Although the SAP® Sybase® IQ 16 New Features Summary describes all new SAP Sybase IQ functionality, some features may require additional action on your part to take advantage of the new architecture.

## *Load Performance Configuration Issues*

Customers upgrading from a previous release, for example, may need to change some initial compatibility options or rebuild wide columns to accommodate different datatypes. The new load engine provides better performance, but requires changes to the default memory allocation to use all available hardware resources efficiently.

This topic highlights migration issues and features which impact load performance. See the appropriate topics in the SAP Sybase IQ core documentation set for details. *Migration (Linux and UNIX)* and *Migration (Windows)* are new administration manuals in 16.0, describing the steps for upgrading your database, steps to install maintenance releases, and information on upgrading to the role-based security model. *Administration: Load Management* is also new in 16.0, describing data import and export procedures.

## *NBit*

Continuous NBit dictionary compression replaces 1, 2, and 3 byte dictionary compression as the default column storage mechanism in 16.0. All datatypes except LOB (character and binary) and BIT datatypes can be NBit columns.

The IQ UNIQUE column constraint determines whether a column loads as Flat FP or NBit FP. An IQ UNIQUE *n* value set to 0 loads the column as Flat FP. An *n* value greater than 0 but less than the FP\_NBIT\_AUTOSIZE\_LIMIT creates a NBit column initially sized to *n*. Columns without an IQ UNIQUE constraint implicitly load as NBit up to the auto-size limit.

Using IQ UNIQUE with an *n* value less than the auto-size limit is not necessary. The load engine automatically sizes all low or medium cardinality columns as NBit. Use IQ UNIQUE in cases where you want to load the column as Flat FP or when you want to load a column as NBit when the number of distinct values exceeds the value of the **FP\_NBIT\_AUTOSIZE\_LIMIT** option.

## *Loads and Large Memory*

Large memory represents the maximum amount of memory that SAP Sybase IQ can dynamically request from the OS for temporary use. Because some load operations may require more large memory than the 2GB default provides, adjust the startup options that control large and cache memory allocation based on the total amount of available physical memory.

## Read Me First

As a general rule, large memory requirements represent one third of the total available physical memory allocated to SAP Sybase IQ. To ensure adequate memory for the main and temporary IQ stores, set the `-iqlm`, `-iqtc`, and `-iqmc` startup parameters so that each parameter receives one third of all available physical memory allocated to SAP Sybase IQ.

In most cases, you should allocate 80% of total physical memory to SAP Sybase IQ to prevent SAP Sybase IQ processes from being swapped out. Adjust actual memory allocation to accommodate other processes running on the same system. For example, on a machine with 32 cores and 128GB of total available physical memory, you would allocate 100GB (approximately 80% of the 128GB total) to SAP Sybase IQ processes. Following the general rule, you would set the `-iqlm`, `-iqtc`, and `-iqmc` parameters to 33GB each.

See `-iqlm iqsrv16 Server Option` and `-iqmc iqsrv16 Server Option` in the *Utility Guide*.

### Index Changes

Changes to FP and HG indexes take advantage of the new column compression mechanism and improve load performance.

Index	Description
New Fast Projection (FP) Indexes	<p>Take advantage of the new continuous NBit dictionary compression, which replaces 1, 2, and 3 byte dictionary compression. FP (1), FP (2), and FP (3) indexes roll over to NBit (8), NBit (16), and NBit (24) respectively.</p> <p>If <code>FP_NBIT_IQ15_COMPATIBILITY='OFF'</code>, IQ UNIQUE constraints applied to the column determine whether the column loads as Flat FP or NBit.</p> <p>See <i>Fast Projection (FP) Index</i> in <i>Administration: Database</i>.</p>
New tiered HG index structure	<p>Decouples load performance from HG index size. In 15.x, load throughput could degrade as the amount of data in an HG index increased. As the index grew, loading the same amount of data could take more time. The new tiered structure decouples load performance from the HG index size to increase throughput.</p> <p>The <code>CREATE_HG_WITH_EXACT_DISTINCTS</code> option determines whether newly created HG indexes are tiered or non-tiered. This option is ON in all new 16.0 databases and all 16.0 databases migrated from 15.x. To take advantage of the new structure, set this option to OFF. See <i>CREATE_HG_WITH_EXACT_DISTINCTS Option</i> in <i>Reference: Statements and Options</i>.</p> <p>Use <code>sp_iqrebuildindex</code> to convert non-tiered HG indexes to tiered HG and vice-versa.</p>

