# Native OData App Development

Use SAP® Mobile Platform OData SDK to create OData (Open Data Protocol) applications for iOS and Android devices. The target audience is advanced developers who may be new to SAP Mobile Platform.

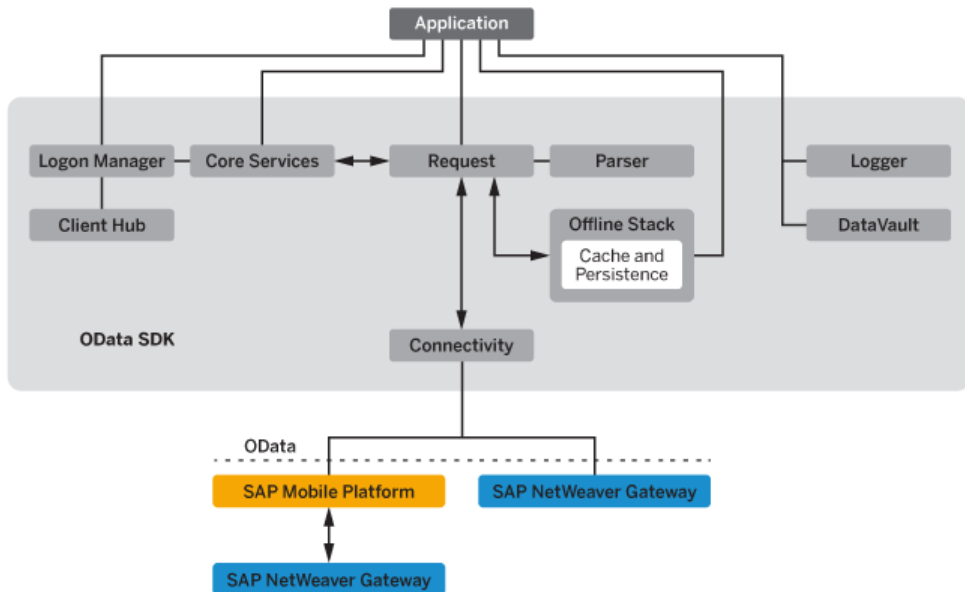

## OData Framework Overview

---

The OData SDK provides an open and flexible framework for native OData application development for both online and offline applications. OData SDK components, each of which can be used independently, are implemented as static runtime libraries.

Use the OData SDK, which consists of a collection of runtime libraries and classes, to build native mobile applications. The OData SDK supports Android and iOS platforms, and is based on the native device SDKs of the platforms. There is a separate implementation for each platform. Native applications that are installed on the devices allow the client application to leverage the support provided by the platform, including:

- Adapting to each device's form factor (for example, automatic layout)
- Exploiting different input methods (for example, touch screen, keyboard or trackball)
- Caching data in native device data stores for better performance
- Tightly integrating with the features of the device

**Figure 1: Main Components of the OData SDK**

### *Logon Manager*

The Mobile Application Framework (MAF) Logon Manager component manages common logon-related tasks, such as registering and deleting users, updating configuration, locking and unlocking applications, changing application passcodes, and securely handling passwords. It is based on reusable controls, and includes a default skinnable UI. MAF Logon Manager supports user onboarding, and its components include **MAFLogonUING** and **MAFLogonManagerNG**.

### *Client Hub*

The Client Hub, which is integrated with Logon Manager, simplifies user onboarding and configuration to enable easier and faster strategic enterprise-wide deployments. The Client Hub simplifies end-user password management for mobile applications, and improves the user experience. The Client Hub:

- Manages the single sign-on (SSO) vault on the device.
- Enables co-signed business applications with the same security configuration to securely share credentials on the device.
- Supports multiple security configurations per device.

### *Core Services*

The Core Services layer enables consumption of SAP Mobile Platform REST services with pure HTTP or HTTPS, (which is, by default, in on-premise connectivity). It provides simplified APIs for registration, exchanging settings between client and server, end-to-end tracing, and native push notifications. Functionalities supported by Core Services include:

- Client connection initialization
- User on-boarding or registration
- Application connection setting exchange
- Customization resource bundle
- Security configurations - Basic authentication, SSO certificate authentication, anonymous access, network edge (SiteMinder authentication - always asynchronous), non-network edge, single SSL and mutual SSL authentication
- Native notification support for iOS and Android platforms
- CAPTCHA support for both synchronous and asynchronous requests. Asynchronous request is recommended for on-boarding using CAPTCHA in a productive scenario.
- Non network edge authentication support for iOS and Android platforms. In Network edge (siteminder) scenario, reverse proxy is configured. User needs to get authenticated, and moves for authentication to server, and then to backend.

### *Request*

The Request library provides the interfaces for handling both online and offline OData requests, and processes data transfer from the server to devices, and devices to the server. It supports offline capabilities, where OData requests (POST, PUT, DELETE) are persisted if there is no network connectivity, and invoked when a network becomes available. You can use the online and offline capabilities for applications that have direct connectivity with Gateway, and for applications that register the users on SAP Mobile Platform Server. Functionalities supported by Request include:

- Synchronous and asynchronous request handling
- OData request batch processing
- Delta token support
- Offline request queueing
- XSRF support

### *Parser*

The Parser library parses OData feeds, service document and metadata and converts them to native objects, saving application developer from having to work with low-level details of OData semantics. The Parser library helps the application developers to generate OData feeds from native objects. Functionalities supported by Parser include:

- Parsing OData XML or JSON structures to native OData objects
- Validating OData XML or JSON during parsing by checking the existence of mandatory fields and structures
- Providing easy access to all OData fields and structures via the objects resulting from the parsing
- Building OData XML or JSON structures from native OData objects

---

**Note:** SAP recommends that, for better performance, you use JSON parser as your parser component.

---

### *Cache Management and Persistence*

The runtime cache stores and accesses OData-related objects in memory, and also stores data on device for easy access. The cache enables mobile applications to access the locally stored data even in offline mode. Functionalities supported by these components include:

- Storing or accessing OData objects (both metadata and application data)
- Searching for OData entries using their searchable fields
- Support for encrypted persistence store

### *Logger*

The Logger component implements logging and error handling to enable supportability from client to back-end. Functionalities supported by Logger include:

- Common exception and error handling
- Event logging

### *Connectivity*

The connectivity layer handles all connectivity-related tasks, hides the complexity of the communication at the transport level, and provides easy-to-use APIs. Productive enterprise applications must use SAP Mobile Platform for connectivity. Functionalities supported by Connectivity include:

- Synchronous and asynchronous HTTP request handling
- Supported authentication methods include:
  - X509 certification
  - SSO token/cookie
  - Basic authentication (user/password)
- Timeout handling
- Compressed payload handling
- Request types as supported by OData Protocol
- Connection pools for optimal performance

### *DataVault*

The DataVault component provides encrypted storage of certificates, database encryption keys, passwords, and other sensitive items. Functionalities supported by DataVault include:

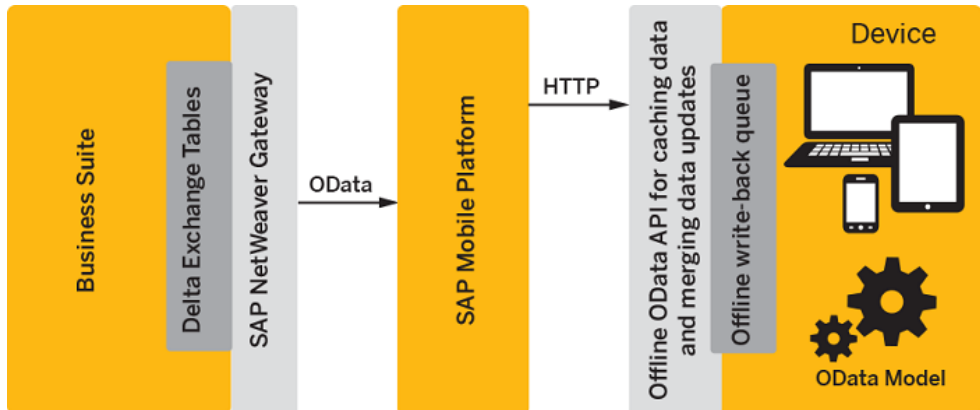

- Create a vault
- Set a vault's properties
- Store objects in a vault
- Retrieve objects from a vault
- Change the password used to access a vault
- Control access to a vault that is shared by multiple iOS applications.

## Offline OData Support

SAP Mobile Platform device users can access and modify enterprise data when disconnected from their corporate network. The device users can easily retrieve and modify the data when a connection is re-established. The OData offline APIs are used to seamlessly cache data and merge the delta updates.

### Offline OData Overview

Offline OData provides the following features:

- No state in middle tier – allows for scalability to large number of users.
- Request-response based – a simple programming model helps in predicting the load on the backend.
- OData is the programming model – helps in unifying disparate back-ends.
- OData delta supported – a standard way for representing back end changes and exposing them to clients.
- Client libraries provide a secure document cache – useful for data protection.

### OData Cache

The OData Cache is used to store service documents, metadata documents, and entities.

### Delta Query Support

Delta Queries return a list of entities that have changed since you last queried the collection. So whatever has been created, updated and deleted since your last visit, these changes can then be merged into your local result set. SAP NetWeaver Gateway SP07 supports Delta Queries. Delta Queries work with the Cache object.

## **Configuring the Application in the Management Cockpit**

Configure the application settings in the Management Cockpit. These settings enable you to monitor and manage your applications.

### **Prerequisites**

- Make sure SAP Mobile Platform Server is installed.
- Make sure the server is started.
- Launch the Management Cockpit.

### **Task**

## **Defining Applications**

Create a new native, hybrid, or Agentry application definition. The definition enables you to manage the application using Management Cockpit.

1. In Management Cockpit, select **Applications**, and click **New**.
2. In the New Application window, enter:

Field	Value
ID	<p>Unique identifier for the application in reverse domain notation. This is the application or bundle identifier that is defined or generated during application development. Reverse domain notation is the practice of reversing a registered domain name; for example, the reverse domain notation for an object in <code>sap.com</code> might be <code>MyApp.sap.com</code>). The application identifier:</p> <ul style="list-style-type: none"> <li>• Must be unique.</li> <li>• Must start with an alphabetic character.</li> <li>• Can contain only alphanumeric characters, underscores (<code>_</code>), and periods (<code>.</code>).</li> <li>• Must not include spaces.</li> <li>• Can be up to 64 characters long.</li> </ul> <p>Formatting guidelines:</p> <ul style="list-style-type: none"> <li>• SAP recommends that application IDs contain a minimum of two dots (<code>."</code>). For example, this ID is valid: <code>com.sap.mobile.appl</code>.</li> <li>• Application IDs should not start with a dot (<code>."</code>). For example, this ID is invalid: <code>.com.sap.mobile.appl</code>.</li> <li>• Application IDs should not include two consecutive dots (<code>."</code>). For example, this ID is invalid: <code>com..sap.mobile.appl</code>.</li> </ul>
Name	<p>Application name. The name:</p> <ul style="list-style-type: none"> <li>• Can contain only alphanumeric characters, spaces, underscores (<code>_</code>), and periods (<code>.</code>).</li> <li>• Can be up to 80 characters long.</li> </ul>
Vendor	<p>(Optional) Vendor who developed the application. The vendor name:</p> <ul style="list-style-type: none"> <li>• Can contain only alphanumeric characters, spaces, underscores (<code>_</code>), and periods (<code>.</code>).</li> <li>• Can be up to 255 characters long.</li> </ul>
Type	<p>Application type.</p> <ul style="list-style-type: none"> <li>• Native – native iOS and Android applications.</li> <li>• Hybrid – container-based applications, such as Kapsel.</li> <li>• Agentry – metadata-driven application.</li> </ul> <p><b>Note:</b> You can configure only one Agentry application per SAP Mobile Platform Server. Once configured, Agentry no longer appears as an option.</p>

Field	Value
Description	(Optional) Short description of the application. The description: <ul style="list-style-type: none"> <li>• Can contain alphanumeric characters.</li> <li>• Can contain most special characters, except for percent signs (%) and ampersands (&amp;).</li> <li>• Can be up to 255 characters long.</li> </ul>

3. Click **Save**. Application-related tabs appear, such as Back End, Authentication, Push, and so forth. You are ready to configure the application, based on the application type.

---

**Note:** These tabs appear in Management Cockpit only after you define or select an application. The tabs used differ by application type.

---

## Defining Back-end Connections for Native and Hybrid Apps

Define back-end connections for the selected native or hybrid application.

1. From Management Cockpit, select **Applications > Back End**, and enter values for the selected application.

Field	Value
Connection Name <hr/> <b>Note:</b> Appears only when adding a connection under Back-End Connections.	Identifies the back-end connection by name. The connection name: <ul style="list-style-type: none"> <li>• Must be unique.</li> <li>• Must start with an alphabetic character.</li> <li>• Can contain only alphanumeric characters, underscores (_), and periods (.).</li> <li>• Must not include spaces.</li> </ul>
Endpoint	The back-end connection URL, or service document URL the application uses to access business data on the back-end system or service. The service document URL is the document destination you assigned to the service in Gateway Management Cockpit. Typical format: <pre>http://host:port/gateway/odata/namespace/Connection_or_ServiceName...</pre> Examples: <pre>http://testapp:65908/help/abc/app1/opg/sdata/TESTFLIGHT</pre> <pre>http://vmw3815.wdf.sap.corp:50009/sap/opu/odata/rwnd/RMTSAMPLE</pre>

Field	Value
Use System Proxy	(Optional) Whether to use system proxy settings in the SAP Mobile Platform <code>props.ini</code> file to access the back-end system. This setting is typically disabled, because most back-end systems can be accessed on the intranet without a proxy. The setting should only be enabled in unusual cases, where proxy settings are needed to access a remote back-end system outside of the network. When enabled, this particular connection is routed via the settings in <code>props.ini</code> file.
Rewrite URL	(Optional) Whether to mask the back-end URL with the equivalent SAP Mobile Platform Server URL. This is necessary to ensure the client makes all requests via SAP Mobile Platform Server and directly to the back end. Rewriting the URL also ensures that client applications need not do any additional steps to make requests to the back end via SAP Mobile Platform Server. If enabled, the back-end URL is rewritten with the SAP Mobile Platform Server URL. By default, the property is enabled.
Allow anonymous connections	<p>(Optional) Whether to enable anonymous access. This means the application user can access the application without entering a user name and password. However, the back-end system still requires log on credentials to access the data, whether it is a read-only user, or a back-end user with specific roles. If enabled, enter the log on credential values used to access the back-end system:</p> <ul style="list-style-type: none"> <li>• <b>User name</b> – supply the user name for the back-end system.</li> <li>• <b>Password</b> – supply the password for the back-end system.</li> </ul> <p>If disabled, you do not need to provide these credentials. By default, the property is disabled.</p> <hr/> <p><b>Note:</b> If you use Allow Anonymous Connections for a native OData application, do not assign the No Authentication Challenge security profile to the application, or the anonymous OData requests will not be sent (Status code: 401 is reported).</p>
Maximum Connections	<p>The number of back-end connections that are available for connection pooling for this application. The larger the pool, the larger the number of possible parallel connections to this specific connection. The default is 500 connections. Factors to consider when resetting this property:</p> <ul style="list-style-type: none"> <li>• The expected number of concurrent users of the application.</li> <li>• The load acceptable to the back-end system.</li> <li>• The load that the underlying hardware and network can handle.</li> </ul> <hr/> <p><b>Note:</b> The maximum connections can be increased only if SAP Mobile Platform Server hardware can support the additional parallel connections, and if the underlying hardware and network infrastructure can handle it.</p>

Field	Value
Certificate Alias	The name under which the administrator has imported the certificate key-pair in the <code>smp_keystore</code> file. The alias must be set when the back-end URL is <code>https://</code> , and the back-end server requires mutual authentication. There are conditions when <code>https</code> is used but the server does not require a client certificate. This certificate alias is required when the back end requires mutual SSL connectivity. Use the alias of a certificate stored in the SAP Mobile Platform Server keystore. SAP recommends that the CN value of the generated certificate be the fully qualified domain name of SAP Mobile Platform Server.

2. (Optional) Under Back-end Connections, view additional connections, or add new connections.
  - a) Click **New**, to add additional back-end connections in the server.
  - b) Enter values for the new back-end connection, using the values shown above.
  - c) Click **Save**. The new connection is added to the list.

Administrator maintains a list of server-level back-end connections (it includes all the connections in the SAP Mobile Platform Server) and application specific back-end connections. Application specific back-end connections are the connections enabled for an application. Users registered to an application can access only these back-end connections. Request-response to a back end connection that is not enabled for an application is not allowed (throws 403, "Forbidden" error).

By default, these additional back-end connections are enabled for an application.

Back-end connection is displayed in the list.

3. Select the **Application-specific Connections** from the drop-down to show the back-end connections that are enabled for a particular application.

You can view the **Server-level Connections** and enable the connections for this application using the checkbox.

---

**Note:** Multiple back ends can be authenticated using various options of authenticating requests available in security configuration.

---

## Defining Application Authentication

Assign a security profile to the selected application. The security profile defines parameters for how the server authenticates the user during onboarding, and request-response interactions.

### Prerequisites

You must configure security profiles for application authentication before you can complete this step.

**Task**

1. From Management Cockpit, select **Applications > Authentication**.
2. Click **Existing Profile**.

---

**Note:** You can also create a new profile.

---

3. In Name, select a security profile name from the list. The name appears under Security Profile Properties, and one or more security providers appear under Authentication Providers.
4. Under Security Profile Properties, enter values.

Field	Value
Name	A unique name for the application authentication profile.
Check Impersonation	(Optional) In token-based authentication, whether to allow authentication to succeed when the user name presented cannot be matched against any of the user names validated in the login modules. To prevent the user authentication from succeeding in this scenario, the property is enabled by default.

5. Under Authentication Providers, you can select a security profile URL to view its settings. To change its settings, you must modify it through **Settings > Security Profiles**.

**OData Security Matrix**

Use one of the supported security configurations to secure your applications.

The below table provides a brief configuration procedure for the supported security configuration in Native OData applications. For more information, refer *Administration* in *SAP Mobile Platform Server*.

Security Configuration	Implemented Using	Security Provider	Configuration Steps (in brief)
Basic authentication with HTTP	OData SDK, Client Hub	HTTP/HTTPS Authentication	Set the back end credentials. <hr/> <b>Note:</b> For anonymous user, set the back end to allow anonymous connections.

Security Configuration	Implemented Using	Security Provider	Configuration Steps (in brief)
Basic authentication with HTTPS	OData SDK, Client Hub	HTTP/HTTPS Authentication	<ol style="list-style-type: none"> <li>1. Set the back end credentials. <b>Note:</b> For anonymous user, set the back end to allow anonymous connections.</li> <li>2. Connect with HTTPS port. For example, 8081.</li> <li>3. Make sure the server certificate is installed in the device trust store. <ul style="list-style-type: none"> <li>• For iOS, use the iPhone Configuration Utility.</li> <li>• For Android, install the certificate from the SD card.</li> </ul> </li> </ol>
Mutual authentication with HTTPS using a certificate	OData SDK, Afaria	X.509 User Certificate	<ol style="list-style-type: none"> <li>1. Connect with HTTPS port. For example, 8082.</li> <li>2. Make sure the server certificate is installed in the device trust store. <ul style="list-style-type: none"> <li>• For iOS, use the iPhone Configuration Utility.</li> <li>• For Android, install the certificate from the SD card.</li> </ul> </li> <li>3. Ensure the client certificate is available on the device.</li> </ol>
SiteMinder (non-network edge)	OData SDK	HTTP/HTTPS Authentication	Connect with SiteMinder backend using HTTPS.
SiteMinder network edge (reverse proxy)	OData SDK	Populate JAAS Subject From Client, HTTP/HTTPS Authentication	<ol style="list-style-type: none"> <li>1. Create a security profile using Populate JAAS Subject From Client authentication provider.</li> <li>2. Create a security profile using HTTP/HTTPS Authentication authentication provider.</li> </ol>

Security Configuration	Implemented Using	Security Provider	Configuration Steps (in brief)
SSO2 token (HTTP and HTTPS)	OData SDK	HTTP/HTTPS Authentication	<ol style="list-style-type: none"> <li>1. Create a new security profile and indicate the SSO cookie name in the security profile.</li> <li>2. Make sure the server certificate is installed in the device trust store. <ul style="list-style-type: none"> <li>• For iOS, use the iPhone Configuration Utility.</li> <li>• For Android, install the certificate from the SD card.</li> </ul> </li> </ol>
Basic authentication with LDAP back end	OData SDK	Directory Service (LDAP/AD)	Create security profile.

## Configuring Push on SAP Mobile Platform Server

You must explicitly register the application connection using the Management Cockpit.

1. Start the Management Cockpit.
2. Select **Applications**, and click **New**.
3. In the **New Application** window, enter values.

Field	Value
ID	Unique identifier for the application in reverse domain notation.
Name	Application name.
Vendor	(Optional) Vendor who developed the application.
Version	Application version. Currently, only version 1.0 is supported.
Type	Application type. <ul style="list-style-type: none"> <li>• Native – native iOS and Android applications.</li> <li>• Hybrid – container-based applications, such as Kapsel.</li> <li>• Agentry – metadata-driven applications, such as Agentry.</li> </ul> Application configuration options differ depending on your selection.
Description	(Optional) Short description of the application.

4. Click the **Backend** tab and configure the endpoint information.
5. Click the **Push** tab to configure the push settings.

For Android GCM, see *Android Push Notifications*.

For Apple APNS, see *Apple Push Notifications*

6. In the settings for your device, enable the app to receive push notifications.

### **Android Push Notifications**

Configure Android push notifications for the selected application, to enable client applications to receive Google Cloud Messaging (GCM) notifications.

1. From Management Cockpit, select **Applications > Push**.
2. Under Android, enter the access key for API key. This is the access key you obtained for your Google API project (<http://developer.android.com/google/gcm/gs.html>).
3. Enter a value for Sender ID. This is the project identifier.
4. (Optional) Configure push notifications for each device type supported.

### **Apple Push Notifications**

Configure Apple Push Notifications for the selected application, to enable client applications to receive APNS notifications.

1. From Management Cockpit, select **Applications > Push**.
2. Under Apple, select **APNS endpoint**. "None" is the default endpoint value for all the applications.
3. Select **Sandbox** to configure APNS in a development and testing environment, or **Production** to configure APNS in a production environment.
  - a) Click **Browse** to navigate to the certificate file.
  - b) Select the file, and click **Open**.
  - c) Enter a valid password.

---

**Note:** The default URL is for a production environment; for a development and testing environment, change the URL to [gateway.sandbox.push.apple.com](http://gateway.sandbox.push.apple.com).

---

4. (Optional) Configure push notifications for each device type supported.

## **Developing Applications Using OData SDK**

---

Develop Android or iOS applications using OData SDK.

### **Developing Android Applications**

The OData SDK is used to develop a device application for the Android platform. An application consists of reusable building blocks, which a developer can use to start the application and perform functions needed for the application. The target audience is advanced developers who are familiar working with APIs, but who may be new to SAP Mobile Platform.

#### *Prerequisites*

Before using OData SDK for developing an Android application:

- Verify that SAP Mobile Platform 3.0 server is installed so you can access it from your Android device.
- Set up a gateway OData service to access the business data from the backend.
- Ensure that you configure the gateway on SAP Mobile Platform Server as a back end by using Management Cockpit.

### **Setting Up the Development Environment**

Complete the prerequisites for setting up the development environment and then develop an application for the Android device.

#### **Prerequisites:**

- Download the Java Standard Edition (6 Update 24 and above versions) Development Kit (JDK) from <http://developer.android.com/sdk/index.html>.
- Download the Android Developer Tool (ADT) Bundle from <http://developer.android.com/sdk/index.html>. With the single download of the ADT Bundle, you can get all the essential Android SDK components and Eclipse IDE installed. For more information on supported Google Android development environment in SAP Mobile Platform 3.0, see <http://service.sap.com/pam>.

### **Creating a Project and Importing the OData Libraries**

Create a new Android project in the eclipse workspace. Add library resources to the project and set other application properties.

#### *Creating an Android Project*

1. Start the Eclipse workspace.
2. Select **File > New > Project**.
3. Select **Android > Android Application Project**, then **Next**.
4. In the Creates a new Android Application page of the New Android Application wizard, enter the appropriate values.
5. Click **Next**.
6. In the Configure Launcher Icon window, accept the default settings and click **Next**.
7. In the Create Activity window, select **Create Activity**, then select **BlankActivity**, and click **Next**.
8. In the New Blank Activity window, use the appropriate values and click **Finish**.

#### *Setting Up the Android SDK Library in the Plug in*

Set up the Android SDK in the ADT Plugin.

1. In the Eclipse environment, from the Window menu, select **Preferences**.
2. In the left navigation pane, select the **Android** node.
3. Click **Browse** to search for the location where you have stored the Android SDK.
4. Click **Apply** and **OK**.

### *Adding User Permissions in Android Manifest File*

1. In the Eclipse project, open the Android manifest file.
2. Add the user permissions in the AndroidManifest.xml file.

To use the applications offline, AndroidManifest.xml should have permission for accessing network state along with registered broadcast receiver.

```
:  
<! -- adding Permission to access network state -->  
  <uses-permission  
    android:name="android.permission.INTERNET"></uses-permission>  
  <! -- adding Permission to access network state -->  
  <uses-permission  
    android:name="android.permission.ACCESS_NETWORK_STATE" ></uses-  
    permission>
```

#### **(Optional) For Offline-Capability**

```
<application  
  .  
  .  
  .  
  .  
>  
  <receiver  
    android:name="com.sap.mobile.lib.request.NetworkStateListener"  
    android:label="NetworkStateListener">  
    <intent-filter>  
      <action  
        android:name="android.net.conn.CONNECTIVITY_CHANGE"/>  
    </intent-filter>  
  </receiver>  
  <activity  
    . . . . .  
  </activity>  
  .  
  .  
  .  
</application>
```

### *Importing Libraries to your Android Application Project*

1. Download the OData SDK library files from <SMP\_HOME>\MobileSDK3\NativeSDK\ODataFramework\Android\ to a <Parent directory> in your host development system.

(Online capability), Download the following libraries:

- CoreServices
- Connectivity
- Common
- DataVaultLib

- gson
- Parser
- perflib
- Request
- Sap-e2etrace

(To use Applications offline) Download the following libraries along with the above mentioned libraries:

- Cache
- Persistence
- sqlcipher-android-2.1.1
- commons-codec-1.3
- guava-r09
- libs/armeabi (includes libdatabase\_sqlcipher.so, libsqlcipher\_android.so and libstlport\_shared.so)
- icudt46l.zip file from assets folder

---

**Note:** Since the X86 SQL Cipher 2.1.1 libraries are not packaged with OData SDK, SAP recommends you download and use these libraries from: <https://s3.amazonaws.com/sqlcipher/SQLCipher%20for%20Android%202.1.1.zip>. Copy x86 folder into libs folder, to ensure offline cache works seamlessly on Intel Atom x86 emulator.

---

2. (Optional) If you did not use the project wizard to create your project, create a new folder, named libs, in your Eclipse/Android project.
3. Right-click the libs folder and choose **Import > General > File System**, then click **Next**.
4. Browse the file system to find the library's parent directory (where you have downloaded it).

---

**Note:** If you use AfariaSSL.jar to provision configuration data and certificates for your SAP Mobile Platform client application, ensure to remove libcrypto.jar and libssl.jar, as AfariaSSL internally has these two libraries.

---

5. (Optional) Click **OK**, then click the directory name (not the checkbox) in the left pane and select the relevant JAR in the right pane from AndroidODataSDK-3.0.0-CIAT-SNAPSHOT-bin[1].zip\Android\libraries. This step physically places the library into your project.
6. (Optional) Right-click your project, choose **Build Path > Configure Build Path**, click the **Libraries** tab, then click **Add JARs**.
7. (Optional) Navigate to the JAR in the libs directory and add it. (This step converts JAR for use on Android.)

This procedure includes a Dalvik-converted JAR in your Android project and makes Java definitions available to Eclipse in order to find the third-party classes when compiling your project's source code.

8. Add the files from assets folder into your application assets folder.

### 9. Build the application.

#### **Initializing an Application**

Initialize the application when it starts the first time and subsequently.

##### *Creating and Initializing the Client Connection*

Create and initialize the `ClientConnection` class, which is part of `Core Services` library. The `ClientConnection` class declares the programmatic interface for an object that manages connection settings required for registering the user and fetching application settings from the server. You must initialize a `ClientConnection` object and set connection properties for it before you can perform user registration or fetch any application settings from the server. Initialize the application using the following example code, which returns an instance of `ClientConnection` class.

A `ClientConnection` object is required to set the parameters required for the registration or request-response with SAP Mobile Platform.

```
public class ClientConnectionUtility{
    public static Logger logger;
    public static Preferences pref;
    public static ConnectivityParameters param;
    public static RequestManager reqManagerObject;
    public static ClientConnection clientConnection;

    public ClientConnectionUtility( Context context){
        logger = new Logger();
        pref = new Preferences(context, logger);
        param = new ConnectivityParameters();
        param.setUsername(<username>);
        param.setUserPassword(<password>);
        reqManagerObject = new RequestManager(logger, pref, param,
1);

        clientConnection = new ClientConnection(context,
<application ID>, <domain>, <security configuration>,
reqManagerObject);
        clientConnection.setConnectionProfile(<host:port>);

clientConnection.setApplicationConnectionID(<ApplicationConnectionID>); //optional, it registers client with the server using this
application connection ID.
    }

    public static ClientConnection getClientConnection(){
        return clientConnection;
    }
}
```

##### *Registering the User*

Register the user to the SAP Mobile Platform by invoking `registerUser(boolean isSynchronous)` method of `UserManager` class. The boolean parameter

isSynchronous specifies whether the registration is synchronous or asynchronous. If asynchronous, implement and register `SMPCClientListeners.ISMPUserRegistrationListener` to get a call back.

---

**Note:** The user name and password and other connectivity parameters should be set on `ConnectivityParameter` instance before calling `registerUser` method.

Alternately, register and implement

`HttpChannelListeners.IAuthenticationChallengeListner` to get a callback upon authentication challenge from the server.

---

#### For Asynchronous Registration

```

        public class SampleApplication extends Activity implements
ISMPUserRegistrationListener
        {
            UserManager um;
            public void onCreate(Bundle savedInstanceState) {
                super.onCreate(savedInstanceState);
                setContentView(<Your Layout>);
                um = new UserManager(clientConnection); //use the
clientConnection initialized in the previous topic
                um.setUserRegistrationListener(SampleApplication.this);
                um.registerUser(false);
            }

            @Override
            public void onAsyncRegistrationResult(State registrationState,
ClientConnection conn, int errCode, String errMsg) {
                if(registrationState == State.SUCCESS)
                {
                    Log.i("RegistrationState Success",conn.getApplicationID());
                    try
                    {
                        Log.i("RegistrationState Success","APPCID" +
um.getApplicationConnectionId());
                    } catch (SMPEException e)
                    {
                        e.printStackTrace();
                    }
                }
                if(registrationState == State.FAILURE)
                {
                    Log.i("Registration State Failure",errCode+errMsg);
                }
            }
        }

```

#### For Synchronous Registration

```

public class SampleApplication extends Activity
{
    public void onCreate(Bundle savedInstanceState)
    {

```

```
try
{
    UserManager userManager = new
UserManager(clientConnection); //use the clientConnection
initialized in the previous section
    userManager.registerUser(true);
    String appCID = userManager.getApplicationConnectionId();
}
catch (SMPEException e){
    e.printStackTrace();
}
}
```

### *Handling Encryption Key*

(Applicable to applications in offline mode) In offline mode, the application data can be encrypted and securely stored using `EncryptionManager` class. Hence, you must use `getEncryptionKey` and `SetEncryptionKey` APIs to generate and set the encryption key. The application must set the encryption key each time, it comes to foreground or is started.

Example to illustrate the usage of encryption key by the application:

```
String cipherKey = null;
/*fetch the cipherKey from Secure store like dataVault or android
applications shared Preference.*/
if(<CipherKey is found in SecureStore>)

/*Should be set every time application is loaded*/
    EncryptionKeyManager.setEncryptionKey(cipherKey,getContext());
/*Store the cipherKey in Secure store like dataVault or android
applications shared Preference.*/
else(<Cipher Key is not yet generated>)
    cipherKey= EncryptionKeyManager.getEncryptionKey(getContext());
```

### *Enabling Single and Mutual SSL Authentication*

In a single SSL connection, the client must trust the server certificate. You can set this up in one of these ways:

- Install the CA certificate on the device trustStore that application uses while connecting to the HTTPS URL.
- If the application does not provide the certificate, implement the `ISSSLChallengeListener`. The application receives a callback to the `isServerTrusted` method. When the application receives the server certificate, it can choose to trust the certificate or not. Based on that, it returns the Boolean value as true or false.
- Bundle the CA certificate in the application and invoke the `setServerCertificate` method to provide the certificate. SAP recommends using one of the other methods, as this one is available only for backward compatibility with Android versions earlier than 4.0.

In mutual SSL connection, the server must trust the client certificate. The application must implement `IMutualSSLChallengeListener`, and invoke the

getClientCertificate callback to request the client certificate. The client returns an X.509 certificate, and a private key, which together form an HttpClientCertInfo object.

Implement listeners for SSL callbacks.

```
public class LaunchActivity extends Activity implements
    ISSLChallengeListener, IMutualSSLChallengeListener {

    RequestManager srm;
    ILogger logger;
    IConnectivityParameters params;
    IPreferences prefer;
    String url="<Gateway URL>";

    public void mreg(View v){
        ClientConnection clientConnection;
        UserManager userManager;
        logger=new Logger();
        prefer=new Preferences(this, logger);
        params=new ConnectivityParameters();
        params.setLanguage("en");
        params.setUserName(<username>);
        params.setUserPassword(<password>);

        Context c = getApplicationContext();
        try{ InputStream certStream =
c.getResources().openRawResource(<certificate>);
CertificateFactory cf = CertificateFactory.getInstance("X509");
Certificate cer= cf.generateCertificate(certStream);

        param.setServerCertificate(cer); //to place certificate in
the devices less than 4.0

        Log.i("tag", "In Set Server certificate API");

        }catch(Exception e){
            Log.i("tag", "set certificate from file failed" +
e.getMessage());
            e.printStackTrace();
        }
        srm=new RequestManager(logger,prefer,params,1);
        /**
        * The set methods which should be called to register the
listeners to the request manager
        *
        */
        srm.setSSLChallengeListener(this);
        srm.setMutualSSLChallengeListener(this);
        ClientConnection.initInstance(getApplicationContext(),
"<application>", "<domain>", "<security configuration>", <request
manager>);
        try {
```

```
        j=ClientConnection.getInstance();
        j.setConnectionProfile("<connection url>");
        UserManager.registerUser(true);
    }
    catch (SMPEException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    }
}
```

Send X.509 certificate and private key to the client as an `HttpClientCertInfo` object.

```
public HttpClientCertInfo getClientCertificate()
{
    InputStream inStream;
    String cert="<p12 certificate location>";
    Context context=this.getApplicationContext();
    try {

        inStream = context.getResources().openRawResource(cert);

        /*following code loads the key store, and retrieves
        The alias under which it is loaded. */

        KeyStore ks = KeyStore.getInstance("PKCS12");
        ks.load(inStream, "mobile".toCharArray());
        Enumeration aliases=ks.aliases();
        String keyname=(String)aliases.nextElement();

        /* using the alias stored in the variable "keyname"
        We get the Private Key and the X509 Certificate
        Which we use to return HttpClientCertInfo object.*/

        PrivateKey
pk=(PrivateKey)ks.getKey(keyname,"mobile".toCharArray());
        X509Certificate xcer=(X509Certificate)
        (ks.getCertificate(keyname));

        return new HttpClientCertInfo(xcer,pk);}

    catch(Exception e){
        return null;
    }

}
/*
 * This is the callback which is invoked if
 * 1) SSL is enabled,
 * 2) The correct certificate is not installed on the device,in
which case it is required of the application to verify the server
certificate.
```

```

    */
@Override
    public boolean isServerTrusted(X509Certificate[]
paramArrayOfX509Certificate) {
        // TODO Auto-generated method stub

        return true;
    }
}

```

### ***Setting the Password Policy Using DataVault***

(Optional) Use the `DVPasswordPolicy` (as defined in `com.sybase.persistence.DataVault`) which holds the information of the Password Policy.

(Applicable to On-Premise only) To make the password policy editable in the SAP Mobile Platform Server, set the application connection property "CapabilitiesPasswordPolicy" to true in the client application. To set the password policy, use the following example code:

```

AppSettings appSettings = new AppSettings(clientConnection); //use
the clientConnection object initialized in the "Creating and
Initializing the Client Connection" section.
DVPasswordPolicy passwordPolicy = appSettings.getPasswordPolicy();

```

### ***(Optional) Initializing an Application Using Logon Manager***

To initialize an application using Logon manager, see *MAF Logon Task Flow* on page 2050.

### **Invoking a Request**

Send an asynchronous data request to the backend through the SAP Mobile Platform Server. With the offline capability, Request library requests are queued in a persistent database, if there is no network connectivity, and invoked when the network becomes available. You can use the Request library to develop applications that have direct connectivity to Gateway or to register users on Management Cockpit.

### ***Creating a Request***

The package structure for the Request library is `com.sap.mobile.lib.request`.

---

**Note:** Once the listener is set on the `RequestManager` class, all POST, PUT, DELETE (except GET) responses are received only on this listener. For GET requests, the listener can be set on corresponding request object itself.

---

1. To enable offline capability, set the response listeners using the following code, before invoking the request:

```

/* Setting the listener */
public class SampleActivity extends Activity implements
INetListener {
@Override

```

```
public void onError(IRequest arg0, IResponse arg1,
IRequestStateElement arg2) {}

@Override
public void onSuccess(IRequest arg0, IResponse arg1) {}
}
.
.
// setting the listener to current class
RequestManager reqMan = new RequestManager(logger, pref, param,
1);
reqMan.setListener(listener);
```

- Set the listener only once per application.
  - For all GET requests, the listener is always set on the request object.
  - If offline capability is disabled, then for POST, PUT, and DELETE requests also, the listener is set on corresponding request.
2. For all GET requests the listener is always set on request object. If offline capability is not enabled, then for POST, PUT, and DELETE requests also, listener is set on corresponding request.

Proceed with the following code to set response listener on request object:

```
public class SampleActivity extends Activity implements
INetListener {
@Override
public void onError(IRequest arg0, IResponse arg1,
IRequestStateElement arg2) {}

@Override
public void onSuccess(IRequest arg0, IResponse arg1) {}
.
.

getrequest.setListener(this);
}
```

3. Proceed with the following code to create the request asynchronously:

```
/*Enable XCSRF handling for OData requests*/
param.enableXsrf(true);
BaseRequest getEntry = new BaseRequest();
/*Initialize the Requesting class with the endpoint URL after
successful registration and set the headers */
Map<String, String> headers = new HashMap<String, String>();
headers.put("Content-Type", "application/atom+xml");
getrequest.setHeaders(headers);
getrequest.setRequestUrl("<Service doc URL>");
getEntry.setRequestMethod(<Request-Method>);
/*Set user name */
param.setUserName(<UserName>);
/*Set password */
param.setUserPassword(<Password>);
/*Set the listener to receive the response */
getrequest.setListener(this);
```

### *Creating a Batch Request*

Batch processing allows you to send multiple requests in a single batch request to the Gateway. The batch request is a multipart POST request that contains one or more changesets comprising of other POST, PUT, or DELETE requests. The batch request can also contain GET-based retrieval requests. The Gateway processes the batch request, and the responses to the various requests that make up the batch request are combined into a single response and sent back to the user as a single response.

#### 1. Initialize the batch request:

```
public BatchRequest batch;
batch = new BatchRequest(<Service doc URL>/$batch);
```

#### 2. Add a retrieve request to the batch request:

```
public BaseRequest get1 = new BaseRequest();
get1.setRequestMethod(BaseRequest.REQUEST_METHOD_GET);
get1.setRequestUrl("<collection name>");
batch.addRetrieveRequestToBatch(get1);
```

#### 3. Add request to a changeset:

```
public BaseRequest post1 = new BaseRequest();
post1.setRequestMethod(BaseRequest.REQUEST_METHOD_POST);
Map<String, String> headers1 = new HashMap<String, String>();
    headers1.put("Content-Type", "application/atom+xml");
post1.setHeaders(headers1);
post1.setRequestUrl("TravelagencyCollection");

//For single request
IODataEntry entry = new ODataEntry(metaDataDocument);
entry.setCollectionId(<collectionId>);
    Iterator<IODataProperty> entryPropIter =
entry.getPropertiesData().iterator();
    IODataProperty entryProp;
    entry.putPropertyValue("agencynum", "agency001");
    entry.putPropertyValue("NAME", "travelagency001");
    String postBody = parser.buildODataEntryRequestBody(entry,
collectionId, metaDataDocument, 1);

    post1.setData(postBody.getBytes());
    batch = new BatchRequest(<Service doc URL>);
    batch.addRequestToChangeset(post1);
```

---

#### **Note:**

- The POST URL should be relative to the batch URL.
  - Change sets are update requests. For the change set to be successfully processed, first do a GET operation on the URL to fetch the XSRF token. Then, after handling of XSRF token is done by the SDK implicitly.
- 

### *Making a Request*

Initialize the RequestManager and make a request.

```
//To initialise the Request manager
import com.sap.mobile.lib.request.Logger;
```

```
import com.sap.mobile.lib.request.Preferences;
import com.sap.mobile.lib.request.RequestManager;
import com.sap.mobile.lib.request.ConnectivityParameters;

....

Logger logger = null;
Preferences pref = null;
ConnectivityParameters param = null;
RequestManager requestManager= null;

logger = new Logger();
//
pref = new Preferences(this.getApplicationContext(), logger);
try {
pref.setBooleanPreference(IPreferences.PERSISTENCE_SECUREMODE,
false);
pref.setIntPreference(IPreferences.CONNECTIVITY_HTTPS_PORT, 443);
pref.setIntPreference(IPreferences.CONNECTIVITY_CONNTIMEOUT, 7000);
pref.setIntPreference(IPreferences.CONNECTIVITY_SCONNTIMEOUT,
7000);

} catch (PreferencesException e) {
logger.e("preferences", e.getMessage(), e);
e.printStackTrace();
}

param = new ConnectivityParameters();
param.setUsername("username");
param.setUserPassword("password");
param.enableXsrf(true);
requestManager = new RequestManager(logger, pref, param, 1);
//To make a request
requestManager.makeRequest(getrequest);
```

### **Parsing the Data**

Parse the response from the backend to the device.

