior objects to EAServer or COM+ without modifying the code.
	Setting UseContextObject to Yes is incompatible with the use of the SetTrans function. The SetTrans function is used when you want the DataWindow engine to manage database connections, transaction state primitives, and related EAServer component deactivation.
	Because the default Web DataWindow component uses SetTrans to specify database connection information, you must not set UseContextObject to Yes in your database profile or in the EAServer properties for the component.
	For information on how to use PowerBuilder to build EAServer and COM+ components, see <i>Application Techniques</i> .

Examples To use the TransactionServer context object:
 Database profile Select the Use Transaction Context Object check box on the EAServer or EAServer/COM+ page in the Database Profile Setup dialog box.
 Application Type the following in code:

 SQLCA.DBParm="UseContextObject='Yes'"

 See also CacheName GetConnectionOption ReleaseConnectionOption

UseProcSyntax		
Description	1	er PowerBuilder should convert the syntax for invoking a rocedure (RSP) or host-resident request before executing that
Applies to	DIR Sybase Dire	ectConnect (applies only to Open ServerConnect)
Syntax	UseProcSyntax= <i>value</i>	
	Parameter	Description
	value	Specifies whether PowerBuilder should convert RSP or host- resident request syntax. Values are:
		• <b>0</b> (Default) Do not convert syntax.
		• 1 Convert syntax to USE PROCEDURE.
Default value	UseProcSyntax=	0
Usage	UseProcSyntax applies <i>only</i> if you are using Open ServerConnect to make a gatewayless database connection to a DB2/MVS database. To indicate that you want to use Open ServerConnect, select Gatewayless from the Choose Gateway drop-down list on the Connection page. If you select Gatewayless, and set the UseProcSyntax parameter to 1, PowerBuilder converts the EXECUTE procedure syntax it normally uses to the USE PROCEDURE syntax required to invoke RSP and host-resident requests.	
	Examples	
	To specify that P	owerBuilder should convert RSP or host-resident syntax:
	-	<b>rofile</b> Select the Use Procedure Syntax for RSPs check box ax page in the Database Profile Setup dialog box.
	Application	Type the following in code:

	SQLCA	A.DBParm="UseProcSyntax=1;TRS=2"
See also	TRS	
	HostReqOwner	r
UTF8		
Description	The LITE8 data	base parameter specifies whether the database server you are
Decomption		handle conversion between the character sets on the client and
	When to speci You must speci PowerBuilder.	fy UTF8 fy a value for UTF8 <i>before</i> connecting to the database in
Applies to	ASE, SYC and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect	
Syntax	UTF8=value	
	Parameter	Description
	value	Specifies whether the database server you are accessing will perform conversion between the character sets used on the client and server. Values are:
		<b>0</b> (Default) The PowerBuilder database interface performs the conversion. Multiple languages are not supported.
		1 Your database server performs the conversion. Multiple languages are supported.
Default value	UTF8=0	
Usage	If UTF8 is set to 1, PowerBuilder always uses UTF-8 as the client character set when connecting to an Adaptive Server database. When UTF8 is set to 0, if the client and database server character sets are different, the database interface converts Transact-SQL, identifiers, parameters, and Char and VarChar data to and from the character set used on the server. Multiple languages are not supported with this setting.	
	to 1 and the data Adaptive Serve	ilanguage support, you must set the UTF8 database parameter abase server must have the UTF-8 character set installed, or, for r, it must be configured to support Unicode conversions. To do administrator must run the following command on the server:
	sp_confi	gure "enable Unicode conversion", 2

This enables the server to perform the conversion to and from Unicode.

Examples To specify that the database server you are accessing with PowerBuilder uses UTF-8 as its default character set:

- **Database profile** Select the UTF8 Character Set Installed or Unicode Conversion Enabled check box on the Regional Settings page in the Database Profile Setup dialog box.
- **Application** Type the following in code:

SQLCA.DBParm="UTF8=1"

# CHAPTER 2 Database Preferences

About this chapter	This chapter describes the syntax and use of each connection-related database preference that you can set in PowerBuilder.
Contents	The database preferences are listed in alphabetical order.