### Stored Procedures

New stored procedures return information about column indexes and constraints.

Procedure	Description
<b>sp_iqindexmetadata</b>	<p>Returns details about column indexes, including the index types (Flat FP, NBit, HG, and tiered HG), distinct counts, IQ UNIQUE <i>n</i> value, and NBit dictionary size.</p> <p>See <i>sp_iqindexmetadata Procedure</i> in <i>Reference: Building Blocks, Tables, and Procedures</i>.</p>
<b>sp_iqcolumnmetadata</b>	<p>Returns FP index metadata for one or more user tables or all tables in the database.</p> <p>See <i>sp_iqcolumnmetadata Procedure</i> in <i>Reference: Building Blocks, Tables, and Procedures</i>.</p>
<b>sp_iqindexrebuildwidedata</b>	<p>Identifies wide columns that you must rebuild before they are available for read/write activities. Output includes statements that you can use with <b>sp_iqrebuildindex</b> to rebuild the columns.</p> <p>See <i>sp_iqindexrebuildwidedata Procedure</i> in <i>Reference: Building Blocks, Tables, and Procedures</i>.</p>
<b>sp_iqrebuildindex</b>	<p>Rebuilds FP indexes (Flat FP as NBit, or NBit as Flat FP) and HG indexes (single HG as tiered HG, or tiered HG as single HG). Before you can insert or update new data, you must rebuild all columns greater than 255 bytes wide.</p> <p>The <code>index_clause</code> can reset IQ UNIQUE <i>n</i> to an explicit value from 0 (to recast an NBit column to Flat FP) up to the limits defined in the <code>FP_NBIT_AUTOSIZE_LIMIT</code> and <code>FP_NBIT_LOOKUP_MB</code> options.</p> <p><b>sp_iqrebuildindex</b> also enables read-write access to columns that contain large object (LOB) data. LOB columns migrated from 15.x databases are read-only until you run <b>sp_iqrebuildindex</b>. The estimated cardinality for NBit columns with an IQ UNIQUE value below or equal to the <code>FP_NBIT_AUTOSIZE_LIMIT</code> is stored as 0 regardless of the <code>FP_NBIT_IQ15_COMPATIBILITY</code> setting. This affects the value returned from <b>sp_iqindexmetadata</b>.</p> <p>See <i>sp_iqrebuildindex Procedure</i> in <i>Reference: Building Blocks, Tables, and Procedures</i>.</p>

*Database Options*

Some database options are not enabled to take advantage of 16.0 features. Maintaining limited compatibility after a database upgrade provides some flexibility to transition existing applications.