#### *Retrieving the Response from Backend*

Based on the data request sent to the backend, retrieve the data as a response to the device.

```
public void onSuccess(IRequest mRequest, IResponse mResponse) {
    /* Parses the service document */
    IODataServiceDocument serviceDocument =
parser.parseODataServiceDocument(EntityUtils.toString(mResponse.getEntity()));
    /*parses response meta data*/
    IODataSchema metaDataDocument =
parser.parseODataSchema(EntityUtils.toString(mResponse.getEntity()),
serviceDocument);

    /*Parses a feed or an entry and returns List of IOdataEntry.*/
    List<IOdataEntry> Entries=
parser.parseODataEntries(EntityUtils.toString(mResponse.getEntity())
```

```

), collectionID, metaDataDocument);
    /*Parses a feed or an entry and returns IODataFeed.*/
    IODataFeed Odatafeed =
parser.parseODataFeed(EntityUtils.toString(mResponse.getEntity()),
collectionID, schema);
}

```

### *Accessing Properties of IODataEntry or IODataFeed*

This section explains how to access properties of IODataEntry or IODataFeed.

```

List<IODataEntry> Entries = Odatafeed.getEntries();
    for(IODataEntry entry:Entries)
    {
        entry.getValues("content", "properties", "Name");
    }

```

### *Features of JSON Parser*

This section lists unique features of JSON parser.

### **Caching the Data**

(Optional, offline mode only) Caching is an important part of getting an application to work in offline mode. Use the Cache API to cache and persist data, when the mobile device is out of the network range and process the data later when the device within the range of the network.

---

#### **Note:**

- Due to limitation on the emulator, you cannot determine the network connection state. For more information on other limitations, see **Emulator Limitations** in *Using the Emulator* at the Android Developer web site.
  - The delete tombstones for delta query support is not available on OData JSON format.
- 

The Cache API is divided into two parts, one that stores a copy of the entries that you receive from the server called as "server copy" and the other is locally modified entries called as "local copy". You can also use this procedure for online scenarios.

### *Prerequisites*

Use the Caching interface, which is implemented by the Cache class, to create an object to work with.

### *Initialize the Cache*

To initialize all the elements required for a cache to work, use the initializeCache method:

```

try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.initializeCache();
}
catch(CacheException e){

```

```
Log.e("", e.getMessage());
}
```

Cache can be used in persistable mode (database) and non-persistable mode (memory). By default, cache is persistable.

If you do not want to persist cache to the database, use the following API:

```
cache.setIsPersistable(false);
```

### *Merge to Cache*

To incrementally update the cache for server entries with the latest state of server objects, use the `mergeEntries` method. Every online HTTP GET operation on a URL should be followed by a `MergeEntries` method to enable the server cache to be in-sync with the backend service. It is important to instantiate a server cache using the `MergeEntries` method for all operations to work after a successful online GET request for a URL at the initial stage. It is recommended to optimize GET operation with Delta support to avoid redundancies.

```
try{
    ILogger logger = new Logger();
    Parser parser = new Parser(pref, logger);
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.initializeCache();
    IODataFeed feed = parser.parseODataFeed(entriesdoc, collectionID,
    schema);
    cache.MergeEntries(feed, EntryURL);parameters.
}
catch(CacheException e){
    Log.e("", e.getMessage());
}
```

---

**Note:** There is no overhead with the cache capabilities, when the parsed content is delivered for presentation, even before merging on to the cache, and when the merging operation is invoked on another thread. So, there is no wait time until the cache is being written.

---

### *Read Entry from Cache*

You can read entries from the cache method either locally, or from the server.

- **Server entry** – All server entries are stored against a URL key, which is the end-point that returns all the entries you want to cache. Use the `readEntriesServer` method to read server entries.
- **Local entry** – Read the locally created, deleted, or modified entries based on the entity type (collection to which entry belongs to) and entry ID. Use the `readEntriesLocal` method to read local entries. Entity type and entry ID are optional parameters, but at least one parameter must be given. Passing null to entry ID retrieves all the entries for a specified entity type. Passing null to entry type and passing entry Id will retrieve specific entry from cache.

The `ODataEntry` class of the parser has two member properties. The `getIsLocal()` property checks if the particular entry is local, and `getCacheState()` checks if the

local entry is created, updated, or deleted on the client. The cache states are represented by the `cacheState{Updated, Deleted, Inserted}` enum.

You need to combine the server and local entries to display the latest version of data on your application.

```

/*Read entry from server.*/
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    List<IODataEntry> entries = cache.ReadEntriesServer(urlKey); //
return all entries respective to the parameter.
    }
catch(CacheException e){
    Log.e("",e.getMessage());
}

/*Read entry from local*/
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    List<IODataEntry> entries =
cache.ReadEntriesLocal(CollectionID,EntryID); // return all entries
respective to either of the parameters.
    }
catch(CacheException e){
    Log.e("",e.getMessage());
}

```

### *Managing Locally Modified Entries in Cache*

- **Add Entry to Cache** – Use the `addEntry()` method to create a new entry in the local cache. With Request library, perform an HTTP POST request on the backend to create an entry in backend. After POST is successful, perform an HTTP GET request to fetch the latest server state optimized with delta, and merge the result with server cache on the device. The `addEntry()` method adds an entry into the local cache. Since the entry ID is generated by the back end in most of the cases, creating a local entry generates a temporary entry ID with which you can manage the cache entry.

```

try{
    //Invoke the HTTP POST request
    ODataEntry entry = new ODataEntry();
    entry.putPropertyValue("<property_name>",
"<property_value>");
    String postbody = Parser.buildODataEntryRequestBody(entry,
"<collection_ID>", schema, IParser.FORMAT_XML);

    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    String generated_id =cache.addEntry(entry);
    //Invoke the HTTP POST request
    BaseRequest post = new BaseRequest();

```

```
post.setRequestMethod(BaseRequest.REQUEST_METHOD_POST);
    post.setData(postbody.getBytes());
    reqMan.makeRequest(post);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

- **Update Entry to Cache** – When you make changes that is stored locally on your device in offline mode, it must be cached and persisted locally to be updated in the backend when connectivity returns. This ensures the OData entries are cached to build an application that works with seamless offline-online experience. Use the `updateEntry` method to create a local copy of the updated entry in cache. With connectivity, perform an update on the back end using an HTTP PUT request. After the updates is successful, perform a HTTP GET request to fetch the latest server state optimized with delta, and merge the result with server cache on the device. The `updateEntry` method does not generate any temporary ID, as the entry is already associated with the ID generated by the back end.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
        cache.updateEntry(entry);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

- **Delete Entry from Cache** – Use the `deleteEntry` method to delete a new entry with its ID in the local cache. With connectivity, perform a HTTP DELETE request on the backend to deleted the entry in back end. Post a successful delete on the backend, perform a HTTP GET request to fetch the latest server state optimized with delta, and merge the result with server cache on the device. The SDK reads the entry from the server cache, based on the entry ID, and updates the entry in the local cache by marking it as a local copy to be deleted. The `deleteEntry` method does not generate any temporary ID, as the entry is already associated with the ID generated by the back end.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
        cache.initializeCache();
        cache.deleteEntry(EntryID);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

- **Co-relating Requests with Local Cache Entries** – Each of the operations like add, update, and delete local cache entries are associated with entry IDs that are unique. These operations are also associated with requests. For example: Add corresponds to a POST request. To co-relate which request corresponds to which cached entry, there is a provision

provided in the Request object interface to tag each of these requests with their respective entry IDs.

In case of request to a single endpoint, each request is associated with single cache entry ID.

- **Clearing Specific Data from the Local Cache** – To clear locally created entries when all the cache instances are updated with the server version of the entry on which modifications were made, use the `clearLocalEntryForEntryId` method.

---

**Note:** Since the local cache is specific to the entry ID, the changes made to an entry from one of the cache instances (for example, URL1 + top 10) should be reflected on all cache instances in which the entry is present (for example URL1 + top 20). Do not delete the local entry until you have refreshed all caches that are relevant for this entry.

---

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    cache.clearLocalEntry(<EntryID>);

}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

### *Store Document in Cache*

To cache the service and metadata document (schema) for a particular service URL, use the `storeDocument` method . You can also define your own enum type and store the data for that enum type. The service document must be stored only after the metadata document is parsed.

```
//Service document
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    cache.storeDocument(serviceDocumentObject,
    DocumentType.ServiceDocument, serviceDocUrl);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}

//MetaData Document
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    cache.storeDocument(serviceDocumentObject,
    DocumentType.MetaDocument, serviceDocUrl);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

### *Read Document from Cache*

To read the service and metadata documents from cache, use the `readDocumentForUrlKey` method. This method returns the stored document in the cache. The application should pass the document type and the URL for which the document is relevant.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    IODataServiceDocument serviceDocumentObject =
    (IODataServiceDocument )cache.readDocument(DocumentType.ServiceDocu
    ment, serviceDocUrl);
    IODataSchema metadata =
    (IODataSchema) cache.readDocument(DocumentType.MetaDocument,
    serviceDocUrl);
}
catch (CacheException e){
    Log.e("",e.getMessage());
}
```

### *Clearing the Cache*

Use the `clearCache` method to clear the cache and persistence of all the entries based on URL key. This method also deletes the delta token of any document stored against this URL. Hence it is recommended that you use this method only when the application does not support delta queries.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    cache.clearCache(URLKey);
}
catch (CacheException e){
    Log.e("",e.getMessage());
}
```

### *Using Delta Link*

The delta link retrieves the delta changes to a particular URL, since the last time URL was called.

---

**Note:** You must pass the complete request URL as `urlKey`. For example, `cache().mergeEntries(list, aRequest.getRequestUrl())`.

---

The default option in cache is to get the delta link if OData entry supports delta link. In this case, once `mergeEntries` API of cache is called to save server entries into cache, the next GET the application fires, will internally be fired for delta link for the OData entry. So only delta changes will be available as the response and the application developer can call `mergeEntries` to merge the entries in the cache.

The application developer can disable default delta link handling by calling the following API:

```
requestObject.disableDeltaHandling(true);
```

### **Changing Settings at Runtime**

(Optional) Update application settings (client and the SAP Mobile Platform Server) using OData SDK.

#### *Download Customization Resource Bundles*

(Optional) Download customization resource bundles as defined in SAP Mobile Platform Server using the following example code:

```
//use the clientConnection object initialized in the "Initializing An
Application -> Creating and Initializing the Client Connection"
section.
AppSettings appSettings = new AppSettings(clientConnection);
byte[] customizationResourceBundle =
appSettings.getCustomizationResourceBundle("<resourcebundlename>:<v
ersion>");
```

#### *Retrieve Push Endpoint*

(Optional) Retrieve the push endpoint URL to register for push notification using the following example code:

```
String pushEndPoint = appSettings.getPushEndPoint();
```

### **Enabling GCM Push Notifications**

(Optional) Subscribe to get GCM (Google Cloud Messaging) push notifications.

To enable GCM push notification for an Android application:

1. Enable the GCM service in Google, see Android developer Web site at: <http://developer.android.com/google/gcm/gs.html#gcm-service>.
2. Configure Management Cockpit for server-side configuration to receive GCM push notification.
3. Obtain the sender ID, configured in the Management Cockpit from the client application.

```
//use the clientConnection object initialized in the "Initializing
An Application -> Creating and Initializing the Client Connection"
section.
AppSettings appSettings = new AppSettings(clientConnection);
String senderID = (String)
appSettings.getConfigProperty("d:AndroidGcmSenderId");
```

4. Use the sender ID to register with the GCM server and obtain the registration ID. For more information on how to build GCM enabled application, see <http://developer.android.com/google/gcm/client.html>.
5. Send the registration ID obtained from the GCM server to the SAP Mobile Platform Server.

```
HashMap<String, String> registrationSetting = new HashMap<String,
String>();
```

```
registrationSetting.put("d:AndroidGcmRegistrationId",
registrationId); //registrationId obtained from the previous
step.

appSettings.setConfigProperty(registrationSetting);
```

### Next

Configuration is complete and now the client application can obtain the push notifications.

Obtain the SAP Mobile Platform push end-point by using the `AppSettings.getPushEndPoint()`. This endpoint can be used to subscribe for push notifications from the back end.

### API Reference

Use the API reference as the primary reference for all API listings and error code information.

#### SAP Mobile Platform 3.0 OData SDK for Android

Use the OData SDK API reference as the primary source for API usage and error code information.

Refer to the OData SDK API reference for each available package.

### *AppSettings class*

#### *Syntax*

```
public class AppSettings extends ISDMNetListener,
INetListener
```

#### *Members*

All members of `AppSettings`, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>AppSettings(ClientConnec- tion)</i> on page 35	Initialize the <code>AppSettings</code> .

#### **Methods**

Modifier and Type	Method	Description
public String	<i>getApplicationEndPoint()</i> on page 35	Return the application end- point value.
public Object	<i>getConfigProperty(String)</i> on page 36	Return the value of the property for the provided key.

Modifier and Type	Method	Description
public HashMap< String, String >	<i>getConfigPropertyMap()</i> on page 36	Return a hash map of key and value pairs of properties.
public byte[]	<i>getCustomizationResourceBundle(String)</i> on page 37	Retrieve the customization resource bundle for the given resource name.
public com.sybase.persistence.DataVault.DVPasswordPolicy	<i>getPasswordPolicy()</i> on page 37	Return the DVPasswordPolicy (as defined in com.sybase.persistence.DataVault) which stores the information of the Password Policy.
public String	<i>getPushEndPoint()</i> on page 38	Return the Push end-point value.
public void	<i>setConfigProperty(HashMap&lt;String, String &gt;)</i> on page 38	Set the value(s) of properties sent as hash map of key and value pairs.

### *AppSettings(ClientConnection) constructor*

Initialize the AppSettings.

#### *Syntax*

```
public AppSettings ( ClientConnection clientCon )
```

#### *Parameters*

- **clientCon** – ClientConnection

```
AppSettings appSettings = new AppSettings(clientConnection);
```

### *getApplicationEndPoint() method*

Return the application end-point value.

#### *Syntax*

```
public String getApplicationEndPoint () throws SMPException
```

#### *Exceptions*

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    String appEndPoint = appSettings.getApplicationEndPoint();
} catch (SMPException e) {
```

```
e.printStackTrace();  
}
```

### *getConfigProperty(String) method*

Return the value of the property for the provided key.

#### *Syntax*

```
public Object getConfigProperty (String key) throws  
SMPEException
```

#### *Parameters*

- **key** – Name of the property.

#### *Exceptions*

- **SMPEException class** –

```
try {  
    AppSettings appSettings = new AppSettings(clientConnection);  
    String property = (String) appSettings  
        .getConfigProperty("d:AndroidGcmRegistrationId");  
} catch (SMPEException e) {  
    e.printStackTrace();  
}
```

### *getConfigPropertyMap() method*

Return a hash map of key and value pairs of properties.

#### *Syntax*

```
public HashMap<String, String> getConfigPropertyMap () throws  
SMPEException
```

#### *Exceptions*

- **SMPEException class** –

```
try {  
    AppSettings appSettings = new AppSettings(clientConnection);  
    HashMap<String, String> property =  
appSettings.getConfigPropertyMap();  
} catch (SMPEException e) {  
    e.printStackTrace();  
}
```

*getCustomizationResourceBundle(String) method*

Retrieve the customization resource bundle for the given resource name.

*Syntax*

```
public byte[] getCustomizationResourceBundle ( String
CustomResource ) throws SMPException
```

*Parameters*

- **CustomResource** – Name of the customization resource bundle.

*Exceptions*

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    byte[] cust =
appSettings.getCustomizationResourceBundle("MC1:1.1");
} catch (SMPException e) {
    e.printStackTrace();
}
```

*getPasswordPolicy() method*

Return the DVPasswordPolicy (as defined in com.sybase.persistence.DataVault) which stores the information of the Password Policy.

*Syntax*

```
public com.sybase.persistence.DataVault.DVPasswordPolicy
getPasswordPolicy () throws SMPException
```

*Exceptions*

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    DVPasswordPolicy passwordPolicy =
appSettings.getPasswordPolicy();
} catch (SMPException e) {
    e.printStackTrace();
}
```

*Usage*

The application uses it to enforce the composition of the Password.

### *getPushEndPoint()* method

Return the Push end-point value.

#### *Syntax*

```
public String getPushEndPoint () throws SMPException
```

#### *Exceptions*

- **SMPException** class –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    String pushEndPoint = appSettings.getPushEndPoint();
} catch (SMPException e) {
    e.printStackTrace();
}
```

### *setConfigProperty(HashMap< String, String >) method*

Set the value(s) of properties sent as hash map of key and value pairs.

#### *Syntax*

```
public void setConfigProperty (HashMap< String, String > list)
throws SMPException
```

#### *Exceptions*

- **SMPException** class –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    HashMap<String, String> property = new HashMap<String, String>();
    property.put("d:AndroidGcmRegistrationId", "1234565");
    appSettings.setConfigurationProperty(property);
} catch (SMPException e) {
    e.printStackTrace();
}
```

### *BaseRequest class*

Consists of the methods used to make Create,Read,Update, and Delete operations on HTTP backend.

#### *Syntax*

```
public class BaseRequest extends IRequest
```

#### *Derived classes*

- *BatchRequest* on page 50

### Members

All members of BaseRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected HashMap< String, String >	<i>eTagMap</i> on page 49	
protected static String	<i>HostURL</i> on page 49	
protected static boolean	<i>isStreamEnabled</i> on page 49	
protected byte[]	<i>mData</i> on page 49	
protected Map< String, String >	<i>mHeaders</i> on page 50	
protected transient INetListener	<i>mListener</i> on page 50	
protected int	<i>mPriority</i> on page 50	
protected int	<i>mRequestMethod</i> on page 50	
protected String	<i>mUrl</i> on page 50	
protected static ArrayList< String >	<i>setCookie</i> on page 50	
protected static String	<i>xsrftoken</i> on page 50	

### Methods

Modifier and Type	Method	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 42	Disables delta query handling.
public byte[]	<i>getData()</i> on page 42	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 43	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 43	Returns the request headers set.

Modifier and Type	Method	Description
public INetListener	<i>getListener()</i> on page 43	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 44	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 44	Returns the request method.
public String	<i>getRequestUrl()</i> on page 44	Returns the URL where the request must be fired.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 45	internal
public boolean	<i>isStreamEnabled()</i> on page 45	Specifies if the data streaming is enabled for this request.
public void	<i>setData(byte[])</i> on page 45	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 46	Set the request data stream in case of POST request.
public void	<i>setETag(String, int)</i> on page 46	sets the Etag for the request
public void	<i>setHeaders(Map&lt;String, String&gt;)</i> on page 46	Set the request headers.
public void	<i>setListener(INetListener)</i> on page 47	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(int)</i> on page 47	Sets the priority of the request.
public void	<i>setRequestMethod(int)</i> on page 48	Sets the request method.
public void	<i>setRequestUrl(String)</i> on page 48	Sets the URL for the request.

Modifier and Type	Method	Description
public void	<i>setStreamEnabled(boolea</i> n) on page 48	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public boolean	<i>useCookies()</i> on page 49	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

### Inherited members from IRequest

Modifier and Type	Member	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 411	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 411	etag "if-none-match"
public static final int	<i>ETAG_IF_RANGE</i> on page 411	etag "if-range"
public static final int	<i>PRIORITY_HIGH</i> on page 411	High priority.
public static final int	<i>PRIORITY_NORMAL</i> on page 412	Normal priority.
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 412	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 412	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 412	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 412	HTTP PUT method.
public void	<i>setListener(fina</i> l <i>INetListener</i> ) on page 409	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

Modifier and Type	Member	Description
public void	<i>setPriority</i> (final int) on page 409	Sets the priority of the request.
public void	<i>setRequestMethod</i> (final int) on page 410	Sets the type of HTTP request method.
public void	<i>setRequestUrl</i> (final String) on page 410	Sets the URL for the request.

*disableDeltaHandling*(boolean) method

Disables delta query handling.

*Syntax*

```
public void disableDeltaHandling ( boolean disable )
```

*Parameters*

- **disable** – If set to true it disables delta handling

*Returns*

None

*Usage*

By default delta handling is enabled.

*getData*() method

If the request method is POST, this method is called from the network library.

*Syntax*

```
public byte[] getData ()
```

*Parameters*

- **none** –

*Returns*

the content data

```
BaseRequest getrequest = new BaseRequest(); byte[] data = getrequest.getData();
```

*Usage*

This method will return with the content to be sent to the server.

*getDataStream() method*

If the request method is POST, this method is called from the network library.

*Syntax*

```
public InputStream getDataStream ()
```

*Parameters*

- **none** –

*Returns*

the content data stream.

```
BaseRequest request = new BaseRequest(); InputStream in = request.getDataStream();
```

*Usage*

This method must return with the content stream to be sent to the server.

*getHeaders() method*

Returns the request headers set.

*Syntax*

```
public Map< String, String > getHeaders ()
```

*Parameters*

- **none** –

*Returns*

the request headers

```
BaseRequest getrequest = new BaseRequest(); Map<String, String> headers =
getrequest.getHeaders();
```

*getListener() method*

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

*Syntax*

```
public INetListener getListener ()
```

*Parameters*

- **none** –

### *Returns*

the listener or null.

```
class example implements INetListener{ .... public void makeGetRequest(...) throws  
Exception { .... BaseRequest getrequest = new BaseRequest();  
getrequest.getListener(); } ... }
```

### *Usage*

Method will return null if there is no registered listener.

### *getPriority() method*

Returns the priority of the request.

### *Syntax*

```
public int getPriority ()
```

### *Parameters*

- **none** –

### *Returns*

the priority i.e. int value

```
BaseRequest getrequest = new BaseRequest(); int priority = getrequest.getPriority();
```

### *getRequestMethod() method*

Returns the request method.

### *Syntax*

```
public int getRequestMethod ()
```

### *Parameters*

- **none** –

### *Returns*

the request method, with a value of IRequest.REQUEST\_METHOD\_\* constants.

```
BaseRequest getrequest = new BaseRequest(); int method = getrequest.getRequestMethod();
```

### *getRequestUrl() method*

Returns the URL where the request must be fired.

### *Syntax*

```
public String getRequestUrl ()
```

*Parameters*

- **None** –

*Returns*

the URL.

```
BaseRequest getrequest = new BaseRequest(); String url = getrequest.getRequestUrl();
```

*isDeltaHandlingDisabled() method*

internal

*Syntax*

```
public boolean isDeltaHandlingDisabled ()
```

*isStreamEnabled() method*

Specifies if the data streaming is enabled for this request.

*Syntax*

```
public boolean isStreamEnabled ()
```

*Parameters*

- **none** –

*Returns*

use of data Streaming in the network library

```
BaseRequest request = new BaseRequest(); boolean isStreamUsed =
request.isStreamEnabled();
```

*setData(byte[]) method*

Set the request data in case of POST request.

*Syntax*

```
public void setData (byte[] data )
```

*Parameters*

- **data** – the request data to set

*Returns*

none

```
BaseRequest getrequest = new BaseRequest(); String postBody= "<atom:entry xmlns:atom=
'http://www.w3.org/2005/Atom'">" + "<atom:content type='application/xml'">" +
"<m:properties xmlns:m='http://schemas.microsoft.com/ado/2007/08/dataservices/
```

```
metadata" *xmlns:d=" http://schemas.microsoft.com/ado/2007/08/dataservices">" +
"<d:agencynum>09964571</d:agencynum>" + "<d:NAME ><d:NAME>" +
"<d:STREET />" + "<d:POSTBOX />" + * "<d:POSTCODE />" + "<d:CITY />" +
"<d:COUNTRY />" + "<d:REGION />" + "<d:TELEPHONE>+9945007007</
d:TELEPHONE>" + "<d:URL />" + "<d:LANGU />" + "<d:CURRENCY />" +
"<d:mimeType>text/html</d:mimeType>" + "</m:properties>" + "</atom:content>" + "</
atom:entry>"; post1.setData(postBody.getBytes());
```

### *setDataStream(InputStream) method*

Set the request data stream in case of POST request.

#### *Syntax*

```
public void setDataStream ( InputStream inputStream )
```

#### *Parameters*

- **InputStream** – the request data stream to set

#### *Returns*

none

```
BaseRequest request = new BaseRequest(); InputStream in = new
InputStream(); ....request.setDataStream(in);
```

### *setETag(String, int) method*

sets the Etag for the request

#### *Syntax*

```
public void setETag ( String tag , int i ) throws
IllegalArgumentException
```

#### *Parameters*

- **tag** – etag header value
- **i** – etag header name

#### *Returns*

none

```
BaseRequest getrequest = new BaseRequest(); getrequest.setETag("tag String",1);
```

### *setHeaders(Map< String, String >) method*

Set the request headers.

#### *Syntax*

```
public void setHeaders ( Map< String, String > headers )
```

*Parameters*

- **headers** – the request headers to set none

```
Map<String, String> headers1 = new HashMap<String, String>(); headers1.put("Content-Type", "application/atom+xml"); BaseRequest getrequest = new BaseRequest(); getrequest.setHeaders(headers1);
```

*setListener(INetListener) method*

Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

*Syntax*

```
public void setListener ( INetListener listener )
```

*Parameters*

- **listener** – the listener to set.

*Returns*

none

```
class example implements INetListener{ .... public void makeGetRequest(...) throws Exception { .... BaseRequest getrequest = new BaseRequest(); getrequest.setListener(this); } ... }
```

*Usage*

By default, the BaseRequest object included in the connectivity layer will contain no registered listeners.

Setting this object is not mandatory. However, it can be used to handle incidental errors.

*setPriority(int) method*

Sets the priority of the request.

*Syntax*

```
public void setPriority ( int value )
```

*Parameters*

- **value** – the priority of the request to set.

*Returns*

none

```
BaseRequest getrequest = new BaseRequest(); getrequest.setPriority(1);
```

### *Usage*

Allowed values: `IRequest.PRIORITY_HIGH` and `IRequest.PRIORITY_NORMAL`. In case of a different value, the default `IRequest.PRIORITY_NORMAL` will be used by the network. If the network layer finds an `IRequest` with `IRequest.PRIORITY_HIGH` priority in the queue, that request will be executed first. If there are more than one `IRequests` with `IRequest.PRIORITY_HIGH` priority, the network layer will choose an execution order. If the priority is not one of the predefined values, the priority will be set by default to `IRequest.PRIORITY_NORMAL`.

### *setRequestMethod(int) method*

Sets the request method.

### *Syntax*

```
public void setRequestMethod ( int requestMethod )
```

### *Parameters*

- **requestMethod** – one of the `IRequest.REQUEST_METHOD_*` constants.

### *Returns*

none

```
BaseRequest getrequest = new BaseRequest();  
getrequest.setRequestMethod(IRequest.REQUEST_METHOD_GET);
```

### *setRequestUrl(String) method*

Sets the URL for the request.

### *Syntax*

```
public void setRequestUrl ( String aUrl )
```

### *Parameters*

- **aUrl** – the URL to set.

### *Returns*

none

```
BaseRequest getrequest = new BaseRequest(); getrequest.setRequestUrl("http://abc.com/  
resource");
```

### *setStreamEnabled(boolean) method*

Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.

### *Syntax*

```
public void setStreamEnabled ( boolean streamEnabled )
```

*Parameters*

- **streamEnabled** –

*Returns*

none

```
BaseRequest request = new BaseRequest(); request.setStreamEnabled(true);
```

*useCookies() method*

This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

*Syntax*

```
public boolean useCookies ()
```

*Parameters*

- **none** – the use of cookies in the network library

```
BaseRequest getRequest = new BaseRequest(); boolean usecookie = getRequest.useCookies();
```

*Usage*

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the BaseRequest implementation.

*eTagMap variable**Syntax*

```
protected HashMap< String, String > eTagMap
```

*HostURL variable**Syntax*

```
protected static String HostURL
```

*isStreamEnabled variable**Syntax*

```
protected static boolean isStreamEnabled
```

*mData variable**Syntax*

```
protected byte[] mData
```

### *mHeaders variable*

#### *Syntax*

```
protected Map< String, String > mHeaders
```

### *mListener variable*

#### *Syntax*

```
protected transient INetListener mListener
```

### *mPriority variable*

#### *Syntax*

```
protected int mPriority
```

### *mRequestMethod variable*

#### *Syntax*

```
protected int mRequestMethod
```

### *mUrl variable*

#### *Syntax*

```
protected String mUrl
```

### *setCookie variable*

#### *Syntax*

```
protected static ArrayList< String > setCookie
```

### *xsrftoken variable*

#### *Syntax*

```
protected static String xsrfToken
```

### *BatchRequest class*

#### *Syntax*

```
public class BatchRequest extends BaseRequest
```

#### *Members*

All members of BatchRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected ArrayList< Object >	<i>batchRequestList</i> on page 56	
protected String	<i>batchRequestURL</i> on page 56	

### Constructors

Modifier and Type	Constructor	Description
public	<i>BatchRequest(String)</i> on page 54	Initializes the BatchRequest by providing the request URL.

### Methods

Modifier and Type	Method	Description
public void	<i>addRequestToChangeset(IRequest)</i> on page 55	Adds a modify request such as HTTP POST/PUT/DELETE request to the change set.
public void	<i>addRetrieveRequestToBatch(IRequest)</i> on page 55	Adds a retrieve request to the batch.
public void	<i>closeExistingChangeSet()</i> on page 56	Closes the existing change set and adds the subsequent modify requests to a different change set.

### Inherited members from BaseRequest

Modifier and Type	Member	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 42	Disables delta query handling.
protected HashMap< String, String >	<i>eTagMap</i> on page 49	
public byte[]	<i>getData()</i> on page 42	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 43	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 43	Returns the request headers set.

Modifier and Type	Member	Description
public INetListener	<i>getListener()</i> on page 43	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 44	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 44	Returns the request method.
public String	<i>getRequestUrl()</i> on page 44	Returns the URL where the request must be fired.
protected static String	<i>HostURL</i> on page 49	
public boolean	<i>isDeltaHandlingDisabled()</i> on page 45	internal
protected static boolean	<i>isStreamEnabled</i> on page 49	
public boolean	<i>isStreamEnabled()</i> on page 45	Specifies if the data streaming is enabled for this request.
protected byte[]	<i>mData</i> on page 49	
protected Map<String, String>	<i>mHeaders</i> on page 50	
protected transient INetListener	<i>mListener</i> on page 50	
protected int	<i>mPriority</i> on page 50	
protected int	<i>mRequestMethod</i> on page 50	
protected String	<i>mUrl</i> on page 50	
protected static ArrayList<String>	<i>setCookie</i> on page 50	
public void	<i>setData(byte[])</i> on page 45	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 46	Set the request data stream in case of POST request.
public void	<i>setETag(String, int)</i> on page 46	sets the Etag for the request

Modifier and Type	Member	Description
public void	<i>setHeaders(Map&lt;String, String&gt;)</i> on page 46	Set the request headers.
public void	<i>setListener(INetListener)</i> on page 47	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(int)</i> on page 47	Sets the priority of the request.
public void	<i>setRequestMethod(int)</i> on page 48	Sets the request method.
public void	<i>setRequestUrl(String)</i> on page 48	Sets the URL for the request.
public void	<i>setStreamEnabled(boolean)</i> on page 48	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public boolean	<i>useCookies()</i> on page 49	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.
protected static String	<i>xsrftoken</i> on page 50	

#### Inherited members from IRequest

Modifier and Type	Member	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 411	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 411	etag "if-none-match"
public static final int	<i>ETAG_IF_RANGE</i> on page 411	etag "if-range"
public static final int	<i>PRIORITY_HIGH</i> on page 411	High priority.
public static final int	<i>PRIORITY_NORMAL</i> on page 412	Normal priority.

Modifier and Type	Member	Description
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 412	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 412	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 412	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 412	HTTP PUT method.
public void	<i>setListener(final INetListener)</i> on page 409	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(final int)</i> on page 409	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 410	Sets the type of HTTP request method.
public void	<i>setRequestUrl(final String)</i> on page 410	Sets the URL for the request.

### *BatchRequest(String) constructor*

Initializes the BatchRequest by providing the request URL.

### *Syntax*

```
public BatchRequest ( String url )
```

### *Parameters*

- **url** – URL with which the Batch Request needs to be initialized.

### *Returns*

Object of Batch Request.

```
BatchRequest batch = new
```

```
BatchRequest(Utils.appSettings.getApplicationEndPoint().toString()+"$batch");
```

*addRequestToChangeset(IRequest) method*

Adds a modify request such as HTTP POST/PUT/DELETE request to the change set.

*Syntax*

```
public void addRequestToChangeset ( IRequest modifyRequest ) throws
ConnectivityException
```

*Parameters*

- **modifyRequest** – Request such as HTTP POST/PUT/DELETE.

*Returns*

None

*Exceptions*

- **ConnectivityException class** –

```
deleteRequest.setRequestMethod(SDMPBaseRequest.REQUEST_METHOD_DELETE);
deleteRequest.setUrl("TravelagencyCollection('09964571')");
batch.addRequestToChangeset(deleteRequest);
```

*addRetrieveRequestToBatch(IRequest) method*

Adds a retrieve request to the batch.

*Syntax*

```
public void addRetrieveRequestToBatch ( IRequest getRequest ) throws
ConnectivityException
```

*Parameters*

- **getRequest** – Retrieve request to be added to the batch.

*Returns*

None

*Exceptions*

- **ConnectivityException class** –

```
batch.addRetrieveRequestToBatch(getrequest);
```

### *closeExistingChangeSet()* method

Closes the existing change set and adds the subsequent modify requests to a different change set.

#### *Syntax*

```
public void closeExistingChangeSet () throws  
ConnectivityException
```

#### *Parameters*

- **None** –

#### *Returns*

None

#### *Exceptions*

- **ConnectivityException class** –

```
batch.addRetrieveRequestToBatch(get1); batch.addRequestToChangeset(post1);  
batch.addRequestToChangeset(put1); batch.closeExistingChangeSet(); // To close this  
change set and separate the subsequent requests to a different change set
```

```
batch.addRequestToChangeset(delete1); batch.closeExistingChangeSet();
```

#### *batchRequestList* variable

#### *Syntax*

```
protected ArrayList< Object > batchRequestList
```

#### *batchRequestURL* variable

#### *Syntax*

```
protected String batchRequestURL
```

#### *BundleRequest* class

#### *Syntax*

```
public class BundleRequest extends IBundleRequest
```

#### *Members*

All members of BundleRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
boolean	<i>isPersistRequest</i> on page 58	

### Constructors

Modifier and Type	Constructor	Description
public	<i>BundleRequest()</i> on page 57	

### Methods

Modifier and Type	Method	Description
public void	<i>addRequest(final IRequest)</i> on page 57	
public void	<i>clearRequests()</i> on page 58	Cleans out the request storage.
public IRequest[]	<i>getRequests()</i> on page 58	Returns all the requests from the storage.
public void	<i>removeRequest(final IRequest)</i> on page 58	

### Inherited members from **IBundleRequest**

Modifier and Type	Member	Description
public void	<i>addRequest(IRequest)</i> on page 107	Adds a request to the storage.
public void	<i>removeRequest(IRequest)</i> on page 108	Removes the specific request from the storage.

#### *BundleRequest()* constructor

##### *Syntax*

```
public BundleRequest ()
```

#### *addRequest(final IRequest)* method

##### *Syntax*

```
public void addRequest ( final IRequest request )
```

### *clearRequests() method*

Cleans out the request storage.

#### *Syntax*

```
public void clearRequests ()
```

#### *Parameters*

- **None** –

#### *Returns*

None

```
BundleRequest bundleRequest = new BundleRequest(); ... bundleRequest.clearRequests();
```

### *getRequests() method*

Returns all the requests from the storage.

#### *Syntax*

```
public IRequest[] getRequests ()
```

#### *Parameters*

- **None** –

#### *Returns*

the array of requests.

```
BundleRequest bundleRequest = new BundleRequest();... BaseRequest[] requests=  
bundleRequest.getRequests();
```

### *removeRequest(final IRequest) method*

#### *Syntax*

```
public void removeRequest ( final IRequest request )
```

### *isPersistRequest variable*

#### *Syntax*

```
boolean isPersistRequest
```

### *Cache class*

Consists of the methods related to Cache.

#### *Syntax*

```
public class Cache extends ICache
```

## Members

All members of Cache, including inherited members. **Variables**

Modifier and Type	Variable	Description
Context	<i>ctx</i> on page 71	
Map< String, DeltaLinkSchema >	<i>deltaCacheMap</i> on page 71	
Map< String, MetaDocumentSchema >	<i>documentMap</i> on page 71	
boolean	<i>isPersistable</i> on page 71	
Map< String, ODataEntryLocal >	<i>LocalCacheMap</i> on page 71	
ILogger	<i>logger</i> on page 71	
PersistenceManagerImpl	<i>manager</i> on page 71	
Map< String, ODataEntryServer >	<i>ServerCacheMap</i> on page 71	
cacheState	<i>state</i> on page 72	
String	<i>temp_key</i> on page 72	

## Constructors

Modifier and Type	Constructor	Description
public	<i>Cache(Context, ILogger)</i> on page 61	

## Methods

Modifier and Type	Method	Description
public String	<i>addEntry(IODataEntry)</i> on page 61	A new cache entry will be added into the local Cache using this particular method.
protected void	<i>addtoDelta(String, String)</i> on page 62	
protected void	<i>addtoLocal(IODataEntry, String)</i> on page 62	

Modifier and Type	Method	Description
protected void	<i>addtoServer(ODataEntryServer, String, boolean)</i> on page 62	
public void	<i>clearCache(String)</i> on page 63	This API will clear entries for the URLkey passed from all the cache except the Local cache.
public void	<i>clearLocalEntry(String)</i> on page 63	This API will clear entry from Local Cache.
public void	<i>deleteEntry(String)</i> on page 64	This API will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.
protected void	<i>deleteFromServercache(String)</i> on page 64	
protected Object	<i>deserialize(byte[])</i> on page 64	
public String	<i>getDeltaLink(String)</i> on page 65	This should return the delta token/delta link for the URL key passed.
public void	<i>initializeCache()</i> on page 65	
public void	<i>mergeEntries(ODataFeed, String)</i> on page 65	Merge APIs are to be invoked after doing a HTTP GET after modification or a set of modifications.
public Object	<i>readDocument(int, String)</i> on page 66	This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.
protected List< IODataEntry >	<i>readEntriesFromServer(String, String)</i> on page 67	
public List< IODataEntry >	<i>readEntriesLocal(String, String)</i> on page 67	Gets the Entries from the Local cache based on the EntityType and the EntryID.

Modifier and Type	Method	Description
public List< IODataEntry >	<i>readEntries.Server(String)</i> on page 68	Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.
protected byte[]	<i>serialize(Object)</i> on page 68	
public void	<i>setCacheListener(ICacheUpdateListener)</i> on page 68	Sets the listener for any update on Server cache and call backs upon merging Cache.
public void	<i>setIsPersistable(boolean)</i> on page 69	This API sets the isPersistable property of the cache which is used to check if the cache is implicitly persistable.
public void	<i>storeDocument(Object, int, String)</i> on page 69	This API Caches the service document or the meta data document depending on the DocumentType and against specified URLKey.
public void	<i>updateEntry(IODataEntry)</i> on page 70	This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

### *Cache(Context, ILogger) constructor*

#### *Syntax*

```
public Cache ( Context context , ILogger logger )
```

### *addEntry(IODataEntry) method*

A new cache entry will be added into the local Cache using this particular method.

#### *Syntax*

```
public String addEntry ( IODataEntry entry ) throws CacheException
```

#### *Parameters*

- **Entry** – object which is built for a new HTTP POST.

### Exceptions

- **CacheException class** –

```
Try{
//Fire a HTTP POST
IODataEntry entry = buildPostEntry();
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
String generated_id =cache.addEntry(entry);
PerformPostrequest(entry)//Fire HTTP POST request
}
Catch(CacheException e){
}. public void onSuccess(I Request arg0, I Response aResponse) {

ClearLocalEntry(generated_id)//on success of POST
request ,application developer clears this entry after all the Cache
instances related to this entry (filter/query all matching) are
updated from the server
}
```

### Usage

This method will be mostly called when the application is trying to create entries in the backend via a HTTP POST.

### *addtoDelta(String, String) method*

#### Syntax

```
protected void addToDelta (String urlKey , String deltaLink) throws
PersistenceException
```

### *addtoLocal(IODataEntry, String) method*

#### Syntax

```
protected void addToLocal (IODataEntry entry , String Id) throws
PersistenceException
```

### *addtoServer(ODataEntryServer, String, boolean) method*

#### Syntax

```
protected void addToServer (ODataEntryServer odataEntryServer ,
String urlKey , boolean isUpdate) throws PersistenceException
```

***clearCache(String) method***

This API will clear entries for the URL key passed from all the cache except the Local cache.

***Syntax***

```
public void clearCache ( String URLKey ) throws CacheException
```

***Parameters***

- **URLKey** – : will clear cache for the URL key specified.

***Exceptions***

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.clearCache(URLKey);
}
Catch(CacheException e){
}
```

***clearLocalEntry(String) method***

This API will clear entry from Local Cache.

***Syntax***

```
public void clearLocalEntry ( String entryID ) throws
CacheException
```

***Parameters***

- **EntryID** – from server Cache will be marked as "Deleted" and will be added in Local Cache

***Exceptions***

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.ClearLocalEntry(EntryID);
}
```

```
}  
Catch (CacheException e) {  
}
```

### *deleteEntry(String) method*

This API is will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.

#### *Syntax*

```
public void deleteEntry ( String entryID ) throws CacheException
```

#### *Parameters*

- **EntryID** – from server Cache will marked as "Deleted" and will be added in Local Cache

#### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);;  
cache.deleteEntry(EntryID);  
  
}  
Catch (CacheException e) {  
}
```

### *deleteFromServercache(String) method*

#### *Syntax*

```
protected void deleteFromServercache ( String Id ) throws  
PersistenceException
```

### *deserialize(byte[]) method*

#### *Syntax*

```
protected Object deserialize ( byte[] rawData )
```

***getDeltaLink(String) method***

This should return the delta token/delta link for the URL key passed.

***Syntax***

```
public String getDeltaLink (String URLKey) throws
CacheException
```

***Parameters***

- **URLKey** – : will return the delta token/delta link for the URL key.

***Exceptions***

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.getDeltaLink(URLKey);
}
Catch(CacheException e){
}
```

***initializeCache() method******Syntax***

```
public void initializeCache ()
```

***mergeEntries(IODataFeed, String) method***

Merge APIS are to be invoked after doing a HTTP GET after modification or a set of modifications.

***Syntax***

```
public void mergeEntries (IODataFeed Feed , String URLKey) throws
CacheException
```

***Parameters***

- **Entries** – list of entries which will be merged into server Cache.
- **URLKey** – : Cache returns cached entries for this urlKey.

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
IODataFeed feed = parser.parseODataFeed(responseEntity,  
collectionID, schema);  
cache.mergeEntries(feed, EntryURL);  
  
}  
Catch(CacheException e){  
  
}
```

### *Usage*

Merge all the entries provided into the Server cache for the respective urlkey.

### *readDocument(int, String) method*

This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.