# Database preferences and supported database interfaces

The following table lists each supported database interface and the connection-related database preferences you can use with that interface in PowerBuilder. The preferences listed in the table pertain to the database connection, and not to the behavior of the Database painter itself.

Database interface	Database preferences
ADO.NET	AutoCommit
	Connect to Default Profile
	Keep Connection Open
	Read Only
	Shared Database Profiles
	SQL Terminator Character
	Use Extended Attributes
ASE Sybase Adaptive Server	AutoCommit
Enterprise	Connect to Default Profile
	Keep Connection Open
	Lock
	Read Only
	Shared Database Profiles
	SQL Terminator Character
	Use Extended Attributes

Database interface	Database preferences
DIR Sybase DirectConnect	AutoCommit Connect to Default Profile Keep Connection Open Lock Read Only Shared Database Profiles SQL Terminator Character Use Extended Attributes
IN9 and I10 Informix	AutoCommit Connect to Default Profile Keep Connection Open Lock Read Only Shared Database Profiles SQL Terminator Character Use Extended Attributes
JDBC	AutoCommit Connect to Default Profile Keep Connection Open Lock Read Only Shared Database Profiles SQL Terminator Character Use Extended Attributes
ODBC Using AutoCommit and Lock with ODBC The AutoCommit and Lock database preferences are supported by the ODBC interface only if <i>both</i> the ODBC driver you are using and the back-end DBMS support the feature.	AutoCommit Connect to Default Profile Keep Connection Open Lock Read Only Shared Database Profiles SQL Terminator Character Use Extended Attributes
OLE DB	AutoCommit Connect to Default Profile Keep Connection Open Read Only Shared Database Profiles SQL Terminator Character Use Extended Attributes

Database interface	Database preferences
O90 Oracle9 <i>i</i>	Connect to Default Profile
O10 Oracle 10g	Keep Connection Open
ORA Oracle 11g	Read Only
Shar Gracie Trg	Shared Database Profiles
	SQL Terminator Character
	Use Extended Attributes
SNC SQL Native Client	AutoCommit
	Connect to Default Profile
	Keep Connection Open
	Lock
	Read Only
	Shared Database Profiles
	SQL Terminator Character
	Use Extended Attributes
SYC Sybase Adaptive Server	AutoCommit
Enterprise	Connect to Default Profile
	Keep Connection Open
	Lock
	Read Only Shared Database Profiles
	SQL Terminator Character Use Extended Attributes
SVI Subasa Adaptiva Samer	AutoCommit
SYJ Sybase Adaptive Server	Connect to Default Profile
Enterprise	Keep Connection Open
	Lock
	Read Only
	Shared Database Profiles
	SOL Terminator Character
	Use Extended Attributes

#### **AutoCommit**

Description

For those DBMSs and database interfaces that support it, AutoCommit controls whether PowerBuilder issues SQL statements outside or inside the scope of a transaction.

When AutoCommit is set to False (the default), PowerBuilder issues SQL statements *inside* the scope of a transaction. When AutoCommit is set to True, PowerBuilder issues SQL statements *outside* the scope of a transaction.

	When to specify AutoCommit In the development environment, you must set AutoCommit before connecting to the database. AutoCommit takes effect only when the database connection occurs. Changes to AutoCommit after the connection occurs have no effect on the current connection.
	<i>In code</i> , you can reset the value of AutoCommit at any time. This lets you override the initial setting if necessary.
Applies to	ADO.NET ASE, SYC and SYJ Sybase Adaptive Server Enterprise DIR Sybase DirectConnect I10 Informix IN9 Informix JDB JDBC ODBC (if driver and back-end DBMS support this feature) OLE DB SNC SQL Native Client for Microsoft SQL Server
In an application	For those DBMSs and database interfaces that support it, you can set AutoCommit in a script as a property of the Transaction object. The following syntax assumes you are using the default Transaction object SQLCA (but you can also define your own Transaction object):