Option	Description
<p><b>FP_NBIT_IQ15_COMPATIBILITY</b></p>	<p>Provides tokenized FP support similar to that available in 15.x. This option is ON by default in all 16.0 databases upgraded from 15.x and OFF in all newly created 16.0 databases.</p> <ul style="list-style-type: none"> <li>• If this option is ON, the database engine uses the <code>MINIMIZE_STORAGE</code>, <code>FP_LOOKUP_SIZE</code>, and <code>FP_LOOKUP_SIZE_PPM</code> options to optimize column storage. These options are ignored in 16.0.</li> <li>• If this option is OFF, the database engine ignores 15.x options and columns conform to SAP Sybase IQ NBit storage options.</li> </ul> <p>Set this option to OFF to take advantage of NBit column compression.</p>
<p><b>CREATE_HG_WITH_EXACT_DISTINCTS</b></p>	<p>Determines whether new HG indexes explicitly created with a <b>CREATE INDEX</b> command, or implicitly creating or altering a table with a <b>PRIMARY KEY</b> or a <b>FOREIGN KEY</b> declaration, are tiered or non-tiered. This option is ON 16.0 databases upgraded from 15.x and all newly created 16.0 databases. If this option is ON, all new HG indexes are non-tiered. To take advantage of the new tiered HG index structure, set this option to OFF.</p> <p>Use <code>sp_iqrebuildindex</code> to convert non-tiered HG indexes to tiered HG and vice-versa.</p>
<p><b>CREATE_HG_AND_FORCE_PHYSICAL_DELETE</b></p>	<p>Governs 16.0 delete behavior for tiered HG indexes. This option determines whether SAP Sybase IQ performs a physical delete immediately or defers the delete to a point later in the load.</p> <p><code>CREATE_HG_AND_FORCE_PHYSICAL_DELETE</code> is ON by default, which instructs SAP Sybase IQ to perform physical deletes.</p>

Option	Description
<b>REVERT_TO_V15_OPTIMIZER</b>	<p>REVERT_TO_V15_OPTIMIZER forces the query optimizer to mimic SAP Sybase IQ 15.x behavior. REVERT_TO_V15_OPTIMIZER='ON' by default in all 16.0 databases upgraded from 15.x. REVERT_TO_V15_OPTIMIZER='OFF' by default in all newly created SAP Sybase IQ 16.0 databases.</p> <p>If you plan to use SAP Sybase IQ hash partitioning features, set the REVERT_TO_V15_OPTIMIZER = 'OFF' in databases upgraded from 15.x to 16.0.</p>

# Installation and Upgrade

This section provides last-minute information about installation and upgrading that was omitted from or incorrect in your installation guide, or that needs special emphasis.

For detailed information about installing and upgrading SAP Sybase IQ, see the *Installation and Configuration Guide*.

Before you run a new version of SAP Sybase IQ, see *Restrictions* for the most current requirements. This section includes installation and migration information that is new for this release or needs emphasis.

## *SAP Sybase IQ 16.0 Requires a License*

SAP Sybase IQ 16.0 uses the SAP Sybase Software Asset Management (SySAM) licensing mechanism that lets system administrators enable and monitor their site's use of SAP Sybase products.

SAP Sybase IQ includes separate SySAM licenses for each product edition and separate licenses for any optional features available for that edition. See *Installation and Configuration Guide > Licensing Your Software*.

## *Extract and Install Installation Packages on the Same Machine [CR #728377]*

The SAP Sybase Product Download Center is an online software delivery service that provides easy access to the latest versions of your software. When you download your software, uncompress the downloaded image and run the installer on the same machine where you install SAP Sybase IQ. Do not copy an uncompressed installation archive to a secondary machine and run the install.

## *Avoid Using Relative Path to Launch Installer [CR #691212]*

SAP Sybase IQ installation fails if you launch the installer using a relative path. During GUI installation, the installer fails to prompt for the license file information and does not install properly.

For example, when launched from the console using a command line:

```
Installer files directory : /system1/users/jones/installldir
$$YBASE dir : /system1/users/jones/IQ160
```

```
cd $$YBASE
../installldir/setup.bin
```

- **Workaround** – Launch the installer from the directory where it is located, or use an absolute path.

### *Sybase Partners with v3 UDFs Must Specify a License Key When Upgrading to v4 [CR #688135]*

If you are an SAP Sybase design partner using v3 UDFs, your UDFs will not continue to work after you upgrade your libraries to v4 unless you specify the SAP Sybase-provided license key in the `a_v4_extfn_license_info` structure. You must implement the `extfn_get_license_info` method, and the method must return a valid key. See the *User-Defined Functions* guide for information on upgrading to the v4 API, and adding the `extfn_get_license_info` method.