### *Syntax*

```
public Object readDocument ( int documentType , String URLKey )  
throws CacheException
```

### *Parameters*

- **DocumentType** – : will return specified type of document
- **UrlKey** – : will fetch document for specified urlkey.

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
IODataServiceDocument serviceDocumentObject =  
(IODataServiceDocument) cache.ReadDocument (documentType.ServiceDocum  
ent, serviceDocUrl);  
IODataSchema metadata =  
(IODataSchema) cache.readDocument (documentType.MetaDocument,  
serviceDocUrl);
```

```

}
Catch (CacheException e) {
}

```

### *readEntriesFromServer(String, String) method*

#### **Syntax**

protected List< IODataEntry > readEntriesFromServer (String *urlkey* , String *EntryId*) throws PersistenceException, CacheException

### *readEntriesLocal(String, String) method*

Gets the Entries from the Local cache based on the EntityType and the EntryID.

#### **Syntax**

public List< IODataEntry > readEntriesLocal (String *entityType* , String *entryID*) throws CacheException

#### **Parameters**

- **EntityType** – is the type which represents collection in ODATA.
- **EntryId** – get entries based on this entry ID.

#### **Exceptions**

- **CacheException class** –

```

Try{
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
List<I ODataEntry> entries =
cache.readEntriesLocal("SomeCollection", "EntryID"); // return all
entries respective to either of the parameters.
}
Catch (CacheException e) {
}

```

#### **Usage**

The return type will be an array of Entries

### *readEntriesServer(String) method*

Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.

#### *Syntax*

```
public List< IODataEntry > readEntriesServer ( String URLKey )  
throws CacheException
```

#### *Parameters*

- **urlkey** – :Returns cached entries for this urlKey.

#### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
List<IODataEntry> entries = cache.readEntriesServer(urlkey);  
IODataEntry entry = entries.get(0);  
String Name =entry.getPropertyValue("NAME");  
  
}  
Catch(CacheException e){  
}
```

### *serialize(Object) method*

#### *Syntax*

```
protected byte[] serialize ( Object obj ) throws IOException
```

### *setCacheListener(ICacheUpdateListener) method*

Sets the listener for any update on Server cache and call backs upon merging Cache.

#### *Syntax*

```
public void setCacheListener ( ICacheUpdateListener  
cacheUpdateListener )
```

#### *Parameters*

- **listener** – The listener to be set for call backs upon merge cache.

```
Class CacheupdateListener implements ICacheUpdateListener {
```

```

        public void OnCacheUpadte(String URLKEY, List<IODataEntry>
Entries) {
            Log.i("OnCacheUpdate", URLKEY);
        }
    }
    cacheupdateListener cacheUpdateListener = new
cacheupdateListener();
cache.setCacheListener(cacheUpdateListener);

```

### *setIsPersistable(boolean) method*

This API sets the `isPersistable` property of the cache which is used to check if the cache is implicitly persistable.

### *Syntax*

```
public void setIsPersistable (boolean value) throws
CacheException
```

### *Parameters*

- **value** – this will persist cache in db or In-Memory, Default is in DB Store

### *Exceptions*

- **CacheException class** –

```

Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.setIsPersistable(true);
}
Catch (CacheException e){
}

```

### *storeDocument(Object, int, String) method*

This API Caches the service document or the meta data document depending on the `DocumentType` and against specified `URLKey`.

### *Syntax*

```
public void storeDocument (Object Document , int documentType ,
String URLKey) throws CacheException
```

### *Parameters*

- **document** – : will return the delta token/delta link for the URL key.
- **documentType** – specify the type of document to be cached.
- **urlKey** – Cache against this urlKey

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
cache.storeDocument(serviceDocumentObject,  
documentType.ServiceDocument, serviceDocUrl);  
  
}  
Catch(CacheException e){  
}
```

### *updateEntry(IODataEntry) method*

This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

### *Syntax*

```
public void updateEntry ( IODataEntry entry ) throws  
CacheException
```

### *Parameters*

- **Entry** – will be marked as 'Updated' in Local cache.

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
cache.updateEntry(OdataEntries, URLKEY);  
  
}  
Catch(CacheException e){
```

```
}
```

### *ctx variable*

#### **Syntax**

```
Context ctx
```

### *deltaCacheMap variable*

#### **Syntax**

```
Map< String, DeltaLinkSchema > deltaCacheMap
```

### *documentMap variable*

#### **Syntax**

```
Map< String, MetaDocumentSchema > documentMap
```

### *isPersistable variable*

#### **Syntax**

```
boolean isPersistable
```

### *LocalCacheMap variable*

#### **Syntax**

```
Map< String, ODataEntryLocal > LocalCacheMap
```

### *logger variable*

#### **Syntax**

```
ILogger logger
```

### *manager variable*

#### **Syntax**

```
PersistenceManagerImpl manager
```

### *ServerCacheMap variable*

#### **Syntax**

```
Map< String, ODataEntryServer > ServerCacheMap
```

*state variable**Syntax*

```
cacheState state
```

*temp\_key variable**Syntax*

```
String temp_key
```

*CacheException class*

This Class represents the exception thrown by the SMP REST library.

*Syntax*

```
public class CacheException extends Exception
```

*Members*

All members of CacheException, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>ANY_INPUT_FIELD_NULL</i> on page 75	Any of the input fields passed is null.
public static final int	<i>APPLICATION_ID_NULL</i> on page 75	Application is not initialized.
public static final int	<i>APPLICATION_USER_ALREADY_REGISTERED</i> on page 75	Attempt to register an application user which is already registered.
public static final int	<i>APPLICATION_USER_NOT_REGISTERED</i> on page 75	Attempt to delete the user which has not been registered.
public static final int	<i>AUTHENTICATION_ERROR</i> on page 76	Error while authenticating user.
public static final int	<i>BTX_UPLOAD_ERROR</i> on page 76	E2E BTX upload error.
public static final int	<i>CacheGenericErrorCode</i> on page 76	Asynchronous user registration listener not registered with UserManager.

Modifier and Type	Variable	Description
public static final int	<i>CAPTCHA_LISTENER_NULL</i> on page 76	Captcha listener is null.
public static final int	<i>CLASS_INITIALIZATION_FAILED</i> on page 76	Class initialization failed.
public static final int	<i>E2E_NOT_STARTED</i> on page 76	E2E Not started.
public static final int	<i>EMPTY_RESPONSE_FROM_SERVER</i> on page 76	Empty response string received from server.
public static final int	<i>HTTP_ERROR</i> on page 77	HTTP error.
public static final int	<i>INVALID_MODULE_ID</i> on page 77	Invalid module handle ID.
public static final int	<i>JSON_PARSING_FAILED</i> on page 77	Internal error, JSON parsing has failed.
public static final int	<i>NETWORK_ERROR</i> on page 77	Network error: Obtained when the URL is unreachable.
public static final int	<i>PARSE_ERROR</i> on page 77	Parse error.
public static final int	<i>REGISTRATION_FAILED_UNKNOWN_ERROR</i> on page 77	User registration timed out.
public static final int	<i>SINGLETON_INITIALIZATION_FAILED</i> on page 78	singleton Initialization failed
public static final int	<i>SUP_INTERNAL_PARSING_ERROR</i> on page 78	SUP Internal Parsing Error.
public static final int	<i>UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS</i> on page 78	Update Settings consists of one or more read only fields.

### Constructors

Modifier and Type	Constructor	Description
public	<i>CacheException(int)</i> on page 74	Constructs a SMPException with specified error code.

Modifier and Type	Constructor	Description
public	<i>CacheException(String)</i> on page 74	Constructs a SMPEException with specified error message.
public	<i>CacheException(int, String)</i> on page 74	Constructs a SMPEException with specified error code and error message.

### Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 75	Returns the error code of this SMPEException.
public String	<i>toString()</i> on page 75	Returns the complete error description of this SMPEException.

#### *CacheException(int) constructor*

Constructs a SMPEException with specified error code.

#### *Syntax*

```
public CacheException ( int errorCode )
```

#### *Parameters*

- **errorCode** –

#### *CacheException(String) constructor*

Constructs a SMPEException with specified error message.

#### *Syntax*

```
public CacheException ( String message )
```

#### *Parameters*

- **message** – - error message

#### *CacheException(int, String) constructor*

Constructs a SMPEException with specified error code and error message.

#### *Syntax*

```
public CacheException ( int errorCode , String message )
```

*Parameters*

- **errorCode** –
- **message** – - error message

*getErrorCode() method*

Returns the error code of this SMPEXception.

*Syntax*

```
public int getErrorCode ()
```

*toString() method*

Returns the complete error description of this SMPEXception.

*Syntax*

```
public String toString ()
```

*ANY\_INPUT\_FIELD\_NULL variable*

Any of the input fields passed is null.

*Syntax*

```
public static final int ANY_INPUT_FIELD_NULL
```

*APPLICATION\_ID\_NULL variable*

Application is not initialized.

*Syntax*

```
public static final int APPLICATION_ID_NULL
```

*APPLICATION\_USER\_ALREADY\_REGISTERED variable*

Attempt to register an application user which is already registered.

*Syntax*

```
public static final int APPLICATION_USER_ALREADY_REGISTERED
```

*APPLICATION\_USER\_NOT\_REGISTERED variable*

Attempt to delete the user which has not been registered.

*Syntax*

```
public static final int APPLICATION_USER_NOT_REGISTERED
```

*AUTHENTICATION\_ERROR variable*

Error while authenticating user.

*Syntax*

```
public static final int AUTHENTICATION_ERROR
```

*BTX\_UPLOAD\_ERROR variable*

E2E BTX upload error.

*Syntax*

```
public static final int BTX_UPLOAD_ERROR
```

*CacheGenericErrorCode variable*

Asynchronous user registration listener not registered with UserManager.

*Syntax*

```
public static final int CacheGenericErrorCode
```

*CAPTCHA\_LISTENER\_NULL variable*

Captcha listener is null.

*Syntax*

```
public static final int CAPTCHA_LISTENER_NULL
```

*CLASS\_INITIALIZATION\_FAILED variable*

Class initialization failed.

*Syntax*

```
public static final int CLASS_INITIALIZATION_FAILED
```

*E2E\_NOT\_STARTED variable*

E2E Not started.

*Syntax*

```
public static final int E2E_NOT_STARTED
```

*EMPTY\_RESPONSE\_FROM\_SERVER variable*

Empty response string received from server.

*Syntax*

```
public static final int EMPTY_RESPONSE_FROM_SERVER
```

*HTTP\_ERROR variable*

HTTP error.

*Syntax*

```
public static final int HTTP_ERROR
```

*INVALID\_MODULE\_ID variable*

Invalid module handle ID.

*Syntax*

```
public static final int INVALID_MODULE_ID
```

*JSON\_PARSING\_FAILED variable*

Internal error, JSON parsing has failed.

*Syntax*

```
public static final int JSON_PARSING_FAILED
```

*NETWORK\_ERROR variable*

Network error: Obtained when the URL is unreachable.

*Syntax*

```
public static final int NETWORK_ERROR
```

*Usage*

Check AndroidManifest.xml if it has proper permissions.

*PARSE\_ERROR variable*

Parse error.

*Syntax*

```
public static final int PARSE_ERROR
```

*REGISTRATION\_FAILED\_UNKNOWN\_ERROR variable*

User registration timed out.

*Syntax*

```
public static final int REGISTRATION_FAILED_UNKNOWN_ERROR
```

*SINGLETON\_INITIALIZATION\_FAILED* variable  
 singleton Initialization failed

**Syntax**

```
public static final int SINGLETON_INITIALIZATION_FAILED
```

*SUP\_INTERNAL\_PARSING\_ERROR* variable  
 SUP Internal Parsing Error.

**Syntax**

```
public static final int SUP_INTERNAL_PARSING_ERROR
```

*UPDATE\_SETTINGS\_CONTAINS\_READONLY\_FIELDS* variable  
 Update Settings consists of one or more read only fields.

**Syntax**

```
public static final int  

UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS
```

*CacheUpdateListener* class

**Syntax**

```
public class CacheUpdateListener
```

**Members**

All members of CacheUpdateListener, including inherited members. **Nested interfaces**

Modifier and Type	Interface	Description
public interface	<i>ICacheUpdateListener</i> on page 78	Interface to get the any updates on Server Cache.

*CacheUpdateListener.ICacheUpdateListener* interface  
 Interface to get the any updates on Server Cache.

**Syntax**

```
public interface ICacheUpdateListener
```

**Members**

All members of ICacheUpdateListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>OnCacheUpdate(String, List&lt; IODataEntry &gt;)</i> on page 79	Call back method upon update on Server cache after Merge Cache.

### *OnCacheUpdate(String, List< IODataEntry >)* method

Call back method upon update on Server cache after Merge Cache.

#### Syntax

```
public void OnCacheUpdate (String URLKEY, List< IODataEntry >
Entries )
```

#### Parameters

- **URLKey** – Call back for the respective URLKey on which the merge was initiated.
- **Entries** – This returns null,(Required for future references)

```
Class CacheupdateListener implements ICacheUpdateListener {
    public void OnCacheUpadte(String URLKEY, List<IODataEntry>
Entries) {
        Log.i("OnCacheUpdate", URLKEY);
    }
}
cacheupdateListener cacheUpdateListener = new
cacheupdateListener();
cache.setCacheListener(cacheUpdateListener);
```

### *ClientConnection class*

#### Syntax

```
public class ClientConnection extends ISDMNetListener,
INetListener
```

#### Members

All members of ClientConnection, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ClientConnection(Context, String, String, String, SDMRequestManager)</i> on page 81	Initialize the client connection with application context, application name, domain,security configuration and request manager.

Modifier and Type	Constructor	Description
public	<i>ClientConnection(Context, String, String, String, RequestManager)</i> on page 82	Initialize the client connection with application context, application name, domain, security configuration and request manager.

### Methods

Modifier and Type	Method	Description
public String	<i>getApplicationID()</i> on page 83	Return Application ID.
public RequestManager	<i>getDefaultRequestManager()</i> on page 83	
public String	<i>getDomain()</i> on page 83	Return Domain.
public SDMRequestManager	<i>getRequestManager()</i> on page 83	Return Request Manager object.
public String	<i>getSecurityConfig()</i> on page 83	Return Security Configuration.
public String	<i>getServerHost()</i> on page 84	Return Server host.
public void	<i>onError(IRequest, IResponse, IRequestStateElement)</i> on page 84	Request library uses this method in case of error/failure scenario during a request operation.
public void	<i>onSuccess(IRequest, IResponse)</i> on page 84	Request library uses this method in case of successful request.
public void	<i>setApplicationConnectionID(String)</i> on page 85	Set the application connection ID.
public void	<i>setConnectionProfile(String)</i> on page 85	Set the URL of the server.
public void	<i>setConnectionProfile(boolean, String, String, String, String)</i> on page 86	Set the value of host and port for the connection.
public void	<i>setDefaultRequestManager(RequestManager)</i> on page 86	

Modifier and Type	Method	Description
public void	<i>setTraceLevel(int)</i> on page 86	Set the end to end trace level.
public void	<i>startTrace()</i> on page 87	Start the end to end tracing.
public void	<i>stopTrace()</i> on page 87	Stop the end to end tracing.
public void	<i>uploadTrace()</i> on page 87	Upload the BTX file to solution manager for end to end tracing.

*ClientConnection(Context, String, String, String, SDMRequestManager) constructor*  
Initialize the client connection with application context, application name, domain, security configuration and request manager.

### Syntax

```
public ClientConnection (Context context , String appID , String
Domain , String securityConfig , SDMRequestManager requestManager )
```

### Parameters

- **context** – Application context.
- **appID** – Application ID.
- **Domain** – Domain name.
- **securityConfig** – Security configuration of the application.
- **requestManager** – Instance of SDMRequestManager.

```

        public static SDMLogger logger;
        public static SDMPreferences pref;
        public static SDMConnectivityParameters param;
        public static SDMRequestManager reqMan;
        logger = new SDMLogger();
        pref = new SDMPreferences (getApplicationContext,
logger);
pref.setBooleanPreference (ISDMPreferences.SDM_PERSISTENCE_SECUREMOD
E, false);
pref.setIntPreference (ISDMPreferences.SDM_CONNECTIVITY_HTTPS_PORT,
443);
pref.setIntPreference (ISDMPreferences.SDM_CONNECTIVITY_CONNTIMEOUT,
70000);
pref.setIntPreference (ISDMPreferences.SDM_CONNECTIVITY_SCONNTIMEOUT
, 70000);
        param = new
SDMConnectivityParameters ();
        param.setUserName (<username>);
        param.setUserPassword (<password>);
```

```
        reqMan = new SDMRequestManager(logger, pref,
param, 1);

        ClientConnection clientConnection = new
ClientConnection(getApplicationContext(), <Application id>="",
<Domain>, <SecurityConfig>, <RequestManager object>="");
```

### Usage

Note: Setting username and password in requestManager as part of param is mandatory.

### *ClientConnection(Context, String, String, String, RequestManager) constructor*

Initialize the client connection with application context, application name, domain, security configuration and request manager.

### Syntax

```
public ClientConnection (Context context , String appID , String
Domain , String securityConfig , RequestManager requestManager )
```

### Parameters

- **context** – Application context.
- **appID** – Application ID.
- **Domain** – Domain name.
- **securityConfig** – Security configuration of the application.
- **requestManager** – Instance of RequestManager.

```
        public static Logger logger;
        public static Preferences pref;
        public static ConnectivityParameters param;
        public static RequestManager reqMan;
        logger = new Logger();
        pref = new Preferences(getApplicationContext,
logger);

        pref.setBooleanPreference(IPreferences.PERSISTENCE_SECUREMODE,
false);

        pref.setIntPreference(IPreferences.CONNECTIVITY_HTTPS_PORT, 443);

        pref.setIntPreference(IPreferences.CONNECTIVITY_CONNTIMEOUT,
70000);

        pref.setIntPreference(IPreferences.CONNECTIVITY_SCONNTIMEOUT,
70000);

        param = new ConnectivityParameters();
        param.setUserName(<username>);
        param.setUserPassword(<password>);
        reqMan = new RequestManager(logger, pref, param,
1);

        ClientConnection clientConnection = new
```

```
ClientConnection(getApplicationContext(), <Application id>="",
<Domain>, <SecurityConfig>, <RequestManager object>="");
```

### Usage

Note: Setting username and password in requestManager as part of param is mandatory.

### *getApplicationID() method*

Return Application ID.

### Syntax

```
public String getApplicationID ()
```

```
clientConnection.getApplicationID();
```

### *getDefaultRequestManager() method*

### Syntax

```
public RequestManager getDefaultRequestManager ()
```

### *getDomain() method*

Return Domain.

### Syntax

```
public String getDomain ()
```

```
clientConnection.getDomain();
```

### *getRequestManager() method*

Return Request Manager object.

### Syntax

```
public SDMRequestManager getRequestManager ()
```

```
clientConnection.getRequestManager();
```

### *getSecurityConfig() method*

Return Security Configuration.

### Syntax

```
public String getSecurityConfig ()
```

```
clientConnection.getSecurityConfig();
```

### *getServerHost() method*

Return Server host.

#### *Syntax*

```
public String getServerHost ()  
clientConnection.getServerHost ();
```

### *onError(IRequest, IResponse, IRequestStateElement) method*

Request library uses this method in case of error/failure scenario during a request operation.

#### *Syntax*

```
public void onError ( IRequest aRequest , IResponse aResponse ,  
IRequestStateElement aRequestStateElement )
```

#### *Parameters*

- **aRequest** – the request object.
- **aResponse** – the response object.
- **aRequestStateElement** – the RequestStateElement object.

#### *Returns*

None

```
public class Activity implements INetListener { ... public void onError(IRequest arg0,  
IResponse arg1, IRequestStateElement arg2) {  
arg1.getStatusLine().toString()  
arg2.getErrorCode(); } ...}
```

#### *Usage*

The listener registered for the request receives the request object, the HttpResponseMessage object which contains the details about the server response, and a RequestStateElement object which provides more details about the occurred error. In case, the error occurs before sending any request to the server, the HttpResponseMessage object will be null.

### *onSuccess(IRequest, IResponse) method*

Request library uses this method in case of successful request.

#### *Syntax*

```
public void onSuccess ( IRequest aRequest , IResponse aResponse )
```

#### *Parameters*

- **aRequest** – the request object.

- **aResponse** – the response object.

### Returns

None

```
public class Activity implements INetListener { .... public void onSuccess(IRequest arg0,
IResponse arg1) {
HttpEntity resp = arg1.getEntity();
String response="";
response = EntityUtils.toString(resp); //process the response }...}
```

### Usage

The listener receives the request in form of parameter and an HttpResponse object containing all the details about the server response.

### *setApplicationConnectionID(String) method*

Set the application connection ID.

### Syntax

```
public void setApplicationConnectionID (String appConID)
```

### Parameters

- **appConID** – Application connection ID.

```
clientConnection.setApplicationConnectionID ("myAppConID");
```

### Usage

If it is set before invoking userManager.register() interface, the user is registered using this application connection ID.

### *setConnectionProfile(String) method*

Set the URL of the server.

### Syntax

```
public void setConnectionProfile (String url)
```

### Parameters

- **url** – URL of the server.

```
clientConnection.setConnectionProfile ("http://
<Host> : <port> &quot;);
```

### *setConnectionProfile(boolean, String, String, String, String) method*

Set the value of host and port for the connection.

#### *Syntax*

```
public void setConnectionProfile (boolean isHttpRequest , String host , String port , String relayserverURLTemplate , String farmID )
```

#### *Parameters*

- **isHttpRequest** –
  - whether HTTP or HTTPS
- **host** –
  - host of the server
- **port** –
  - port of the server
- **relayserverURLTemplate** – URL Template of Relay server
- **farmID** – Farm ID of the relay server

```
clientConnection.setConnectionProfile(true,<Host>,<port>, <Relay server URL template>, <Relay server Farm Id>);
```

### *setDefaultRequestManager(RequestManager) method*

#### *Syntax*

```
public void setDefaultRequestManager ( RequestManager defaultRequestManager )
```

### *setTraceLevel(int) method*

Set the end to end trace level.

#### *Syntax*

```
public void setTraceLevel ( int level )
```

#### *Parameters*

- **level** – Trace level defined in PropertyID class. It includes: TrcLvl\_HIGH, TrcLvl\_MEDIUM, TrcLvl\_LOW and TrcLvl\_NONE.

```
clientConnection.setTraceLevel (PropertyID.TrcLvl_HIGH);
```

***startTrace() method***

Start the end to end tracing.

***Syntax***

```
public void startTrace ()
clientConnection.startTrace();
```

***stopTrace() method***

Stop the end to end tracing.

***Syntax***

```
public void stopTrace () throws SMPEXception
```

SMPEXception class

```
clientConnection.stopTrace();
```

***uploadTrace() method***

Upload the BTX file to solution manager for end to end tracing.

***Syntax***

```
public void uploadTrace () throws SMPEXception
```

***Exceptions***

- **SMPEXception class** –

```
clientConnection.uploadTrace();
```

***ConnectivityParameters class******Syntax***

```
public class ConnectivityParameters extends
IConnectivityParameters
```

***Members***

All members of ConnectivityParameters, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static boolean	<i>autoredirectenabled</i> on page 93	
Certificate	<i>certificate</i> on page 93	
public static Boolean	<i>isXcsrfEnabled</i> on page 93	

**Methods**

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 89	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 89	Returns the base URL for the requests.
public Certificate[]	<i>getCertificate()</i> on page 89	
public String	<i>getLanguage()</i> on page 90	Returns the language setting.
public final TrustManager[]	<i>getTrustManagers()</i> on page 90	Returns an array of TrustManager instances.
public String	<i>getUserName()</i> on page 90	Returns the username.
public String	<i>getUserPassword()</i> on page 91	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 91	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 91	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 91	Sets the base URL for requests.
public void	<i>setCertificate(Certificate[])</i> on page 92	
public void	<i>setLanguage(final String)</i> on page 92	
public void	<i>setServerCertificate(Certificate[])</i> on page 92	
public void	<i>setServerCertificate(Certificate)</i> on page 92	
public void	<i>setUserName(String)</i> on page 92	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 92	Sets the password.

### Inherited members from IConnectivityParameters

Modifier and Type	Member	Description
public void	<i>setLanguage(String)</i> on page 123	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 123	Sets the server certificate array.
public void	<i>setServerCertificate(final Certificate)</i> on page 124	Sets a single server certificate.

***enableXsrf(Boolean) method***

Sets the XSRFEnabled flag.

***Syntax***

```
public void enableXsrf ( Boolean isXsrfEnabled )
```

***Parameters***

- **isXsrfEnabled** – the boolean to set.

***Returns***

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.enableXsrf(isXsrfEnabled);
```

***getBaseUrl() method***

Returns the base URL for the requests.

***Syntax***

```
public String getBaseUrl ()
```

***Parameters***

- **None** –

***Returns***

the base URL for the requests.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getBaseUrl();
```

***getCertificate() method******Syntax***

```
public Certificate[] getCertificate ()
```

### *getLanguage() method*

Returns the language setting.

#### *Syntax*

```
public String getLanguage ()
```

#### *Parameters*

- **None** –

#### *Returns*

the language setting

```
ConnectivityParameters param = new ConnectivityParameters(); param.getLanguage();
```

### *getTrustManagers() method*

Returns an array of TrustManager instances.

#### *Syntax*

```
public final TrustManager[] getTrustManagers ()
```

#### *Parameters*

- **None** –

#### *Returns*

the array

```
ConnectivityParameters param = new ConnectivityParameters(); param.getTrustManagers();
```

### *getUserName() method*

Returns the username.

#### *Syntax*

```
public String getUserName ()
```

#### *Parameters*

- **None** –

#### *Returns*

the user name.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserName();
```

*getUserPassword() method*

Returns the password.

*Syntax*

```
public String getUserPassword ()
```

*Parameters*

- **None** –

*Returns*

the password.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserPassword();
```

*isAutoRedirectEnabled() method*

Returns whether auto redirect is enabled.

*Syntax*

```
public boolean isAutoRedirectEnabled ()
```

*setAutoRedirectEnabled(boolean) method*

Enables or disables auto redirect.

*Syntax*

```
public void setAutoRedirectEnabled ( boolean paramboolean )
```

*Parameters*

- **paramboolean** – the boolean to set

*setBaseUrl(String) method*

Sets the base URL for requests.

*Syntax*

```
public void setBaseUrl ( String baseUrl )
```

*Parameters*

- **baseUrl** – The base URL for the requests.

*Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setBaseUrl(baseUrl);
```

### *setCertificate(Certificate[]) method*

#### *Syntax*

```
public void setCertificate ( Certificate[] certificate )
```

### *setLanguage(final String) method*

#### *Syntax*

```
public void setLanguage ( final String language )
```

### *setServerCertificate(Certificate[]) method*

#### *Syntax*

```
public void setServerCertificate ( Certificate[] certificate ) throws  
KeyStoreException
```

### *setServerCertificate(Certificate) method*

#### *Syntax*

```
public void setServerCertificate ( Certificate arg0 )
```

### *setUserName(String) method*

Sets the username which must be used during authentication.

#### *Syntax*

```
public void setUserName ( String aUserName )
```

#### *Parameters*

- **aUserName** – the user name to set.

#### *Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();  
param.setUserName(aUserName);
```

### *setUserPassword(String) method*

Sets the password.

#### *Syntax*

```
public void setUserPassword ( String aPassword )
```

*Parameters*

- **aPassword** – the password to set.

*Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setUserPassword(aPassword);
```

*autoredirectenabled variable**Syntax*

```
public static boolean autoredirectenabled
```

*certificate variable**Syntax*

```
Certificate certificate
```

*isXcsrfEnabled variable**Syntax*

```
public static Boolean isXcsrfEnabled
```

*Constants interface**Syntax*

```
public interface Constants
```

*Derived classes*

- *Preferences* on page 969

*Members*

All members of Constants, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final boolean	<i>DEFAULT_BUSINESS_TRANSACTION_ENABLED</i> on page 95	SAP Business Transaction XML enablement default setting.
public static final String	<i>DEFAULT_CIPHER_TRANSFORMATION</i> on page 95	Default cipher transformation.

Modifier and Type	Variable	Description
public static final int	<i>DEFAULT_CONNECTION_TIMEOUT</i> on page 95	Default connection timeout.
public static final String	<i>DEFAULT_HANDLER_CLASS_NAME</i> on page 96	Default handler class.
public static final int	<i>DEFAULT_HTTP_PORT</i> on page 96	Default HTTP port.
public static final int	<i>DEFAULT_HTTPS_PORT</i> on page 96	Default HTTPS port.
public static final int	<i>DEFAULT_LOG_LEVEL</i> on page 96	Default log level.
public static final boolean	<i>DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE</i> on page 96	Default security mode.
public static final int	<i>DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 96	Default buffer size.
public static final String	<i>DEFAULT_PROXY_HOST</i> on page 96	Default proxy host.
public static final int	<i>DEFAULT_PROXY_PORT</i> on page 97	Default proxy port.
public static final String	<i>DEFAULT_SAP_APPLICATIONID_HEADER_VALUE</i> on page 97	Default application ID.
public static final boolean	<i>DEFAULT_SAPPASSPORT_ENABLED</i> on page 97	SAP Passport enablement default setting.
public static final int	<i>DEFAULT_SEARCH_LIMIT</i> on page 97	Default for maximum search results retrieved from cache.
public static final int	<i>DEFAULT_SOCKET_CONNECTION_TIMEOUT</i> on page 97	Default socket connection timeout.

Modifier and Type	Variable	Description
public static final int	<i>DEFAULT_STORE_CAPACITY</i> on page 97	Default cache capacity.
public static final String	<i>HTTP_HANDLER_CLASS</i> on page 97	Socket Connection handler class.
public static final String	<i>IMO_HANDLER_CLASS</i> on page 98	IMO Connection handler class.
public static final int	<i>MAX_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 98	Maximum buffer size.
public static final int	<i>MAXIMUM_STORE_CAPACITY</i> on page 98	Maximum cache capacity.
public static final int	<i>MIN_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 98	Minimum buffer size.
public static final String	<i>SHARED_PREFERENCES</i> on page 98	Shared preferences.

*DEFAULT\_BUSINESSTRANSACTION\_ENABLED* variable  
SAP Business Transaction XML enablement default setting.

**Syntax**

```
public static final boolean
DEFAULT_BUSINESSTRANSACTION_ENABLED
```

*DEFAULT\_CIPHER\_TRANSFORMATION* variable  
Default cipher transformation.

**Syntax**

```
public static final String DEFAULT_CIPHER_TRANSFORMATION
```

*DEFAULT\_CONNECTION\_TIMEOUT* variable  
Default connection timeout.

**Syntax**

```
public static final int DEFAULT_CONNECTION_TIMEOUT
```

*DEFAULT\_HANDLER\_CLASS\_NAME variable*

Default handler class.

*Syntax*

```
public static final String DEFAULT_HANDLER_CLASS_NAME
```

*DEFAULT\_HTTP\_PORT variable*

Default HTTP port.

*Syntax*

```
public static final int DEFAULT_HTTP_PORT
```

*DEFAULT\_HTTPS\_PORT variable*

Default HTTPS port.

*Syntax*

```
public static final int DEFAULT_HTTPS_PORT
```

*DEFAULT\_LOG\_LEVEL variable*

Default log level.

*Syntax*

```
public static final int DEFAULT_LOG_LEVEL
```

*DEFAULT\_PERSISTENCE\_BOOLEAN\_SECUREMODE variable*

Default security mode.

*Syntax*

```
public static final boolean  
DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE
```

*DEFAULT\_PERSISTENCE\_BYTE\_BUFFER\_SIZE variable*

Default buffer size.

*Syntax*

```
public static final int DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE
```

*DEFAULT\_PROXY\_HOST variable*

Default proxy host.

*Syntax*

```
public static final String DEFAULT_PROXY_HOST
```

***DEFAULT\_PROXY\_PORT variable***

Default proxy port.

***Syntax***

```
public static final int DEFAULT_PROXY_PORT
```

***DEFAULT\_SAP\_APPLICATIONID\_HEADER\_VALUE variable***

Default application ID.

***Syntax***

```
public static final String
DEFAULT_SAP_APPLICATIONID_HEADER_VALUE
```

***DEFAULT\_SAPPASSPORT\_ENABLED variable***

SAP Passport enablement default setting.

***Syntax***

```
public static final boolean DEFAULT_SAPPASSPORT_ENABLED
```

***DEFAULT\_SEARCH\_LIMIT variable***

Default for maximum search results retrieved from cache.

***Syntax***

```
public static final int DEFAULT_SEARCH_LIMIT
```

***DEFAULT\_SOCKET\_CONNECTION\_TIMEOUT variable***

Default socket connection timeout.

***Syntax***

```
public static final int DEFAULT_SOCKET_CONNECTION_TIMEOUT
```

***DEFAULT\_STORE\_CAPACITY variable***

Default cache capacity.

***Syntax***

```
public static final int DEFAULT_STORE_CAPACITY
```

***HTTP\_HANDLER\_CLASS variable***

Socket Connection handler class.

***Syntax***

```
public static final String HTTP_HANDLER_CLASS
```

*IMO\_HANDLER\_CLASS* variable

IMO Connection handler class.

*Syntax*

```
public static final String IMO_HANDLER_CLASS
```

*MAX\_PERSISTENCE\_BYTE\_BUFFER\_SIZE* variable

Maximum buffer size.

*Syntax*

```
public static final int MAX_PERSISTENCE_BYTE_BUFFER_SIZE
```

*MAXIMUM\_STORE\_CAPACITY* variable

Maximum cache capacity.

*Syntax*

```
public static final int MAXIMUM_STORE_CAPACITY
```

*MIN\_PERSISTENCE\_BYTE\_BUFFER\_SIZE* variable

Minimum buffer size.

*Syntax*

```
public static final int MIN_PERSISTENCE_BYTE_BUFFER_SIZE
```

*SHARED\_PREFERENCES* variable

Shared preferences.

*Syntax*

```
public static final String SHARED_PREFERENCES
```

*DeltaLinkHandler* class

*Syntax*

```
public class DeltaLinkHandler
```

*Members*

All members of DeltaLinkHandler, including inherited members. **Methods**

Modifier and Type	Method	Description
public static void	<i>handle(IRequest, ILogger, IPreferences)</i> on page 99	

*handle(IRequest, ILogger, IPreferences) method*

**Syntax**

```
public static void handle ( IRequest request , ILogger mLogger ,
IPreferences mPreferences )
```

**EncryptionKeyManager class**

Consists of the methods related to Encryptoin key required for SQL Cipher Encryption.

**Syntax**

```
public class EncryptionKeyManager
```

**Members**

All members of EncryptionKeyManager, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static String	<i>encryptionKey</i> on page 101	

**Methods**

Modifier and Type	Method	Description
public static String	<i>getEncryptionKey(Context)</i> on page 99	Returns the Encryption key,Generates unique 128 bit encryption for first time,and subsequent call returns the key set by setEncryptionKey API .
public static String	<i>resetEncryptionKey(Context)</i> on page 100	This API reset the encryption key along with clearing all the cache and Queued offline requests and returns the new generated unique 128 bit key.
public static void	<i>setEncryptionKey(String, Context)</i> on page 100	Set the Encryption key,Expected to be set to null before Application goes to background.

**getEncryptionKey(Context) method**

Returns the Encryption key,Generates unique 128 bit encryption for first time,and subsequent call returns the key set by setEncryptionKey API .

**Syntax**

```
public static String getEncryptionKey ( Context context ) throws
PersistenceException
```

### *Parameters*

- **Context:** – Application Context.

### *Returns*

key: returns the Encryption key,Generates unique 128 bit encryption.

```
EncryptionKeyManager.getEncryptionKey(getApplicaitonContext());
```

### *Usage*

Application if not using MAFLogonComponent is expected to securely persist this key across application Life Cycle using data vault.

### *resetEncryptionKey(Context) method*

This API reset the encryption key along with clearing all the cache and Queued offline requests and returns the new generated unique 128 bit key.

### *Syntax*

```
public static String resetEncryptionKey ( Context context ) throws PersistenceException
```

### *Parameters*

- **Context:** – Application Context.

### *Returns*

key: returns the Encryption key,Generates unique 128 bit encryption.

```
EncryptionKeyManager.resetEncryptionKey(getApplicaitonContext());
```

### *setEncryptionKey(String, Context) method*

Set the Encryption key,Expected to be set to null before Application goes to background.

### *Syntax*

```
public static void setEncryptionKey ( String Key , Context context ) throws PersistenceException
```

### *Parameters*

- **key:** – This is the key which is generated by getEncryptionKey and same key must be set every time application is opened or brought to foreground.
- **Context:** – Application Context.

```
EncryptionKeyManager.setEncryptionKey("encryptionkey",getApplicaitonContext());
```

*Usage*

And must be set with Key which is generated using `getEncryptionkey` on Application.

*encryptionKey variable**Syntax*

```
protected static String encryptionKey
```

*HttpChannelListeners class**Syntax*

```
public class HttpChannelListeners
```

*Members*

All members of `HttpChannelListeners`, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>Authenticationschema</i> on page 101	
public class	<i>BasicCredetials</i> on page 103	
public class	<i>CookieCredetials</i> on page 104	

**Nested interfaces**

Modifier and Type	Interface	Description
public interface	<i>IAuthenticationChallengeList-</i> <i>ner</i> on page 104	
public interface	<i>ICredential</i> on page 105	
public interface	<i>IMutualSSLChallengeListener</i> on page 105	
public interface	<i>ISSLChallengeListener</i> on page 106	

*HttpChannelListeners.Authenticationschema class**Syntax*

```
public class Authenticationschema
```

*Members*

All members of `Authenticationschema`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public String	<i>realm</i> on page 102	
public String	<i>schemaName</i> on page 102	

**Methods**

Modifier and Type	Method	Description
public String	<i>getRealm()</i> on page 102	
public String	<i>getSchemeName()</i> on page 102	
public void	<i>processChallenge(ICredential, IRequest)</i> on page 102	

*getRealm() method***Syntax**

```
public String getRealm ()
```

*getSchemeName() method***Syntax**

```
public String getSchemeName ()
```

*processChallenge(ICredential, IRequest) method***Syntax**

```
public void processChallenge ( ICredential credentials , IRequest request )
```

*realm variable***Syntax**

```
public String realm
```

*schemaName variable***Syntax**

```
public String schemaName
```

*HttpChannelListeners.BasicCredetials class***Syntax**

```
public class BasicCredetials extends ICredential
```

**Members**

All members of **BasicCredetials**, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static String	<i>passwd</i> on page 103	
public static String	<i>uName</i> on page 103	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>BasicCredetials(String, String)</i> on page 103	

**Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 103	

*BasicCredetials(String, String) constructor***Syntax**

```
public BasicCredetials (String username , String pwd)
```

*getAuthHeader() method***Syntax**

```
public Map< String, Object > getAuthHeader ()
```

*passwd variable***Syntax**

```
public static String passwd
```

*uName variable***Syntax**

```
public static String uName
```

*HttpChannelListeners.CookieCredetials class**Syntax*

```
public class CookieCredetials extends ICredential
```

*Members*

All members of *CookieCredetials*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static Cookie	<i>cookieValue</i> on page 104	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>CookieCredetials(Cookie)</i> on page 104	

**Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 104	

*CookieCredetials(Cookie) constructor**Syntax*

```
public CookieCredetials ( Cookie cookie )
```

*getAuthHeader() method**Syntax*

```
public Map< String, Object > getAuthHeader ()
```

*cookieValue variable**Syntax*

```
protected static Cookie cookieValue
```

*HttpChannelListeners.IAuthenticationChallengeListner interface**Syntax*

```
public interface IAuthenticationChallengeListner
```

*Derived classes*

- *AuthenticationChallengeListener* on page 996

*Members*

All members of *IAuthenticationChallengeListner*, including inherited members. **Methods**

Modifier and Type	Method	Description
public ICredential	<i>OnAuthenticationFailed(Authenticationschema, HttpResponse)</i> on page 105	

*OnAuthenticationFailed(Authenticationschema, HttpResponse)* method

*Syntax*

```
public ICredential OnAuthenticationFailed
( Authenticationschema authScheme , HttpResponse response )
```

*HttpChannelListeners.ICredential interface**Syntax*

```
public interface ICredential
```

*Derived classes*

- *BasicCredetials* on page 103
- *CookieCredetials* on page 104

*Members*

All members of *ICredential*, including inherited members. **Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 105	

*getAuthHeader()* method

*Syntax*

```
public Map< String, Object > getAuthHeader ()
```

*HttpChannelListeners.IMutualSSLChallengeListener interface**Syntax*

```
public interface IMutualSSLChallengeListener
```

*Members*

All members of `IMutualSSLChallengeListener`, including inherited members. **Methods**

Modifier and Type	Method	Description
public <code>HttpClientCertInfo</code>	<i>getClientCertificate()</i> on page 106	

*getClientCertificate() method**Syntax*

```
public HttpClientCertInfo getClientCertificate ()
```

*HttpChannelListeners.ISSLChallengeListener interface**Syntax*

```
public interface ISSLChallengeListener
```

*Members*

All members of `ISSLChallengeListener`, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>isServerTrusted(X509Certificate[])</i> on page 106	

*isServerTrusted(X509Certificate[]) method**Syntax*

```
public boolean isServerTrusted ( X509Certificate[]
paramArrayOfX509Certificate )
```

*IBundleRequest interface*

Consists of interface for request bundle.

*Syntax*

```
public interface IBundleRequest
```

*Derived classes*

- *BundleRequest* on page 56

*Members*

All members of `IBundleRequest`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>addRequest(IRequest)</i> on page 107	Adds a request to the storage.
public void	<i>clearRequests()</i> on page 107	Cleans out the request storage.
public IRequest[]	<i>getRequests()</i> on page 108	Returns all the requests from the storage.
public void	<i>removeRequest(IRequest)</i> on page 108	Removes the specific request from the storage.

### *addRequest(IRequest) method*

Adds a request to the storage.

#### *Syntax*

```
public void addRequest ( IRequest request )
```

#### *Parameters*

- **request** – the request to be added.

#### *Returns*

None

```
BundleRequest bundleRequest = new BundleRequest(); BaseRequest request1 = new
BaseRequest(); BaseRequest request2 = new BaseRequest();
bundleRequest.addRequest(request1); bundleRequest.addRequest(request2);
```

#### *Usage*

NOTE! Request priority

( `com.sap.mobile.com.sap.mobile.lib.request.Request.IRequest#setPriority(int)` ) is ignored during request processing! Because requests are processed in the order they are added to the bundle, the order is considered to handle the priority.

### *clearRequests() method*

Cleans out the request storage.

#### *Syntax*

```
public void clearRequests ()
```

#### *Parameters*

- **None** –

### *Returns*

None

```
BundleRequest bundleRequest = new BundleRequest(); ... bundleRequest.clearRequests();
```

### *getRequests() method*

Returns all the requests from the storage.

### *Syntax*

```
public IRequest[] getRequests ()
```

### *Parameters*

- **None** –

### *Returns*

the array of requests.