#### SQLCA.AutoCommit=value

Parameter	Description
value	Specifies whether PowerBuilder issues SQL statements outside or inside the scope of a transaction. Values are:
	• <b>True</b> PowerBuilder issues SQL statements <i>outside the scope of a transaction</i> . The statements are not part of a logical unit of work (LUW). If the SQL statement is successful, the DBMS updates the database immediately as if a COMMIT statement had been issued.
	• False (Default) PowerBuilder issues SQL statements <i>inside</i> <i>the scope of a transaction</i> . PowerBuilder issues a BEGIN TRANSACTION statement at the start of the connection and issues another BEGIN TRANSACTION statement after each COMMIT or ROLLBACK statement is issued.

In the development Select or clear the AutoCommit Mode check box on the Connection tab in the environment Database Profile Setup dialog box, as follows: Select the check box. Sets AutoCommit to true for this connection. Clear the check box. (Default) Sets AutoCommit to false for this connection. For instructions, see "Setting Additional Connection Parameters" in Connecting to Your Database. Default value AutoCommit=False *Transactions* A transaction is one or more SOL statements that form a Usage logical unit of work (LUW). Within a transaction, all SQL statements must succeed or fail as one logical entity. Changes are made to the database only if all statements in the transaction succeed and a COMMIT is issued. If one or more statements fail, you must issue a ROLLBACK to undo the changes. This ensures the integrity and security of data in your database. *Executing SQL DDL statements* Some DBMSs require you to execute certain SQL statements outside the scope of a transaction. For example, when connected to a SQL Server 7 or earlier database, you must execute SQL Data Definition Language (DDL) statements such as CREATE TABLE and DROP TABLE outside a transaction. There are two reasons for this: It ensures that the structure of your database cannot change during a transaction. It improves database performance, because DDL statements are costly ٠ operations to recover. Therefore, to execute DDL statements or stored procedures containing DDL statements in a SQL Server database, you must set AutoCommit to true to issue the DDL statements outside the scope of a transaction. You should, however, set AutoCommit back to false immediately after executing the DDL statements. When you change the value of AutoCommit from false to true, PowerBuilder issues a COMMIT statement by default. Caution When you set AutoCommit to true, you cannot roll back database changes. Therefore, use care when changing the setting of AutoCommit.

*Using EXECUTE IMMEDIATE* When AutoCommit is set to True, you can use the EXECUTE IMMEDIATE dynamic SQL statement to issue BEGIN TRANSACTION, COMMIT TRANSACTION, ROLLBACK TRANSACTION, and other SQL statements to control your own transaction processing. If you use the EXECUTE IMMEDIATE dynamic SQL statement to issue BEGIN TRANSACTION, you must use the EXECUTE IMMEDIATE dynamic SQL statement to issue a corresponding COMMIT TRANSACTION or ROLLBACK TRANSACTION.

For information about using the EXECUTE IMMEDIATE statement, see the *PowerScript Reference*.

*DirectConnect interface* As part of the Connect process, the DIR interface automatically issues TransactionMode=short to override the access service default configuration. It then issues begin transaction at connect time and after every Commit and Rollback whenever AutoCommit=False. Most developers should start their connections with AutoCommit=True, switch to False only when the application demands transaction processing, and then switch back to AutoCommit=True after the transaction is committed or rolled back.

Examples To set AutoCommit to true and issue SQL statements outside the scope of a transaction:

- **Development environment** Select the AutoCommit Mode check box on the Connection tab in the Database Profile Setup dialog box.
- **Application** Type the following in a script:

SQLCA.AutoCommit=True

**Using the examples in code** If you specify AutoCommit Mode in your database profile, the correct syntax displays on the Preview tab in the Database Profile Setup dialog box. You can copy the syntax from the Preview tab into your code.

### **Connect to Default Profile**

Description	Connect to Default Profile controls whether the Database painter establishes a connection to a database using a default profile when the painter is invoked. If not selected, the Database painter opens without establishing a connection to a database.
Applies to	All database interfaces
In an application	You <i>cannot</i> set the Connect to Default Profile database preference in code.