### *SySAM Licensing Checkout [CR #628594]*

If SAP Sybase IQ was licensed using a per-processor license type in previous releases, the license quantity was determined at startup. In this release, SAP Sybase IQ periodically checks the number of processors it can use and attempts to check-out additional licenses for any increase. SAP Sybase IQ shuts down after 30 days, if additional licenses are not made available within this period. See the *SySAM Users Guide* for details regarding license grace.

### *ALTER DATABASE UPGRADE PROCEDURE ON Required*

To install new system tables, you must run **ALTER DATABASE UPGRADE PROCEDURE ON** on existing databases after installing SAP Sybase IQ 16.0.

For syntax, see *Reference: Statements and Options*.

## **Problem Solutions from Earlier Versions**

---

*How to Enable SAP Sybase Sub-Capacity Licensing*

You must have a sub-capacity licensing agreement with SAP Sybase before you can enable sub-capacity licensing. If you choose to use SAP Sybase IQ in a sub-capacity environment, see the *SySAM Quick Start Guide* for instructions for generating your license key.

---

**Note:** Keep your license server up-to-date.

Although the installation media includes a copy of the most recent SySAM license server, SAP Sybase recommends that you periodically check for license server updates on the *SySAM Standalone License Server Install site*.

---

## Database Upgrades

---

Important information about database upgrades.

For detailed information about installing and upgrading SAP Sybase IQ, see the *Installation and Configuration Guide*.

SAP Sybase IQ 12.7 databases with remote server definitions based on the <code>asejdbc</code> driver will not have these definitions migrated to by the <code>iqunload</code> tool and will not give an error at the beginning of an unload saying that you need to drop any <code>asejdbc</code> servers (if there are any present).</li> </ul>

Therefore, when migrating from 12.x to 15.x, you may need to update registries and applications to locate libraries. For example, <code>win32\dbodbc11.dll</code> is now in <code>bin32</code>.  In SAP Sybase IQ 16.0, 64-bit drivers are now in the <code>bin64</code> directory, instead of <code>x64</code>. If upgrading from 15.x to 16.0 the directory names remain the same, but the driver library has changed from <code>dbodbc11.dll</code> (from SAP Sybase IQ 15.0 – 15.3) or <code>dbodbc12.dll</code> (from SAP Sybase IQ 15.4) to <code>dbodbc16.dll</code>.</li> </ul>

## SAP Sybase IQ Operations Known Issues from Previous Versions

Descriptions of known issues and workarounds for SAP Sybase IQ operations from previous versions.

### *dbisql Reports Java Stack Trace Error [CR #624363]*

On rare occasions, the Interactive SQL utility (**dbisql**) may encounter a Java stack trace error when you highlight text:

```
Index Array Out of Bounds
```

This is due to a problem in the Java Runtime Environment. See Bug ID 6921603 in the Java Bug Database on the Oracle Sun Developer Network (SDN).

### *sp\_iqstatus Returns Error on Chinese and Japanese Locale Installations [CR #622928]*

On SAP Sybase IQ servers that are set up for Chinese and Japanese locales, running `sp_iqstatus` returns an error similar to:

```
Could not execute statement.
Syntax error near '2010' on line 1
SQLCODE=-131, ODBC 3 State="42000"
Line 1, column 1
```

Workaround:

1. Stop the server.
2. For Chinese locales, remove `dblgzh_iq11.dll` from `%IQDIR16%\bin64`.  
For Japanese locales, remove `dblgja_iq11.dll` from `%IQDIR16%\bin64`.
3. Restart the server.

After this procedure, certain strings in the `.iqmsg` files and the output of **sp\_iqmpxinfo**, **sp\_iqstatistics**, and **sp\_iqstatus** are in English, instead of Chinese or Japanese.