```
BundleRequest bundleRequest = new BundleRequest();... BaseRequest[] requests=  
bundleRequest.getRequests();
```

### *removeRequest(IRequest) method*

Removes the specific request from the storage.

### *Syntax*

```
public void removeRequest ( IRequest request )
```

### *Parameters*

- **request** – the request to be removed.

### *Returns*

None

```
BundleRequest bundleRequest = new BundleRequest(); BaseRequest request1 = new  
BaseRequest(); ... bundleRequest.removeRequest(request1);
```

### *ICache interface*

### *Syntax*

```
public interface ICache
```

### *Derived classes*

- *Cache* on page 58

*Members*All members of ICache, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>DocumentType</i> on page 110	Document Format type for caching.

**Methods**

Modifier and Type	Method	Description
public String	<i>addEntry(IODataEntry)</i> on page 111	A new cache entry will be added into the local Cache using this particular method.
public void	<i>clearCache(String)</i> on page 112	This API will clear entries for the URLkey passed from all the cache except the Local cache.
public void	<i>clearLocalEntry(String)</i> on page 112	This API will clear entry from Local Cache.
public void	<i>deleteEntry(String)</i> on page 113	This API will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.
public String	<i>getDeltaLink(String)</i> on page 113	This should return the delta token/delta link for the URL key passed.
public void	<i>initializeCache()</i> on page 114	
public void	<i>mergeEntries(IODataFeed, String)</i> on page 114	Merge APIs are to be invoked after doing a HTTP GET after modification or a set of modifications.
public Object	<i>readDocument(int, String)</i> on page 115	This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.

Modifier and Type	Method	Description
public List< IODataEntry >	<i>readEntriesLocal(String, String)</i> on page 115	Gets the Entries from the Local cache based on the EntityType and the EntryID.
public List< IODataEntry >	<i>readEntriesServer(String)</i> on page 116	Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.
public void	<i>setCacheListener(ICacheUpdateListener)</i> on page 117	Sets the listener for any update on Server cache and call backs upon merging Cache.
public void	<i>setIsPersistable(boolean)</i> on page 117	This API sets the isPersistable property of the cache which is used to check if the cache is implicitly persistable.
public void	<i>storeDocument(Object, int, String)</i> on page 118	This API Caches the service document or the meta data document depending on the DocumentType and against specified URLKey.
public void	<i>updateEntry(IODataEntry)</i> on page 118	This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

*ICache.DocumentType class*

Document Format type for caching.

*Syntax*

```
public class DocumentType
```

*Members*

All members of DocumentType, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>MetaDocument</i> on page 111	

Modifier and Type	Variable	Description
public static final int	<i>ServiceDocument</i> on page 111	

### *MetaDocument variable*

#### *Syntax*

```
public static final int MetaDocument
```

### *ServiceDocument variable*

#### *Syntax*

```
public static final int ServiceDocument
```

### *addEntry(IODataEntry) method*

A new cache entry will be added into the local Cache using this particular method.

#### *Syntax*

```
public String addEntry ( IODataEntry entry ) throws CacheException
```

### *Parameters*

- **Entry** – object which is built for a new HTTP POST.

### *Exceptions*

- **CacheException class** –

```
Try{
//Fire a HTTP POST
IODataEntry entry = buildPostEntry();
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
String generated_id =cache.addEntry(entry);
PerformPostrequest(entry)//Fire HTTP POST request
}
Catch(CacheException e){
}. public void onSuccess(I Request arg0, I Response aResponse) {

ClearLocalEntry(generated_id)//on success of POST
request ,application developer clears this entry after all the Cache
instances related to this entry (filter/query all matching) are
updated from the server
}
```

### *Usage*

This method will be mostly called when the application is trying to create entries in the backend via a HTTP POST.

### *clearCache(String) method*

This API will clear entries for the URLKey passed from all the cache except the Local cache.

### *Syntax*

```
public void clearCache (String URLKey) throws CacheException
```

### *Parameters*

- **URLKey** – : will clear cache for the URL key specified.

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
cache.clearCache(URLKey);  
  
}  
Catch(CacheException e){  
}
```

### *clearLocalEntry(String) method*

This API will clear entry from Local Cache.

### *Syntax*

```
public void clearLocalEntry (String entryID) throws  
CacheException
```

### *Parameters*

- **EntryID** – from server Cache will be marked as "Deleted" and will be added in Local Cache

### *Exceptions*

- **CacheException class** –

```
Try{
```

```

ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
cache.ClearLocalEntry(EntryID);

}
Catch(CacheException e){
}

```

### *deleteEntry(String) method*

This API will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.

### *Syntax*

```
public void deleteEntry (String entryID) throws CacheException
```

### *Parameters*

- **EntryID** – from server Cache will marked as "Deleted" and will be added in Local Cache

### *Exceptions*

- **CacheException class** –

```

Try{
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);;
cache.deleteEntry(EntryID);

}
Catch(CacheException e){
}

```

### *getDeltaLink(String) method*

This should return the delta token/delta link for the URL key passed.

### *Syntax*

```
public String getDeltaLink (String URLKey) throws
CacheException
```

### *Parameters*

- **URLKey** – : will return the delta token/delta link for the URL key.

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
cache.getDeltaLink(URLKey);  
  
}  
Catch(CacheException e){  
}
```

### *initializeCache() method*

#### *Syntax*

```
public void initializeCache ()
```

### *mergeEntries(IODataFeed, String) method*

Merge APIS are to be invoked after doing a HTTP GET after modification or a set of modifications.

#### *Syntax*

```
public void mergeEntries ( IODataFeed Feed , String URLKey) throws  
CacheException
```

#### *Parameters*

- **Entries** – list of entries which will be merged into server Cache.
- **URLKey** – : Cache returns cached entries for this urlKey.

### *Exceptions*

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
IODataFeed feed = parser.parseODataFeed(responseEntity,  
collectionID, schema);  
cache.mergeEntries(feed, EntryURL);  
  
}
```

```
Catch (CacheException e) {
}
```

### Usage

Merge all the entries provided into the Server cache for the respective urlkey.

### *readDocument(int, String) method*

This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.

### Syntax

```
public Object readDocument ( int documentType , String URLKey )
throws CacheException
```

### Parameters

- **ICache.DocumentType class** – : will return specified type of document
- **UrlKey** – : will fetch document for specified urlkey.

### Exceptions

- **CacheException class** –

```
Try{
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(), logger);
IODataServiceDocument serviceDocumentObject =
(IODataServiceDocument) cache.ReadDocument (documentType.ServiceDocum
ent, serviceDocUrl);
IODataSchema metadata =
(IODataSchema) cache.readDocument (documentType.MetaDocument,
serviceDocUrl);
}
Catch (CacheException e) {
}
```

### *readEntriesLocal(String, String) method*

Gets the Entries from the Local cache based on the EntityType and the EntryID.

### Syntax

```
public List< IODataEntry > readEntriesLocal ( String entityType ,
String entryID ) throws CacheException
```

### Parameters

- **EntityType** – is the type which represents collection in ODATA.
- **EntryId** – get entries based on this entry ID.

### Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
List<I ODataEntry> entries =  
cache.readEntriesLocal("SomeCollection", "EntryID"); // return all  
entries respective to either of the parameters.  
  
}  
Catch(CacheException e){  
}
```

### Usage

The return type will be an array of Entries

### *readEntriesServer(String) method*

Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.

### Syntax

```
public List< IODataEntry > readEntriesServer (String URLKey)  
throws CacheException
```

### Parameters

- **urlkey** – :Returns cached entries for this urlKey.

### Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
List<IODataEntry> entries = cache.readEntriesServer(urlkey);  
IODataEntry entry = entries.get(0);
```

```
String Name =entry.getPropertyValue("NAME");
}
Catch(CacheException e){
}
```

### *setCacheListener(ICacheUpdateListener) method*

Sets the listener for any update on Server cache and call backs upon merging Cache.

#### *Syntax*

```
public void setCacheListener ( ICacheUpdateListener
cacheUpdateListener )
```

#### *Parameters*

- **listener** – The listener to be set for call backs upon merge cache.

```
Class CacheupdateListener implements ICacheUpdateListener {
    public void OnCacheUpadte(String URLKEY, List<IODataEntry>
Entries) {
        Log.i("OnCacheUpdate", URLKEY);
    }
}
cacheupdateListener cacheUpdateListener = new
cacheupdateListener();
cache.setCacheListener(cacheUpdateListener);
```

### *setIsPersistable(boolean) method*

This API sets the isPersistable property of the cache which is used to check if the cache is implicitly persistable.

#### *Syntax*

```
public void setIsPersistable ( boolean value ) throws
CacheException
```

#### *Parameters*

- **value** – this will persist cache in db or In-Memory, Default is in DB Store

#### *Exceptions*

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
```

```
        ICache cache =new Cache(getApplicationContext(),logger);
        cache.setIsPersistable(true);

    }
    Catch (CacheException e) {
    }
```

### *storeDocument(Object, int, String) method*

This API Caches the service document or the meta data document depending on the `DocumentType` and against specified `URLKey`.

### *Syntax*

```
public void storeDocument ( Object Document , int documentType ,
String URLKey ) throws CacheException
```

### *Parameters*

- **document** – : will return the delta token/delta link for the URL key.
- **documentType** – specify the type of document to be cached.
- **urlKey** – Cache against this urlKey

### *Exceptions*

- **CacheException class** –

```
Try{

ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
cache.storeDocument(serviceDocumentObject,
documentType.ServiceDocument, serviceDocUrl);

}
Catch (CacheException e) {
}
```

### *updateEntry(IODataEntry) method*

This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

### *Syntax*

```
public void updateEntry ( IODataEntry entry ) throws
CacheException
```

### Parameters

- **Entry** – will be marked as 'Updated' in Local cache.

### Exceptions

- **CacheException class** –

```

Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.updateEntry(OdataEntries, URLKEY);
}
Catch(CacheException e){
}

```

### *IConnectivityParameters interface*

Consists of interface used to store connectivity properties like username, password etc.

### Syntax

```
public interface IConnectivityParameters extends Serializable
```

### Derived classes

- *ConnectivityParameters* on page 87

### Members

All members of IConnectivityParameters, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 120	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 121	Returns the base URL for the requests.
public String	<i>getLanguage()</i> on page 121	Returns the language setting.
public TrustManager[]	<i>getTrustManagers()</i> on page 121	Returns an array of TrustManager instances.
public String	<i>getUserName()</i> on page 122	Returns the username.

Modifier and Type	Method	Description
public String	<i>getUserPassword()</i> on page 122	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 122	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 122	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 123	Sets the base URL for requests.
public void	<i>setLanguage(String)</i> on page 123	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 123	Sets the server certificate array.
public void	<i>setServerCertificate(final Certificate)</i> on page 124	Sets a single server certificate.
public void	<i>setUserName(String)</i> on page 124	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 124	Sets the password.

#### *enableXsrf(Boolean) method*

Sets the XSRFEnabled flag.

#### *Syntax*

```
public void enableXsrf ( Boolean isXsrfEnabled )
```

#### *Parameters*

- **isXsrfEnabled** – the boolean to set.

#### *Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.enableXsrf(isXsrfEnabled);
```

*getBaseUrl() method*

Returns the base URL for the requests.

*Syntax*

```
public String getBaseUrl ()
```

*Parameters*

- **None** –

*Returns*

the base URL for the requests.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getBaseUrl();
```

*getLanguage() method*

Returns the language setting.

*Syntax*

```
public String getLanguage ()
```

*Parameters*

- **None** –

*Returns*

the language setting

```
ConnectivityParameters param = new ConnectivityParameters(); param.getLanguage();
```

*getTrustManagers() method*

Returns an array of TrustManager instances.

*Syntax*

```
public TrustManager[] getTrustManagers ()
```

*Parameters*

- **None** –

*Returns*

the array

```
ConnectivityParameters param = new ConnectivityParameters(); param.getTrustManagers();
```

### *getUserName() method*

Returns the username.

#### *Syntax*

```
public String getUserName ()
```

#### *Parameters*

- **None** –

#### *Returns*

the user name.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserName();
```

### *getUserPassword() method*

Returns the password.

#### *Syntax*

```
public String getUserPassword ()
```

#### *Parameters*

- **None** –

#### *Returns*

the password.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserPassword();
```

### *isAutoRedirectEnabled() method*

Returns whether auto redirect is enabled.

#### *Syntax*

```
public boolean isAutoRedirectEnabled ()
```

### *setAutoRedirectEnabled(boolean) method*

Enables or disables auto redirect.

#### *Syntax*

```
public void setAutoRedirectEnabled (boolean paramboolean )
```

#### *Parameters*

- **paramboolean** – the boolean to set

*setBaseUrl(String) method*

Sets the base URL for requests.

*Syntax*

```
public void setBaseUrl ( String baseUrl )
```

*Parameters*

- **baseUrl** – The base URL for the requests.

*Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setBaseUrl(baseUrl);
```

*setLanguage(String) method*

Sets the language used in connection.

*Syntax*

```
public void setLanguage ( String language )
```

*Parameters*

- **language** – to set

*Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setLanguage(alanguage);
```

*setServerCertificate(final Certificate[]) method*

Sets the server certificate array.

*Syntax*

```
public void setServerCertificate ( final Certificate[] certificate )
throws KeyStoreException
```

*Parameters*

- **certificate** – array to set.

*Returns*

None

### *Exceptions*

- **KeyStoreException** –

```
ConnectivityParameters param = new ConnectivityParameters(); param.  
setServerCertificate(aCertificate[]);
```

### *setServerCertificate(final Certificate) method*

Sets a single server certificate.

### *Syntax*

```
public void setServerCertificate ( final Certificate certificate )
```

### *Parameters*

- **certificate** – to set

### *setUserName(String) method*

Sets the username which must be used during authentication.

### *Syntax*

```
public void setUsername ( String aUserName )
```

### *Parameters*

- **aUserName** – the user name to set.

### *Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();  
param.setUsername(aUserName);
```

### *setUserPassword(String) method*

Sets the password.

### *Syntax*

```
public void setUserPassword ( String aPassword )
```

### *Parameters*

- **aPassword** – the password to set.

### *Returns*

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setUserPassword(aPassword);
```

### *ILocalSchema interface*

#### *Syntax*

```
public interface ILocalSchema
```

#### *Derived classes*

- *ODataReturnSchema* on page 778

### *ILogger interface*

#### *Syntax*

```
public interface ILogger
```

#### *Derived classes*

- *Logger* on page 426

### *Members*

All members of ILogger, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>ASSERT</i> on page 138	Log level ASSERT.
public static final int	<i>DEBUG</i> on page 139	Log level DEBUG.
public static final int	<i>ERROR</i> on page 139	Log level ERROR.
public static final int	<i>FATAL</i> on page 139	Log level FATAL.
public static final int	<i>INFO</i> on page 139	Log level INFO.
public static final int	<i>PERFORMANCE</i> on page 139	Log level PERFORMANCE.
public static final int	<i>VERBOSE</i> on page 139	Log level VERBOSE.
public static final int	<i>WARN</i> on page 139	Log level WARN.

### **Methods**

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 128	Implementer should override this method!

Modifier and Type	Method	Description
public void	<i>d(final String, final String)</i> on page 128	Sends a DEBUG log message.
public void	<i>d(final String, final String, final String)</i> on page 128	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 129	Sends a DEBUG log message and logs the exception.
public void	<i>d(final String, final String, final Throwable, final String)</i> on page 129	Sends a DEBUG log message and logs the exception.
public void	<i>e(final String, final String)</i> on page 129	Sends an ERROR log message.
public void	<i>e(final String, final String, final String)</i> on page 130	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable)</i> on page 130	Sends an ERROR log message and logs the exception.
public void	<i>e(final String, final String, final Throwable, final String)</i> on page 131	Sends an ERROR log message and logs the exception.
public int	<i>getLogLevel()</i> on page 131	Returns the log level.
public void	<i>i(final String, final String)</i> on page 131	Sends an INFO log message.
public void	<i>i(final String, final String, final String)</i> on page 132	Sends an INFO log message.
public void	<i>i(final String, final String, final Throwable)</i> on page 132	Sends a INFO log message and logs the exception.
public void	<i>i(final String, final String, final Throwable, final String)</i> on page 132	Sends a INFO log message and logs the exception.
public void	<i>logFullLocation(boolean)</i> on page 133	Setting to control log full location (class-path and method name).

Modifier and Type	Method	Description
public boolean	<i>logsFullLocation()</i> on page 133	To get the setting which controls log output should contain full location (class and method name) or not.
public void	<i>p(final String, final String)</i> on page 133	Sends a PERFORMANCE log message.
public void	<i>p(final String, final String, final String)</i> on page 134	Sends a PERFORMANCE log message.
public void	<i>setHeaderData(final String, final String, final String, final String, final String, final String, final String, final String)</i> on page 134	Sets the log header fields.
public void	<i>setLogLevel(final int)</i> on page 135	Set the log level.
public void	<i>v(final String, final String)</i> on page 135	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final String)</i> on page 135	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable)</i> on page 136	Sends a VERBOSE log message and logs the exception.
public void	<i>v(final String, final String, final Throwable, final String)</i> on page 136	Sends a VERBOSE log message and logs the exception.
public void	<i>w(final String, final Throwable)</i> on page 136	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final Throwable, final String)</i> on page 137	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable)</i> on page 137	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable, final String)</i> on page 137	Sends a WARN log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>w</i> (final String, final String) on page 138	Sends a WARN log message.
public void	<i>w</i> (final String, final String, final String) on page 138	Sends a WARN log message.

***canLog()* method**

Implementer should override this method!

***Syntax***

```
public boolean canLog ()
```

***Returns***

State of ability to log.

***d*(final String, final String) method**

Sends a DEBUG log message.

***Syntax***

```
public void d ( final String tag , final String msg )
```

***Parameters***

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

***Usage***

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,String)`

***d*(final String, final String, final String) method**

Sends a DEBUG log message.

***Syntax***

```
public void d ( final String tag , final String msg , final String location )
```

***Parameters***

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*d(final String, final String, final Throwable) method*

Sends a DEBUG log message and logs the exception.

*Syntax*

```
public void d ( final String tag , final String msg , final
Throwable tr )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,Throwable,String)`

*d(final String, final String, final Throwable, final String) method*

Sends a DEBUG log message and logs the exception.

*Syntax*

```
public void d ( final String tag , final String msg , final
Throwable tr , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*e(final String, final String) method*

Sends an ERROR log message.

*Syntax*

```
public void e ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,String)`

### *e(final String, final String, final String) method*

Sends an ERROR log message.

### *Syntax*

```
public void e ( final String tag , final String msg , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *e(final String, final String, final Throwable) method*

Sends an ERROR log message and logs the exception.

### *Syntax*

```
public void e ( final String tag , final String msg , final Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,Throwable,String)`

*e(final String, final String, final Throwable, final String) method*

Sends an ERROR log message and logs the exception.

*Syntax*

```
public void e ( final String tag , final String msg , final
Throwable tr , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*getLogLevel() method*

Returns the log level.

*Syntax*

```
public int getLogLevel ()
```

*Returns*

the log level.

*i(final String, final String) method*

Sends an INFO log message.

*Syntax*

```
public void i ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,String)`

### *i(final String, final String, final String) method*

Sends an INFO log message.

#### *Syntax*

```
public void i ( final String tag , final String msg , final String location )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *i(final String, final String, final Throwable) method*

Sends a INFO log message and logs the exception.

#### *Syntax*

```
public void i ( final String tag , final String msg , final Throwable tr )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,Throwable,String)`

### *i(final String, final String, final Throwable, final String) method*

Sends a INFO log message and logs the exception.

#### *Syntax*

```
public void i ( final String tag , final String msg , final Throwable tr , final String location )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

#### *logFullLocation(boolean) method*

Setting to control log full location (class-path and method name).

#### *Syntax*

```
public void logFullLocation ( boolean logFullLocation )
```

#### *Parameters*

- **logFullLocation** – log i or do not log it.

#### *logsFullLocation() method*

To get the setting which controls log output should contain full location (class and method name) or not.

#### *Syntax*

```
public boolean logsFullLocation ()
```

#### *Returns*

logging with full location or not.

#### *p(final String, final String) method*

Sends a PERFORMANCE log message.

#### *Syntax*

```
public void p ( final String tag , final String msg )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#p(String,String,String)`

*p(final String, final String, final String) method*

Sends a PERFORMANCE log message.

### Syntax

```
public void p (final String tag , final String msg , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*setHeaderData(final String, final String, final String, final String, final String, final String, final String, final String) method*

Sets the log header fields.

### Syntax

```
public void setHeaderData (final String osVersion , final String appName , final String appVersion , final String thirdParty , final String hwVersion , final String user , final String timezone , final String language , final String baseUrl )
```

### Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (Connectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (Connectivity sets it)
- **baseUrl** – the URL used in Connectivity (connectivity sets it)

### Usage

A header field is set only if it is not *null*. Also, it is set only once; subsequent calls will not overwrite the first write.

*setLogLevel(final int) method*

Set the log level.

*Syntax*

```
public void setLogLevel ( final int level )
```

*Parameters*

- **level** – the log level

*v(final String, final String) method*

Sends a VERBOSE log message.

*Syntax*

```
public void v ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,String)`

*v(final String, final String, final String) method*

Sends a VERBOSE log message.

*Syntax*

```
public void v ( final String tag , final String msg , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *v(final String, final String, final Throwable) method*

Sends a VERBOSE log message and logs the exception.

#### *Syntax*

```
public void v ( final String tag , final String msg , final  
Throwable tr )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,Throwable,String)`

### *v(final String, final String, final Throwable, final String) method*

Sends a VERBOSE log message and logs the exception.

#### *Syntax*

```
public void v ( final String tag , final String msg , final  
Throwable tr , final String location )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *w(final String, final Throwable) method*

Sends a WARN log message and logs the exception.

#### *Syntax*

```
public void w ( final String tag , final Throwable tr )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,Throwable,String)`

### *w(final String, final Throwable, final String) method*

Sends a WARN log message and logs the exception.

### *Syntax*

```
public void w ( final String tag , final Throwable tr , final
String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *w(final String, final String, final Throwable) method*

Sends a WARN log message and logs the exception.

### *Syntax*

```
public void w ( final String tag , final String msg , final
Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,Throwable,String)`

### *w(final String, final String, final Throwable, final String) method*

Sends a WARN log message and logs the exception.

### *Syntax*

```
public void w ( final String tag , final String msg , final
Throwable tr , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *w(final String, final String) method*

Sends a WARN log message.

### *Syntax*

```
public void w ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,String)`

### *w(final String, final String, final String) method*

Sends a WARN log message.

### *Syntax*

```
public void w ( final String tag , final String msg , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *ASSERT variable*

Log level ASSERT.

### *Syntax*

```
public static final int ASSERT
```

***DEBUG variable***

Log level DEBUG.

***Syntax***

```
public static final int DEBUG
```

***ERROR variable***

Log level ERROR.

***Syntax***

```
public static final int ERROR
```

***FATAL variable***

Log level FATAL.

***Syntax***

```
public static final int FATAL
```

***INFO variable***

Log level INFO.

***Syntax***

```
public static final int INFO
```

***PERFORMANCE variable***

Log level PERFORMANCE.

***Syntax***

```
public static final int PERFORMANCE
```

***VERBOSE variable***

Log level VERBOSE.

***Syntax***

```
public static final int VERBOSE
```

***WARN variable***

Log level WARN.

***Syntax***

```
public static final int WARN
```

*INetListener interface*

Consists of interface for request listener.

*Syntax*

```
public interface INetListener
```

*Derived classes*

- *AppSettings* on page 34
- *ClientConnection* on page 79
- *UserManager* on page 1023

*Members*

All members of INetListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onError(IRequest, IResponse, IRequestStateElement)</i> on page 140	Request library uses this method in case of error/failure scenario during a request operation.
public void	<i>onSuccess(IRequest, IResponse)</i> on page 141	Request library uses this method in case of successful request.

*Usage*

This interface must be implemented to get success/failure call backs for each request.

*onError(IRequest, IResponse, IRequestStateElement) method*

Request library uses this method in case of error/failure scenario during a request operation.

*Syntax*

```
public void onError ( IRequest aRequest , IResponse aResponse ,
IRequestStateElement aRequestStateElement )
```

*Parameters*

- **aRequest** – the request object.
- **aResponse** – the response object.
- **aRequestStateElement** – the RequestStateElement object.

*Returns*

None

```
public class Activity implements INetListener { ... public void onError(IRequest arg0,
IResponse arg1, IRequestStateElement arg2) {
```

```
arg1.getStatusLine().toString()
arg2.getErrorCode()); } ...}
```

### *Usage*

The listener registered for the request receives the request object, the `HttpResponse` object which contains the details about the server response, and a `RequestStateElement` object which provides more details about the occurred error. In case, the error occurs before sending any request to the server, the `HttpResponse` object will be null.

### *onSuccess(IRequest, IResponse) method*

Request library uses this method in case of successful request.

### *Syntax*

```
public void onSuccess ( IRequest aRequest , IResponse aResponse )
```

### *Parameters*

- **aRequest** – the request object.
- **aResponse** – the response object.

### *Returns*

None

```
public class Activity implements INetListener { .... public void onSuccess(IRequest arg0,
IResponse arg1) {
HttpEntity resp = arg1.getEntity();
String response="";
response = EntityUtils.toString(resp); //process the response }...}
```

### *Usage*

The listener receives the request in form of parameter and an `HttpResponse` object containing all the details about the server response.

### *IODataAssociation interface*

Represents the appropriate OData element.

### *Syntax*

```
public abstract interface IODataAssociation extends
IParserDocument
```

### *Derived classes*

- *IODataAssociationSet* on page 151

- *IODataAssociation* on page 447

### Members

All members of *IODataAssociation*, including inherited members. **Nested interfaces**

Modifier and Type	Interface	Description
public abstract interface	<i>IODataAssociationEnd</i> on page 147	Represents the appropriate OData element.

### Variables

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 151	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ASSOCIATIONEND</i> on page 151	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract <i>IODataAssociationEnd</i>	<i>getAssociationEnd(String)</i> on page 150	Returns the value of the appropriate Association End OData element with the given role.
public abstract List< <i>IODataAssociationEnd</i> >	<i>getAssociationEnds()</i> on page 150	Returns list of the appropriate OData elements.
public abstract String	<i>getName()</i> on page 151	Returns the value of the appropriate OData attribute.

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *IODataAssociation.IODataAssociationEnd* interface

Represents the appropriate OData element.

#### Syntax

```
public abstract interface IODataAssociationEnd
```

#### Derived classes

- *IODataAssociationEnd* on page 462

*Members*

All members of `IODataAssociationEnd`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 149	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_MULTIPLICITY</i> on page 150	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ROLE</i> on page 150	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 150	Name of the appropriate OData attribute.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getCollectionId()</i> on page 148	Returns the value of the appropriate EntitySet OData attribute.
public abstract String	<i>getEntitySet()</i> on page 149	Returns the value of the appropriate OData attribute.
public abstract String	<i>getMultiplicity()</i> on page 149	Returns the value of the appropriate OData attribute.
public abstract String	<i>getRole()</i> on page 149	Returns the value of the appropriate OData attribute.
public abstract String	<i>getType()</i> on page 149	Returns the value of the appropriate OData attribute.

*getCollectionId() method*

Returns the value of the appropriate EntitySet OData attribute.

*Syntax*

```
public abstract String getCollectionId ()
```

*Returns*

the value of the appropriate EntitySet OData attribute

*getEntitySet() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getEntitySet ()
```

*Returns*

the value of the appropriate OData attribute

*getMultiplicity() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getMultiplicity ()
```

*Returns*

the value of the appropriate OData attribute

*getRole() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getRole ()
```

*Returns*

the value of the appropriate OData attribute

*getType() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getType ()
```

*Returns*

the value of the appropriate OData attribute

*ATTRIBUTE\_ENTITYSET variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_ENTITYSET
```

### *ATTRIBUTE\_MULTIPLICITY* variable

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_MULTIPLICITY
```

### *ATTRIBUTE\_ROLE* variable

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_ROLE
```

### *ATTRIBUTE\_TYPE* variable

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_TYPE
```

### *getAssociationEnd(String)* method

Returns the value of the appropriate Association End OData element with the given role.

#### *Syntax*

```
public abstract IODataAssociationEnd getAssociationEnd  
( String role )
```

#### *Parameters*

- **role** – The expected value of the appropriate OData attribute

#### *Returns*

the value of the appropriate Association End OData element

### *getAssociationEnds()* method

Returns list of the appropriate OData elements.

#### *Syntax*

```
public abstract List< IODataAssociationEnd >  
getAssociationEnds ( )
```

#### *Returns*

list of the appropriate OData elements

***getName() method***

Returns the value of the appropriate OData attribute.

***Syntax***

```
public abstract String getName ()
```

***Returns***

the value of the appropriate OData attribute

***ATTRIBUTE\_ASSOCIATION variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_ASSOCIATION
```

***ATTRIBUTE\_NAME variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NAME
```

***ELEMENT\_ASSOCIATION variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_ASSOCIATION
```

***ELEMENT\_ASSOCIATIONEND variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_ASSOCIATIONEND
```

***IODataAssociationSet interface***

Represents the appropriate OData element.

***Syntax***

```
public abstract interface IODataAssociationSet extends
IODataAssociation
```

***Derived classes***

- *IODataAssociationSet* on page 474

*Members*

All members of `IODataAssociationSet`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_ASSOCIATION-SET</i> on page 158	Name of the appropriate OData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getAssociation()</i> on page 157	Returns the value of appropriate OData element.

**Inherited members from IODataAssociation**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 151	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ASSOCIATION-END</i> on page 151	Name of the appropriate OData element.
public abstract IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 150	Returns the value of the appropriate Association End OData element with the given role.
public abstract List<IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 150	Returns list of the appropriate OData elements.
public abstract String	<i>getName()</i> on page 151	Returns the value of the appropriate OData attribute.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getAssociation()* method

Returns the value of appropriate OData element.

#### Syntax

```
public abstract String getAssociation ()
```

#### Returns

the value of appropriate OData element

*ELEMENT\_ASSOCIATIONSET* variable

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_ASSOCIATIONSET
```

*IODataCollection* interface

Represents the 'Collection' element of the OData Service Document.

*Syntax*

```
public abstract interface IODataCollection extends
  IParserDocument
```

*Derived classes*

- *ODataCollection* on page 494

*Members*

All members of IODataCollection, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 169	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 169	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DISPLAYORDER</i> on page 169	Name of the appropriate OData extension attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 169	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_HREF</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 170	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_VALUE_REL_SEARCH</i> on page 170	Possible value of the appropriate OData attribute.
public static final String	<i>ELEMENT_COLLECTION</i> on page 170	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 170	Name of the appropriate OData element.
public static final String	<i>ELEMENT_MEMBERTITLE</i> on page 171	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 171	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract int	<i>getDisplayOrder()</i> on page 165	Returns the value of the appropriate OData extension attribute.
public abstract String	<i>getHref()</i> on page 165	Returns the value of the 'href' OData attribute.
public abstract List< IODataIcon >	<i>getIcons()</i> on page 166	Returns list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 166	Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)
public abstract List< IODataLink >	<i>getLinks()</i> on page 166	Returns the value of the appropriate OData elements.
public abstract String	<i>getMemberTitle()</i> on page 166	Returns the value of the appropriate OData element.
public abstract IODataLink	<i>getSearchLink()</i> on page 166	Returns OData Link object that should be used for retrieving Open Search Description XML.
public abstract String	<i>getSemantics()</i> on page 167	Returns the value of the appropriate OData attribute.

Modifier and Type	Method	Description
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 167	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getTitle()</i> on page 167	Returns the value of the appropriate OData element.
public abstract String	<i>getUrl()</i> on page 167	Returns OData Link object that should be used for self related operations.
public abstract boolean	<i>isCreatable()</i> on page 168	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isDeletable()</i> on page 168	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isFilterable()</i> on page 168	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isSearchable()</i> on page 168	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 168	Returns the value of the appropriate OData attribute.
public abstract void	<i>setEntitySet(IODataEntitySet)</i> on page 169	Sets the data held by the appropriate element of the OData Schema.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getDisplayOrder()* method

Returns the value of the appropriate OData extension attribute.

#### *Syntax*

```
public abstract int getDisplayOrder ()
```

#### *Returns*

The value of the appropriate OData extension attribute

#### *getHref()* method

Returns the value of the 'href' OData attribute.

#### *Syntax*

```
public abstract String getHref ()
```

#### *Returns*

The value of the 'href' OData attribute

### *getIcons() method*

Returns list of the appropriate OData elements.

#### *Syntax*

```
public abstract List< IODataIcon > getIcons ()
```

#### *Returns*

list of the appropriate OData elements

### *getId() method*

Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)

#### *Syntax*

```
public abstract String getId ()
```

#### *Returns*

The value of the 'href' OData attribute

### *getLinks() method*

Returns the value of the appropriate OData elements.

#### *Syntax*

```
public abstract List< IODataLink > getLinks ()
```

#### *Returns*

The value of the appropriate OData elements

### *getMemberTitle() method*

Returns the value of the appropriate OData element.

#### *Syntax*

```
public abstract String getMemberTitle ()
```

#### *Returns*

The value of the appropriate OData element

### *getSearchLink() method*

Returns OData Link object that should be used for retrieving Open Search Description XML.

#### *Syntax*

```
public abstract IODataLink getSearchLink ()
```

*Returns*

OData Link for search

*getSemantics() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getSemantics ()
```

*Returns*

The value of the appropriate OData attribute

*getSubscriptionLink() method*

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

*Syntax*

```
public abstract IODataLink getSubscriptionLink ()
```

*Returns*

OData Link for subscribe

*getTitle() method*

Returns the value of the appropriate OData element.

*Syntax*

```
public abstract String getTitle ()
```

*Returns*

The value of the appropriate OData element

*getUrl() method*

Returns OData Link object that should be used for self related operations.

*Syntax*

```
public abstract String getUrl ()
```

*Returns*

OData Link for self Returns the full URL of the collectionThe full URL of the collection

### *isCreatable() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public abstract boolean isCreatable ()
```

#### *Returns*

The value of the appropriate OData attribute

### *isDeletable() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public abstract boolean isDeletable ()
```

#### *Returns*

The value of the appropriate OData attribute

### *isFilterable() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public abstract boolean isFilterable ()
```

#### *Returns*

The value of the appropriate OData attribute

### *isSearchable() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public abstract boolean isSearchable ()
```

#### *Returns*

The value of the appropriate OData attribute

### *isUpdatable() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public abstract boolean isUpdatable ()
```

*Returns*

The value of the appropriate OData attribute

*setEntitySet(IODataEntitySet) method*

Sets the data held by the appropriate element of the OData Schema.

*Syntax*

```
public abstract void setEntitySet ( IODataEntitySet entitySet )
```

*Parameters*

- **entitySet** – The OData EntitySet to use the data from.

*Usage*

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

*ATTRIBUTE\_CREATABLE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_CREATABLE
```

*ATTRIBUTE\_DELETABLE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_DELETABLE
```

*ATTRIBUTE\_DISPLAYORDER variable*

Name of the appropriate OData extension attribute.

*Syntax*

```
public static final String ATTRIBUTE_DISPLAYORDER
```

*ATTRIBUTE\_FILTERABLE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_FILTERABLE
```

### *ATTRIBUTE\_HREF variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_HREF
```

### *ATTRIBUTE\_SEARCHABLE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEARCHABLE
```

### *ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

### *ATTRIBUTE\_UPDATABLE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_UPDATABLE
```

### *ATTRIBUTE\_VALUE\_REL\_SEARCH variable*

Possible value of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_VALUE_REL_SEARCH
```

### *ELEMENT\_COLLECTION variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_COLLECTION
```

### *ELEMENT\_LINK variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_LINK
```

***ELEMENT\_MEMBERTITLE* variable**

Name of the appropriate OData element.

**Syntax**

```
public static final String ELEMENT_MEMBERTITLE
```

***ELEMENT\_TITLE* variable**

Name of the appropriate OData element.

**Syntax**

```
public static final String ELEMENT_TITLE
```

***IODataComplexType* interface**

Represents the appropriate OData element.

**Syntax**

```
public abstract interface IODataComplexType extends
  IParserDocument
```

**Derived classes**

- *IODataComplexType* on page 516

**Members**

All members of *IODataComplexType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_NAME</i> on page 177	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 177	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 177	Name of the appropriate OData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 176	Returns the value of the appropriate OData element.
public abstract List< IODataProperty >	<i>getProperties()</i> on page 177	Returns the list of the appropriate OData elements.

**Inherited members from *IParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getName()* method

Returns the value of the appropriate OData element.

#### Syntax

```
public abstract String getName ()
```

#### Returns

The value of the appropriate OData element

*getProperties() method*

Returns the list of the appropriate OData elements.

*Syntax*

```
public abstract List< IODataProperty > getProperties ()
```

*Returns*

The list of the appropriate OData elements

*ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAME
```

*ELEMENT\_COMPLEXTYPE variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_COMPLEXTYPE
```

*ELEMENT\_PROPERTY variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_PROPERTY
```

*IODataEntitySet interface*

Represents the appropriate OData element.

*Syntax*

```
public abstract interface IODataEntitySet extends  
IParserDocument
```

*Derived classes*

- *IODataEntitySet* on page 531

*Members*

All members of IODataEntitySet, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 184	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 184	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 185	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 185	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 185	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 185	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 183	
public abstract boolean	<i>isCreatable()</i> on page 183	
public abstract boolean	<i>isDeletable()</i> on page 183	
public abstract boolean	<i>isSearchable()</i> on page 184	
public abstract boolean	<i>isSearchable(String)</i> on page 184	Returns the value of the given OData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 184	

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getName()* method

##### *Syntax*

```
public abstract String getName ()
```

##### *Returns*

The value of the appropriate OData attribute

#### *isCreatable()* method

##### *Syntax*

```
public abstract boolean isCreatable ()
```

##### *Returns*

The value of the appropriate OData attribute

#### *isDeletable()* method

##### *Syntax*

```
public abstract boolean isDeletable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isSearchable() method*

### *Syntax*

```
public abstract boolean isSearchable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isSearchable(String) method*

Returns the value of the given OData attribute.

### *Syntax*

```
public abstract boolean isSearchable (String searchAttributeName )
```

### *Parameters*

- **searchAttributeName** – The name of the OData attribute

### *Returns*

The value of the given OData attribute

### *isUpdatable() method*

### *Syntax*

```
public abstract boolean isUpdatable ()
```

### *Returns*

The value of the appropriate OData attribute

### *ATTRIBUTE\_CREATABLE variable*

Name of the appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_CREATABLE
```

### *ATTRIBUTE\_DELETABLE variable*

Name of the appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_DELETABLE
```

***ATTRIBUTE\_NAME*** variable

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NAME
```

***ATTRIBUTE\_SEARCHABLE*** variable

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_SEARCHABLE
```

***ATTRIBUTE\_UPDATABLE*** variable

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_UPDATABLE
```

***ELEMENT\_ENTITYSET*** variable

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_ENTITYSET
```

***IODataEntityType*** interface

Represents the appropriate OData element.

***Syntax***

```
public abstract interface IODataEntityType extends
  IParserDocument
```

***Derived classes***

- *IODataEntityType* on page 547

***Members***

All members of *IODataEntityType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_HASSTREAM</i> on page 196	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_NAME</i> on page 196	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_KEY</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTYREF</i> on page 196	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 192	Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 192	Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 193	Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.
public abstract List< String >	<i>getKeyPropertyNames()</i> on page 193	Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.
public abstract String	<i>getName()</i> on page 193	Returns The value of the appropriate OData attribute.
public abstract List< IODataNavigationProperty >	<i>getNavigationProperties()</i> on page 193	Returns The list of appropriate OData elements.
public abstract IODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 194	Returns The appropriate OData element with the given name.

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getProperties()</i> on page 194	Returns The list of appropriate OData elements.
public abstract List< IODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 194	Returns The list of appropriate OData elements with given attribute value.
public abstract List< IODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 194	Returns The list of appropriate OData elements with given attribute value.
public abstract IODataProperty	<i>getProperty(String)</i> on page 195	Returns The appropriate OData element with the given name.
public abstract List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 195	Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.
public abstract List< IODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 195	Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.
public abstract boolean	<i>hasStream()</i> on page 195	Returns The value of the appropriate OData attribute.

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getGPUseInSearchPropertiesData()* method

Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

#### *Syntax*

```
public abstract List< IODataProperty >
getGPUseInSearchPropertiesData ()
```

#### *Returns*

The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value

#### *getGPVisibleInDetailPropertiesData()* method

Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

#### *Syntax*

```
public abstract List< IODataProperty >
getGPVisibleInDetailPropertiesData ()
```

**Returns**

The list of appropriate OData elements with 'true' visible-in-detail (Generic Player namespace) attribute value

***getGPVisibleInListPropertiesData() method***

Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player namespace) attribute value.

**Syntax**

```
public abstract List< IODataProperty >
getGPVisibleInListPropertiesData ()
```

**Returns**

The list of appropriate OData elements with 'true' visible-in-list (Generic Player namespace) attribute value

***getKeyPropertyNames() method***

Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.

**Syntax**

```
public abstract List< String > getKeyPropertyNames ()
```

**Returns**

The list of the values of the 'PropertyRef' OData element

***getName() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public abstract String getName ()
```

**Returns**

The value of the appropriate OData attribute

***getNavigationProperties() method***

Returns The list of appropriate OData elements.

**Syntax**

```
public abstract List< IODataNavigationProperty >
getNavigationProperties ()
```

### *Returns*

The list of appropriate OData elements

### *getNavigationProperty(String) method*

Returns The appropriate OData element with the given name.

### *Syntax*

```
public abstract IODataNavigationProperty  
getNavigationProperty ( String name )
```

### *Returns*

The appropriate OData element with the given name

### *getProperties() method*

Returns The list of appropriate OData elements.

### *Syntax*

```
public abstract List< IODataProperty > getProperties ( )
```

### *Returns*

The list of appropriate OData elements

### *getPropertiesWithAttribute(String, String) method*

Returns The list of appropriate OData elements with given attribute value.

### *Syntax*

```
public abstract List< IODataProperty >  
getPropertiesWithAttribute ( String attributeName , String  
attributeValue )
```

### *Returns*

The list of appropriate OData elements with given attribute value

### *getPropertiesWithAttribute(String, String, boolean) method*

Returns The list of appropriate OData elements with given attribute value.

### *Syntax*

```
public abstract List< IODataProperty >  
getPropertiesWithAttribute ( String attributeName , String  
attributeValue , boolean addByDefault )
```

**Returns**

The list of appropriate OData elements with given attribute value

***getProperty(String) method***

Returns The appropriate OData element with the given name.

**Syntax**

```
public abstract IODataProperty getProperty ( String
propertyName )
```

**Returns**

The appropriate OData element with the given name

***getSAPSearchablePropertiesData() method***

Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.

**Syntax**

```
public abstract List< IODataProperty >
getSAPSearchablePropertiesData ( )
```

**Returns**

The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value

***getSearchablePropertiesData(String) method***

Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.

**Syntax**

```
public abstract List< IODataProperty >
getSearchablePropertiesData ( String searchAttributeName )
```

**Returns**

The list of appropriate OData elements with 'true' attribute value of the given attribute

***hasStream() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public abstract boolean hasStream ( )
```

**Returns**

The value of the appropriate OData attribute

### *ATTRIBUTE\_HASSTREAM variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_HASSTREAM
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

### *ELEMENT\_ENTITYTYPE variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_ENTITYTYPE
```

### *ELEMENT\_KEY variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_KEY
```

### *ELEMENT\_PROPERTY variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_PROPERTY
```

### *ELEMENT\_PROPERTYREF variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_PROPERTYREF
```

### *IODataEntry interface*

Represents the 'entry' OData element with maintained reference to the appropriate OData Schema document.