In the development environment	In the Database painter, select or clear the Connect to Default Profile check box in the Database Preferences dialog box as follows:		
	• <b>Select the check box</b> (Default) The next time you invoke the Database painter, it automatically connects to the default database profile.		
	• <b>Clear the check box</b> The next time you invoke the Database painter, it does <i>not</i> automatically connect to the default database profile.		
Default value	The Connect to Default Profile check box in the Database Preferences dialog box is selected by default.		
Usage	Connect to Default Profile allows you to open the Database painter <i>without</i> establishing a connection to a database. Consequently, you can perform all database-related tasks, including defining a database profile and connecting to a database, in the Database painter. However, you might want to continue to define profiles and/or connect to a database using the Database Profile since opening the Database painter uses more system resources.		

# **Keep Connection Open**

Description	By default, PowerBuilder opens a database connection the first time you open a painter requiring a connection, and stays connected throughout the session until you exit.
	When you connect to a database in the PowerBuilder development environment without using a database profile, you can set the Keep Connection Open database preference to specify when PowerBuilder closes the database connection.
	Keep Connection Open applies only when connecting to a database in the PowerBuilder development environment without using a database profile. The setting of Keep Connection Open has no effect when you use a database profile to connect in PowerBuilder.
Applies to	All database interfaces (only in the development environment)
In an application	You <i>cannot</i> set the Keep Connection Open database preference in code.
In the development environment	In the Database painter, select or clear the Keep Connection Open check box in the Database Preferences dialog box as follows:
	• Select the check box (Default) Stays connected to the database throughout your PowerBuilder session and closes the connection when you exit.

	• <b>Clear the check box</b> Opens the database connection when a painter requires it and closes the connection when you close a painter or finish compiling a script
Default value	The Keep Connection Open check box in the Database Preferences dialog box is selected by default.
Usage	<i>Requirements for using Keep Connection Open</i> To use the Keep Connection Open database preference, <i>both</i> of the following must be true:
	• Working in the development environment You must be working in the development environment.
	• Using default connection information PowerBuilder must use the most recently used connection information in the Windows registry to connect to the database. Keep Connection Open has no effect when you

select a database profile to connect to the database.

*What happens* If you meet both of these requirements, clearing the Keep Connection Open check box opens a database connection only when you are working in a painter that requires a connection, and closes the connection at other times. This can save you money if you are accessing a database that charges for connect time.

### Lock

Description For those DBMSs and database interfaces that support the use of lock values and isolation levels, the Lock preference sets the isolation level to use when connecting to the database.

In multiuser databases, transactions initiated by different users can overlap. If these transactions access common data in the database, they can overwrite each other or collide.

To prevent concurrent transactions from interfering with each other and compromising the integrity of your database, certain DBMSs allow you to set the isolation level when you connect to the database. **Isolation levels** are defined by your DBMS, and specify the degree to which operations in one transaction are visible to operations in a concurrent transaction. Isolation levels determine how your DBMS isolates or **locks** data from other processes while it is being accessed.

PowerBuilder uses the Lock preference to allow you to set various database lock options. Each lock value corresponds to an isolation level defined by your DBMS.

	value takes effect only	value <i>before</i> you cor when the database c	nnect to the database. The Lock onnection occurs. Changes to the e no effect on the current
Applies to	ASE, SYC and SYJ S DIR Sybase DirectCor I10 Informix IN9 Informix JDB JDBC ODBC (if driver and b OLE DB SNC SQL Native Clie	nnect back-end DBMS supp	port this feature)
In an application	For those DBMSs and database interfaces that support it, you can set the Lock value in code as a property of the Transaction object. The following syntax assumes you are using the default Transaction object, SQLCA, but you can also use a user-defined Transaction object:		
	SQLCA.Lock ='va	lue'	
	where <i>value</i> is the locl	x value you want to se	et.
Lock values	The following table lists the lock values and corresponding isolation levels for each database interface that supports locking. You set the lock value in code, and the isolation level in a database profile.		
	For more about the iso documentation.	lation levels that your	DBMS supports, see your DBMS
	Database interface	Lock values	Isolation levels
	IN9 and I10 Informix	Dirty Read	Dirty Read
	(for OnLine databases	Committed Read	Committed Read
	only)	Cursor Stability	Cursor Stability
		Repeatable Read	Repeatable Read
	JDB JDBC	RU	Read Uncommitted
		RC	Read Committed
		RR	Repeatable Read
		TS	Serializable Transactions
		TN	Transaction None