### *ASE Connections to SAP Sybase IQ with BIGDATETIME [CR #622007]*

When a version 15.5 GA Adaptive Server Enterprise server uses Component Integration Services (CIS) to connect to an SAP Sybase IQ server version that has `BIGDATETIME` and `BIGTIME` capability, any chronological data type sent to the Adaptive Server server using CIS results in the error:

```
Msg 7225, Level 16, State 4:
Line 1:
Unknown datatype token 188 'BIGDATETIME NULL'
encountered.
Exited passthru mode from server 'QA_IQ16_ASECIS'.
```

SAP Sybase IQ sends the data as `BIGDATETIME` and relies on Adaptive Server to convert appropriately. The `BIGDATETIME` data type was implemented in CIS in Adaptive Server Enterprise version 15.5 ESD #1, so this error occurs with Adaptive Server Enterprise 15.5 before any ESDs have been applied.

## Known Issues

### Workaround:

SET TEMPORARY OPTION RETURN\_DATE\_TIME\_AS\_STRING='ON' in SAP Sybase IQ for each session. The SAP Sybase IQ server sends all chronological data as strings and Adaptive Server completes the conversion. This workaround is for Adaptive Server Enterprise 15.5 GA connecting to SAP Sybase IQ in passthrough mode.

You can also use this workaround in the definition of a remote stored procedure, but it is not a solution for proxy tables created on Adaptive Server returning chronological data types from SAP Sybase IQ.

### *RSA Certificate Creation Fails [CR #557702]*

RSA certificate creation fails with the error `createcert` command not found because the **createcert** utility is missing. The utility is currently available only on the AIX64, LinuxAMD64, Sun64, Win32, and Win64 platforms. Please contact Technical Support if you need this utility.

### *FORWARD TO from SAP Sybase IQ to ASE Fails [CR #539484]*

Execution of a **FORWARD TO** command from SAP Sybase IQ to Adaptive Server Enterprise using the ASEODBC driver fails with ASA Error -660 “The identifier that starts with '<identifier>' is too long. Maximum length is 28.”

### Workaround:

To avoid this problem, do one of the following after creating a remote Adaptive Server Enterprise server using either server class `aseodbc` or server class `asejdbc` and before executing a SQL statement that contains a string with double quotes against the remote server using the **FORWARD TO** statement:

1. Change the double quotes to single quotes.
2. Include the database option **SET QUOTED\_IDENTIFIER OFF** before the SQL statement to be executed:

```
FORWARD TO <remote server name> {  
  SET QUOTED_IDENTIFIER OFF  
  <SQL statement>  
}
```

3. Set the `QUOTED_IDENTIFIER` database option to **OFF** using a separate **FORWARD TO** statement:

```
FORWARD TO <remote server name> {  
  SET QUOTED_IDENTIFIER OFF }  
FORWARD TO <remote server name> {  
  <SQL statement>  
}
```

### *Creating Very Large Databases*

Attempting to create extremely large SAP Sybase IQ databases on certain Windows configurations may fail with an exception occurring in the module `hos_bion.cxx` at or near line 182.

If you require a database that exceeds 100GB, try creating a database of that size to see if your system configuration exhibits the problem. If you create a smaller database and later try to add dbspaces, correcting the problem at that time may be more difficult and time consuming.

This problem is intermittent but tends to occur if you have approximately 180GB of open files. Changing the setting of the `OS_File_Cache_Buffering` database option could trigger the problem. In some cases, you might see an `INSUFFICIENT_RESOURCES` Windows error message.

The best way to avoid this problem is to create on a raw device any databases that may become larger than 180GB.

If you create a very large database on a file system, and either the **CREATE DATABASE** statement fails as described above, or you see the `INSUFFICIENT_RESOURCES` message, apply Microsoft corrections. The problem is caused by a bug in the Windows kernel. More information is available on the Microsoft support Web site:

## Technical Support

---

Get support for Sybase products.

If your organization has purchased a support contract for this product, then one or more of your colleagues is designated as an authorized support contact. If you have any questions, or if you need assistance during the installation process, ask a designated person to contact Sybase Technical Support or the Sybase subsidiary in your area.

## Information for Technical Support

---

Technical Support needs information about your environment to resolve your problem.