#### *Syntax*

```
public abstract interface IODataEntry extends IParserDocument
```

*Derived classes*

- *IODataSubscriptionEntry* on page 324
- *ODataEntry* on page 567
- *ODataReturnTypeEntry* on page 752

*Members*

All members of *IODataEntry*, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	

### Methods

Modifier and Type	Method	Description
public abstract List< IOData-Link >	<i>getActionLinks()</i> on page 208	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 208	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 208	
public Long	<i>getCacheTimestamp()</i> on page 208	
public abstract String	<i>getCollectionId()</i> on page 208	Returns the Id of the OCata Collection that this Entry belongs to.
public abstract String	<i>getContentType()</i> on page 209	Returns the content type of the entry.
public abstract String	<i>getEtag()</i> on page 209	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 209	Returns the full execution URL hat can be used for filtering collection search for this single entry.

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 209	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 210	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 210	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getIcons()</i> on page 210	Returns the list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 210	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 211	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 211	Returns the values of the properties that are marked as key properties in the OData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 211	Returns The parsed value of the 'updated' OData Element.
public abstract List< IODataLink >	<i>getLinks()</i> on page 211	Returns the list of the appropriate OData elements.
public abstract String	<i>getMediaSrc()</i> on page 211	Returns the media source if the entry has a media content.

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getPropertiesData()</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract IParserDocument	<i>getPropertiesDocument()</i> on page 213	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 213	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 213	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 214	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List&lt; String[]&gt;)</i> on page 214	Return list of property values for the given property paths.

Modifier and Type	Method	Description
public abstract List< IOData-Link >	<i>getRelatedDataLinks()</i> on page 215	Returns OData Link objects that represents links to Related Data.
public abstract List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 215	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract IODataSchema	<i>getSchema()</i> on page 215	Returns the appropriate OData Schema object.
public abstract IODataLink	<i>getSelfLink()</i> on page 215	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 216	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 216	Returns The value of the appropriate OData element.
public abstract String	<i>getTitle()</i> on page 216	Returns The value of the appropriate OData element.
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 216	Puts the new property element as a sub-element of the 'complex properties' OData element.
public abstract void	<i>putContentType(String)</i> on page 217	Puts the content type for a new entry object.
public abstract void	<i>putId(String)</i> on page 217	Sets id of this OData Entry document (value of appropriate OData Id element)
public abstract void	<i>putMediaSrc(String)</i> on page 217	Puts the media source for a new entry object.

Modifier and Type	Method	Description
public abstract void	<i>putPropertyValue(String, String)</i> on page 217	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 218	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>setAuthorName(String)</i> on page 218	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cache.State)</i> on page 218	
public void	<i>setCacheTimestamp(Long)</i> on page 219	
public abstract void	<i>setCollectionId(String)</i> on page 219	Maintains the Id of the OCata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 219	
public abstract void	<i>setSchema(IODataSchema)</i> on page 219	Maintains the reference to the appropriate OData Schema object.
public abstract void	<i>setSummary(String)</i> on page 219	Sets the value of the appropriate OData element.
public abstract void	<i>setTitle(String)</i> on page 219	Sets the value of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *IODataEntry.cacheState* enum

##### Members

All members of *cacheState*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	<i>Deleted</i> on page 207	
public	<i>Inserted</i> on page 207	
public	<i>Updated</i> on page 208	

##### *Deleted* variable

###### Syntax

```
public Deleted
```

##### *Inserted* variable

###### Syntax

```
public Inserted
```

### *Updated variable*

#### *Syntax*

```
public Updated
```

#### *getActionLinks() method*

Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')

#### *Syntax*

```
public abstract List< IODataLink > getActionLinks ()
```

#### *Returns*

List of OData Action Link documents

#### *getAuthorName() method*

Returns The value of the 'name' OData element of the 'author' OData element.

#### *Syntax*

```
public abstract String getAuthorName ()
```

#### *Returns*

The value of the 'name' OData element of the 'author' OData element

#### *getCachestate() method*

#### *Syntax*

```
public cacheState getCachestate ()
```

#### *getCacheTimestamp() method*

#### *Syntax*

```
public Long getCacheTimestamp ()
```

#### *getCollectionId() method*

Returns the Id of the OCata Collection that this Entry belongs to.

#### *Syntax*

```
public abstract String getCollectionId ()
```

#### *Returns*

The Id of the OCata Collection that this Entry belongs to

*getContentTypes() method*

Returns the content type of the entry.

*Syntax*

```
public abstract String getContentTypes ()
```

*Returns*

Content Type of the entry

*getEtag() method*

Returns the Id of the OData Collection that this Entry belongs to.

*Syntax*

```
public abstract String getEtag ()
```

*Returns*

The Id of the OData Collection that this Entry belongs to

*getFilterUrl() method*

Returns the full execution URL hat can be used for filtering collection search for this single entry.

*Syntax*

```
public abstract String getFilterUrl ()
```

*Returns*

The full filter URL

*getGPUseInSearchPropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.

*Syntax*

```
public abstract List< IODataProperty >
getGPUseInSearchPropertiesData ()
```

*Returns*

The meta-informations and values of the appropriate properties

### *getGPVisibleInDetailPropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.

#### *Syntax*

```
public abstract List< IODataProperty >  
getGPVisibleInDetailPropertiesData ()
```

#### *Returns*

The meta-informations and values of the appropriate properties

### *getGPVisibleInListPropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.

#### *Syntax*

```
public abstract List< IODataProperty >  
getGPVisibleInListPropertiesData ()
```

#### *Returns*

The meta-informations and values of the appropriate properties

### *getIcons() method*

Returns the list of the appropriate OData elements.

#### *Syntax*

```
public abstract List< IODataIcon > getIcons ()
```

#### *Returns*

The list of the appropriate OData elements

### *getId() method*

Returns The Id of this OData Entry (value of appropriate OData Id element)

#### *Syntax*

```
public abstract String getId ()
```

#### *Returns*

The Id of this OData Entry

*getIsLocal() method**Syntax*

```
public boolean getIsLocal ()
```

*getKeyPropertyValues() method*

Returns the values of the properties that are marked as key properties in the OData Schema document.

*Syntax*

```
public abstract Map< String, String > getKeyPropertyValues  
( )
```

*Returns*

The name-value pairs of the key properties

*getLastUpdated() method*

Returns The parsed value of the 'updated' OData Element.

*Syntax*

```
public abstract Date getLastUpdated ()
```

*Returns*

The parsed value of the value of the 'updated' OData element or null is parsing failed

*getLinks() method*

Returns the list of the appropriate OData elements.

*Syntax*

```
public abstract List< IODataLink > getLinks ()
```

*Returns*

The list of the appropriate OData elements

*getMediaSrc() method*

Returns the media source if the entry has a media content.

*Syntax*

```
public abstract String getMediaSrc ()
```

*Returns*

Media source link of the entry

### *getPropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.

#### *Syntax*

```
public abstract List< IODataProperty > getPropertiesData ()
```

#### *Returns*

The meta-informations and values of the contained properties

### *getPropertiesDataWithAttribute(String, String) method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

#### *Syntax*

```
public abstract List< IODataProperty >  
getPropertiesDataWithAttribute ( String attributeName , String  
attributeValue )
```

#### *Parameters*

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

#### *Returns*

The meta-informations and values of the appropriate properties

### *getPropertiesDataWithAttribute(String, String, boolean) method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

#### *Syntax*

```
public abstract List< IODataProperty >  
getPropertiesDataWithAttribute ( String attributeName , String  
attributeValue , boolean addByDefault )
```

#### *Parameters*

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

*Returns*

The meta-informations and values of the appropriate properties

*getPropertiesDocument() method*

Returns the representer document of OData 'properties' (Metadata name-space) document  
This method is created for performance reasons mostly to use in search methods.

*Syntax*

```
public abstract IParserDocument getPropertiesDocument ()
```

*Returns*

The ParseDocument representation of OData 'properties' (Metadata name-space) document

*getPropertyValue(String...) method*

Returns the value of the appropriate property.

*Syntax*

```
public abstract String getPropertyValue (String... propertyPath )  
throws IllegalArgumentException
```

*Parameters*

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

*Returns*

The value of the property

*Exceptions*

- **IllegalArgumentException** – if the property name is null or ambiguous.

*Usage*

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

*getPropertyValueParsed(String...) method*

Returns the value of the appropriate property parsed to it's real type.

*Syntax*

```
public abstract< T > T getPropertyValueParsed (String...  
propertyPath ) throws ClassCastException
```

### *Parameters*

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

### *Returns*

The value of the property

### *Exceptions*

- **IllegalArgumentException** – if the property name is null or ambiguous
- **ClassCastException** – if the property value can not be parsed to the expected type

### *Usage*

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

### *getPropertyValues() method*

Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

### *Syntax*

```
public abstract Map< String, String > getPropertyValues ()
```

### *Returns*

The name/path and value pairs of the contained properties

### *Usage*

The name of the properties will contain their current name-space prefixes.

### *getPropertyValues(List< String[]>) method*

Return list of property values for the given property paths.

### *Syntax*

```
public abstract List< String > getPropertyValues ( List<  
String[]> propertyPathes )
```

### *Parameters*

- **propertyPathes** – Name of the property or path including the name of the enclosing Complex Types

### *Returns*

The list of the values of the properties

*getRelatedDataLinks() method*

Returns OData Link objects that represents links to Related Data.

*Syntax*

```
public abstract List< IODataLink > getRelatedDataLinks ()
```

*Returns*

List of OData Related Link documents

*getSAPSearchablePropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.

*Syntax*

```
public abstract List< IODataProperty >
getSAPSearchablePropertiesData ()
```

*Returns*

The meta-informations and values of the appropriate properties

*getSchema() method*

Returns the appropriate OData Schema object.

*Syntax*

```
public abstract IODataSchema getSchema ()
```

*Returns*

The appropriate OData Schema object.

*getSelfLink() method*

Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

*Syntax*

```
public abstract IODataLink getSelfLink ()
```

*Returns*

OData self Link

### *getSubscriptionLink() method*

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

#### *Syntax*

```
public abstract IODataLink getSubscriptionLink ()
```

#### *Returns*

OData Link for subscribe

### *getSummary() method*

Returns The value of the appropriate OData element.

#### *Syntax*

```
public abstract String getSummary ()
```

#### *Returns*

The value of the appropriate OData element

### *getTitle() method*

Returns The value of the appropriate OData element.

#### *Syntax*

```
public abstract String getTitle ()
```

#### *Returns*

The value of the appropriate OData element

### *putComplexPropertyValue(String, String...) method*

Puts the new property element as a sub-element of the 'complex properties' OData element.

#### *Syntax*

```
public abstract void putComplexPropertyValue (String  
propertyValue , String... propertyName )
```

#### *Parameters*

- **propertyName** – The route of the property with or without name-space until the complex type.
- **propertyValue** – The value of the property

*Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

*putContentType(String) method*

Puts the content type for a new entry object.

*Syntax*

```
public abstract void putContentType ( String contentType )
```

*Parameters*

- **contentType** – - Content Type of the entry

*putId(String) method*

Sets id of this OData Entry document (value of appropriate OData Id element)

*Syntax*

```
public abstract void putId ( String id ) throws  
IllegalArgumentException
```

*Parameters*

- **id** – The new id.

*putMediaSrc(String) method*

Puts the media source for a new entry object.

*Syntax*

```
public abstract void putMediaSrc ( String mediaSrc )
```

*Parameters*

- **mediaSrc** – - Media source of the entry

*putPropertyValue(String, String) method*

Puts the new property element as a sub-element of the 'properties' OData element.

*Syntax*

```
public abstract void putPropertyValue ( String propertyName ,  
String propertyValue )
```

### *Parameters*

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

### *putPropertyValue(String, String, boolean) method*

Puts the new property element as a sub-element of the 'properties' OData element.

### *Syntax*

```
public abstract void putPropertyValue ( String propertyName ,  
String propertyValue , boolean useDefaultPrefix )
```

### *Parameters*

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

### *setAuthorName(String) method*

Sets the value of the 'name' OData element of the 'author' OData element.

### *Syntax*

```
public abstract void setAuthorName ( String authorName )
```

### *Parameters*

- **authorName** – The new value of the element

### *setCachestate(cacheState) method*

### *Syntax*

```
public void setCachestate ( cacheState cachestate )
```

*setCacheTimestamp(Long) method**Syntax*

```
public void setCacheTimestamp ( Long timestamp )
```

*setCollectionId(String) method*

Maintains the Id of the OCata Collection that this Entry belongs to.

*Syntax*

```
public abstract void setCollectionId ( String collectionId )
```

*Parameters*

- **collectionId** – The Id of the OCata Collection that this Entry belongs to

*setIsLocal(boolean) method**Syntax*

```
public void setIsLocal ( boolean isLocal )
```

*setSchema(IODataSchema) method*

Maintains the reference to the appropriate OData Schema object.

*Syntax*

```
public abstract void setSchema ( IODataSchema schema )
```

*Parameters*

- **schema** – The appropriate OData Schema object.

*setSummary(String) method*

Sets the value of the appropriate OData element.

*Syntax*

```
public abstract void setSummary ( String summary )
```

*Parameters*

- **summary** – The new value of the element

*setTitle(String) method*

Sets the value of the appropriate OData element.

*Syntax*

```
public abstract void setTitle ( String title )
```

### *Parameters*

- **title** – The new value of the element

### *ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

### *ATTRIBUTE\_TERM variable*

Name of the appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_TERM
```

### *ATTRIBUTE\_VALUE\_SEMANTICS\_ACTION variable*

Value option for appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_VALUE_SEMANTICS_ACTION
```

### *ELEMENT\_AUTHOR variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_AUTHOR
```

### *ELEMENT\_CATEGORY variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_CATEGORY
```

### *ELEMENT\_CONTENT variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_CONTENT
```

***ELEMENT\_ENTRY variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_ENTRY
```

***ELEMENT\_LINK variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_LINK
```

***ELEMENT\_NAME variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_NAME
```

***ELEMENT\_PROPERTIES variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_PROPERTIES
```

***ELEMENT\_SUMMARY variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_SUMMARY
```

***ELEMENT\_TITLE variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_TITLE
```

***ELEMENT\_UPDATED variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_UPDATED
```

*PROPERTY\_LEVEL\_SEPARATOR* variable*Syntax*

```
public static final String PROPERTY_LEVEL_SEPARATOR
```

*IODataError* interface

Represents the appropriate OData element.

*Syntax*

```
public abstract interface IODataError extends IParserDocument
```

*Derived classes*

- *IODataError* on page 604

*Members*

All members of *IODataError*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_LANGUAGE</i> on page 228	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ERROR</i> on page 228	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ERRORCODE</i> on page 228	Name of the appropriate OData element.
public static final String	<i>ELEMENT_MESSAGE</i> on page 228	Name of the appropriate OData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getErrorCode()</i> on page 227	Returns The value of the 'code' OData element.
public abstract String	<i>getLang()</i> on page 228	Returns The value of the appropriate OData attribute of the 'message' element.
public abstract String	<i>getMessage()</i> on page 228	Return the localized error message.

**Inherited members from *IParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getErrorCode()* method

Returns The value of the 'code' OData element.

#### Syntax

```
public abstract String getErrorCode ()
```

#### Returns

The value of the 'code' OData element

### *getLang() method*

Returns The value of the appropriate OData attribute of the 'message' element.

#### *Syntax*

```
public abstract String getLang ()
```

#### *Returns*

The value of the appropriate OData attribute of the 'message' element

### *getMessage() method*

Return the localized error message.

#### *Syntax*

```
public abstract String getMessage ()
```

#### *Returns*

The value of the 'message' OData element

### *ATTRIBUTE\_LANGUAGE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_LANGUAGE
```

### *ELEMENT\_ERROR variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_ERROR
```

### *ELEMENT\_ERRORCODE variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_ERRORCODE
```

### *ELEMENT\_MESSAGE variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_MESSAGE
```

*IODataFeed interface**Syntax*

```
public interface IODataFeed
```

*Derived classes*

- *ODataFeed* on page 620

*Members*

All members of IODataFeed, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>getAuthor()</i> on page 229	Returns the name of the Author of the OData Feed.
public List< String >	<i>getDeletedEntries()</i> on page 230	Returns the list of links of the Deleted Entries.
public IODataLink	<i>getDeltaLink()</i> on page 230	Returns the latest delta link token.
public List< IODataEntry >	<i>getEntries()</i> on page 230	Returns the entries in the feed that have been updated/ entire list of entries in the collection.
public String	<i>getId()</i> on page 230	Returns the id of the OData Feed.
public String	<i>getLastUpdated()</i> on page 230	Returns the date/time of last update on the OData Feed.
public List< IODataLink >	<i>getLinks()</i> on page 231	
public String	<i>getTitle()</i> on page 231	Returns the Title of the OData Feed.

*getAuthor() method*

Returns the name of the Author of the OData Feed.

*Syntax*

```
public String getAuthor ()
```

*Returns*

String Author Name

### *getDeletedEntries() method*

Returns the list of links of the Deleted Entries.

#### *Syntax*

```
public List< String > getDeletedEntries ()
```

#### *Returns*

List<ISDMODataLink> - List of links of the deleted entries

### *getDeltaLink() method*

Returns the latest delta link token.

#### *Syntax*

```
public IODataLink getDeltaLink ()
```

### *getEntries() method*

Returns the entries in the feed that have been updated/ entire list of entries in the collection.

#### *Syntax*

```
public List< IODataEntry > getEntries ()
```

#### *Returns*

List<ISDMODataEntry> - List of ODataEntries

### *getId() method*

Returns the id of the OData Feed.

#### *Syntax*

```
public String getId ()
```

#### *Returns*

String Id

### *getLastUpdated() method*

Returns the date/time of last update on the OData Feed.

#### *Syntax*

```
public String getLastUpdated ()
```

#### *Returns*

String Date-time

*getLinks() method**Syntax*

```
public List< IODataLink > getLinks ()
```

*getTitle() method*

Returns the Title of the OData Feed.

*Syntax*

```
public String getTitle ()
```

*Returns*

String Title

*IODataFunctionImport interface*

Represents the 'FunctionImport' OData element.

*Syntax*

```
public abstract interface IODataFunctionImport extends
IParserDocument
```

*Derived classes*

- *IODataFunctionImport* on page 623

*Members*

All members of IODataFunctionImport, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ACTION_FOR</i> on page 241	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 241	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_HTTPMETHOD</i> on page 241	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 242	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_RETURNTYPE</i> on page 242	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_FUNCTIONAL_IMPORT</i> on page 242	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 242	Name of the appropriate OData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getActionFor()</i> on page 239	Returns The value of the appropriate OData attribute.
public abstract String	<i>getCollectionId()</i> on page 239	Returns The value of the 'EntitySet' OData attribute.
public abstract String	<i>getEntitySet()</i> on page 239	Returns The value of the 'EntitySet' OData attribute.
public abstract String	<i>getExecutionUrl(Map&lt; String, String &gt;)</i> on page 239	Calculate the full execution URL for executing this Function Import according to the passed parameters.
public abstract String	<i>getHTTPMethod()</i> on page 240	Returns The value of the appropriate OData attribute.
public abstract List< String >	<i>getInputParameterNames()</i> on page 240	Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.
public abstract String	<i>getName()</i> on page 240	Returns The value of the appropriate OData attribute.
public abstract List< String >	<i>getOutputParameterNames()</i> on page 240	Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.
public abstract List< IOData-Parameter >	<i>getParameters()</i> on page 240	Returns The list of the appropriate OData element.
public abstract String	<i>getReturnType()</i> on page 241	Returns The value of the appropriate OData attribute.
public RETURN_TYPE_ENUM	<i>getReturnTypeEnum()</i> on page 241	Returns The return type of this Function Import OData document.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *IODataFunctionImport.RETURNTYPE\_ENUM* enum

Possible return type of a SMDOData Function Import element.

#### Members

All members of RETURNTYPE\_ENUM, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	<i>RETURNTYPE_COMPLEX</i> on page 238	

Modifier and Type	Variable	Description
public	<i>RETURNTYPE_COMPLEX_COLLECTION</i> on page 238	
public	<i>RETURNTYPE_ENTRY</i> on page 238	
public	<i>RETURNTYPE_FEED</i> on page 238	
public	<i>RETURNTYPE_SIMPLE</i> on page 238	
public	<i>RETURNTYPE_SIMPLE_COLLECTION</i> on page 239	

*RETURNTYPE\_COMPLEX* variable**Syntax**

```
public RETURNTYPE_COMPLEX
```

*RETURNTYPE\_COMPLEX\_COLLECTION* variable**Syntax**

```
public RETURNTYPE_COMPLEX_COLLECTION
```

*RETURNTYPE\_ENTRY* variable**Syntax**

```
public RETURNTYPE_ENTRY
```

*RETURNTYPE\_FEED* variable**Syntax**

```
public RETURNTYPE_FEED
```

*RETURNTYPE\_SIMPLE* variable**Syntax**

```
public RETURNTYPE_SIMPLE
```

*RETURNTYPE\_SIMPLE\_COLLECTION* variable

**Syntax**

```
public RETURNTYPE_SIMPLE_COLLECTION
```

*getActionFor()* method

Returns The value of the appropriate OData attribute.

**Syntax**

```
public abstract String getActionFor ()
```

**Returns**

The value of the appropriate OData attribute

*getCollectionId()* method

Returns The value of the 'EntitySet' OData attribute.

**Syntax**

```
public abstract String getCollectionId ()
```

**Returns**

The value of the 'EntitySet' OData attribute

*getEntitySet()* method

Returns The value of the 'EntitySet' OData attribute.

**Syntax**

```
public abstract String getEntitySet ()
```

**Returns**

The value of the 'EntitySet' OData attribute

*getExecutionUrl(Map< String, String >) method*

Calculate the full execution URL for executing this Function Import according to the passed paramteres.

**Syntax**

```
public abstract String getExecutionUrl (Map< String, String >
parameters )
```

**Returns**

The full execution URL

### *getHTTPMethod() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getHTTPMethod ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getInputParameterNames() method*

Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.

#### *Syntax*

```
public abstract List< String > getInputParameterNames ()
```

#### *Returns*

The list of the appropriate OData element with 'In' or 'InOut' attribute value

### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getOutputParameterNames() method*

Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.

#### *Syntax*

```
public abstract List< String > getOutputParameterNames ()
```

#### *Returns*

The list of the appropriate OData element with 'Out' or 'InOut' attribute value

### *getParameters() method*

Returns The list of the appropriate OData element.

#### *Syntax*

```
public abstract List< IODataParameter > getParameters ()
```

**Returns**

The list of the appropriate OData element

***getReturnType() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public abstract String getReturnType ()
```

**Returns**

The value of the appropriate OData attribute

***getReturnTypeEnum() method***

Returns The return type of this Function Import OData document.

**Syntax**

```
public RETURN_TYPE_ENUM getReturnTypeEnum ()
```

**Returns**

The return type of this Function Import OData document

***ATTRIBUTE\_ACTION\_FOR variable***

Name of the appropriate OData attribute.

**Syntax**

```
public static final String ATTRIBUTE_ACTION_FOR
```

***ATTRIBUTE\_ENTITYSET variable***

Name of the appropriate OData attribute.

**Syntax**

```
public static final String ATTRIBUTE_ENTITYSET
```

***ATTRIBUTE\_HTTPMETHOD variable***

Name of the appropriate OData attribute.

**Syntax**

```
public static final String ATTRIBUTE_HTTPMETHOD
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

### *ATTRIBUTE\_RETURNTYPE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_RETURNTYPE
```

### *ELEMENT\_FUNCTIONALIMPORT variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

### *ELEMENT\_PARAMETER variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_PARAMETER
```

### *IODataIcon interface*

Represents the appropriate OData element.

#### *Syntax*

```
public interface IODataIcon extends IParserDocument
```

#### *Derived classes*

- *ODataIcon* on page 641

#### *Members*

All members of IODataIcon, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_HEIGHT</i> on page 249	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_WIDTH</i> on page 249	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_ICON</i> on page 249	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public int	<i>getHeight()</i> on page 248	Returns The value of the appropriate OData attribute.
public String	<i>getUrl()</i> on page 248	Returns The value of the appropriate OData attribute.
public int	<i>getWidth()</i> on page 248	Returns The value of the appropriate OData attribute.

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*getHeight() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public int getHeight ()
```

*Returns*

The value of the appropriate OData attribute

*getUrl() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public String getUrl ()
```

*Returns*

The value of the appropriate OData attribute

*getWidth() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public int getWidth ()
```

*Returns*

The value of the appropriate OData attribute

***ATTRIBUTE\_HEIGHT variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_HEIGHT
```

***ATTRIBUTE\_WIDTH variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_WIDTH
```

***ELEMENT\_ICON variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_ICON
```

***IODataLink interface***

Represents the appropriate OData element.

***Syntax***

```
public abstract interface IODataLink extends IParserDocument
```

***Derived classes***

- *IODataLink* on page 658

***Members***

All members of IODataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_HREF</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_REL</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_REL_VAL-UE_EDIT</i> on page 260	Value option for the appropriate OData parameter.
public static final String	<i>ATTRIBUTE_REL_VAL-UE_SELF</i> on page 260	Value option for the appropriate OData parameter.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TITLE</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE-PART_DELTA</i> on page 260	String that should be part of every rel attribute of a Delta.
public static final String	<i>ATTRIBUTE_VALUE-PART_RELATED</i> on page 261	String that should be part of every rel attribute of a Related Data Link.
public static final String	<i>ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION</i> on page 261	String that should be end of every rel attribute of a Subscription Link.
public static final String	<i>ELEMENT_INLINE</i> on page 261	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 261	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 261	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PARAMETER-SET</i> on page 261	Name of the appropriate OData element.

## Methods

Modifier and Type	Method	Description
public abstract String	<i>getHref()</i> on page 256	Returns the value of the appropriate OData attribute.
public abstract List<IODataEntry >	<i>getInlineEntries()</i> on page 257	Returns the list of OData Entries contained by the appropriate OData 'inline' element.
public abstract List< String >	<i>getInputParameterNames()</i> on page 257	Returns the list of the appropriate OData Parameter elements that should be used as input parameter.

Modifier and Type	Method	Description
public abstract List< String >	<i>getOutputParameterNames()</i> on page 257	Returns the list of the appropriate OData Parameter elements that should be used as output parameter.
public abstract List< IOData-Parameter >	<i>getParameters()</i> on page 257	Returns the list of the appropriate OData Parameter elements.
public abstract String	<i>getRel()</i> on page 257	Returns the value of the appropriate OData attribute.
public abstract IODataSchema	<i>getSchema()</i> on page 258	Returns the Schema that is to be used for 'Inline entries'.
public abstract String	<i>getSemantics()</i> on page 258	Returns The value of the appropriate OData extension (vCard) attribute.
public abstract String	<i>getTargetCollectionId()</i> on page 258	Returns the Id of the collection that this link points to (if any)
public abstract String	<i>getTitle()</i> on page 258	Returns the value of the appropriate OData attribute.
public abstract String	<i>getUrl()</i> on page 259	Returns the full URL for this OData Link object without parameters.
public abstract String	<i>getUrlWithParameters(Map&lt;String, String &gt;)</i> on page 259	Returns the full URL for this OData Link object extended with the given parameter names and values.
public abstract void	<i>setSchema(IODataSchema)</i> on page 259	Sets the Schema that is to be used for 'Inline entries'.
public abstract void	<i>setTargetCollectionId(String)</i> on page 259	Maintains the Id of the collection that this link points to (if any)

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getHref()* method

Returns the value of the appropriate OData attribute.

#### Syntax

```
public abstract String getHref ()
```

#### Returns

The value of the appropriate OData attribute

*getInlineEntries() method*

Returns the list of OData Entries contained by the appropriate OData 'inline' element.

*Syntax*

```
public abstract List< IODataEntry > getInlineEntries ()
```

*Returns*

The List of 'inline' OData Entries

*getInputParameterNames() method*

Returns the list of the appropriate OData Parameter elements that should be used as input parameter.

*Syntax*

```
public abstract List< String > getInputParameterNames ()
```

*Returns*

The list of the appropriate OData Parameter elements that should be used as input parameter

*getOutputParameterNames() method*

Returns the list of the appropriate OData Parameter elements that should be used as output parameter.

*Syntax*

```
public abstract List< String > getOutputParameterNames ()
```

*Returns*

The list of the appropriate OData Parameter elements that should be used as output parameter

*getParameters() method*

Returns the list of the appropriate OData Parameter elements.

*Syntax*

```
public abstract List< IODataParameter > getParameters ()
```

*Returns*

The list of the appropriate OData Parameter elements

*getRel() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getRel ()
```

### *Returns*

The value of the appropriate OData attribute

### *getSchema() method*

Returns the Schema that is to be used for 'Inline entries'.

### *Syntax*

```
public abstract IODataSchema getSchema ()
```

### *Returns*

The relevant schema

### *getSemantics() method*

Returns The value of the appropriate OData extension (vCard) attribute.

### *Syntax*

```
public abstract String getSemantics ()
```

### *Returns*

The value of the appropriate OData extension (vCard) attribute

### *getTargetCollectionId() method*

Returns the Id of the collection that this link points to (if any)

### *Syntax*

```
public abstract String getTargetCollectionId ()
```

### *Returns*

The Id of the collection that this link points to

### *getTitle() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public abstract String getTitle ()
```

### *Returns*

The value of the appropriate OData attribute

*getUrl() method*

Returns the full URL for this OData Link object without parameters.

*Syntax*

```
public abstract String getUrl ()
```

*Returns*

The full URL of this link without parameters

*getUrlWithParameters(Map< String, String >) method*

Returns the full URL for this OData Link object extended with the given parameter names and values.

*Syntax*

```
public abstract String getUrlWithParameters (Map< String,
String > parameters )
```

*Returns*

The full URL of this link with parameters

*setSchema(IODataSchema) method*

Sets the Schema that is to be used for 'Inline entries'.

*Syntax*

```
public abstract void setSchema ( IODataSchema schema )
```

*Parameters*

- **schema** – The relevant schema

*setTargetCollectionId(String) method*

Maintains the Id of the collection that this link points to (if any)

*Syntax*

```
public abstract void setTargetCollectionId (String
targetCollectionId )
```

*Parameters*

- **targetCollectionId** – The Id of the collection that this link points to

### *ATTRIBUTE\_HREF variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_HREF
```

### *ATTRIBUTE\_REL variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_REL
```

### *ATTRIBUTE\_REL\_VALUE\_EDIT variable*

Value option for the appropriate OData parameter.

#### *Syntax*

```
public static final String ATTRIBUTE_REL_VALUE_EDIT
```

### *ATTRIBUTE\_REL\_VALUE\_SELF variable*

Value option for the appropriate OData parameter.

#### *Syntax*

```
public static final String ATTRIBUTE_REL_VALUE_SELF
```

### *ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

### *ATTRIBUTE\_TITLE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_TITLE
```

### *ATTRIBUTE\_VALUEPART\_DELTA variable*

String that should be part of every rel attribute of a Delta.

#### *Syntax*

```
public static final String ATTRIBUTE_VALUEPART_DELTA
```

***ATTRIBUTE\_VALUEPART\_RELATED variable***

String that should be part of every rel attribute of a Related Data Link.

***Syntax***

```
public static final String ATTRIBUTE_VALUEPART_RELATED
```

***ATTRIBUTE\_VALUESUFFIX\_SUBSCRIPTION variable***

String that should be end of every rel attribute of a Subscription Link.

***Syntax***

```
public static final String
ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION
```

***ELEMENT\_INLINE variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_INLINE
```

***ELEMENT\_LINK variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_LINK
```

***ELEMENT\_PARAMETER variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_PARAMETER
```

***ELEMENT\_PARAMETERSET variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_PARAMETERSET
```

***IODataNavigationProperty interface***

Represents the appropriate OData element.

***Syntax***

```
public abstract interface IODataNavigationProperty extends
IParserDocument
```

*Derived classes*

- *INavigationProperty* on page 678

*Members*

All members of *INavigationProperty*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_FROMROLE</i> on page 268	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 268	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_RELATIONSHIP</i> on page 269	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TOROLE</i> on page 269	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_NAVIGATIONPROPERTY</i> on page 269	Name of the appropriate OData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getFromRole()</i> on page 267	Returns The value of the appropriate OData attribute.
public abstract String	<i>getName()</i> on page 268	Returns The value of the appropriate OData attribute.
public abstract String	<i>getRelationship()</i> on page 268	Returns The value of the appropriate OData attribute.
public abstract String	<i>getToRole()</i> on page 268	Returns The value of the appropriate OData attribute.

**Inherited members from *IParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getFromRole()* method

Returns The value of the appropriate OData attribute.

#### Syntax

```
public abstract String getFromRole ()
```

#### Returns

The value of the appropriate OData attribute

### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getRelationship() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getRelationship ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getToRole() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getToRole ()
```

#### *Returns*

The value of the appropriate OData attribute

### *ATTRIBUTE\_FROMROLE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_FROMROLE
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

***ATTRIBUTE\_RELATIONSHIP* variable**

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_RELATIONSHIP
```

***ATTRIBUTE\_TOROLE* variable**

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_TOROLE
```

***ELEMENT\_NAVIGATIONPROPERTY* variable**

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_NAVIGATIONPROPERTY
```

***IODataOpenSearchDescription* interface**

Represents the appropriate OData element.

***Syntax***

```
public abstract interface IODataOpenSearchDescription extends
  IParserDocument, Serializable
```

***Derived classes***

- *IODataOpenSearchDescription* on page 695

***Members***

All members of *IODataOpenSearchDescription*, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>ELEMENT_DESCRIPTION</i> on page 275	Name of the appropriate OData element.
public static final String	<i>ELEMENT_OPENSEARCH-DESCRIPTION</i> on page 275	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SHORTNAME</i> on page 276	Name of the appropriate OData element.
public static final String	<i>ELEMENT_URL</i> on page 276	Name of the appropriate OData element.

***Methods***

Modifier and Type	Method	Description
public abstract String	<i>getDescription()</i> on page 275	Returns The value of the appropriate OData element.
public abstract String	<i>getShortName()</i> on page 275	Returns The value of the appropriate OData element.
public abstract List<IODataURL >	<i>getUrls()</i> on page 275	Returns The list of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*getDescription() method*

Returns The value of the appropriate OData element.

*Syntax*

```
public abstract String getDescription ()
```

*Returns*

The value of the appropriate OData element

*getShortName() method*

Returns The value of the appropriate OData element.

*Syntax*

```
public abstract String getShortName ()
```

*Returns*

The value of the appropriate OData element

*getUrls() method*

Returns The list of the appropriate OData element.

*Syntax*

```
public abstract List< IODataURL > getUrls ()
```

*Returns*

The list of the appropriate OData element

*ELEMENT\_DESCRIPTION variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_DESCRIPTION
```

*ELEMENT\_OPENSEARCHDESCRIPTION variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_OPENSEARCHDESCRIPTION
```

*ELEMENT\_SHORTNAME variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_SHORTNAME
```

*ELEMENT\_URL variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_URL
```

*IODataParameter interface*

Represents the appropriate OData element.

*Syntax*

```
public abstract interface IODataParameter extends
IParserDocument
```

*Derived classes*

- *ODataParameter* on page 711

*Members*

All members of IODataParameter, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_MODE</i> on page 282	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 282	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 283	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_PARAMETER</i> on page 283	Name of the appropriate OData element.
public static final String	<i>VALUE_MODE_IN</i> on page 283	Value option for the 'Mode' OData attribute.
public static final String	<i>VALUE_MODE_OUT</i> on page 283	Value option for the 'Mode' OData attribute.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getMode()</i> on page 282	Returns The value of the appropriate OData attribute.
public abstract String	<i>getName()</i> on page 282	Returns The value of the appropriate OData attribute.
public abstract String	<i>getType()</i> on page 282	Returns The value of the appropriate OData attribute.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParser-Document&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

### *getMode() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getMode ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getType() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getType ()
```

#### *Returns*

The value of the appropriate OData attribute

### *ATTRIBUTE\_MODE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_MODE
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

***ATTRIBUTE\_TYPE* variable**

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_TYPE
```

***ELEMENT\_PARAMETER* variable**

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_PARAMETER
```

***VALUE\_MODE\_IN* variable**

Value option for the 'Mode' OData attribute.

***Syntax***

```
public static final String VALUE_MODE_IN
```

***VALUE\_MODE\_OUT* variable**

Value option for the 'Mode' OData attribute.

***Syntax***

```
public static final String VALUE_MODE_OUT
```

***IODataProperty* interface**

Represents the appropriate OData element.

***Syntax***

```
public abstract interface IODataProperty extends
  IParserDocument
```

***Derived classes***

- *ODataProperty* on page 726

***Members***

All members of IODataProperty, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_COLLATION</i> on page 299	Name of the appropriate OData attribute.

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DEFAULTVALUE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DETAIL_DISPLAYORDER</i> on page 299	Name of the display-order OData attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_FIXEDLENGTH</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_LABEL</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_LIST_DISPLAYORDER</i> on page 300	Name of the display-order OData attribute.
public static final String	<i>ATTRIBUTE_MAXLENGTH</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NULLABLE</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_PRECISION</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SCALE</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 301	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_UNICODE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_USEIN-SEARCH</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEINDE-TAIL</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEIN-LIST</i> on page 302	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_PROPERTY</i> on page 302	Name of the appropriate OData element.

## Methods

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getChildPropertiesData()</i> on page 292	Returns all the child properties added to this document with putChildProperty method.
public abstract List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 292	Returns list of appropriate contained Property OData elements with the given attribute value.
public abstract List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 293	Returns list of appropriate contained Property OData elements with the given attribute value.
public abstract IODataProperty	<i>getChildPropertyData(String)</i> on page 293	Return a single child property added with putChildProperty method.
public abstract String	<i>getCollation()</i> on page 293	Returns the value of the appropriate OData attribute.
public abstract String	<i>getDefaultValue()</i> on page 294	Returns the value of the appropriate OData attribute.
public abstract int	<i>getDetailDisplayOrder()</i> on page 294	In current version it return the same value as getListDisplayOrder.

<b>Modifier and Type</b>	<b>Method</b>	<b>Description</b>
public abstract String	<i>getLabel()</i> on page 294	Returns The value of the appropriate OData attribute.
public abstract int	<i>getListDisplayOrder()</i> on page 294	In current version it returns the same value as getDetailDisplayOrder.
public abstract int	<i>getMaxLength()</i> on page 294	Returns the value of the appropriate OData attribute with defaultValue = 0;.
public abstract String	<i>getName()</i> on page 295	Returns The value of the appropriate OData attribute.
public abstract String	<i>getPrecision()</i> on page 295	Returns the value of the appropriate OData attribute.
public abstract String	<i>getScale()</i> on page 295	Returns the value of the appropriate OData attribute.
public abstract String	<i>getSemantics()</i> on page 295	Returns the value of the appropriate OData attribute with defaultValue = 0;.
public abstract String	<i>getType()</i> on page 296	Returns The value of the appropriate OData attribute.
public abstract String	<i>getValue()</i> on page 296	Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.
public abstract boolean	<i>hasFixedLength()</i> on page 296	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isComplex()</i> on page 296	Returns if the property has complex type and has child properties.
public abstract boolean	<i>isCreatable()</i> on page 297	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isDeletable()</i> on page 297	Returns The value of the appropriate OData attribute.

Modifier and Type	Method	Description
public abstract boolean	<i>isFilterable()</i> on page 297	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isNullable()</i> on page 297	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isSearchable()</i> on page 297	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isUnicode()</i> on page 298	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 298	Returns The value of the appropriate OData attribute.
public abstract void	<i>putChildPropertyData(IODataProperty)</i> on page 298	Put new child property to this property document.
public abstract void	<i>setValue(String)</i> on page 298	Sets the value of the property, represented by this object.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*Usage*

May contain additional data retrieved from several source documents

*getChildPropertiesData() method*

Returns all the child properties added to this document with putChildProperty method.

*Syntax*

```
public abstract List< IODataProperty > getChildPropertiesData
()
```

*Returns*

List of child properties.

*getChildPropertiesDataWithAttribute(String, String) method*

Returns list of appropriate contained Property OData elements with the given attribute value.

*Syntax*

```
public abstract List< IODataProperty >
getChildPropertiesDataWithAttribute (String attributeName , String
attributeValue )
```

*Parameters*

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

*Returns*

list of appropriate contained Property OData elements with the given attribute value

*getChildPropertiesDataWithAttribute(String, String, boolean) method*

Returns list of appropriate contained Property OData elements with the given attribute value.

*Syntax*

```
public abstract List< IODataProperty >
getChildPropertiesDataWithAttribute ( String attributeName , String
attributeValue , boolean addByDefault )
```

*Parameters*

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

*Returns*

list of appropriate contained Property OData elements with the given attribute value

*getChildPropertyData(String) method*

Return a single child property added with putChildProperty method.

*Syntax*

```
public abstract IODataProperty getChildPropertyData ( String
propertyName )
```

*Parameters*

- **propertyName** – The name of the child property that should be returned.

*Returns*

The found child property or null if there is no child property with the given name.