Database interface	Lock values	Isolation levels
ODBC	RU	Read Uncommitted
	RC	Read Committed
	RR	Repeatable Read
	TS	Serializable Transactions
	TV	Transaction Versioning
OLE DB	RU	Read Uncommitted
	RC	Read Committed
	RR	Repeatable Read
	TS	Serializable Transactions (defau
	TC	Chaos
SNC SQL Native	RU	Read Uncommitted
Client	RC	Read Committed (default)
	RR	Repeatable Read
	SS	Snapshot
	TS	Serializable Transactions
	TC	Chaos
Sybase Adaptive	0	Read Uncommitted
Server Enterprise	1	Read Committed (default)
	3	Serializable Transactions
Sybase DirectConnect	0	Read Uncommitted
	1	Read Committed (default)
	2	Repeatable Read
	3	Serializable Transactions

In the development environment	Select the isolation level you want from the Isolation Level drop-down list on the Connection tab in the Database Profile Setup dialog box.
	For instructions, see "Setting Additional Connection Parameters" in <i>Connecting to Your Database</i> .
Default value	The default lock value depends on how your database is configured. For information, see your DBMS documentation.
Usage	<i>ODBC</i> The TV (Transaction Versioning) setting does <i>not</i> apply to SQL Anywhere databases.

*OLE DB* The default value for Lock in the discontinued MSS native interface and the SNC interface for Microsoft SQL Server 2005 is Read Committed, but for OLE DB the default is Serializable Transactions. If you want to connect to SQL Server 2000 using OLE DB, you can override the default value by specifying a value for Lock in the *PBODB125.INI* file. For example:

```
[Microsoft SQL Server]
...
LOCK='RC'
...
```

The value in the PBODB125.INI file is used if you do not change the default in the database profile or set the Lock parameter of the Transaction object in code.

*Sybase Adaptive Server Enterprise* Sybase Adaptive Server Enterprise supports the following lock values, which correspond to SQL Server isolation levels:

• **O—Read Uncommitted (dirty reads)** Isolation level 0 prevents other transactions from changing data that an uncommitted transaction has already modified (through SQL statements such as UPDATE).

Other transactions cannot modify the data until the transaction commits, but they can still read the uncommitted data (perform dirty reads). Isolation level 0 prohibits retrieval locks on tables or pages.

Isolation level 0 is valid only for Sybase System 10 or higher databases.

 1—Read Committed (Default) Isolation level 1 prevents dirty reads by issuing shared locks on tables or pages.

A **dirty read** occurs when one transaction modifies a table row and a second transaction reads that row before the first transaction commits the change. If the first transaction rolls back the change, the information read by the second transaction becomes invalid.

• **3—Serializable Transactions (HOLDLOCK behavior)** Isolation level 3 prevents dirty reads, nonrepeatable reads, and phantoms for the duration of a transaction.

A **nonrepeatable read** occurs when one transaction reads a row and then a second transaction modifies that row. If the second transaction commits the change, subsequent reads by the first transaction produce different results than the original read. A phantom occurs when one transaction reads a set of rows that satisfy a search condition, and then a second transaction modifies that data through a SQL INSERT, UPDATE, or DELETE statement. Subsequent reads by the first transaction using the same search conditions produce a different set of rows than the original read.

