# Introduction

Sybase® CEP provides an Oracle driver plug-in that enables you to integrate or communicate with Oracle databases.

Before you install the Sybase CEP Oracle driver plug-in, acquire the Oracle database driver add-on, known as the OCI driver, and a valid Oracle license. You can acquire both from Oracle Corporation or an authorized Oracle channel.

This documentation assumes you have licensed and installed the OCI driver. For information on the installation and configuration of OCI driver software, please consult the documentation provided by Oracle. This document deals exclusively with the installation and usage of the Sybase CEP Oracle driver plug-in.

# Supported Platforms

The Sybase CEP Oracle driver plug-in is available on platforms and operating systems supported by the CEP R3 server.

Supported platforms and operating systems include:

| Platform         | Supported OS   | Compiler       | JDK Version   |
|------------------|--|----------------|---------------|
| Linux-64         | Red Hat 5.0 (AMD), Red Hat 5.0 (Intel), SUSE 10 (AMD)  | gcc 3.4.6      | 5.0 Update 12 |
| Sun-64 (Sparc)   | Solaris 10   | gcc 3.4.6      | 5.0 Update 12 |
| Sun-64 (AMD)     | Solaris 10   | gcc 3.4.6      | 5.0 Update 12 |
| Windows (32-bit) | Windows 2003 Server (32-bit), XP Professional (32-bit) | MSDEV 2005 SP1 | 5.0 Update 12 |

# Installation

To install the Sybase CEP Oracle driver plug-in, unzip or untar the installation package and run an installation command.

The installation files for the Sybase CEP Oracle driver plug-in are provided on the plug-in CD.

1. Ensure you have installed Sybase CEP server and the OCI driver.
2. Locate the installation package at the root of the plug-in CD, and copy this package to a temporary directory. Installation packages are named based on operating system. All packages begin with **c8-server-orcl-dbdriver** and end in either **.tar.gz** or **.zip**. Ensure you select the appropriate package for your platform.
3. Run the appropriate command (depending on your operating system) to unpack the installation files.
4. Locate and run the installation scripts to perform the installation. The scripts are located in the target directory you selected when unpacking the installation files, under `SybaseC8/addon-installers/orcl-dbdriver`.
  - For UNIX, run **install-server.sh**.
  - For Windows, run **install-server.bat**.

# Configuration

Configure your connection to Oracle databases with a user name, password, and DSN.

The most common way of configuring CCL queries to interact with an Oracle database includes a database user name, password, and Database Source Name (DSN). Follow the steps in this section to set up this type of connection with Oracle from within Sybase CEP Engine.

1. In the `c8-services.xml` file, create a service entry section for the Oracle database. This entry provides information to enable Sybase CEP Server to communicate with the external database server. If you want to connect to multiple database servers, or to multiple databases on a single server, create a separate section for each database.

The `c8-services.xml` file distributed with Sybase CEP contains several sample database service entry sections, each for a different type of database service. To find these entries, search for the string

```
Type="DATABASE"
```

inside the file. You can either customize one of these sections, or make a copy of it elsewhere in the file and customize the copy.

2. Set the "Service Name" preference to a unique service name for Oracle. This name is case-sensitive, must begin with a letter, and may contain a character string consisting of letters, numbers, underscores, dots, and/or colons. The service name must be the same name as the name of the database you use in your CCL queries. For example, if your database subquery is:

```
...
FROM (DATABASE "Database1" SCHEMA "valuation.ccs"
SELECT * FROM Stocks WHERE T.symbol=Stocks.symbol)
```

The database name (

```
Database1
```

) in the database subquery should match the service name in the `c8-services.xml` file.

3. Set the "Type" preference to DATABASE.
4. Optionally, add a description of your service entry in the "Description" element.
5. Set the "DBDriverType" preference to the type of driver you use to communicate with your Oracle database. Sybase supports the following driver types:
  - `DBDriverOracle` – use if you are connecting to the database with a native (non-ODBC) Oracle driver. The connect string for `DBDriverOracle` is either an Oracle TNS Name or an EZ Connect string.