*getCollation() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getCollation ()
```

*Returns*

The value of the appropriate OData attribute

### *getDefaultValue() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getDefaultValue ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getDetailDisplayOrder() method*

In current version it return the same value as getListDisplayOrder.

#### *Syntax*

```
public abstract int getDetailDisplayOrder ()
```

#### *Returns*

The value of 'display-order' attribute with default value = 0;

### *getLabel() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public abstract String getLabel ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getListDisplayOrder() method*

In current version it returns the same value as getDetailDisplayOrder.

#### *Syntax*

```
public abstract int getListDisplayOrder ()
```

#### *Returns*

The value of 'display-order' attribute with default value = 0;

### *getMaxLength() method*

Returns the value of the appropriate OData attribute with default value = 0;.

#### *Syntax*

```
public abstract int getMaxLength ()
```

**Returns**

The value of the appropriate OData attribute with default Value = 0;

**getName() method**

Returns The value of the appropriate OData attribute.

**Syntax**

```
public abstract String getName ()
```

**Returns**

The value of the appropriate OData attribute

**getPrecision() method**

Returns the value of the appropriate OData attribute.

**Syntax**

```
public abstract String getPrecision ()
```

**Returns**

The value of the appropriate OData attribute

**getScale() method**

Returns the value of the appropriate OData attribute.

**Syntax**

```
public abstract String getScale ()
```

**Returns**

The value of the appropriate OData attribute

**getSemantics() method**

Returns the value of the appropriate OData attribute with default Value = 0;.

**Syntax**

```
public abstract String getSemantics ()
```

**Returns**

The value of the appropriate OData attribute with default Value = 0;

### *getType() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public abstract String getType ()
```

### *Returns*

The value of the appropriate OData attribute

### *getValue() method*

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

### *Syntax*

```
public abstract String getValue ()
```

### *Returns*

the value of the property instance represented by this object.

### *Usage*

Otherwise it returns null.

Typically this object contains value only if this object was returned by an OData Entry.

### *hasFixedLength() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public abstract boolean hasFixedLength ()
```

### *Returns*

The value of the appropriate OData attribute

### *isComplex() method*

Returns if the property has complex type and has child properties.

### *Syntax*

```
public abstract boolean isComplex ()
```

### *Returns*

true if the property has complex type and has child properties.

*isCreatable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public abstract boolean isCreatable ()
```

*Returns*

The value of the appropriate OData attribute

*isDeletable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public abstract boolean isDeletable ()
```

*Returns*

The value of the appropriate OData attribute

*isFilterable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public abstract boolean isFilterable ()
```

*Returns*

The value of the appropriate OData attribute

*isNullable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public abstract boolean isNullable ()
```

*Returns*

The value of the appropriate OData attribute

*isSearchable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public abstract boolean isSearchable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isUnicode() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public abstract boolean isUnicode ()
```

### *Returns*

The value of the appropriate OData attribute

### *isUpdatable() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public abstract boolean isUpdatable ()
```

### *Returns*

The value of the appropriate OData attribute

### *putChildPropertyData(IODataProperty) method*

Put new child property to this property document.

### *Syntax*

```
public abstract void putChildPropertyData ( IODataProperty  
property )
```

### *Parameters*

- **property** – The child property

### *setValue(String) method*

Sets the value of the property, represented by this object.

### *Syntax*

```
public abstract void setValue (String value )
```

### *Parameters*

- **value** – The value of the property instance represented by this object.

### *Usage*

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an OData Entry object.

***ATTRIBUTE\_COLLATION variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_COLLATION
```

***ATTRIBUTE\_CREATABLE variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_CREATABLE
```

***ATTRIBUTE\_DEFAULTVALUE variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_DEFAULTVALUE
```

***ATTRIBUTE\_DELETABLE variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_DELETABLE
```

***ATTRIBUTE\_DETAIL\_DISPLAYORDER variable***

Name of the display-order OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_DETAIL_DISPLAYORDER
```

***ATTRIBUTE\_FILTERABLE variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_FILTERABLE
```

***ATTRIBUTE\_FIXEDLENGTH variable***

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_FIXEDLENGTH
```

### *ATTRIBUTE\_LABEL variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_LABEL
```

### *ATTRIBUTE\_LIST\_DISPLAYORDER variable*

Name of the display-order OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_LIST_DISPLAYORDER
```

### *ATTRIBUTE\_MAXLENGTH variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_MAXLENGTH
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

### *ATTRIBUTE\_NULLABLE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_NULLABLE
```

### *ATTRIBUTE\_PRECISION variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_PRECISION
```

### *ATTRIBUTE\_SCALE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SCALE
```

*ATTRIBUTE\_SEARCHABLE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_SEARCHABLE
```

*ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

*ATTRIBUTE\_TYPE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_TYPE
```

*ATTRIBUTE\_UNICODE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_UNICODE
```

*ATTRIBUTE\_UPDATABLE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_UPDATABLE
```

*ATTRIBUTE\_USEINSEARCH variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_USEINSEARCH
```

*ATTRIBUTE\_VISIBLEINDETAIL variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_VISIBLEINDETAIL
```

*ATTRIBUTE\_VISIBLEINLIST variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_VISIBLEINLIST
```

*ELEMENT\_PROPERTY variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_PROPERTY
```

*IODataSchema interface*

Represents the OData Service Document.

*Syntax*

```
public abstract interface IODataSchema extends
IParserDocument
```

*Derived classes*

- *IODataSchema* on page 814

*Members*

All members of IODataSchema, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ACTION_FOR</i> on page 313	name of the appropriate Odata attribute
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ENTITYTYPE</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAMESPACE</i> on page 314	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 314	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_DATASERVICES</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_EDMX</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYCONTAINER</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_FUNCTIONALIMPORT</i> on page 315	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SCHEMA</i> on page 315	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract IODataAssociation	<i>getAssociation(String)</i> on page 309	Returns the appropriate OData Association element with the given relationship attribute.
public abstract List<IODataAssociation >	<i>getAssociations()</i> on page 309	Returns the list of the appropriate OData elements.
public abstract IODataAssociationSet	<i>getAssociationSet(String)</i> on page 310	Returns the appropriate AssociationSet with for given association.
public abstract List<IODataAssociationSet >	<i>getAssociationSets()</i> on page 310	Returns the list of the appropriate OData elements.
public abstract IODataComplexType	<i>getComplexType(String)</i> on page 310	Returns The 'ComplexType' OData element associated with the reference.
public abstract List< IODataComplexType >	<i>getComplexTypes()</i> on page 310	Returns The list of the appropriate OData element.
public abstract IODataEntitySet	<i>getEntitySet(String)</i> on page 311	Returns The appropriate OData EntitySet.

Modifier and Type	Method	Description
public abstract IODataEntityType	<i>getEntityType(String)</i> on page 311	Returns The 'EntityType' OData element associated with the reference argument.
public abstract IODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 311	Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.
public abstract List< IODataFunctionImport >	<i>getFunctionImports()</i> on page 312	Returns The list of the 'FunctionImport' OData element.
public abstract List< IODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 312	Returns List of FunctionImports valid for the appropriate collection.
public abstract IODataServiceDocument	<i>getServiceDocument()</i> on page 312	Returns the appropriate OData Service Document.
public abstract String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 312	Resolves the target collection Id of the given OData Navigation Property element.
public abstract void	<i>setServiceDocument(IODataServiceDocument)</i> on page 313	Maintains reference to the appropriate OData Service Document.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getAssociation(String)* method

Returns the appropriate OData Association element with the given relationship attribute.

#### *Syntax*

```
public abstract IODataAssociation getAssociation (String
relationShip )
```

#### *getAssociations()* method

Returns the list of the appropriate OData elements.

#### *Syntax*

```
public abstract List< IODataAssociation > getAssociations ( )
```

#### *Returns*

List of the appropriate OData elements

### *getAssociationSet(String) method*

Returns the appropriate AssociationSet with for given association.

#### *Syntax*

```
public abstract IODataAssociationSet getAssociationSet  
( String association )
```

#### *Parameters*

- **association** – The association of the AssociationSet

#### *Returns*

The appropriate AssociationSet with for given association

### *getAssociationSets() method*

Returns the list of the appropriate OData elements.

#### *Syntax*

```
public abstract List< IODataAssociationSet >  
getAssociationSets ()
```

#### *Returns*

List of the appropriate OData elements

### *getComplexType(String) method*

Returns The 'ComplexType' OData element associated with the reference.

#### *Syntax*

```
public abstract IODataComplexType getComplexType (String  
complexTypeReference )
```

#### *Parameters*

- **complexTypeReference** – Reference to the appropriate Complex Type (example: 'namespace.complextypename')

#### *Returns*

The 'ComplexType' OData element associated with the reference

### *getComplexTypes() method*

Returns The list of the appropriate OData element.

#### *Syntax*

```
public abstract List< IODataComplexType > getComplexTypes ()
```

*Returns*

The list of the appropriate OData element

*getEntitySet(String) method*

Returns The appropriate OData EntitySet.

*Syntax*

```
public abstract IODataEntitySet getEntitySet ( String
collectionId )
```

*Parameters*

- **collectionId** – The href of the collection to find the OData EntitySet for

*Returns*

The appropriate OData EntitySet

*getEntityType(String) method*

Returns The 'EntityType' OData element associated with the reference argument.

*Syntax*

```
public abstract IODataEntityType getEntityType ( String
entityTypeReference )
```

*Parameters*

- **entityTypeReference** – Reference to the appropriate Entity Type (example: 'namespace.entitytypename')

*Returns*

The 'EntityType' OData element associated with the reference argument

*getEntityTypeForCollection(String) method*

Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.

*Syntax*

```
public abstract IODataEntityType getEntityTypeForCollection (
String collectionId )
```

*Parameters*

- **collectionId** – The Id to be compared with the name of 'EntitySet' elements

### *Returns*

The matching EntityType

### *getFunctionImports() method*

Returns The list of the 'FunctionImport' OData element.

### *Syntax*

```
public abstract List< IODataFunctionImport >  
getFunctionImports ()
```

### *Returns*

The list of the 'FunctionImport' OData element

### *getFunctionImportsForCollection(String) method*

Returns List of FunctionImports valid for the appropriate collection.

### *Syntax*

```
public abstract List< IODataFunctionImport >  
getFunctionImportsForCollection ( String collectionId )
```

### *Parameters*

- **collectionId** – The href of the appropriate collection.

### *Returns*

List of FunctionImports valid for the appropriate collection.

### *getServiceDocument() method*

Returns the appropriate OData Service Document.

### *Syntax*

```
public abstract IODataServiceDocument getServiceDocument ()
```

### *Returns*

The appropriate OData Service Document

### *getTargetCollectionIdForNavigationProperty(String, String) method*

Resolves the target collection Id of the given OData Navigation Property element.

### *Syntax*

```
public abstract String  
getTargetCollectionIdForNavigationProperty ( String  
sourceCollectionId , String navigationPropertyName )
```

*Parameters*

- **sourceCollectionId** – The source Id of the source collection that is linked with the target collection
- **navigationPropertyName** – The name of the Navigation Property

*Returns*

The Id of the target collection

*setServiceDocument(IODataServiceDocument) method*

Maintains reference to the appropriate OData Service Document.

*Syntax*

```
public abstract void setServiceDocument
( IODataServiceDocument serviceDocument )
```

*Parameters*

- **serviceDocument** – The appropriate OData Service Document

*ACTION\_FOR variable*

name of the appropriate Odata attribute

*Syntax*

```
public static final String ACTION_FOR
```

*ATTRIBUTE\_ENTITYSET variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_ENTITYSET
```

*ATTRIBUTE\_ENTITYTYPE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_ENTITYTYPE
```

*ATTRIBUTE\_NAME variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAME
```

*ATTRIBUTE\_NAMESPACE variable*

Name of the appropriate OData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAMESPACE
```

*ELEMENT\_COMPLEXTYPE variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_COMPLEXTYPE
```

*ELEMENT\_DATASERVICES variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_DATASERVICES
```

*ELEMENT\_EDMX variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_EDMX
```

*ELEMENT\_ENTITYCONTAINER variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_ENTITYCONTAINER
```

*ELEMENT\_ENTITYSET variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_ENTITYSET
```

*ELEMENT\_ENTITYTYPE variable*

Name of the appropriate OData element.

*Syntax*

```
public static final String ELEMENT_ENTITYTYPE
```

***ELEMENT\_FUNCTIONALIMPORT*** variable

Name of the appropriate OData element.

**Syntax**

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

***ELEMENT\_SCHEMA*** variable

Name of the appropriate OData element.

**Syntax**

```
public static final String ELEMENT_SCHEMA
```

***IODataServiceDocument*** interface

Represents the OData Service Document.

**Syntax**

```
public abstract interface IODataServiceDocument extends
  IParserDocument
```

**Derived classes**

- *IODataServiceDocument* on page 835

**Members**

All members of *IODataServiceDocument*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_BASE</i> on page 324	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_LANG</i> on page 324	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COLLECTION</i> on page 324	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SERVICE</i> on page 324	Name of the appropriate OData element.
public static final String	<i>ELEMENT_WORKSPACE</i> on page 324	Name of the appropriate OData element.
public static final String	<i>URL_SUFFIX_METADATA</i> on page 324	URL value suffix for retrieving OData Schema document.

**Methods**

Modifier and Type	Method	Description
public abstract List< IOData-Collection >	<i>getAllCollections()</i> on page 321	Returns the list of all 'collection' OData element contained by the 'workspace' elements.
public abstract String	<i>getBaseUrl()</i> on page 321	Returns The value of the 'base' OData attribute.
public abstract String	<i>getEtag()</i> on page 322	Returns The value of the 'etag' OData attribute.
public abstract String	<i>getLanguage()</i> on page 322	Returns the value of the 'lang' OData attribute.
public abstract IODataOpen-SearchDescription	<i>getOpenSearchDescription(String)</i> on page 322	Returns the appropriate Open-Search Description Document for the given collection.
public abstract IODataSchema	<i>getSchema()</i> on page 322	Returns the appropriate OData Schema document.
public abstract String	<i>getSchemaUrl()</i> on page 323	Returns The full URL that can be used for retrieving the OData Schema document.
public abstract List< IOData-Workspace >	<i>getWorkspaces()</i> on page 323	Returns the list of appropriate OData elements.
public abstract void	<i>setOpenSearchDescription(String, IODataOpen-SearchDescription)</i> on page 323	Maintains the appropriate OpenSearch Description Document for the given collection.
public abstract void	<i>setSchema(IODataSchema)</i> on page 323	Maintains the appropriate OData Schema document.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getAllCollections()* method

Returns the list of all 'collection' OData element contained by the 'workspace' elements.

#### *Syntax*

```
public abstract List< IODataCollection > getAllCollections
()
```

#### *Returns*

The list of all 'collection' OData element contained by the 'workspace' elements

#### *getBaseUrl()* method

Returns The value of the 'base' OData attribute.

#### *Syntax*

```
public abstract String getBaseUrl ()
```

#### *Returns*

The value of the 'base' OData attribute

### *getEtag() method*

Returns The value of the 'etag' OData attribute.

#### *Syntax*

```
public abstract String getEtag ()
```

#### *Returns*

The value of the 'etag' OData attribute

### *getLanguage() method*

Returns the value of the 'lang' OData attribute.

#### *Syntax*

```
public abstract String getLanguage ()
```

#### *Returns*

The value of the 'lang' OData attribute

### *getOpenSearchDescription(String) method*

Returns the appropriate OpenSearch Description Document for the given collection.

#### *Syntax*

```
public abstract IODataOpenSearchDescription  
getOpenSearchDescription ( String collectionId )
```

#### *Parameters*

- **collectionId** – The Id of the collection

#### *Returns*

The appropriate OpenSearch Description Document

### *getSchema() method*

Returns the appropriate OData Schema document.

#### *Syntax*

```
public abstract IODataSchema getSchema ()
```

#### *Returns*

The appropriate OData Schema document

*getSchemaUrl() method*

Returns The full URL that can be used for retrieving the OData Schema document.

*Syntax*

```
public abstract String getSchemaUrl ()
```

*Returns*

The full URL that can be used for retrieving the OData Schema document

*getWorkspaces() method*

Returns the list of appropriate OData elements.

*Syntax*

```
public abstract List< IODataWorkspace > getWorkspaces ()
```

*Returns*

The list of appropriate OData elements

*setOpenSearchDescription(String, IODataOpenSearchDescription) method*

Maintains the appropriate OpenSearch Description Document for the given collection.

*Syntax*

```
public abstract void setOpenSearchDescription (String  
collectionId , IODataOpenSearchDescription openSearchDescription )
```

*Parameters*

- **collectionId** – The Id of the collection
- **openSearchDescription** – The appropriate OpenSearch Description Document

*setSchema(IODataSchema) method*

Maintains the appropriate OData Schema document.

*Syntax*

```
public abstract void setSchema ( IODataSchema schema )
```

*Parameters*

- **schema** – The appropriate OData Schema document

### *ATTRIBUTE\_BASE variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_BASE
```

### *ATTRIBUTE\_LANG variable*

Name of the appropriate OData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_LANG
```

### *ELEMENT\_COLLECTION variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_COLLECTION
```

### *ELEMENT\_SERVICE variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_SERVICE
```

### *ELEMENT\_WORKSPACE variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ELEMENT_WORKSPACE
```

### *URL\_SUFFIX\_METADATA variable*

URL value suffix for retrieving OData Schema document.

#### *Syntax*

```
public static final String URL_SUFFIX_METADATA
```

### *IODataSubscriptionEntry interface*

Subclass of ODataEntry to be used for subscription s.

#### *Syntax*

```
public abstract interface IODataSubscriptionEntry extends  
IODataEntry
```

*Derived classes*

- *ODataSubscriptionEntry* on page 853

*Members*

All members of *IODataSubscriptionEntry*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_COLLECTION</i> on page 338	Name of the appropriate OData element.
public static final String	<i>ELEMENT_DELIVERYADDRESS</i> on page 338	Name of the appropriate OData element.
public static final String	<i>ELEMENT_FILTER</i> on page 338	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SELECT</i> on page 338	Name of the appropriate OData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getCollection()</i> on page 336	Returns The value of the appropriate entry property.
public abstract String	<i>getDeliveryAddress()</i> on page 336	Returns The value of the appropriate entry property.
public abstract String	<i>getFilter()</i> on page 336	Returns The value of the appropriate entry property.
public abstract String	<i>getSelect()</i> on page 337	Returns The value of the appropriate entry property.
public abstract void	<i>setCollection(String)</i> on page 337	Sets the value of the appropriate entry property.
public abstract void	<i>setDeliveryAddress(String)</i> on page 337	Sets the value of the appropriate entry property.
public abstract void	<i>setFilter(String)</i> on page 337	Sets the value of the appropriate entry property.
public abstract void	<i>setSelect(String)</i> on page 337	Sets the value of the appropriate entry property.

**Inherited members from *IODataEntry***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public abstract List< IOData-Link >	<i>getActionLinks()</i> on page 208	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 208	Returns The value of the 'name' OData element of the 'author' OData element.

Modifier and Type	Member	Description
public cacheState	<i>getCacheState()</i> on page 208	
public Long	<i>getCacheTimestamp()</i> on page 208	
public abstract String	<i>getCollectionId()</i> on page 208	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getContentType()</i> on page 209	Returns the content type of the entry.
public abstract String	<i>getEtag()</i> on page 209	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 209	Returns the full execution URL that can be used for filtering collection search for this single entry.
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 209	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 210	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 210	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.

Modifier and Type	Member	Description
public abstract List< IODataIcon >	<i>getIcons()</i> on page 210	Returns the list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 210	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 211	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 211	Returns the values of the properties that are marked as key properties in the OData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 211	Returns The parsed value of the 'updated' OData Element.
public abstract List< IODataLink >	<i>getLinks()</i> on page 211	Returns the list of the appropriate OData elements.
public abstract String	<i>getMediaSrc()</i> on page 211	Returns the media source if the entry has a media content.
public abstract List< IODataProperty >	<i>getPropertiesData()</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getPropertiesDocument()</i> on page 213	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 213	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 213	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 214	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List&lt; String[]&gt;)</i> on page 214	Return list of property values for the given property paths.
public abstract List< IODataLink >	<i>getRelatedDataLinks()</i> on page 215	Returns OData Link objects that represents links to Related Data.
public abstract List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 215	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract IODataSchema	<i>getSchema()</i> on page 215	Returns the appropriate OData Schema object.
public abstract IODataLink	<i>getSelfLink()</i> on page 215	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

Modifier and Type	Member	Description
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 216	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 216	Returns The value of the appropriate OData element.
public abstract String	<i>getTitle()</i> on page 216	Returns The value of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 216	Puts the new property element as a sub-element of the 'complex properties' OData element.
public abstract void	<i>putContentType(String)</i> on page 217	Puts the content type for a new entry object.
public abstract void	<i>putId(String)</i> on page 217	Sets id of this OData Entry document (value of appropriate OData Id element)
public abstract void	<i>putMediaSrc(String)</i> on page 217	Puts the media source for a new entry object.
public abstract void	<i>putPropertyValue(String, String)</i> on page 217	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 218	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>setAuthorName(String)</i> on page 218	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cache.State)</i> on page 218	
public void	<i>setCacheTimestamp(Long)</i> on page 219	

Modifier and Type	Member	Description
public abstract void	<i>setCollectionId(String)</i> on page 219	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 219	
public abstract void	<i>setSchema(IODataSchema)</i> on page 219	Maintains the reference to the appropriate OData Schema object.
public abstract void	<i>setSummary(String)</i> on page 219	Sets the value of the appropriate OData element.
public abstract void	<i>setTitle(String)</i> on page 219	Sets the value of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*getCollection() method*

Returns The value of the appropriate entry property.

*Syntax*

```
public abstract String getCollection ()
```

*Returns*

The value of the appropriate entry property

*getDeliveryAddress() method*

Returns The value of the appropriate entry property.

*Syntax*

```
public abstract String getDeliveryAddress ()
```

*Returns*

The value of the appropriate entry property

*getFilter() method*

Returns The value of the appropriate entry property.

*Syntax*

```
public abstract String getFilter ()
```

*Returns*

The value of the appropriate entry property

*getSelect() method*

Returns The value of the appropriate entry property.

*Syntax*

```
public abstract String getSelect ()
```

*Returns*

The value of the appropriate entry property

*setCollection(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public abstract void setCollection (String collection)
```

*Parameters*

- **collection** – The new value of the appropriate entry property

*setDeliveryAddress(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public abstract void setDeliveryAddress (String deliveryAddress)
```

*Parameters*

- **deliveryAddress** –

*setFilter(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public abstract void setFilter (String filterString)
```

*Parameters*

- **filterString** – The new value of the appropriate entry property

*setSelect(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public abstract void setSelect (String selectString)
```

### *Parameters*

- **selectString** – The new value of the appropriate entry property

### *ELEMENT\_COLLECTION variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_COLLECTION
```

### *ELEMENT\_DELIVERYADDRESS variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_DELIVERYADDRESS
```

### *ELEMENT\_FILTER variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_FILTER
```

### *ELEMENT\_SELECT variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_SELECT
```

### *IODataURL interface*

Represents the appropriate OData element.

### *Syntax*

```
public abstract interface IODataURL extends IParserDocument
```

### *Derived classes*

- *IODataURL* on page 888

### *Members*

All members of IODataURL, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_TEMPLATE</i> on page 346	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 346	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_URL</i> on page 346	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract List< String >	<i>getMandatoryTemplateParameters()</i> on page 344	Returns the list of mandatory template parameter names.
public abstract List< String >	<i>getOptionalTemplateParameters()</i> on page 345	Returns the list of optional template parameter names.
public abstract String	<i>getTemplate()</i> on page 345	Returns the value of the appropriate OData attribute.
public abstract List< String >	<i>getTemplateParameters()</i> on page 345	Returns the list of all template parameter names.
public abstract String	<i>getType()</i> on page 345	Returns the value of the appropriate OData attribute.
public abstract String	<i>getUrl()</i> on page 345	Returns the full URL of this OData attribute without parameters.
public abstract String	<i>getUrlFromTemplate(Map&lt; String, String &gt;)</i> on page 346	Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *getMandatoryTemplateParameters()* method

Returns the list of mandatory template parameter names.

#### Syntax

```
public abstract List< String > getMandatoryTemplateParameters
()
```

#### Returns

the list of mandatory template parameter names

***getOptionalTemplateParameters() method***

Returns the list of optional template parameter names.

***Syntax***

```
public abstract List< String > getOptionalTemplateParameters  
( )
```

***Returns***

the list of optional template parameter names

***getTemplate() method***

Returns the value of the appropriate OData attribute.

***Syntax***

```
public abstract String getTemplate ( )
```

***Returns***

The value of the appropriate OData attribute

***getTemplateParameters() method***

Returns the list of all template parameter names.

***Syntax***

```
public abstract List< String > getTemplateParameters ( )
```

***Returns***

the list of all template parameter names

***getType() method***

Returns the value of the appropriate OData attribute.

***Syntax***

```
public abstract String getType ( )
```

***Returns***

The value of the appropriate OData attribute

***getUrl() method***

Returns the full URL of this OData attribute without parameters.

***Syntax***

```
public abstract String getUrl ( )
```

### *Returns*

The full URL this OData attribute without parameters

### *getUrlFromTemplate(Map< String, String >) method*

Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.

### *Syntax*

```
public abstract String getUrlFromTemplate (Map< String,  
String > parameters )
```

### *Returns*

The full URL this OData attribute with parameters names and values

### *ATTRIBUTE\_TEMPLATE variable*

Name of the appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_TEMPLATE
```

### *ATTRIBUTE\_TYPE variable*

Name of the appropriate OData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_TYPE
```

### *ELEMENT\_URL variable*

Name of the appropriate OData element.

### *Syntax*

```
public static final String ELEMENT_URL
```

### *IODataWorkspace interface*

### *Syntax*

```
public abstract interface IODataWorkspace extends  
IParserDocument
```

### *Derived classes*

- *IODataWorkspace* on page 906

### *Members*

All members of IODataWorkspace, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 353	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_TITLE</i> on page 353	Name of the appropriate OData element.
public static final String	<i>ELEMENT_WORKSPACE</i> on page 353	Name of the appropriate OData element.

### Methods

Modifier and Type	Method	Description
public abstract List< IOData-Collection >	<i>getCollections()</i> on page 352	Returns The list of of 'collection' OData element.
public abstract String	<i>getSemantics()</i> on page 352	Returns the value of the appropriate OData attribute.
public abstract String	<i>getTitle()</i> on page 352	Returns the value of the appropriate OData element.

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*getCollections()* method

Returns The list of of 'collection' OData element.

*Syntax*

```
public abstract List< IODataCollection > getCollections ()
```

*Returns*

The list of of 'collection' OData element.

*getSemantics()* method

Returns the value of the appropriate OData attribute.

*Syntax*

```
public abstract String getSemantics ()
```

*Returns*

The value of the appropriate OData attribute

*getTitle()* method

Returns the value of the appropriate OData element.

*Syntax*

```
public abstract String getTitle ()
```

*Returns*

The value of the appropriate OData element

***ATTRIBUTE\_SEMANTICS* variable**

Name of the appropriate OData attribute.

***Syntax***

```
public static final String ATTRIBUTE_SEMANTICS
```

***ELEMENT\_TITLE* variable**

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_TITLE
```

***ELEMENT\_WORKSPACE* variable**

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_WORKSPACE
```

***IParser* interface**

Main interface for OData parser.

***Syntax***

```
public abstract interface IParser
```

***Derived classes***

- *Parser* on page 921

***Members***

All members of IParser, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final int	<i>FORMAT_JSON</i> on page 365	JSON Format for Building Post Body.
public static final int	<i>FORMAT_XML</i> on page 365	XML Format for Building Post Body.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>buildODataDocument(IParserDocument)</i> on page 356	Builds a valid OData Entry XML Post body from the entry argument.
public String	<i>buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int)</i> on page 356	Builds a valid OData Entry JSON Post body from the entry argument.
public void	<i>enableParserPerformanceLog(boolean, Context)</i> on page 357	This method is to be called if performance data point are to be enabled for Parser.
public abstract IParserDocument	<i>parse(String)</i> on page 357	Parses the Source and converts it to a Java Object containing all the information that were contained by the source.
public abstract IParserDocument	<i>parse(InputStream)</i> on page 358	Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.
public abstract List<IODataEntry >	<i>parseFunctionImportResult(String, IODataFunctionImport, IODataSchema)</i> on page 358	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..
public abstract List<IODataEntry >	<i>parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema)</i> on page 359	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..
public abstract List<IODataEntry >	<i>parseODataEntries(String, String, IODataSchema)</i> on page 359	Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

Modifier and Type	Method	Description
public abstract List<IODataEntry >	<i>parseODataEntries(InputStream, String, IODataSchema)</i> on page 360	Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.
public abstract IODataError	<i>parseODataError(String)</i> on page 360	Parses the OData Error.
public abstract IODataError	<i>parseODataError(InputStream)</i> on page 361	Parses the OData Error from stream.
public IODataFeed	<i>parseODataFeed(String, String, IODataSchema)</i> on page 361	Parse OData Feed, support for Delta Query.
public IODataFeed	<i>parseODataFeed(InputStream, String, IODataSchema)</i> on page 362	Parse OData Feed from stream, support for Delta Query.
public abstract IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(String, String, IODataServiceDocument)</i> on page 362	Parses the OData Open Search Description.
public abstract IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument)</i> on page 362	Parses the OData Open Search Description from stream.
public abstract IODataSchema	<i>parseODataSchema(String, IODataServiceDocument)</i> on page 363	Parses the OData Schema.
public abstract IODataSchema	<i>parseODataSchema(InputStream, IODataServiceDocument)</i> on page 363	Parses the OData Schema from stream.
public abstract IODataServiceDocument	<i>parseODataServiceDocument(String)</i> on page 364	Parses the OData Service Document.
public abstract IODataServiceDocument	<i>parseODataServiceDocument(InputStream)</i> on page 364	Parses the OData Service Document from stream.

### *buildODataDocument(IParserDocument) method*

Builds a valid OData Entry XML Post body from the entry argument.

#### *Syntax*

```
public abstract String buildODataDocument ( IParserDocument  
document ) throws ParserException, IllegalArgumentException
```

#### *Parameters*

- **entry** – The ODataEntry object to build the from
- **document** – The ParserDocument object to build the from

#### *Returns*

The built documentThe built document

#### *Exceptions*

- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds and representation of the document argument
- **ParserException class** – If building document has failed
- **IllegalArgumentException** – If the argument is null

### *buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int) method*

Builds a valid OData Entry JSON Post body from the entry argument.

#### *Syntax*

```
public String buildODataEntryRequestBody ( IODataEntry entry ,  
String collectionId , IODataSchema schema , int formatType ) throws  
ParserException
```

#### *Parameters*

- **entry** – The ODataEntry object to build the from
- **collectionID** –
- **entry** – The ODataEntry object to build the from
- **collectionID** – Collection t which the entry would be posted
- **schema** – Schema of the service
- **formatType** – Format of the post body to be built 1 - Atom/XML 2 - JSON

#### *Returns*

The built documentThe built document

*Exceptions*

- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds a valid OData Entry XML or JSON Post body from the entry argument
- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null

*enableParserPerformanceLog(boolean, Context) method*

This method is to be called if performance data point are to be enabled for Parser.

*Syntax*

```
public void enableParserPerformanceLog ( boolean perflog ,
Context applicationContext )
```

*Parameters*

- **perflog** –
- **applicationContext** –

*parse(String) method*

Parses the Source and converts it to a Java Object containing all the information that were contained by the source.

*Syntax*

```
public abstract IParserDocument parse ( String document ) throws
ParserException, IllegalArgumentException
```

*Parameters*

- **A** – syntactically valid document

*Returns*

The Object representation of the parsed document

*Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parse(InputStream) method*

Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.

### *Syntax*

```
public abstract IParserDocument parse (InputStream stream) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – A stream that holds a syntactically valid document

### *Returns*

The Object representation of the parsed document

### *Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseFunctionImportResult(String, IODataFunctionImport, IODataSchema) method*

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..

### *Syntax*

```
public abstract List< IODataEntry > parseFunctionImportResult  
(String document , IODataFunctionImport functionImport ,  
IODataSchema schema) throws ParserException,  
IllegalArgumentException
```

### *Parameters*

- **document** – The Function Import result document
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

### *Returns*

List of OData Entry containing the result values

### *Exceptions*

- **ParserException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

*parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema) method*

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.

*Syntax*

```
public abstract List< IODataEntry > parseFunctionImportResult
( InputStream stream , IODataFunctionImport functionImport ,
IODataSchema schema ) throws ParseException,
IllegalArgumentException
```

*Parameters*

- **stream** – The function Import result stream
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

*Returns*

List of OData Entry containing the result values

*Exceptions*

- **ParseException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

*parseODataEntries(String, String, IODataSchema) method*

Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

*Syntax*

```
public abstract List< IODataEntry > parseODataEntries ( String
entries , String collectionId , IODataSchema schema ) throws
ParseException, IllegalArgumentException
```

*Parameters*

- **entries** – The source of either a single OData Entry or OData Feed of several OData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

*Returns*

The list of the OData Entries contained by the source

### *Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataEntries(InputStream, String, IODataSchema) method*

Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.

### *Syntax*

```
public abstract List< IODataEntry > parseODataEntries  
( InputStream stream , String collectionId , IODataSchema schema ) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – The stream that holds the source of either a single OData Entry or OData Feed of several OData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

### *Returns*

The list of the OData Entries contained by the source

### *Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataError(String) method*

Parses the OData Error.

### *Syntax*

```
public abstract IODataError parseODataError ( String error ) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **error** – The OData Error

### *Returns*

The OData Error document

*Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

*parseODataError(InputStream) method*

Parses the OData Error from stream.

*Syntax*

```
public abstract IODataError parseODataError ( InputStream
stream ) throws ParserException, IllegalArgumentException
```

*Parameters*

- **stream** – The OData Error as stream

*Returns*

The OData Error document

*Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

*parseODataFeed(String, String, IODataSchema) method*

Parse OData Feed, support for Delta Query.

*Syntax*

```
public IODataFeed parseODataFeed ( String feed, String collectionId,
IODataSchema schema ) throws ParserException
```

*Parameters*

- **feed** –
- **collectionId** –
- **schema** –

*Exceptions*

- **SDMParseException** –

### *parseODataFeed(InputStream, String, IODataSchema) method*

Parse OData Feed from stream, support for Delta Query.

#### *Syntax*

```
public IODataFeed parseODataFeed ( InputStream stream , String  
collectionId , IODataSchema schema ) throws ParserException
```

#### *Parameters*

- **stream** –
- **collectionId** –
- **schema** –

#### *Exceptions*

- **ParserException class** –

### *parseODataOpenSearchDescription(String, String, IODataServiceDocument) method*

Parses the OData Open Search Description.

#### *Syntax*

```
public abstract IODataOpenSearchDescription  
parseODataOpenSearchDescription ( String openSearchDescription ,  
String collectionId , IODataServiceDocument serviceDocument ) throws  
ParserException, IllegalArgumentException
```

#### *Parameters*

- **openSearchDescription** – The OData Open Search Description

#### *Returns*

OData Open Search Description document

#### *Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument) method*

Parses the OData Open Search Description from stream.

#### *Syntax*

```
public abstract IODataOpenSearchDescription  
parseODataOpenSearchDescription ( InputStream stream , String
```

*collectionId*, *IODataServiceDocument serviceDocument*) throws *ParserException*, *IllegalArgumentException*

### Parameters

- **stream** – The stream that holds the OData Open Search Description .

### Returns

OData Open Search Description document

### Exceptions

- **ParserException class** – If the stream source is invalid.
- **IllegalArgumentException** – If the argument is null.

### *parseODataSchema(String, IODataServiceDocument) method*

Parses the OData Schema.

### Syntax

```
public abstract IODataSchema parseODataSchema (String schema ,
IODataServiceDocument serviceDocument) throws ParserException,
IllegalArgumentException
```

### Parameters

- **schema** – The OData Schema
- **serviceDocument** – The appropriate OData Service Document object

### Returns

The OData Schema document

### Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataSchema(InputStream, IODataServiceDocument) method*

Parses the OData Schema from stream.

### Syntax

```
public abstract IODataSchema parseODataSchema (InputStream
stream , IODataServiceDocument serviceDocument) throws
ParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – The stream that holds OData Schema
- **serviceDocument** – The appropriate OData Service Document object

### *Returns*

The OData Schema document

### *Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataServiceDocument(String) method*

Parses the OData Service Document.

### *Syntax*

```
public abstract IODataServiceDocument  
parseODataServiceDocument ( String serviceDocument ) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **serviceDocument** – The OData Service Document

### *Returns*

The OData Service Document

### *Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataServiceDocument(InputStream) method*

Parses the OData Service Document from stream.

### *Syntax*

```
public abstract IODataServiceDocument  
parseODataServiceDocument ( InputStream stream ) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – The stream that holds OData Service Document

*Returns*

The OData Service Document

*Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

*FORMAT\_JSON variable*

JSON Format for Building Post Body.

*Syntax*

```
public static final int FORMAT_JSON
```

*FORMAT\_XML variable*

XML Format for Building Post Body.

*Syntax*

```
public static final int FORMAT_XML
```

*IParserDocument interface*

Represents a general XML-compatible, persistable object.

*Syntax*

```
public abstract interface IParserDocument extends
IPersistable
```

*Derived classes*

- *IODataAssociation* on page 141
- *IODataCollection* on page 158
- *IODataComplexType* on page 171
- *IODataEntitySet* on page 177
- *IODataEntityType* on page 185
- *IODataEntry* on page 196

- *IODataServiceDocument* on page 315
- *IODataURL* on page 338
- *IODataWorkspace* on page 346
- *ParserDocument* on page 935

*Members*

All members of *IParserDocument*, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .

Modifier and Type	Variable	Description
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

## Methods

Modifier and Type	Method	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Method	Description
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParseDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParseDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.

Modifier and Type	Method	Description
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Method	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

### Usage

XML like elements, values and attributes can be access via routes Routes are list of element names where each element contains the next element in the list

Elements can be retrieved as a new `IParserDocument` containing all the attributes, values and child elements of the represented element.

Empty routes always refer to the given object the method invoked on

### *IParserDocument.EDMSIMPLETYPES* enum

Enum for all the available simple types.

### Members

All members of `EDMSIMPLETYPES`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	<i>BINARY</i> on page 372	
public	<i>BOOLEAN</i> on page 372	
public	<i>BYTE</i> on page 372	
public	<i>DATETIME</i> on page 372	
public	<i>DATETIMEOFFSET</i> on page 372	
public	<i>DECIMAL</i> on page 372	
public	<i>DOUBLE</i> on page 372	
public	<i>FLOAT</i> on page 372	
public	<i>GUID</i> on page 373	
public	<i>INT16</i> on page 373	
public	<i>INT32</i> on page 373	
public	<i>INT64</i> on page 373	
public	<i>SBYTE</i> on page 373	
public	<i>SINGLE</i> on page 373	
public	<i>STRING</i> on page 373	
public	<i>TIME</i> on page 373	

*BINARY variable*

*Syntax*

```
public BINARY
```

*BOOLEAN variable*

*Syntax*

```
public BOOLEAN
```

*BYTE variable*

*Syntax*

```
public BYTE
```

*DATETIME variable*

*Syntax*

```
public DATETIME
```

*DATETIMEOFFSET variable*

*Syntax*

```
public DATETIMEOFFSET
```

*DECIMAL variable*

*Syntax*

```
public DECIMAL
```

*DOUBLE variable*

*Syntax*

```
public DOUBLE
```

*FLOAT variable*

*Syntax*

```
public FLOAT
```

*GUID variable**Syntax*

```
public  GUID
```

*INT16 variable**Syntax*

```
public  INT16
```

*INT32 variable**Syntax*

```
public  INT32
```

*INT64 variable**Syntax*

```
public  INT64
```

*SBYTE variable**Syntax*

```
public  SBYTE
```

*SINGLE variable**Syntax*

```
public  SINGLE
```

*STRING variable**Syntax*

```
public  STRING
```

*TIME variable**Syntax*

```
public  TIME
```

### *clone() method*

Creates a copy of this object.

### *Syntax*

```
public abstract IParserDocument clone () throws  
CloneNotSupportedException
```

### *Returns*

The new copy of this object

### *getAttribute(String...) method*

Returns the value of the first attribute with the given route.

### *Syntax*

```
public abstract String getAttribute (String... route ) throws  
IllegalArgumentException
```

### *Parameters*

- **route** – The route to the attribute

### *Returns*

The value of the first attribute or null if there is no such attribute

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getAttributes(String...) method*

Returns all the values of attributes with the given route.

### *Syntax*

```
public abstract List< String > getAttributes (String... route )  
throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the attributes

### *Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildAttributeMap(String...) method*

Returns all the name-value pairs of attributes contained by the element with the given route.

*Syntax*

```
public abstract Map< String, String > getChildAttributeMap
( String... route ) throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the element with the child attributes

*Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildAttributes(String...) method*

Returns all the values of attributes contained by the element with the given route.

*Syntax*

```
public abstract List< String > getChildAttributes ( String...
route ) throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the element with the child attributes

*Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildDocuments(String...) method*

Returns the elements contained by the element with the given route.

*Syntax*

```
public abstract List< IParserDocument > getChildDocuments
( String... route ) throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element with the child elements

### *Returns*

List of elements as new `IParser` documents

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getChildDocumentsWithAttribute(String, String, String...) method*

Returns the elements contained by the element with the given route and having the given attribute with the given value.

### *Syntax*

```
public abstract List< IParserDocument >  
getChildDocumentsWithAttribute ( String attributeName , String  
attributeValue , String... route ) throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### *Returns*

List of elements as new `IParser` documents

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *getChildDocumentsWithAttribute(String, String, boolean, String...) method*

Returns the elements contained by the element with the given route and having the given attribute with the given value.

### *Syntax*

```
public abstract List< IParserDocument >  
getChildDocumentsWithAttribute ( String attributeName , String  
attributeValue , boolean addByDefault , String... route )
```

*Parameters*

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

*Returns*

List of elements as new IParser documents

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*getDocument(String...) method*

Returns the first element with the given route.

*Syntax*

```
public abstract IParserDocument getDocument ( String... route )
throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the element

*Returns*

The element as a new IParser document or null if there is no such element

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getDocuments(String...) method*

Returns all the elements with the given route.

*Syntax*

```
public abstract List< IParserDocument > getDocuments
( String... route ) throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the elements

### Returns

List of elements as new IParser documents

### Exceptions

- **IllegalArgumentException** – if the argument is null.

### *getDocumentsWithAttribute(String, String, String...) method*

Returns the elements with the given route that contains the given attribute with the given value.

### Syntax

```
public abstract List< IParserDocument >  
getDocumentsWithAttribute ( String attributeName , String  
attributeValue , String... route )
```

### Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### Returns

List of elements as new IParser documents

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentsWithAttribute(String, String, boolean, String...) method*

Returns the elements with the given route that contains the given attribute with the given value.

### Syntax

```
public abstract List< IParserDocument >  
getDocumentsWithAttribute ( String attributeName , String  
attributeValue , boolean addByDefault , String... route )
```

### Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

- **addByDefault** – true if element should be returned in case it does not contain the given attribute

### Returns

List of elements as new IParser documents

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentWithAttribute(String, String, String...) method*

Returns the first element with the given route that contains the given attribute with the given value.

### Syntax

```
public abstract IParserDocument getDocumentWithAttribute
( String attributeName , String attributeValue , String... route )
```

### Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### Returns

The element as a new IParser document or null if there is no such element

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentWithAttribute(String, String, boolean, String...) method*

Returns the first element with the given route that contains the given attribute with the given value.