*Dynamically controlling the isolation level* PowerBuilder makes a second connection to implement either of the following while connected to a Sybase Adaptive Server Enterprise database:

- The Retrieve.AsNeeded property to specify that a DataWindow should retrieve only as many rows as needed from the database
- A SELECTBLOB embedded SQL statement to select a single blob column in a specified table row

The lock value you set before making the first Adaptive Server Enterprise connection is automatically inherited by the second connection, and *cannot be changed for the second connection*.

However, you can dynamically control the isolation level for the first (original) Adaptive Server Enterprise connection in an application by coding the following PowerScript embedded SQL statement, where n is 0, 1, or 3 for the isolation level you want to set for the first connection:

EXECUTE IMMEDIATE "set transaction isolation level n"

For example, the following PowerScript embedded SQL code specifies isolation level 0 (dirty read behavior) for the second connection, and isolation level 1 (read committed behavior) for the first connection:

```
// Isolation level inherited by second connection
SQLCA.Lock="0"
CONNECT USING SQLCA;
// Override lock value 0 for first connection only
EXECUTE IMMEDIATE "set transaction isolation level 1";
```

*Use in three-tier applications* If an ASE connection on an application server, such as EAServer, is used by a component with a specified isolation level and cached by the server, it is released back into the connection pool with the isolation level set by the component. If that connection is then used by another component that has no specified isolation level, the isolation level may not be the default level expected by the component (1). This could result in the occurrence of deadlocks. To avoid this, always set the SQLCA.Lock property explicitly in application server components.

Examples Example 1 To set the Lock value to RC (Read Committed) for a SQL Anywhere database:

- **Development environment** Select Read Committed from the Isolation Level drop-down list in the Database Profile Setup dialog box.
- **Application** Type the following in a script:

SQLCA.Lock="RC"

**Example 2** To set the Lock value to 3 (Serializable Transactions) for a Sybase Adaptive Server Enterprise database:

- **Development environment** Select Serializable Transactions from the Isolation Level drop-down list in the Database Profile Setup dialog box.
- **Application** Type the following in a script:

SQLCA.Lock="3"

**Using the examples in code** If you specify Isolation Level in your database profile, the syntax displays on the Preview tab in the Database Profile Setup dialog box. You can copy the syntax from the Preview tab into your code.

#### **Read Only**

Description	Read Only specifies whether PowerBuilder should update the extended attribute system tables and any other tables in your database. The extended attribute system tables (also known as the extended catalog) consist of five tables that contain default extended attribute information for your database.
	The Read Only setting determines whether you can modify (update) the tables in your database. By default, the Read Only check box is cleared in the Database Preferences dialog box. This means that PowerBuilder updates the extended attribute system tables and other tables in your database when you make changes.
	If you select the Read Only check box, PowerBuilder <i>does not update</i> the extended attribute system tables or any other tables in your database. You <i>cannot</i> modify (update) information in the extended attribute system tables or any other database tables from the DataWindow painter when the Read Only check box is selected.
Applies to	All database interfaces
In an application	You <i>cannot</i> set the Read Only database preference in code.

In the development environment In the Database painter, select or clear the Read Only check box in the Database Preferences dialog box as follows:

- Select the check box PowerBuilder does not update the extended attribute system tables or any other tables in your database. You *cannot* modify (update) information in the extended attribute system tables or any other database tables from the DataWindow painter when the Read Only check box is selected.
- **Clear the check box** (Default) PowerBuilder updates the extended attribute system tables and any other tables in your database when you modify them.
- Default value The Read Only check box in the Database Preferences dialog box is cleared by default.

If you select the Read Only check box in the Database Preferences dialog box, you cannot modify information in *any* tables from the DataWindow painter.

Therefore, you can use only:

- SELECT and Retrieve statements in the DataWindow painter
- SELECT statements in embedded SQL

See also Use Extended Attributes

#### **Shared Database Profiles**

Description	Specifies the path name of the PowerBuilder initialization file containing the database profiles you want to share.	
	For instructions on sharing database profiles in the PowerBuilder development environment, see "Managing Database Connections" in <i>Connecting to Your Database</i> .	
Applies to	All database interfaces	
In an application	You cannot set the Shared Database Profiles database preference in code.	
In the development environment	In the Database painter, supply the path name of the PowerBuilder initialization file containing shared profiles in the Shared Database Profiles box in the Database Preferences dialog box. You can type the path name or click the Browse button to display it.	
	For instructions, see "Setting Additional Connection Parameters" in <i>Connecting to Your Database</i> .	