Before contacting Technical Support, run the **getiqinfo** script to automatically collect as much information as possible. You may also need to collect some information manually .

In this list, \* indicates items collected by **getiqinfo**:

- SAP Sybase IQ version (for example, 16.0 GA or ESD level)
- Type of hardware, amount of memory, number of CPUs\*
- Operating system and version (for example, Microsoft Windows 2008 Service Pack 1)\*
- Operating system patch level
- Front-end tool used (for example, Business Objects Crystal Reports)
- Connectivity protocol used (for example, ODBC, JDBC, Tabular Data Stream™ (TDS))
- Open Client version
- Configuration type (single user or multiuser)

## Obtaining Help and Additional Information

- (Important) Message log file\* – by default, named `dbname.iqmsg` and located in the directory where you started the database server
- Stack trace file for the date and time the problem occurred (if applicable), by default named `stktrc-YYYYMMDD-HHMMSS_#.iq` and located in the directory where you started the database server\*
- Command or query that produced the error
- Query plan\* (recorded in `.iqmsg` file)

The query plan is collected automatically by **getiqinfo**. If you manually collect information, enter these commands, then re-run the command that produced the error:

```
SET TEMPORARY OPTION Query_Plan = 'ON'  
SET TEMPORARY OPTION Query_Detail = 'ON'  
SET TEMPORARY OPTION Query_Plan_As_Html = 'ON'  
SET TEMPORARY OPTION Query_Plan_As_Html_Directory =  
'ON'
```

The plan is in the message log file.

If you have performance problems, set this database option:

```
SET TEMPORARY OPTION Query_Plan_After_Run = 'ON'
```

This enables Technical Support to see which steps in the query processing used the time.

- Server logs
  - For UNIX and Linux: `IQ-16_0/logfiles/<servername>.nnnn.stderr` and `IQ-16_0/logfiles/<servername>.nnnn.srvlog*`
  - On Windows platforms: `%ALLUSERSPROFILE%SybaseIQ\logfiles\<servername>.nnnn.srvlog*`  
For example, on Windows 2003, the server log files are located in `C:\Documents and Settings\All Users\SybaseIQ\logfiles`. On Windows 2008, the server log files are located in `C:\ProgramData\SybaseIQ\logfiles`.
- Startup and connection option settings, from the configuration file (by default, `dbname.cfg`)\*
- Database option settings and output from **sa\_conn\_properties**\* (if the server is still running)
- Schema and indexes for the database
- Output from **sp\_iqstatus** and **sp\_iqcheckdb**
- On multiplex databases, execute **getiqinfo** on each node (coordinator and secondary nodes)
- Screen snapshot of the problem, if possible

A checklist for recording this information for Technical Support is provided in this release bulletin.

See *System Administration Guide: Volume 1 > Troubleshooting Hints > Reporting Problems to Technical Support > Collecting Diagnostic Information Using getiqinfo*.

## Accessibility Features

---

Accessibility ensures access to electronic information for all users, including those with disabilities.

Documentation for this product is available in an HTML version that is designed for accessibility.

Vision impaired users can navigate through the online document with an adaptive technology such as a screen reader, or view it with a screen enlarger.

HTML documentation has been tested for compliance with accessibility requirements of Section 508 of the U.S Rehabilitation Act. Documents that comply with Section 508 generally also meet non-U.S. accessibility guidelines, such as the World Wide Web Consortium (W3C) guidelines for Web sites.

---

**Note:** You may need to configure your accessibility tool for optimal use. Some screen readers pronounce text based on its case; for example, they pronounce ALL UPPERCASE TEXT as initials, and MixedCase Text as words. You might find it helpful to configure your tool to announce syntax conventions. Consult the documentation for your tool.

---

For information about how Sybase supports accessibility, see the Sybase Accessibility site: <http://www.sybase.com/products/accessibility>. The site includes links to information about Section 508 and W3C standards.

You may find additional information about accessibility features in the product documentation.