### Syntax

```
public abstract IParserDocument getDocumentWithAttribute
( String attributeName , String attributeValue , boolean addByDefault ,
String... route )
```

### Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

- **addByDefault** – true if element should be returned in case it does not contain the given attribute

### *Returns*

The element as a new IParser document or null if there is no such element

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *getElementName() method*

Returns The name of the root element of this document.

### *Syntax*

```
public abstract String getElementName ()
```

### *Returns*

The name of the root element of this document

### *getFunctionImportComplexPropertyValue(String...) method*

### *Syntax*

```
public abstract String getFunctionImportComplexPropertyValue  
(String... route)
```

### *getPrefixForUri(String) method*

Returns the appropriate name-space prefix for the given XML name-space URI.

### *Syntax*

```
public abstract String getPrefixForUri (String uri) throws  
IllegalArgumentException
```

### *Parameters*

- **uri** – An XML names-pace URI

### *Returns*

The appropriate name-space prefix

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getStrings() method*

Returns all the string values contained by this document.

*Syntax*

```
public abstract String[] getStrings ()
```

*Returns*

all the string values contained by this document

*getValue(String...) method*

Returns the value of the first element with the given route.

*Syntax*

```
public abstract String getValue (String... route ) throws
IllegalArgumentException
```

*Parameters*

- **route** – The route to the element

*Returns*

The value of the first element or null if there is no such element

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getValues(String...) method*

Returns all the values of elements with the given route.

*Syntax*

```
public abstract List< String > getValues (String... route ) throws
IllegalArgumentException
```

*Parameters*

- **route** – The route to the elements

*Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *putAttribute(String, String...) method*

Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non-existing elements in the route.

#### *Syntax*

```
public abstract void putAttribute (String value , String... route)  
throws IllegalArgumentException
```

#### *Parameters*

- **value** – The new value
- **route** – The route to the attribute

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *putDocument(IParserDocument, String...) method*

Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.

#### *Syntax*

```
public abstract void putDocument ( IParserDocument document ,  
String... route ) throws IllegalArgumentException
```

#### *Parameters*

- **document** – The new document
- **route** – The route to the parent element of the new document

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *putValue(String, String...) method*

Sets the value of the first element with the given route.

#### *Syntax*

```
public abstract void putValue (String value , String... route)  
throws IllegalArgumentException
```

*Parameters*

- **value** – The new value
- **route** – The route to the element

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*removeAttribute(String...) method*

Removes first element with the given route.

*Syntax*

```
public abstract boolean removeAttribute (String... route)
```

*Parameters*

- **route** – The route to the attribute to remove

*Returns*

true if at least one attribute has been removed or false otherwise

*removeAttributes(String...) method*

Removes all the attribute with the given route.

*Syntax*

```
public abstract boolean removeAttributes (String... route)
```

*Parameters*

- **route** – The route to the attributes to remove

*Returns*

true if at least one attribute has been removed or false otherwise

*removeDocument(String...) method*

Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

*Syntax*

```
public abstract boolean removeDocument (String... route) throws  
IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element to remove

### *Returns*

true if at least one element has been removed or false otherwise

### *setAttributes(List< String >, String...) method*

Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

### *Syntax*

```
public abstract void setAttributes ( List< String > values ,  
String... route ) throws IllegalArgumentException
```

### *Parameters*

- **values** – The new values of the attributes
- **route** – The route to the attributes

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *setDocuments(List< IParserDocument >, String...) method*

Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

### *Syntax*

```
public abstract void setDocuments ( List< IParserDocument >  
documents , String... route ) throws IllegalArgumentException
```

### *Parameters*

- **documents** – The list of new documents or nulls if one or more document should be removed
- **route** – The route to the elements

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*setElementName(String, String...) method*

Sets the name of the root element with the given route Use empty route for setting root name of this document.

*Syntax*

```
public abstract void setElementName ( String name , String...
route ) throws IllegalArgumentException
```

*Parameters*

- **name** – The new name of the root element
- **route** – The route to the element

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*setValues(List< String >, String...) method*

Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

*Syntax*

```
public abstract void setValues ( List< String > values ,
String... route ) throws IllegalArgumentException
```

*Parameters*

- **values** – The new values of the elements
- **route** – The route to the elements

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*toXMLString() method*

Returns the XML string representation of this object.

*Syntax*

```
public abstract String toXMLString ()
```

*Returns*

The XML string representation of this object

### *ATTRIBUTE\_ETAG variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static final String ATTRIBUTE_ETAG
```

### *ATTRIBUTE\_VALUEPREFIX\_EDMTYPE variable*

Value prefix for EDM Type type values.

#### *Syntax*

```
public static final String ATTRIBUTE_VALUEPREFIX_EDMTYPE
```

### *DEFAULT\_PREFIXMAPPING variable*

The default XML Namespace-to-Prefix mapping used for building XMLS.

#### *Syntax*

```
public static Map< String, String > DEFAULT_PREFIXMAPPING
```

### *EDMDATETIME\_PATTERNS variable*

Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

#### *Syntax*

```
public static final String[] EDMDATETIME_PATTERNS
```

### *EDMDATETIMEOFFSET\_PATTERNS variable*

Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

#### *Syntax*

```
public static final String[] EDMDATETIMEOFFSET_PATTERNS
```

### *EDMTIME\_PATTERN variable*

EDM Time pattern.

#### *Syntax*

```
public static final String EDMTIME_PATTERN
```

### *ELEMENT\_FEED variable*

Name of the appropriate OData element.

#### *Syntax*

```
public static String ELEMENT_FEED
```

***ELEMENT\_ID variable***

Name of the appropriate OData element.

***Syntax***

```
public static final String ELEMENT_ID
```

***ROOT\_DOCUMENT\_NAME variable***

The default root element name for a new document.

***Syntax***

```
public static final String ROOT_DOCUMENT_NAME
```

***XMLNS\_APPLICATION\_URI variable***

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

***Syntax***

```
public static final String XMLNS_APPLICATION_URI
```

***XMLNS\_ATOM\_URI variable***

Constant for XMLNS URI: <http://www.w3.org/2005/Atom>.

***Syntax***

```
public static final String XMLNS_ATOM_URI
```

***XMLNS\_DATASERVICES\_URI variable***

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

***Syntax***

```
public static final String XMLNS_DATASERVICES_URI
```

***XMLNS\_EDM\_URI variable***

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/05/edm>.

***Syntax***

```
public static final String XMLNS_EDM_URI
```

***XMLNS\_EDMX\_URI variable***

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/06/edmx>.

***Syntax***

```
public static final String XMLNS_EDMX_URI
```

*XMLNS\_GENERICPLAYER\_URI variable*

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData/GenericPlayer>.

*Syntax*

```
public static final String XMLNS_GENERICPLAYER_URI
```

*XMLNS\_METADATA\_URI variable*

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices/metadata>.

*Syntax*

```
public static final String XMLNS_METADATA_URI
```

*XMLNS\_SAP\_URI variable*

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData>.

*Syntax*

```
public static final String XMLNS_SAP_URI
```

*IPersistable interface*

Interface that any object should implement that is to store by SDMPersistence.

*Syntax*

```
public interface IPersistable
```

*Derived classes*

- *IParserDocument* on page 365
- *Logger* on page 426

*Members*

All members of IPersistable, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

*Parameters*

- **reader** – The buffered reader to read the object from.

*Exceptions*

- **PersistenceException class** – if data can not be loaded from the reader.

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException class** – if data can not be written into the writer

*IPreferenceChangeListener interface*

Interface for classes that are to listen changes of preferences.

*Syntax*

```
public interface IPreferenceChangeListener
```

*Derived classes*

- *RequestManager* on page 994

*Members*

All members of IPreferenceChangeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onPreferenceChanged(String, Object)</i> on page 390	Callback method for preference change event.

*onPreferenceChanged(String, Object) method*

Callback method for preference change event.

*Syntax*

```
public void onPreferenceChanged ( String key , Object value )
```

*Parameters*

- **key** – key of the preference
- **value** – value of the preference

```
public class Activity implements IPreferenceChangeListener{ ...@override public void
onPreferenceChanged(String key, Object value) { Logger.d(TAG,"Got preference change
notification: " + key + " to value " + value + """); } ... }
```

*IPreferences interface*

Main interface for Configuration.

*Syntax*

```
public interface IPreferences
```

*Derived classes*

- *Preferences* on page 969

*Members*

All members of IPreferences, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>BUSINESSSTRANSAC- TION_ENABLED</i> on page 400	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	<i>BYPASS_PROXY</i> on page 400	Preference for the indicator to decide which URLs need the proxy bypassed.
public static final String	<i>CACHE_CAPACITY</i> on page 400	Preference for the maximum number of documents can be stored in cache.
public static final String	<i>CACHE_MAX_SEARCH_RE- SULTS</i> on page 400	Preference for the maximum entries that can be returned as a result of a search.

Modifier and Type	Variable	Description
public static final String	<i>CACHE_PARSER_SEARCH_ATTRIBUTE</i> on page 400	Preference for the name of the XML attribute that should be used to decide if a property is searchable.
public static final String	<i>CACHE_SEARCH_ATTRIBUTE_XMLNS</i> on page 401	Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.
public static final String	<i>CONNECTIVITY_CONNECTION_TIMEOUT</i> on page 401	Preference for connection time out.
public static final String	<i>CONNECTIVITY_HANDLER_CLASS_NAME</i> on page 401	Preference for full name (including package) of the class that should be initialized as connectivity handler.
public static final String	<i>CONNECTIVITY_HTTP_PORT</i> on page 401	Preference for default HTTP port.
public static final String	<i>CONNECTIVITY_HTTPS_PORT</i> on page 401	Preference for default HTTPS port.
public static final String	<i>CONNECTIVITY_PROXY_HOST</i> on page 401	Preference for proxy host if there is a proxy should be used.
public static final String	<i>CONNECTIVITY_PROXY_PORT</i> on page 401	Preference for proxy port if there is a proxy should be used.
public static final String	<i>CONNECTIVITY_SOCKET_TIMEOUT</i> on page 402	Preference for socket connection time out.
public static final String	<i>LOG_LEVEL</i> on page 402	Preference for the current log severity.
public static final String	<i>PARSER_FOLDER_PATH</i> on page 402	Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.

Modifier and Type	Variable	Description
public static final String	<i>PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 402	Preference for the size of the buffer that is used during persistence. Should be changed only in case of low memory available.
public static final String	<i>PERSISTENCE_CIPHER_TRANSFORMATION</i> on page 402	Preference for the default cipher transformation algorithm. Should be matched with algorithm of the Secure Key generation used for data encryption.
public static final String	<i>PERSISTENCE_FOLDER_PATH</i> on page 402	Preference for the default folder where data should be persisted.
public static final String	<i>PERSISTENCE_SECURE_MODE</i> on page 403	Preference for indicator if persisted data should be encrypted.
public static final String	<i>SAP_APPLICATION_ID_HEADER_VALUE</i> on page 403	Preference for application ID (used in request headers)
public static final String	<i>SAPPASSPORT_ENABLED</i> on page 403	Preference for the indicator to decide if SAP passport should be enabled or not.

### Methods

Modifier and Type	Method	Description
public boolean	<i>containsPreference(String)</i> on page 394	Checks the existence of the given preference.
public Map< String, ?>	<i>getAllPreferences()</i> on page 394	
public Boolean	<i>getBooleanPreference(String)</i> on page 394	Returns the value of the given preference or null if there is no preference with the given key.
public Context	<i>getContext()</i> on page 395	Returns the context.
public Float	<i>getFloatPreference(String)</i> on page 395	Returns the value of the given preference or null if there is no preference with the given key.

Modifier and Type	Method	Description
public Integer	<i>getIntPreference(String)</i> on page 395	Returns the value of the given preference or null if there is no preference with the given key.
public Long	<i>getLongPreference(String)</i> on page 396	Returns the value of the given preference or null if there is no preference with the given key.
public String	<i>getStringPreference(String)</i> on page 396	Returns the value of the given preference or null if there is no preference with the given key.
public void	<i>registerPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 396	You can register a class implementing the <code>IPreferenceChangeListener</code> interface for the change of a preference with the given key.
public void	<i>removePreference(String)</i> on page 397	Removes the preferences with the given key.
public void	<i>resetPreference(String)</i> on page 397	Resets the preference's value to its default value or to null if there is no default value for the given preference.
public void	<i>setBooleanPreference(String, boolean)</i> on page 398	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setFloatPreference(String, float)</i> on page 398	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setIntPreference(String, int)</i> on page 398	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setLongPreference(String, long)</i> on page 399	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setStringPreference(String, String)</i> on page 399	Sets and validates and persists the value of the preferences with the given type.

Modifier and Type	Method	Description
public void	<i>unRegisterPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 399	You can unregister a change listener.

*containsPreference(String) method*

Checks the existence of the given preference.

*Syntax*

```
public boolean containsPreference ( String key )
```

*Parameters*

- **key** – The key of the preference

*Returns*

true if Preference contains the given key or false otherwise

*getAllPreferences() method**Syntax*

```
public Map< String, ?> getAllPreferences () throws  
PreferencesException
```

*getBooleanPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Boolean getBooleanPreference ( String key ) throws  
PreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the boolean type preference with the given key

*Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

*getContext() method*

Returns the context.

*Syntax*

```
public Context getContext ()
```

*getFloatPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Float getFloatPreference (String key) throws  
PreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the float type preference with the given key

*Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

*getIntPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Integer getIntPreference (String key) throws  
PreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the integer type preference with the given key

*Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

### *getLongPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

#### *Syntax*

```
public Long getLongPreference ( String key ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference

#### *Returns*

the long type preference with the given key

#### *Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

### *getStringPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

#### *Syntax*

```
public String getStringPreference ( String key ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference

#### *Returns*

the String type preference with the given key

#### *Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

### *registerPreferenceChangeListener(String, IPreferenceChangeListener) method*

You can register a class implementing the IPreferenceChangeListener interface for the change of a preference with the given key.

#### *Syntax*

```
public void registerPreferenceChangeListener ( String key ,  
IPreferenceChangeListener changeListener )
```

*Parameters*

- **key** – key of the preference
- **changeListener** – listener object to be registered

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*Usage*

If any of the arguments are null, an `IllegalArgumentException` is thrown.

*removePreference(String) method*

Removes the preferences with the given key.

*Syntax*

```
public void removePreference (String key) throws
PreferencesException
```

*Parameters*

- **key** – The key of the preference

*Exceptions*

- **PreferencesException class** – If the preference does not exist or it cannot be removed (e.g. a preference)

*Usage*

Also notifies the listeners with null value.

*resetPreference(String) method*

Resets the preference's value to its default value or to null if there is no default value for the given preference.

*Syntax*

```
public void resetPreference (String key)
```

*Parameters*

- **key** – The key of the preference

### *setBooleanPreference(String, boolean) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setBooleanPreference ( String key , boolean value )  
throws PreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

#### *Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

### *setFloatPreference(String, float) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setFloatPreference ( String key , float value ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

#### *Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

### *setIntPreference(String, int) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setIntPreference ( String key , int value ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*setLongPreference(String, long) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setLongPreference ( String key , long value ) throws
PreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*setStringPreference(String, String) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setStringPreference ( String key , String value ) throws
PreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*unRegisterPreferenceChangeListener(String, IPreferenceChangeListener) method*

You can unregister a change listener.

*Syntax*

```
public void unRegisterPreferenceChangeListener ( String key ,
IPreferenceChangeListener changeListener )
```

### *Parameters*

- **key** – key of the preference
- **changeListener** – listener object to be unregistered

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *Usage*

If any of the arguments are null, an `IllegalArgumentException` is thrown.

### *BUSINESSTRANSACTION\_ENABLED variable*

Preference for the indicator to decide if SAP passport should be enabled or not.

### *Syntax*

```
public static final String BUSINESSSTRANSACTION_ENABLED
```

### *BYPASS\_PROXY variable*

Preference for the indicator to decide which URLs need the proxy bypassed.

### *Syntax*

```
public static final String BYPASS_PROXY
```

### *CACHE\_CAPACITY variable*

Preference for the maximum number of documents can be stored in cache.

### *Syntax*

```
public static final String CACHE_CAPACITY
```

### *CACHE\_MAX\_SEARCH\_RESULTS variable*

Preference for the maximum entries that can be returned as a result of a search.

### *Syntax*

```
public static final String CACHE_MAX_SEARCH_RESULTS
```

### *CACHE\_PARSER\_SEARCH\_ATTRIBUTE variable*

Preference for the name of the XML attribute that should be used to decide if a property is searchable.

### *Syntax*

```
public static final String CACHE_PARSER_SEARCH_ATTRIBUTE
```

***CACHE\_SEARCH\_ATTRIBUTE\_XMLNS variable***

Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.

***Syntax***

```
public static final String CACHE_SEARCH_ATTRIBUTE_XMLNS
```

***CONNECTIVITY\_CONNTIMEOUT variable***

Preference for connection time out.

***Syntax***

```
public static final String CONNECTIVITY_CONNTIMEOUT
```

***CONNECTIVITY\_HANDLER\_CLASS\_NAME variable***

Preference for full name (including package) of the class that should be initialized as connectivity handler.

***Syntax***

```
public static final String CONNECTIVITY_HANDLER_CLASS_NAME
```

***CONNECTIVITY\_HTTP\_PORT variable***

Preference for default HTTP port.

***Syntax***

```
public static final String CONNECTIVITY_HTTP_PORT
```

***CONNECTIVITY\_HTTPS\_PORT variable***

Preference for default HTTPS port.

***Syntax***

```
public static final String CONNECTIVITY_HTTPS_PORT
```

***CONNECTIVITY\_PROXY\_HOST variable***

Preference for proxy host if there is a proxy should be used.

***Syntax***

```
public static final String CONNECTIVITY_PROXY_HOST
```

***CONNECTIVITY\_PROXY\_PORT variable***

Preference for proxy port if there is a proxy should be used.

***Syntax***

```
public static final String CONNECTIVITY_PROXY_PORT
```

### *CONNECTIVITY\_SCONNTIMEOUT variable*

Preference for socket connection time out.

#### *Syntax*

```
public static final String CONNECTIVITY_SCONNTIMEOUT
```

### *LOG\_LEVEL variable*

Preference for the current log severity.

#### *Syntax*

```
public static final String LOG_LEVEL
```

### *PARSER\_FOLDER\_PATH variable*

Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.

#### *Syntax*

```
public static final String PARSER_FOLDER_PATH
```

### *PERSISTENCE\_BYTE\_BUFFER\_SIZE variable*

Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.

#### *Syntax*

```
public static final String PERSISTENCE_BYTE_BUFFER_SIZE
```

### *PERSISTENCE\_CIPHER\_TRANSFORMATION variable*

Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.

#### *Syntax*

```
public static final String PERSISTENCE_CIPHER_TRANSFORMATION
```

### *PERSISTENCE\_FOLDER\_PATH variable*

Preference for the default folder where data should be persisted.

#### *Syntax*

```
public static final String PERSISTENCE_FOLDER_PATH
```

*PERSISTENCE\_SECUREMODE* variable

Preference for indicator if persisted data should be encrypted.

*Syntax*

```
public static final String PERSISTENCE_SECUREMODE
```

*SAP\_APPLICATIONID\_HEADER\_VALUE* variable

Preference for application ID (used in request headers)

*Syntax*

```
public static final String SAP_APPLICATIONID_HEADER_VALUE
```

*SAPPASSPORT\_ENABLED* variable

Preference for the indicator to decide if SAP passport should be enabled or not.

*Syntax*

```
public static final String SAPPASSPORT_ENABLED
```

*IRequest* interface

Consists of interface for requests.

*Syntax*

```
public interface IRequest extends Serializable
```

*Derived classes*

- *BaseRequest* on page 38
- *PushRequest* on page 986

*Members*

All members of IRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 411	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 411	etag "if-none-match"
public static final int	<i>ETAG_IF_RANGE</i> on page 411	etag "if-range"
public static final int	<i>PRIORITY_HIGH</i> on page 411	High priority.

Modifier and Type	Variable	Description
public static final int	<i>PRIORITY_NORMAL</i> on page 412	Normal priority.
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 412	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 412	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 412	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 412	HTTP PUT method.

### Methods

Modifier and Type	Method	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 405	Disables delta query handling.
public byte[]	<i>getData()</i> on page 406	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 406	Returns the request headers set.
public INetListener	<i>getListener()</i> on page 406	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 407	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 407	Retrieves the request method type.
public String	<i>getRequestUrl()</i> on page 407	Returns the URL where the request must be invoked.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 408	internal
public void	<i>setData(byte[])</i> on page 408	Sets the request data in case of an HTTP POST request.

Modifier and Type	Method	Description
public void	<i>setHeaders</i> ( <i>Map&lt;String, String&gt;</i> ) on page 408	Sets the request headers.
public void	<i>setListener</i> ( <i>final INetListener</i> ) on page 409	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority</i> ( <i>final int</i> ) on page 409	Sets the priority of the request.
public void	<i>setRequestMethod</i> ( <i>final int</i> ) on page 410	Sets the type of HTTP request method.
public void	<i>setRequestUrl</i> ( <i>final String</i> ) on page 410	Sets the URL for the request.
public boolean	<i>useCookies</i> () on page 411	Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

### Usage

All request objects must implement this interface. The network layer uses this interface to interact with the request objects.

### *disableDeltaHandling*(*boolean*) method

Disables delta query handling.

### Syntax

```
public void disableDeltaHandling ( boolean disable )
```

### Parameters

- **disable** – If set to true it disables delta handling

### Returns

None

### Usage

By default delta handling is enabled.

### *getData() method*

If the request method is POST, this method is called from the network library.

#### *Syntax*

```
public byte[] getData ()
```

#### *Parameters*

- **None** –

#### *Returns*

the content data of the request.

```
BaseRequest getrequest = new BaseRequest(); byte[] data = getrequest.getData();
```

#### *Usage*

This method will return with the content to be sent to the server.

### *getHeaders() method*

Returns the request headers set.

#### *Syntax*

```
public Map< String, String > getHeaders ()
```

#### *Parameters*

- **None** –

#### *Returns*

the request headers

```
BaseRequest getrequest = new BaseRequest(); Map<String, String> headers =  
getrequest.getHeaders();
```

### *getListener() method*

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

#### *Syntax*

```
public INetListener getListener ()
```

#### *Parameters*

- **None** –

**Returns**

the listener or null.

```
class example implements INetListener{ .... public void makeGetRequest(...) throws
Exception { .... BaseRequest getrequest = new BaseRequest();
getrequest.getListener(); } ... }
```

**Usage**

Method will return null if there is no registered listener.

***getPriority() method***

Returns the priority of the request.

**Syntax**

```
public int getPriority ()
```

**Parameters**

- **None** –

**Returns**

The priority of the request. The value is integer.

```
BaseRequest getrequest = new BaseRequest(); int priority = getrequest.getPriority();
```

***getRequestMethod() method***

Retrieves the request method type.

**Syntax**

```
public int getRequestMethod ()
```

**Parameters**

- **None** –

**Returns**

Type of the HTTP request specified by IRequest.REQUEST\_METHOD\_\* constants.

```
BaseRequest getrequest = new BaseRequest(); int method = getrequest.getRequestMethod();
```

***getRequestUrl() method***

Returns the URL where the request must be invoked.

**Syntax**

```
public String getRequestUrl ()
```

### *Parameters*

- **None** –

### *Returns*

the URL.

```
BaseRequest getRequest = new BaseRequest(); String url = getRequest.getRequestUrl();
```

### *isDeltaHandlingDisabled() method*

internal

### *Syntax*

```
public boolean isDeltaHandlingDisabled ()
```

### *setData(byte[]) method*

Sets the request data in case of an HTTP POST request.

### *Syntax*

```
public void setData (byte[] data )
```

### *Parameters*

- **data** – the request data to set.

### *Returns*

None

```
BaseRequest getRequest = new BaseRequest(); String postBody= "<atom:entry xmlns:atom=" +
 "\"http://www.w3.org/2005/Atom">" + "<atom:content type=\"application/xml\">" +
 "<m:properties xmlns:m=\"http://schemas.microsoft.com/ado/2007/08/dataservices/" +
 "metadata\" *xmlns:d=\"http://schemas.microsoft.com/ado/2007/08/dataservices\">" +
 "<d:agencynum>09964571</d:agencynum>" + "<d:NAME ></d:NAME>" +
 "<d:STREET />" + "<d:POSTBOX />" + * "<d:POSTCODE />" + "<d:CITY />" +
 "<d:COUNTRY />" + "<d:REGION />" + "<d:TELEPHONE>+9945007007</" +
 "d:TELEPHONE>" + "<d:URL />" + "<d:LANGU />" + "<d:CURRENCY />" +
 "<d:mimeType>text/html</d:mimeType>" + "</m:properties>" + "</atom:content>" + "</" +
 "atom:entry>"; post1.setData(postBody.getBytes());
```

### *setHeaders(Map< String, String >) method*

Sets the request headers.

### *Syntax*

```
public void setHeaders (Map< String, String > headers )
```

*Parameters*

- **headers** – the request headers to set.

*Returns*

None

```
Map<String, String> headers1 = new HashMap<String, String>(); headers1.put("Content-Type", "application/atom+xml"); BaseRequest getrequest = new BaseRequest(); getrequest.setHeaders(headers1);
```

*setListener(final INetListener) method*

Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

*Syntax*

```
public void setListener ( final INetListener aListener )
```

*Parameters*

- **aListener** – the listener to be set.

*Returns*

None

```
class example implements INetListener { .... public void makeGetRequest(...) throws Exception { .... BaseRequest getrequest = new BaseRequest(); getrequest.setListener(this); } ... }
```

*Usage*

By default, the BaseRequest object included in the connectivity layer will contain no registered listeners.

*setPriority(final int) method*

Sets the priority of the request.

*Syntax*

```
public void setPriority ( final int aPriority )
```

*Parameters*

- **aPriority** – the priority of the request to set.

*Returns*

None

```
BaseRequest getrequest = new BaseRequest();
getrequest.setPriority(IRequest.PRIORITY_NORMAL);
```

### *Usage*

Allowed values are `IRequest.PRIORITY_HIGH` or `IRequest.PRIORITY_NORMAL`. In case of a different value, the default `IRequest.PRIORITY_NORMAL` will be used by the network. If the network layer finds an `IRequest` with `IRequest.PRIORITY_HIGH` priority in the queue, that request will be executed first. If there are more than one `IRequests` with `IRequest.PRIORITY_HIGH` priority, the network layer will choose an execution order. If the priority is not one of the predefined values, the priority will be set to the default value `IRequest.PRIORITY_NORMAL`.

### *setRequestMethod(final int) method*

Sets the type of HTTP request method.

### *Syntax*

```
public void setRequestMethod ( final int aRequestMethod )
```

### *Parameters*

- **requestMethod** – Type of the HTTP request specified by `IRequest.REQUEST_METHOD_*` constants.

### *Returns*

None

```
BaseRequest getrequest = new BaseRequest();
getrequest.setRequestMethod(IRequest.REQUEST_METHOD_GET);
```

### *setRequestUrl(final String) method*

Sets the URL for the request.

### *Syntax*

```
public void setRequestUrl ( final String aUrl )
```

### *Parameters*

- **aUrl** – the URL to set.

### *Returns*

None

```
BaseRequest getrequest = new BaseRequest(); getrequest.setRequestUrl("http://abc.com/
resource");
```

*useCookies() method*

Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

*Syntax*

```
public boolean useCookies ()
```

*Parameters*

- **None** – Cookies in the network library.

```
BaseRequest getRequest = new BaseRequest(); boolean usecookie = getRequest.useCookies();
```

*Usage*

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the BaseRequest implementation.

*ETAG\_IF\_MATCH variable*

```
etag "if-match"
```

*Syntax*

```
public static final int ETAG_IF_MATCH
```

*ETAG\_IF\_NONE\_MATCH variable*

```
etag "if-none-match"
```

*Syntax*

```
public static final int ETAG_IF_NONE_MATCH
```

*ETAG\_IF\_RANGE variable*

```
etag "if-range"
```

*Syntax*

```
public static final int ETAG_IF_RANGE
```

*PRIORITY\_HIGH variable*

High priority.

*Syntax*

```
public static final int PRIORITY_HIGH
```

*Usage*

Requests with high priority will be executed first. If there are more than one IRequests with IRequest.PRIORITY\_HIGH priority, the network layer will choose an execution order.

### *PRIORITY\_NORMAL variable*

Normal priority.

#### *Syntax*

```
public static final int PRIORITY_NORMAL
```

#### *Usage*

This is the default priority.

### *REQUEST\_METHOD\_DELETE variable*

HTTP DELETE method.

#### *Syntax*

```
public static final int REQUEST_METHOD_DELETE
```

### *REQUEST\_METHOD\_GET variable*

HTTP GET method.

#### *Syntax*

```
public static final int REQUEST_METHOD_GET
```

### *REQUEST\_METHOD\_POST variable*

HTTP POST method.

#### *Syntax*

```
public static final int REQUEST_METHOD_POST
```

### *REQUEST\_METHOD\_PUT variable*

HTTP PUT method.

#### *Syntax*

```
public static final int REQUEST_METHOD_PUT
```

### *IRequestManager interface*

Consists of interface for execution of requests.

#### *Syntax*

```
public interface IRequestManager
```

#### *Derived classes*

- *RequestManager* on page 994

## Members

All members of `IRequestManager`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>clearPendingRequests(ILogger, Context)</i> on page 413	Clears all the persisted requests from database.
public void	<i>enablePerformanceLogging()</i> on page 414	Enables performance logging for Core Services.
public IConnectivityParameters	<i>getConnectivityParameters()</i> on page 414	Returns the ConnectivityParameters object containing the settings used by the Request library.
public boolean	<i>isPerformanceLoggingEnabled()</i> on page 414	Returns whether the Performance Logging is enabled or not.
public void	<i>makeRequest(final IRequest)</i> on page 415	Puts a request object into the RequestManager object.
public void	<i>makeRequest(final IBundleRequest)</i> on page 415	Puts a bundle request object into the RequestManager object.

### *clearPendingRequests(ILogger, Context) method*

Clears all the persisted requests from database.

### Syntax

```
public void clearPendingRequests ( ILogger logger , Context
context )
```

### Parameters

- **logger** – Logger instance.
- **context** – Application context.

### Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
reqMan.clearPendingRequests(logger, context);
```

### *enablePerformanceLogging() method*

Enables performance logging for Core Services.

#### *Syntax*

```
public void enablePerformanceLogging ()
```

#### *Parameters*

- **None** –

#### *Returns*

None

### *getConnectivityParameters() method*

Returns the ConnectivityParameters object containing the settings used by the Request library.

#### *Syntax*

```
public IConnectivityParameters getConnectivityParameters ()
```

#### *Parameters*

- **None.** –

#### *Returns*

IConnectivityParameters Object containing the settings used by the Request library.

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
```

```
IConnectivityParameters params = reqMan.getConnectivityParameters();
```

### *isPerformanceLoggingEnabled() method*

Returns whether the Performance Logging is enabled or not.

#### *Syntax*

```
public boolean isPerformanceLoggingEnabled ()
```

#### *Parameters*

- **None** –

#### *Returns*

boolean - True/False

*makeRequest(final IRequest) method*

Puts a request object into the RequestManager object.

*Syntax*

```
public void makeRequest ( final IRequest aRequest )
```

*Parameters*

- **aRequest** – The request.

*Returns*

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BaseRequest
request = new BaseRequest(); reqMan.makeRequest(request);
```

*makeRequest(final IBundleRequest) method*

Puts a bundle request object into the RequestManager object.

*Syntax*

```
public void makeRequest ( final IBundleRequest aBundleRequest )
```

*Parameters*

- **aBundleRequest** – The request object.

*Returns*

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BundleRequest
request = new BundleRequest(); reqMan.makeRequest(request);
```

*IRequestStateElement interface*

Consists of methods to store the information of an exception.

*Syntax*

```
public abstract interface IRequestStateElement
```

*Derived classes*

- *RequestStateElement* on page 1005

*Members*

All members of IRequestStateElement, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>AUTHENTICATION_ERROR</i> on page 419	Authentication error.
public static final int	<i>CLIENT_ERROR</i> on page 420	Client error.
public static final int	<i>HTTP_ERROR</i> on page 420	Server response status > 302.
public static final int	<i>NETWORK_ERROR</i> on page 420	There was a network error during a read/write to/from stream.
public static final int	<i>NO_ERROR</i> on page 420	
public static final int	<i>PARSE_ERROR</i> on page 420	Problem with parsing the response xml.
public static final int	<i>REQUEST_ERROR</i> on page 420	Problem with parsing the request.

### Methods

Modifier and Type	Method	Description
public abstract int	<i>getErrorCode()</i> on page 417	Returns the error code.
public abstract Exception	<i>getException()</i> on page 417	Returns the exception if it is set.
public abstract HttpResponseMessage	<i>getHttpResponse()</i> on page 417	Returns the HttpResponseMessage.
public abstract int	<i>getHttpStatusCode()</i> on page 418	Returns the HTTP status if it is set.
public abstract void	<i>setErrorCode(final int)</i> on page 418	Sets the error code.
public abstract void	<i>setException(final Exception)</i> on page 418	Sets the exception.
public abstract void	<i>setHttpResponse(HttpResponse)</i> on page 419	Sets the HttpResponseMessage.
public abstract void	<i>setHttpStatusCode(final int)</i> on page 419	Sets the HTTP status.

### Usage

Whenever there is an exception in the network layer, or there is an exception during the data parsing, this is sent by the network layer to the registered classes.

*getErrorCode() method*

Returns the error code.

*Syntax*

```
public abstract int getErrorCode ()
```

*Parameters*

- **None** –

*Returns*

error code

RequestStateElement element; element.getErrorCode();

*Usage*

The error code can be any of the following:

- HTTP\_ERROR
- PARSE\_ERROR
- NETWORK\_ERROR
- AUTHENTICATION\_ERROR

*getException() method*

Returns the exception if it is set.

*Syntax*

```
public abstract Exception getException ()
```

*Parameters*

- **None** –

*Returns*

The exception stored in RequestStateElement.

RequestStateElement element; element.getException();

*getHttpResponse() method*

Returns the HttpResponse.

*Syntax*

```
public abstract HttpResponse getHttpResponse ()
```

### *Parameters*

- **None** –

### *Returns*

The `HttpResponse`

```
RequestStateElement element; element.getHttpResponse();
```

### *getHttpStatusCode() method*

Returns the HTTP status if it is set.

### *Syntax*

```
public abstract int getHttpStatusCode ()
```

### *Parameters*

- **None** –

### *Returns*

The HTTP status code, if available.

```
RequestStateElement element; int code =element.getHttpStatusCode();
```

### *Usage*

If the HTTP status is not set, the default value is -1.

### *setErrorCode(final int) method*

Sets the error code.

### *Syntax*

```
public abstract void setErrorCode ( final int code )
```

### *Parameters*

- **code** – Error code.

### *Returns*

None

```
RequestStateElement element; element.setErrorCode(0x06);
```

### *setException(final Exception) method*

Sets the exception.

### *Syntax*

```
public abstract void setException ( final Exception aException )
```

*Parameters*

- **aException** – the exception to be set.

*Returns*

None

```
RequestStateElement element; element.setException(new Exception());
```

*setHttpResponse(HttpResponse) method*

Sets the HttpResponse.

*Syntax*

```
public abstract void setHttpResponse ( HttpResponse aResponse )
```

*Parameters*

- **aResponse** – The HttpResponse

*Returns*

None

```
RequestStateElement element; HttpResponse httpResponse;
element.setHttpResponse(httpResponse);
```

*setHttpStatusCode(final int) method*

Sets the HTTP status.

*Syntax*

```
public abstract void setHttpStatusCode ( final int httpStatus )
```

*Parameters*

- **httpStatus** – Set the HTTP status.

*Returns*

None

```
RequestStateElement element; element.setHttpStatusCode(200);
```

*AUTHENTICATION\_ERROR variable*

Authentication error.

*Syntax*

```
public static final int AUTHENTICATION_ERROR
```

### *CLIENT\_ERROR variable*

Client error.

#### *Syntax*

```
public static final int CLIENT_ERROR
```

### *HTTP\_ERROR variable*

Server response status > 302.

#### *Syntax*

```
public static final int HTTP_ERROR
```

### *NETWORK\_ERROR variable*

There was a network error during a read/write to/from stream.

#### *Syntax*

```
public static final int NETWORK_ERROR
```

### *NO\_ERROR variable*

#### *Syntax*

```
public static final int NO_ERROR
```

### *PARSE\_ERROR variable*

Problem with parsing the response xml.

#### *Syntax*

```
public static final int PARSE_ERROR
```

### *REQUEST\_ERROR variable*

Problem with parsing the request.

#### *Syntax*

```
public static final int REQUEST_ERROR
```

### *IResponse interface*

Consists of interface for responses.

#### *Syntax*

```
public interface IResponse extends HttpResponseMessage
```

*Derived classes*

- *ResponseImpl* on page 1011

*Members*

All members of *IResponse*, including inherited members. **Methods**

Modifier and Type	Method	Description
public ArrayList< <i>HttpResponse</i> >	<i>getBatchResponse()</i> on page 421	Returns the list of responses from batch response.
public HashMap< <i>IRequest</i> , <i>HttpResponse</i> >	<i>getBatchResponseMap()</i> on page 421	Returns the mapping of requests with corresponding responses within a batch response.
public Map< String, String >	<i>getHeadersMap()</i> on page 422	Returns all the response headers as a HashMap containing header name and header value.

*Usage*

All response objects must implement this interface. The network layer uses this interface to interact with the response objects.

*getBatchResponse() method*

Returns the list of responses from batch response.

*Syntax*

```
public ArrayList< HttpResponse > getBatchResponse ()
```

*Parameters*

- **None.** –

*Returns*

List of responses.

```
Response res; ArrayList<HttpResponse> res = res.getBatchResponse();
```

*getBatchResponseMap() method*

Returns the mapping of requests with corresponding responses within a batch response.

*Syntax*

```
public HashMap< IRequest, HttpResponse > getBatchResponseMap  
()
```

## Parameters

- **None.** –

## Returns

Map of requests and responses.

Response res; `HashMap<IRequest, HttpResponse> res = res.getBatchResponseMap();`

## *getHeadersMap()* method

Returns all the response headers as a `HashMap` containing header name and header value.

## Syntax

```
public Map<String, String > getHeadersMap ()
```

## Parameters

- **None** –

## Returns

Response headers in the form of a `hashmap`.

Response res; `Map<String,string> headers = res.getHeadersMap();`

## *JSONParser* class

## Syntax

```
public class JSONParser
```

## Members

All members of `JSONParser`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static String	<i>JSON_TAG_D</i> on page 425	
protected static String	<i>JSON_TAG_DEFERRED</i> on page 425	
protected static String	<i>JSON_TAG_DELTA</i> on page 425	
protected static String	<i>JSON_TAG_METADATA</i> on page 425	
protected static String	<i>JSON_TAG_RESULTS</i> on page 425	

Modifier and Type	Variable	Description
protected static String	<i>JSON_TAG_TYPE</i> on page 425	
protected static String	<i>JSON_TAG_URI</i> on page 426	

### Constructors

Modifier and Type	Constructor	Description
public	<i>JSONParser()</i> on page 423	

### Methods

Modifier and Type	Method	Description
protected List< IODataEntry >	<i>parseComplexEntry(String, String, IODataSchema, String)</i> on page 424	
protected List< IODataEntry >	<i>parseFunctionImportComplexType(String, String, IODataSchema, String)</i> on page 424	
protected List< IODataEntry >	<i>parseODataEntries(String, String, IODataSchema, JsonObject)</i> on page 424	
protected List< IODataEntry >	<i>parseODataEntry(String, String, IODataSchema)</i> on page 424	
protected IODataFeed	<i>parseODataFeed(String, String, IODataSchema)</i> on page 424	
protected IODataServiceDocument	<i>parseODataServiceDocument(String)</i> on page 425	
protected void	<i>populateODataEntry(ODataEntry, JsonObject)</i> on page 425	

### *JSONParser()* constructor

#### Syntax

```
public JSONParser ()
```

*parseComplexEntry(String, String, IODataSchema, String) method*

**Syntax**

```
protected List< IODataEntry > parseComplexEntry ( String  
complexEntryXml , String functionImport , IODataSchema schema , String  
returnType )
```

*parseFunctionImportComplexType(String, String, IODataSchema, String) method*

**Syntax**

```
protected List< IODataEntry > parseFunctionImportComplexType  
( String entryJson , String functionImport , IODataSchema schema , String  
returnType )
```

*parseODataEntries(String, String, IODataSchema, JsonObject) method*

**Syntax**

```
protected List< IODataEntry > parseODataEntries ( String  
entriesJson , String collectionId , IODataSchema schema , JsonObject  
parsedFeed ) throws ParseException
```

**Parameters**

- **entriesJson** –
- **collectionId** –
- **schema** –

**Exceptions**

- **ParseException class** –

*parseODataEntry(String, String, IODataSchema) method*

**Syntax**

```
protected List< IODataEntry > parseODataEntry ( String entryJson ,  
String collectionId , IODataSchema schema )
```

*parseODataFeed(String, String, IODataSchema) method*

**Syntax**

```
protected IODataFeed parseODataFeed ( String entriesJson , String  
collectionId , IODataSchema schema ) throws ParseException
```

*parseODataServiceDocument(String) method***Syntax**

```
protected IODataServiceDocument parseODataServiceDocument
( String serviceDocumentXML )
```

*populateODataEntry(ODataEntry, JsonObject) method***Syntax**

```
protected void populateODataEntry ( ODataEntry oDataEntry ,
JsonObject properties )
```

*JSON\_TAG\_D variable***Syntax**

```
protected static String JSON_TAG_D
```

*JSON\_TAG\_DEFERRED variable***Syntax**

```
protected static String JSON_TAG_DEFERRED
```

*JSON\_TAG\_DELTA variable***Syntax**

```
protected static String JSON_TAG_DELTA
```

*JSON\_TAG\_METADATA variable***Syntax**

```
protected static String JSON_TAG_METADATA
```

*JSON\_TAG\_RESULTS variable***Syntax**

```
protected static String JSON_TAG_RESULTS
```

*JSON\_TAG\_TYPE variable***Syntax**

```
protected static String JSON_TAG_TYPE
```

*JSON\_TAG\_URI variable**Syntax*

```
protected static String JSON_TAG_URI
```

*Logger class*

ILogger implementation.

*Syntax*

```
public class Logger extends ILogger, IPersistable
```

*Members*

All members of Logger, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>LogEntry</i> on page 430	A log entry.

**Variables**

Modifier and Type	Variable	Description
SimpleDateFormat	<i>dateFormat</i> on page 447	
public static int	<i>e2eStep</i> on page 447	
public static int	<i>passportTraceLevel</i> on page 447	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>Logger()</i> on page 433	Constructs a new Logger, an ILogger implementation.