Usage

Default value	The Shared Database Profiles box in the Database Preferences dialog box is blank (unspecified) by default.
Examples	To share database profiles contained in the file <i>I</i> :\ <i>SHARE</i> \ <i>PB.INI</i> on the Windows platform, type or browse to the following in the Shared Database Profiles box in the Database Preferences dialog box:
	I:\SHARE\PB.INI

### **SQL** Terminator Character

Description	Specifies the SQL statement terminator character used by the Database painter's Interactive SQL (ISQL) view.
	The default terminator character for the ISQL view is a semicolon (;). If a semicolon conflicts with the terminator character used by your DBMS syntax, you can change the painter's terminator character by specifying a different character in the SQL Terminator Character box in the Database Preferences dialog box. A good choice for a terminator character is the backquote (`) character.
	Changing the terminator character is recommended when you are using the ISQL view to create or execute stored procedures, triggers, and SQL scripts.
Applies to	All database interfaces
In an application	You cannot set the SQL Terminator Character database preference in code.
In the development environment	In the Database Preferences dialog box in the Database painter, type the terminator character you want to use in the SQL Terminator Character box. For instructions, see "Setting Additional Connection Parameters" in <i>Connecting to Your Database</i> .
Default value	The default SQL Terminator Character value in the Database Preferences dialog box is a semicolon (;).
Usage	The following are typical situations that might require you to change the default SQL Terminator Character value:
	• <b>Creating stored procedures and triggers</b> If you are creating stored procedures and triggers in the ISQL view, change the painter's terminator character to one that you do not expect to use in the stored procedure or trigger syntax for your DBMS, such as the backquote (`) character.

After you finish using the stored procedure, you can change the terminator character back to a semicolon (;). If you prefer, you can continue to use the new terminator character as long as it does not conflict with any stored procedure or trigger syntax you plan to use.

• **Executing SQL scripts** If you plan to execute any SQL scripts in the ISQL view, make sure the terminator character used in the script agrees with the terminator character currently set in the view.

ExamplesTo change the SQL statement terminator character in the ISQL view to a<br/>backquote (`), type a backquote in the SQL Terminator Character box in the<br/>Database Preferences dialog box.

### **Use Extended Attributes**

Description	Controls access to the extended attribute system tables by specifying whether you want PowerBuilder to create these tables. The extended attribute system tables (also known as the extended catalog) consist of five tables that contain default extended attribute information for your database.	
	By default, the Use Extended Attributes check box is selected in the Database Preferences dialog box. This setting creates the extended attribute system tables the first time you connect to a database using PowerBuilder.	
Applies to	All database interfaces	
In an application	You cannot set the Use Extended Attributes database preference in code.	
In the development environment	In the Database painter, select or clear the Use Extended Attributes check box in the Database Preferences dialog box as follows:	
	• Select the check box (Default) Creates the extended attribute system tables when connecting to the database for the first time.	
	• <b>Clear the check box</b> Does <i>not</i> create the extended attribute system tables if they do not exist. Instead, the DataWindow painter use the appropriate default values for extended attributes (such as headers, labels, and text color). If the extended attribute system tables already exist, PowerBuilder does not use them when you create a new DataWindow object.	
Default value	The Use Extended Attributes check box in the Database Preferences dialog box is selected by default.	

If you clear the Use Extended Attributes check box in the Database Preferences dialog box, PowerBuilder <i>does not do</i> any of the following:		
• Create the extended attribute system tables		
• Insert, update, or delete rows in the extended attribute system tables		
• Select information (such as header names) from the extended attribute system tables		
• Execute statements that reference the extended attribute system tables		
Read Only