## Configuration

- `DBDriverODBCSybaseIQUnix` – use if you are connecting to the database with a Sybase IQ driver on UNIX-like operating systems.
  - `DBDriverODBC` – use if you are connecting to the database with an ODBC driver, including a Sybase IQ driver on Microsoft Windows. If you set up an ODBC connection that uses the DSN name as the connect string name, you must also set up a DSN. Refer to your ODBC documentation for instructions on installing and setting up the necessary ODBC drivers for your database.
6. If necessary, include a "DatabaseType" preference in your service entry. You can only use this preference in conjunction with the "DBDriverType" setting of `DBDriverODBC`. You must set this preference if you want to connect to the Oracle TimesTen database from Sybase CEP Engine. It may improve performance and compatibility for database drivers that do not fully implement the ODBC standard, or that provide features or optimizations that are not part of the standard. You can set the preference to the following values:
- `MyODBC35`.
  - `PostgreSQL`.
  - `SQLServer2005`.
  - `TimesTen`.

Here is an example of a "DatabaseType" setting:

```
<Param Name="DatabaseType">TimesTen</Param>
```

7. Set the "DBDriverConnectionString" preference.

The "DBDriverConnectionString" may be the Oracle TNS Name, or may use the following format:

```
dbserver:port/OracleSID
```

where:

- *dbserver*  
is the name of the computer on which the other server resides.
- *port*  
is the port number used to communicate with the other server.
- *OracleSID*

is the service name of the Oracle database to which you want to connect.

For `DBDriverODBC` and `DBDriverODBCSybaseIQUnix`, the "DBDriverConnectionString" is the name of the DSN entry you have set up for your connection in the ODBC control panel.

Note that, if your "DBDriverConnectionString" contains one of the following characters, the character must be preceded by a back slash escape character (`\`). These characters are:

semicolon (;), forward slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equal sign (=), plus sign (+), dollar sign (\$), and comma (,).

8. Optionally, set the "CacheMaximumAge" preference to specify how long Sybase CEP Server should keep a cached copy of the information that it read from the external database.

For more information on caching, see "Caching Data from an External Database, RPC Server, or Public Window" on page 74 of the Sybase CEP Administrator's Guide.

9. Set the "Username" preference to the user name that should be used when communicating with the external database.

Note that this value is unencrypted, so anyone with access to the `c8-services.xml` file may read the user name.

10. Set the "Password" preference to the password for the user name you specified in the "Username" preference.

Like the user name, the password is unencrypted.

11. Set any desired optional preferences for your database service entry in the `c8-services.xml` file.

For more information, see "Setting Optional Preferences for Services" on page 71 of the Sybase CEP Administrator's Guide.

This is an example of an entry that uses the Oracle OCI driver:

```
<Service Name="OracleDb" Type="DATABASE" >
  <Description>local oracle dod db</Description>
  <Param Name="DBDriverType">DBDriverOracle</Param>
  <Param Name="DBDriverConnectionString">myhost:6789/mydb</Param>
  <Param Name="CacheMaximumAge">0</Param>
  <Param Name="Username">myuser</Param>
  <Param Name="Password">mypass</Param>
</Service>
```

This example uses an ODBC driver. Note the different value for `DBDriverType`:

```
<Service Name="MyDB" Type="DATABASE" >
  <Description>sample odbc db</Description>
  <Param Name="DBDriverType">DBDriverODBC</Param>
  <Param Name="DBDriverConnectionString">MyDSNName</Param>
  <Param Name="CacheMaximumAge">0</Param>
  <Param Name="Username">myuser</Param>
  <Param Name="Password">mypass</Param>
</Service>
```

This example uses a Sybase IQ driver. Note the different value for `DBDriverType`:

```
<Service Name="MyIQDB" Type="DATABASE" >
  <Description>sample sybase iq db</Description>
  <Param Name="DBDriverType">DBDriverODBCSybaseIQUnix</Param>
  <Param Name="DBDriverConnectionString">MyDSNName</Param>
```

## Configuration

```
<Param Name="CacheMaximumAge">0</Param>  
<Param Name="Username">myuser</Param>  
<Param Name="Password">mypass</Param>  
</Service>
```

Make sure that the external database to which you are connecting is running properly before attempting to connect to it from Sybase CEP Engine.