**Methods**

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 434	Implementer should override this method!
public void	<i>cleanUp(final int)</i> on page 434	Deletes all entries weaker than the threshold priority.

Modifier and Type	Method	Description
public void	<i>d(final String, final String)</i> on page 434	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 434	Sends a DEBUG log message and logs the exception.
public void	<i>d(final String, final String, final String)</i> on page 435	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable, final String)</i> on page 435	Sends a DEBUG log message and logs the exception.
public void	<i>e(final String, final String)</i> on page 435	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable)</i> on page 436	Sends an ERROR log message and logs the exception.
public void	<i>e(final String, final String, final String)</i> on page 436	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable, final String)</i> on page 437	Sends an ERROR log message and logs the exception.
public Enumeration< LogEntry >	<i>getLogElements()</i> on page 437	
public Vector< LogEntry >	<i>getLogElements(final int)</i> on page 437	Get the log elements above (and including) the threshold.
public Vector< LogEntry >	<i>getLogElementsByCorrelationId(final String)</i> on page 437	
public Vector< LogEntry >	<i>getLogElementsByPID(final long)</i> on page 437	
public Vector< LogEntry >	<i>getLogElementsByTag(final String)</i> on page 438	
public Vector< LogEntry >	<i>getLogElementsByTimeStamp(final long, final long)</i> on page 438	
public final int	<i>getLogLevel()</i> on page 438	Returns the log level.

Modifier and Type	Method	Description
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> ) on page 438	Sends an INFO log message.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 438	Sends a INFO log message and logs the exception.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 439	Sends an INFO log message.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 439	Sends a INFO log message and logs the exception.
public void	<i>log</i> ( <i>final int</i> , <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>String</i> ) on page 440	Logs a log message.
public void	<i>logFullLocation</i> ( <i>boolean</i> ) on page 440	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation</i> () on page 440	To get the setting which controls log output should contain full location (class and method name) or not.
public boolean	<i>logsToAndroid</i> () on page 440	To get the setting which controls log output to Android log.
public void	<i>logToAndroid</i> ( <i>final boolean</i> ) on page 441	Setting to control log output to Android log.
public void	<i>p</i> ( <i>final String</i> , <i>final String</i> ) on page 441	Sends a PERFORMANCE log message.
public void	<i>p</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 441	Sends a PERFORMANCE log message.
public void	<i>read</i> ( <i>BufferedReader</i> ) on page 441	
public void	<i>setHeaderData</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> , <i>final String</i> , <i>final String</i> , <i>final String</i> , <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 442	Sets the log header fields.

Modifier and Type	Method	Description
public void	<i>setLogLevel(final int)</i> on page 442	Set the log level.
public void	<i>terminate()</i> on page 443	Clears collected log data.
public synchronized String	<i>toString()</i> on page 443	Get log data.
public void	<i>v(final String, final String)</i> on page 443	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable)</i> on page 443	Sends a VERBOSE log message and logs the exception.
public void	<i>v(final String, final String, final String)</i> on page 444	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable, final String)</i> on page 444	Sends a VERBOSE log message and logs the exception.
public void	<i>w(final String, final Throwable)</i> on page 444	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable)</i> on page 445	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String)</i> on page 445	Sends a WARN log message.
public void	<i>w(final String, final Throwable, final String)</i> on page 446	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final String)</i> on page 446	Sends a WARN log message.
public void	<i>w(final String, final String, final Throwable, final String)</i> on page 446	Sends a WARN log message and logs the exception.
public void	<i>write(BufferedWriter)</i> on page 447	

#### Inherited members from ILogger

Modifier and Type	Member	Description
public static final int	<i>ASSERT</i> on page 138	Log level ASSERT.

Modifier and Type	Member	Description
public static final int	<i>DEBUG</i> on page 139	Log level DEBUG.
public static final int	<i>ERROR</i> on page 139	Log level ERROR.
public static final int	<i>FATAL</i> on page 139	Log level FATAL.
public static final int	<i>INFO</i> on page 139	Log level INFO.
public static final int	<i>PERFORMANCE</i> on page 139	Log level PERFORMANCE.
public static final int	<i>VERBOSE</i> on page 139	Log level VERBOSE.
public static final int	<i>WARN</i> on page 139	Log level WARN.

### *Logger.LogEntry* class

A log entry.

#### Syntax

```
public class LogEntry
```

#### Members

All members of LogEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public String	<i>caller</i> on page 433	
public Throwable	<i>ex</i> on page 433	
public String	<i>message</i> on page 433	
public int	<i>PID</i> on page 433	
public int	<i>priority</i> on page 433	
public String	<i>tag</i> on page 433	
public long	<i>when</i> on page 433	

#### Constructors

Modifier and Type	Constructor	Description
public	<i>LogEntry</i> (final int, final String, final String, final Throwable, final String, final int) on page 431	

Modifier and Type	Constructor	Description
public	<i>LogEntry()</i> on page 431	

### Methods

Modifier and Type	Method	Description
public LogEntry	<i>setCaller(String)</i> on page 431	
public LogEntry	<i>setMessage(final String)</i> on page 432	
public LogEntry	<i>setPID(int)</i> on page 432	
public LogEntry	<i>setPriority(int)</i> on page 432	
public LogEntry	<i>setPriority(String)</i> on page 432	
public LogEntry	<i>setTag(final String)</i> on page 432	
public LogEntry	<i>setThrowable(Throwable)</i> on page 432	
public LogEntry	<i>setWhen(long)</i> on page 432	
public String	<i>toString()</i> on page 432	

*LogEntry(final int, final String, final String, final Throwable, final String, final int)*  
*constructor*

#### Syntax

```
public LogEntry ( final int priority , final String tag , final
String message , final Throwable tr , final String location , final
int pid )
```

*LogEntry()* constructor

#### Syntax

```
public LogEntry ()
```

*setCaller(String)* method

#### Syntax

```
public LogEntry setCaller ( String caller )
```

*setMessage(final String) method*

**Syntax**

```
public LogEntry setMessage ( final String message )
```

*setPID(int) method*

**Syntax**

```
public LogEntry setPID ( int pID )
```

*setPriority(int) method*

**Syntax**

```
public LogEntry setPriority ( int priority )
```

*setPriority(String) method*

**Syntax**

```
public LogEntry setPriority ( String logLevel )
```

*setTag(final String) method*

**Syntax**

```
public LogEntry setTag ( final String tag )
```

*setThrowable(Throwable) method*

**Syntax**

```
public LogEntry setThrowable ( Throwable ex )
```

*setWhen(long) method*

**Syntax**

```
public LogEntry setWhen ( long when )
```

*toString() method*

**Syntax**

```
public String toString ( )
```

*caller variable***Syntax**

```
public String caller
```

*ex variable***Syntax**

```
public Throwable ex
```

*message variable***Syntax**

```
public String message
```

*PID variable***Syntax**

```
public int PID
```

*priority variable***Syntax**

```
public int priority
```

*tag variable***Syntax**

```
public String tag
```

*when variable***Syntax**

```
public long when
```

*Logger() constructor*

Constructs a new Logger, an ILogger implementation.

**Syntax**

```
public Logger ()
```

### *canLog() method*

Implementer should override this method!

### *Syntax*

```
public boolean canLog ()
```

### *Returns*

State of ability to log.

### *cleanUp(final int) method*

Deletes all entries weaker than the threshold priority.

### *Syntax*

```
public void cleanUp ( final int threshold )
```

### *d(final String, final String) method*

Sends a DEBUG log message.

### *Syntax*

```
public void d ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,String)`

### *d(final String, final String, final Throwable) method*

Sends a DEBUG log message and logs the exception.

### *Syntax*

```
public void d ( final String tag , final String msg , final  
Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,Throwable,String)`

### *d(final String, final String, final String) method*

Sends a DEBUG log message.

### *Syntax*

```
public void d ( final String tag , final String msg , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *d(final String, final String, final Throwable, final String) method*

Sends a DEBUG log message and logs the exception.

### *Syntax*

```
public void d ( final String tag , final String msg , final Throwable tr , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *e(final String, final String) method*

Sends an ERROR log message.

### *Syntax*

```
public void e ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,String)`

### *e(final String, final String, final Throwable) method*

Sends an ERROR log message and logs the exception.

### *Syntax*

```
public void e ( final String tag , final String msg , final
Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,Throwable,String)`

### *e(final String, final String, final String) method*

Sends an ERROR log message.

### *Syntax*

```
public void e ( final String tag , final String msg , final String
location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*e(final String, final String, final Throwable, final String) method*

Sends an ERROR log message and logs the exception.

*Syntax*

```
public void e ( final String tag , final String msg , final
Throwable tr , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*getLogElements() method**Syntax*

```
public Enumeration< LogEntry > getLogElements ()
```

*getLogElements(final int) method*

Get the log elements above (and including) the threshold.

*Syntax*

```
public Vector< LogEntry > getLogElements ( final int threshold )
```

*Parameters*

- **threshold** – the desired level (inclusively)

*Returns*

log elements as Vector

*getLogElementsByCorrelationId(final String) method**Syntax*

```
public Vector< LogEntry > getLogElementsByCorrelationId
( final String correlationId )
```

*getLogElementsByPID(final long) method**Syntax*

```
public Vector< LogEntry > getLogElementsByPID ( final long
PID )
```

### *getLogElementsByTag(final String) method*

#### *Syntax*

```
public Vector< LogEntry > getLogElementsByTag ( final String  
aTag )
```

### *getLogElementsByTimeStamp(final long, final long) method*

#### *Syntax*

```
public Vector< LogEntry > getLogElementsByTimeStamp ( final  
long start , final long end )
```

### *getLogLevel() method*

Returns the log level.

#### *Syntax*

```
public final int getLogLevel ()
```

#### *Returns*

the log level.

### *i(final String, final String) method*

Sends an INFO log message.

#### *Syntax*

```
public void i ( final String tag , final String msg )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,String)`

### *i(final String, final String, final Throwable) method*

Sends a INFO log message and logs the exception.

#### *Syntax*

```
public void i ( final String tag , final String msg , final  
Throwable tr )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,Throwable,String)`

### *i(final String, final String, final String) method*

Sends an INFO log message.

### Syntax

```
public void i ( final String tag , final String msg , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *i(final String, final String, final Throwable, final String) method*

Sends a INFO log message and logs the exception.

### Syntax

```
public void i ( final String tag , final String msg , final Throwable tr , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *log(final int, final String, final String, final Throwable, String) method*

Logs a log message.

#### *Syntax*

```
public void log (final int level, final String tag, final String msg, final Throwable tr, String location)
```

#### *Parameters*

- **level** – the log level
- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *logFullLocation(boolean) method*

Setting to control log full location (class-path and method name).

#### *Syntax*

```
public void logFullLocation (boolean logFullLocation)
```

#### *Parameters*

- **logFullLocation** – log i or do not log it.

### *logsFullLocation() method*

To get the setting which controls log output should contain full location (class and method name) or not.

#### *Syntax*

```
public boolean logsFullLocation ()
```

#### *Returns*

logging with full location or not.

### *logsToAndroid() method*

To get the setting which controls log output to Android log.

#### *Syntax*

```
public boolean logsToAndroid ()
```

#### *Returns*

logging to Android log or not logging.

*logToAndroid(final boolean) method*

Setting to control log output to Android log.

*Syntax*

```
public void logToAndroid ( final boolean doIt )
```

*Parameters*

- **doIt** – log or do not log.

*p(final String, final String) method*

Sends a PERFORMANCE log message.

*Syntax*

```
public void p ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#p(String,String,String)`

*p(final String, final String, final String) method*

Sends a PERFORMANCE log message.

*Syntax*

```
public void p ( final String tag , final String msg , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*read(BufferedReader) method**Syntax*

```
public void read ( BufferedReader reader ) throws  
PersistenceException
```

### Parameters

- **reader** – The buffered reader to read the object from.

### Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

*setHeaderData(final String, final String, final String, final String, final String, final String, final String, final String, final String) method*

Sets the log header fields.

### Syntax

```
public void setHeaderData ( final String osVersion , final String appName , final String appVersion , final String thirdParty , final String hwVersion , final String user , final String timezone , final String language , final String baseUrl )
```

### Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (Connectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (Connectivity sets it)
- **baseUrl** – the URL used in Connectivity (connectivity sets it)

### Usage

A header field is set only if it is not *null*. Also, it is set only once; subsequent calls will not overwrite the first write.

*setLogLevel(final int) method*

Set the log level.

### Syntax

```
public void setLogLevel ( final int level )
```

### Parameters

- **level** – the log level

*terminate() method*

Clears collected log data.

*Syntax*

```
public void terminate ()
```

*toString() method*

Get log data.

*Syntax*

```
public synchronized String toString ()
```

*Returns*

log data as string

*v(final String, final String) method*

Sends a VERBOSE log message.

*Syntax*

```
public void v ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,String)`

*v(final String, final String, final Throwable) method*

Sends a VERBOSE log message and logs the exception.

*Syntax*

```
public void v ( final String tag , final String msg , final
Throwable tr )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,Throwable,String)`

### *v(final String, final String, final String) method*

Sends a VERBOSE log message.

### *Syntax*

```
public void v ( final String tag , final String msg , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *v(final String, final String, final Throwable, final String) method*

Sends a VERBOSE log message and logs the exception.

### *Syntax*

```
public void v ( final String tag , final String msg , final Throwable tr , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *w(final String, final Throwable) method*

Sends a WARN log message and logs the exception.

### *Syntax*

```
public void w ( final String tag , final Throwable tr )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,Throwable,String)`

### *w(final String, final String, final Throwable) method*

Sends a WARN log message and logs the exception.

### Syntax

```
public void w ( final String tag , final String msg , final
Throwable tr )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,Throwable,String)`

### *w(final String, final String) method*

Sends a WARN log message.

### Syntax

```
public void w ( final String tag , final String msg )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,String)`

*w(final String, final Throwable, final String) method*

Sends a WARN log message and logs the exception.

### Syntax

```
public void w ( final String tag , final Throwable tr , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*w(final String, final String, final String) method*

Sends a WARN log message.

### Syntax

```
public void w ( final String tag , final String msg , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*w(final String, final String, final Throwable, final String) method*

Sends a WARN log message and logs the exception.

### Syntax

```
public void w ( final String tag , final String msg , final Throwable tr , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException** – if data can not be written into the writer

*dateFormat variable**Syntax*

```
SimpleDateFormat dateFormat
```

*e2eStep variable**Syntax*

```
public static int e2eStep
```

*passportTraceLevel variable**Syntax*

```
public static int passportTraceLevel
```

*ODataAssociation class**Syntax*

```
public class ODataAssociation extends ParserDocument,
IODataAssociation
```

*Derived classes*

- *ODataAssociationSet* on page 474

*Members*

All members of ODataAssociation, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>ODataAssociationEnd</i> on page 462	

### Constructors

Modifier and Type	Constructor	Description
public	<i>ODataAssociation()</i> on page 472	
public	<i>ODataAssociation(ParserDocument)</i> on page 473	
protected	<i>ODataAssociation(int[], String[])</i> on page 473	
protected	<i>ODataAssociation(String)</i> on page 473	

### Methods

Modifier and Type	Method	Description
public IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 473	Returns the value of the appropriate Association End OData element with the given role.
public List< IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 473	Returns list of the appropriate OData elements.
public String	<i>getName()</i> on page 473	Returns the value of the appropriate OData attribute.

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	

Modifier and Type	Member	Description
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public void	<i>removeExtension(String)</i> on page 958	

Modifier and Type	Member	Description
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958

public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	

Modifier and Type	Member	Description
public void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt; IParserDocument &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt; String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt; String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValues(List&lt;String&gt;, String...)</i> on page 962	Sets all the values of the elements with the given route. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from `IParserDocument`

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIX_MAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataAssociation**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 151	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ASSOCIATIONEND</i> on page 151	Name of the appropriate OData element.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataAssociation.ODataAssociationEnd* class

##### Syntax

```
public class ODataAssociationEnd extends ParserDocument,
IODataAssociationEnd
```

##### Members

All members of *ODataAssociationEnd*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataAssociationEnd()</i> on page 471	
public	<i>ODataAssociationEnd(ParserDocument)</i> on page 472	
protected	<i>ODataAssociationEnd(int[], String[])</i> on page 472	

##### Methods

Modifier and Type	Method	Description
public String	<i>getCollectionId()</i> on page 472	
public String	<i>getEntitySet()</i> on page 472	
public String	<i>getMultiplicity()</i> on page 472	
public String	<i>getRole()</i> on page 472	
public String	<i>getType()</i> on page 472	

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	

Modifier and Type	Member	Description
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	

Modifier and Type	Member	Description
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	

Modifier and Type	Member	Description
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958

public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataAssociationEnd

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 149	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_MULTIPLICITY</i> on page 150	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ROLE</i> on page 150	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 150	Name of the appropriate OData attribute.

#### *IODataAssociationEnd()* constructor

##### Syntax

```
public IODataAssociationEnd ()
```

*ODataAssociationEnd(ParserDocument) constructor*

*Syntax*

```
public ODataAssociationEnd ( ParserDocument document )
```

*ODataAssociationEnd(int[], String[]) constructor*

*Syntax*

```
protected ODataAssociationEnd ( int[] routes , String[] values )
```

*getCollectionId() method*

*Syntax*

```
public String getCollectionId ()
```

*getEntitySet() method*

*Syntax*

```
public String getEntitySet ()
```

*getMultiplicity() method*

*Syntax*

```
public String getMultiplicity ()
```

*getRole() method*

*Syntax*

```
public String getRole ()
```

*getType() method*

*Syntax*

```
public String getType ()
```

*ODataAssociation() constructor*

*Syntax*

```
public ODataAssociation ()
```

*ODataAssociation(ParserDocument) constructor**Syntax*

```
public ODataAssociation ( ParserDocument document )
```

*ODataAssociation(int[], String[]) constructor**Syntax*

```
protected ODataAssociation ( int[] routes , String[] values )
```

*ODataAssociation(String) constructor**Syntax*

```
protected ODataAssociation ( String elementAssociationset )
```

*getAssociationEnd(String) method*

Returns the value of the appropriate Association End OData element with the given role.

*Syntax*

```
public IODataAssociationEnd getAssociationEnd ( String role )
```

*Parameters*

- **role** – The expected value of the appropriate OData attribute

*Returns*

the value of the appropriate Association End OData element

*getAssociationEnds() method*

Returns list of the appropriate OData elements.

*Syntax*

```
public List< IODataAssociationEnd > getAssociationEnds ( )
```

*Returns*

list of the appropriate OData elements

*getName() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public String getName ( )
```

**Returns**

the value of the appropriate OData attribute

**ODataAssociationSet class****Syntax**

```
public class ODataAssociationSet extends ODataAssociation,
IODataAssociationSet
```

**Members**

All members of ODataAssociationSet, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataAssociationSet()</i> on page 494	
public	<i>ODataAssociationSet(Parser-Document)</i> on page 494	
protected	<i>ODataAssociationSet(int[], String[])</i> on page 494	

**Methods**

Modifier and Type	Method	Description
public String	<i>getAssociation()</i> on page 494	Returns the value of appropriate OData element.

**Inherited members from ODataAssociation**

Modifier and Type	Member	Description
public IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 473	Returns the value of the appropriate Association End OData element with the given role.
public List< IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 473	Returns list of the appropriate OData elements.
public String	<i>getName()</i> on page 473	Returns the value of the appropriate OData attribute.
public	<i>ODataAssociation()</i> on page 472	

Modifier and Type	Member	Description
protected	<i>ODataAssociation(int[], String[])</i> on page 473	
public	<i>ODataAssociation(ParserDocument)</i> on page 473	
protected	<i>ODataAssociation(String)</i> on page 473	

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	

Modifier and Type	Member	Description
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	

Modifier and Type	Member	Description
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	

Modifier and Type	Member	Description
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	

Modifier and Type	Member	Description
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataAssociation

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 151	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ASSOCIATIONEND</i> on page 151	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATA_SERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataAssociationSet

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ASSOCIATION_SET</i> on page 158	Name of the appropriate OData element.

#### Inherited members from IODataAssociation

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 151	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 151	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ASSOCIATION_END</i> on page 151	Name of the appropriate OData element.
public abstract IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 150	Returns the value of the appropriate Association End OData element with the given role.
public abstract List< IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 150	Returns list of the appropriate OData elements.
public abstract String	<i>getName()</i> on page 151	Returns the value of the appropriate OData attribute.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataAssociationSet()* constructor*Syntax*

```
public ODataAssociationSet ()
```

*ODataAssociationSet(ParserDocument)* constructor*Syntax*

```
public ODataAssociationSet ( ParserDocument document )
```

*ODataAssociationSet(int[], String[])* constructor*Syntax*

```
protected ODataAssociationSet ( int[] routes , String[] values )
```

*getAssociation()* method

Returns the value of appropriate OData element.

*Syntax*

```
public String getAssociation ()
```

*Returns*

the value of appropriate OData element

*ODataCollection* class*Syntax*

```
public class ODataCollection extends ParserDocument,
IODataCollection
```

### Members

All members of `ODataCollection`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 516	
protected String	<i>collectionName</i> on page 516	
protected boolean	<i>isJson</i> on page 516	

### Constructors

Modifier and Type	Constructor	Description
public	<i>ODataCollection()</i> on page 511	
public	<i>ODataCollection(ParserDocument)</i> on page 511	
public	<i>ODataCollection(String)</i> on page 511	
protected	<i>ODataCollection(int[], String[])</i> on page 511	

### Methods

Modifier and Type	Method	Description
public int	<i>getDisplayOrder()</i> on page 511	Returns the value of the appropriate OData extension attribute.
public String	<i>getHref()</i> on page 511	Returns the value of the 'href' OData attribute.
public List< IODataIcon >	<i>getIcons()</i> on page 511	Returns list of the appropriate OData elements.
public String	<i>getId()</i> on page 512	Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)
public List< IODataLink >	<i>getLinks()</i> on page 512	Returns the value of the appropriate OData elements.

Modifier and Type	Method	Description
public String	<i>getMemberTitle()</i> on page 512	Returns the value of the appropriate OData element.
public IODataLink	<i>getSearchLink()</i> on page 512	Returns OData Link object that should be used for retrieving Open Search Description XML.
public String	<i>getSemantics()</i> on page 513	Returns the value of the appropriate OData attribute.
public IODataLink	<i>getSubscriptionLink()</i> on page 513	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getTitle()</i> on page 513	Returns the value of the appropriate OData element.
public String	<i>getUrl()</i> on page 513	Returns OData Link object that should be used for self related operations.
public boolean	<i>isCreatable()</i> on page 513	Returns the value of the appropriate OData attribute.
public boolean	<i>isDeletable()</i> on page 514	Returns the value of the appropriate OData attribute.
public boolean	<i>isFilterable()</i> on page 514	Returns the value of the appropriate OData attribute.
public boolean	<i>isSearchable()</i> on page 514	Returns the value of the appropriate OData attribute.
public boolean	<i>isUpdatable()</i> on page 514	Returns the value of the appropriate OData attribute.
public void	<i>read(BufferedReader)</i> on page 515	
protected void	<i>setBaseUrl(String)</i> on page 515	
public void	<i>setEntitySet(IODataEntitySet)</i> on page 515	Sets the data held by the appropriate element of the OData Schema.

Modifier and Type	Method	Description
public void	<i>write(BufferedWriter)</i> on page 515	

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[]>	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	

Modifier and Type	Member	Description
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	

Modifier and Type	Member	Description
public	<i>ParserDocument(ParserDocu-ment)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boo-lean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocu-ment, String...)</i> on page 955	Insert the document under the element with the given route in-serted document will be placed before already existing docu-ments with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first ele-ment with the given route.
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.

Modifier and Type	Member	Description
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	

Modifier and Type	Member	Description
public void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt; IParserDocument &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt; String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt; String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValues(List&lt;String&gt;, String...)</i> on page 962	Sets all the values of the elements with the given route. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataCollection**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 169	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 169	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DISPLAYORDER</i> on page 169	Name of the appropriate OData extension attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 169	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_HREF</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 170	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_REL_SEARCH</i> on page 170	Possible value of the appropriate OData attribute.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_COLLECTION</i> on page 170	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 170	Name of the appropriate OData element.
public static final String	<i>ELEMENT_MEMBERTITLE</i> on page 171	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 171	Name of the appropriate OData element.

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <i>IParserDocument</i>	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParseDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParseDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataCollection()* constructor**Syntax**

```
public ODataCollection ()
```

*ODataCollection(ParserDocument)* constructor**Syntax**

```
public ODataCollection ( ParserDocument document )
```

*ODataCollection(String)* constructor**Syntax**

```
public ODataCollection ( String string )
```

*ODataCollection(int[], String[])* constructor**Syntax**

```
protected ODataCollection ( int[] routes , String[] values )
```

*getDisplayOrder()* method

Returns the value of the appropriate OData extension attribute.

**Syntax**

```
public int getDisplayOrder ()
```

**Returns**

The value of the appropriate OData extension attribute

*getHref()* method

Returns the value of the 'href' OData attribute.

**Syntax**

```
public String getHref ()
```

**Returns**

The value of the 'href' OData attribute

*getIcons()* method

Returns list of the appropriate OData elements.

**Syntax**

```
public List< IODataIcon > getIcons ()
```

### *Returns*

list of the appropriate OData elements

### *getId() method*

Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)

### *Syntax*

```
public String getId ()
```

### *Returns*

The value of the 'href' OData attribute

### *getLinks() method*

Returns the value of the appropriate OData elements.

### *Syntax*

```
public List< IODataLink > getLinks ()
```

### *Returns*

The value of the appropriate OData elements

### *getMemberTitle() method*

Returns the value of the appropriate OData element.

### *Syntax*

```
public String getMemberTitle ()
```

### *Returns*

The value of the appropriate OData element

### *getSearchLink() method*

Returns OData Link object that should be used for retrieving Open Search Description XML.

### *Syntax*

```
public IODataLink getSearchLink ()
```

### *Returns*

OData Link for search

*getSemantics() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public String getSemantics ()
```

*Returns*

The value of the appropriate OData attribute

*getSubscriptionLink() method*

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

*Syntax*

```
public IODataLink getSubscriptionLink ()
```

*Returns*

OData Link for subscribe

*getTitle() method*

Returns the value of the appropriate OData element.

*Syntax*

```
public String getTitle ()
```

*Returns*

The value of the appropriate OData element

*getUrl() method*

Returns OData Link object that should be used for self related operations.

*Syntax*

```
public String getUrl ()
```

*Returns*

OData Link for self Returns the full URL of the collectionThe full URL of the collection

*isCreatable() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public boolean isCreatable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isDeletable() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public boolean isDeletable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isFilterable() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public boolean isFilterable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isSearchable() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public boolean isSearchable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isUpdatable() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public boolean isUpdatable ()
```

### *Returns*

The value of the appropriate OData attribute

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

*Parameters*

- **reader** – The buffered reader to read the object from.

*Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

*setBaseUrl(String) method**Syntax*

```
protected void setBaseUrl (String baseUrl)
```

*setEntitySet(IODataEntitySet) method*

Sets the data held by the appropriate element of the OData Schema.

*Syntax*

```
public void setEntitySet ( IODataEntitySet entitySet)
```

*Parameters*

- **entitySet** – The OData EntitySet to use the data from.

*Usage*

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException** – if data can not be written into the writer

*baseUrl variable*

*Syntax*

```
protected String baseUrl
```

*collectionName variable*

*Syntax*

```
protected String collectionName
```

*isJson variable*

*Syntax*

```
protected boolean isJson
```

*ODataComplexType class*

*Syntax*

```
public class ODataComplexType extends ParserDocument,
IODataComplexType
```

*Members*

All members of ODataComplexType, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataComplexType()</i> on page 530	
public	<i>ODataComplexType(ParserDocument)</i> on page 530	
protected	<i>ODataComplexType(int[], String[])</i> on page 531	

**Methods**

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 531	Returns the value of the appropriate OData element.

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getProperties()</i> on page 531	Returns the list of the appropriate OData elements.

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	

Modifier and Type	Member	Description
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	

Modifier and Type	Member	Description
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	

Modifier and Type	Member	Description
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	

Modifier and Type	Member	Description
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataComplexType

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_NAME</i> on page 177	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 177	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 177	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataComplexType()* constructor

##### Syntax

```
public ODataComplexType ()
```

#### *ODataComplexType(ParserDocument)* constructor

##### Syntax

```
public ODataComplexType ( ParserDocument document )
```

*ODataComplexType(int[], String[]) constructor***Syntax**

```
protected ODataComplexType ( int[] routes , String[] values )
```

*getName() method*

Returns the value of the appropriate OData element.

**Syntax**

```
public String getName ()
```

**Returns**

The value of the appropriate OData element

*getProperties() method*

Returns the list of the appropriate OData elements.

**Syntax**

```
public List< IODataProperty > getProperties ()
```

**Returns**

The list of the appropriate OData elements

*ODataEntitySet class***Syntax**

```
public class ODataEntitySet extends ParserDocument,
IODataEntitySet
```

**Members**

All members of ODataEntitySet, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataEntitySet()</i> on page 545	
public	<i>ODataEntitySet(ParserDocument)</i> on page 546	
protected	<i>ODataEntitySet(int[], String[])</i> on page 546	

**Methods**

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 546	
public boolean	<i>isCreatable()</i> on page 546	
public boolean	<i>isDeletable()</i> on page 546	
public boolean	<i>isSearchable()</i> on page 546	
public boolean	<i>isSearchable(String)</i> on page 547	Returns the value of the given OData attribute.
public boolean	<i>isUpdatable()</i> on page 547	

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	

Modifier and Type	Member	Description
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	

Modifier and Type	Member	Description
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	

Modifier and Type	Member	Description
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	

Modifier and Type	Member	Description
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataEntitySet

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 184	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 184	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 185	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 185	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 185	Name of the appropriate OData attribute.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ENTITYSET</i> on page 185	Name of the appropriate OData element.

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataEntitySet()* constructor

##### Syntax

```
public ODataEntitySet ()
```

*ODataEntitySet(ParserDocument) constructor*

*Syntax*

```
public ODataEntitySet ( ParserDocument document )
```

*ODataEntitySet(int[], String[]) constructor*

*Syntax*

```
protected ODataEntitySet ( int[] routes , String[] values )
```

*getName() method*

*Syntax*

```
public String getName ()
```

*Returns*

The value of the appropriate OData attribute

*isCreatable() method*

*Syntax*

```
public boolean isCreatable ()
```

*Returns*

The value of the appropriate OData attribute

*isDeletable() method*

*Syntax*

```
public boolean isDeletable ()
```

*Returns*

The value of the appropriate OData attribute

*isSearchable() method*

*Syntax*

```
public boolean isSearchable ()
```

*Returns*

The value of the appropriate OData attribute

*isSearchable(String) method*

Returns the value of the given OData attribute.

*Syntax*

```
public boolean isSearchable ( String searchAttributeName )
```

*Parameters*

- **searchAttributeName** – The name of the OData attribute

*Returns*

The value of the given OData attribute

*isUpdatable() method**Syntax*

```
public boolean isUpdatable ()
```

*Returns*

The value of the appropriate OData attribute

*ODataEntityType class**Syntax*

```
public class ODataEntityType extends ParserDocument,  
IODataEntityType
```

*Derived classes*

- *ODataReturnEntityType* on page 795

*Members*

All members of ODataEntityType, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataEntityType()</i> on page 563	
public	<i>ODataEntityType(ParserDocument)</i> on page 563	
protected	<i>ODataEntityType(int[], String[])</i> on page 563	

**Methods**

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 563	Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 564	Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 564	Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.
public List< String >	<i>getKeyPropertyNames()</i> on page 564	Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.
public String	<i>getName()</i> on page 564	Returns The value of the appropriate OData attribute.
public List< IODataNavigationProperty >	<i>getNavigationProperties()</i> on page 565	Returns The list of appropriate OData elements.
public IODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 565	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getProperties()</i> on page 565	Returns The list of appropriate OData elements.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 565	Returns The list of appropriate OData elements with given attribute value.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 566	Returns The list of appropriate OData elements with given attribute value.
public IODataProperty	<i>getProperty(String)</i> on page 566	Returns The appropriate OData element with the given name.

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 566	Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.
protected IODataSchema	<i>getSchema()</i> on page 566	
public List< IODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 567	Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.
public boolean	<i>hasStream()</i> on page 567	Returns The value of the appropriate OData attribute.
protected void	<i>setSchema(IODataSchema)</i> on page 567	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	

Modifier and Type	Member	Description
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945

protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	

Modifier and Type	Member	Description
public void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	

Modifier and Type	Member	Description
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataEntityType

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HASSTREAM</i> on page 196	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 196	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_KEY</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTYREF</i> on page 196	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataEntityType()* constructor*Syntax*

```
public ODataEntityType ()
```

*ODataEntityType(ParserDocument)* constructor*Syntax*

```
public ODataEntityType ( ParserDocument document )
```

*ODataEntityType(int[], String[])* constructor*Syntax*

```
protected ODataEntityType ( int[] routes , String[] values )
```

*getGPUseInSearchPropertiesData()* method

Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

*Syntax*

```
public List< IODataProperty > getGPUseInSearchPropertiesData  
( )
```

*Returns*

The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value

### *getGPVisibleInDetailPropertiesData() method*

Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

#### *Syntax*

```
public List< IODataProperty >  
getGPVisibleInDetailPropertiesData ()
```

#### *Returns*

The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value

### *getGPVisibleInListPropertiesData() method*

Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

#### *Syntax*

```
public List< IODataProperty >  
getGPVisibleInListPropertiesData ()
```

#### *Returns*

The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value

### *getKeyPropertyNames() method*

Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.

#### *Syntax*

```
public List< String > getKeyPropertyNames ()
```

#### *Returns*

The list of the values of the 'PropertyRef' OData element

### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

***getNavigationProperties() method***

Returns The list of appropriate OData elements.

***Syntax***

```
public List< IODataNavigationProperty >
getNavigationProperties ()
```

***Returns***

The list of appropriate OData elements

***getNavigationProperty(String) method***

Returns The appropriate OData element with the given name.

***Syntax***

```
public IODataNavigationProperty getNavigationProperty (String
name )
```

***Returns***

The appropriate OData element with the given name

***getProperties() method***

Returns The list of appropriate OData elements.

***Syntax***

```
public List< IODataProperty > getProperties ()
```

***Returns***

The list of appropriate OData elements

***getPropertiesWithAttribute(String, String) method***

Returns The list of appropriate OData elements with given attribute value.

***Syntax***

```
public List< IODataProperty > getPropertiesWithAttribute
( String attributeName , String attributeValue )
```

***Returns***

The list of appropriate OData elements with given attribute value

### *getPropertiesWithAttribute(String, String, boolean) method*

Returns The list of appropriate OData elements with given attribute value.

#### *Syntax*

```
public List< IODataProperty > getPropertiesWithAttribute  
( String attributeName , String attributeValue , boolean addByDefault )
```

#### *Returns*

The list of appropriate OData elements with given attribute value

### *getProperty(String) method*

Returns The appropriate OData element with the given name.

#### *Syntax*

```
public IODataProperty getProperty ( String propertyName )
```

#### *Returns*

The appropriate OData element with the given name

### *getSAPSearchablePropertiesData() method*

Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.

#### *Syntax*

```
public List< IODataProperty > getSAPSearchablePropertiesData  
( )
```

#### *Returns*

The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value

### *getSchema() method*

#### *Syntax*

```
protected IODataSchema getSchema ( )
```

#### *Returns*

the schema

*getSearchablePropertiesData(String) method*

Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.

*Syntax*

```
public List< IODataProperty > getSearchablePropertiesData
( String searchAttributeName )
```

*Returns*

The list of appropriate OData elements with 'true' attribute value of the given attribute

*hasStream() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public boolean hasStream ()
```

*Returns*

The value of the appropriate OData attribute

*setSchema(IODataSchema) method**Syntax*

```
protected void setSchema ( IODataSchema schema )
```

*Parameters*

- **schema** – the schema to set

*ODataEntry class**Syntax*

```
public class ODataEntry extends ParserDocument, IODataEntry,
Externalizable, Cloneable
```

*Derived classes*

- *ODataReturnTypeEntry* on page 752
- *ODataSubscriptionEntry* on page 853

*Members*

All members of ODataEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description

protected boolean	<i>isLocalEntry</i> on page 604	
protected transient JsonObject	<i>jsonObject</i> on page 604	JSON related variables
protected static transient static final int	<i>NOT_TESTED</i> on page 604	
protected transient IOData-Schema	<i>schema</i> on page 604	
protected static transient static final int	<i>TRUE</i> on page 604	

### Constructors

Modifier and Type	Constructor	Description
public	<i>ODataEntry()</i> on page 588	
public	<i>ODataEntry(boolean)</i> on page 588	
public	<i>ODataEntry(IODataSchema)</i> on page 588	
public	<i>ODataEntry(ParserDocument)</i> on page 588	
public	<i>ODataEntry(ParserDocument, IODataSchema)</i> on page 588	

Modifier and Type	Constructor	Description
public	<i>ODataEntry(JsonObject)</i> on page 589	Json Related
protected	<i>ODataEntry(int[], String[])</i> on page 589	

### Methods

Modifier and Type	Method	Description
protected void	<i>addPropertyValues(IODataProperty, Map&lt;String, String&gt;, String)</i> on page 589	
public ODataEntry	<i>clone()</i> on page 589	Creates a copy of this object.
protected void	<i>fillPropertyData(IODataProperty, String...)</i> on page 589	
protected void	<i>fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...)</i> on page 589	
public List< IODataLink >	<i>getActionLinks()</i> on page 590	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 590	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 590	
public Long	<i>getCacheTimestamp()</i> on page 590	
public String	<i>getCollectionId()</i> on page 590	Returns the Id of the OCata Collection that this Entry belongs to.
public String	<i>getContentType()</i> on page 590	Returns the content type of the entry.

Modifier and Type	Method	Description
public String	<i>getEtag()</i> on page 591	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 591	Returns the full execution URL that can be used for filtering collection search for this single entry.
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 591	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 591	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 592	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public List< IODataIcon >	<i>getIcons()</i> on page 592	Returns the list of the appropriate OData elements.
public String	<i>getId()</i> on page 592	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 592	

Modifier and Type	Method	Description
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 593	Returns the values of the properties that are marked as key properties in the OData Schema document.
public Date	<i>getLastUpdated()</i> on page 593	Returns The parsed value of the 'updated' OData Element.
public List< IODataLink >	<i>getLinks()</i> on page 593	Returns the list of the appropriate OData elements.
public String	<i>getMediaSrc()</i> on page 593	Returns the media source if the entry has a media content.
public List< IODataProperty >	<i>getPropertiesData()</i> on page 593	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 594	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 594	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public IParserDocument	<i>getPropertiesDocument()</i> on page 594	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public String	<i>getPropertyValue(String...)</i> on page 595	Returns the value of the appropriate property.

Modifier and Type	Method	Description
public< T > T	<i>getPropertyValue-Parsed(String...)</i> on page 595	Returns the value of the appropriate property parsed to it's real type.
public List< String >	<i>getPropertyValues(List&lt;String[]&gt;)</i> on page 596	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 596	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< IODataLink >	<i>getRelatedDataLinks()</i> on page 596	Returns OData Link objects that represents links to Related Data.
public List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 597	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public IODataSchema	<i>getSchema()</i> on page 597	Returns the appropriate OData Schema object.
public IODataLink	<i>getSelfLink()</i> on page 597	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public IODataLink	<i>getSubscriptionLink()</i> on page 597	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 598	Returns The value of the appropriate OData element.
public String	<i>getTitle()</i> on page 598	Returns The value of the appropriate OData element.
protected void	<i>materialize()</i> on page 598	

Modifier and Type	Method	Description
protected void	<i>parseCollectionId()</i> on page 598	
protected long	<i>parseEdmTime(String)</i> on page 598	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 598	Puts the new property element as a sub-element of the 'complex properties' OData element.
public void	<i>putContentType(String)</i> on page 599	Puts the content type for a new entry object.
public void	<i>putDocument(IParserDocument, String...)</i> on page 599	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 599	Sets id of this OData Entry document (value of appropriate OData Id element)
public void	<i>putMediaSrc(String)</i> on page 600	Puts the media source for a new entry object.
public void	<i>putPropertyValue(String, String)</i> on page 600	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 600	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>read(BufferedReader)</i> on page 601	
protected String	<i>resolveTargetCollection(IODataLink)</i> on page 601	
public void	<i>setAuthorName(String)</i> on page 601	Sets the value of the 'name' OData element of the 'author' OData element.

Modifier and Type	Method	Description
public void	<i>setCacheState(cacheState)</i> on page 601	
public void	<i>setCacheTimestamp(Long)</i> on page 601	
public void	<i>setCollectionId(String)</i> on page 602	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 602	
public void	<i>setSchema(IODataSchema)</i> on page 602	Maintains the reference to the appropriate OData Schema object.
public void	<i>setSummary(String)</i> on page 602	Sets the value of the appropriate OData element.
public void	<i>setTitle(String)</i> on page 602	Sets the value of the appropriate OData element.
public void	<i>write(BufferedWriter)</i> on page 603	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	

Modifier and Type	Member	Description
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	

Modifier and Type	Member	Description
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	

Modifier and Type	Member	Description
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	

Modifier and Type	Member	Description
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataEntry**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataEntry()* constructor**Syntax**

```
public ODataEntry ()
```

*ODataEntry(boolean)* constructor**Syntax**

```
public ODataEntry ( boolean isComplex )
```

*ODataEntry(IODataSchema)* constructor**Syntax**

```
public ODataEntry ( IODataSchema schema )
```

*ODataEntry(ParserDocument)* constructor**Syntax**

```
public ODataEntry ( ParserDocument document )
```

*ODataEntry(ParserDocument, IODataSchema)* constructor**Syntax**

```
public ODataEntry ( ParserDocument document , IODataSchema schema )
```

*ODataEntry(JsonObject) constructor*

Json Related

*Syntax*

```
public ODataEntry ( JsonObject entry )
```

*ODataEntry(int[], String[]) constructor**Syntax*

```
protected ODataEntry ( int[] routes , String[] values )
```

*addPropertyValues(IODataProperty, Map< String, String >, String) method**Syntax*

```
protected void addPropertyValues ( IODataProperty property , Map< String, String > values , String pathString )
```

*clone() method*

Creates a copy of this object.

*Syntax*

```
public ODataEntry clone () throws CloneNotSupportedException
```

*Returns*

The new copy of this object

*fillPropertyData(IODataProperty, String...) method**Syntax*

```
protected void fillPropertyData ( IODataProperty property , String... path )
```

*fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...) method**Syntax*

```
protected void fillPropertyDataWithAttribute ( IODataProperty property , String attributeName , String attributeValue , boolean addByefault , String... path )
```

### *getActionLinks() method*

Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')

#### *Syntax*

```
public List< IODataLink > getActionLinks ()
```

#### *Returns*

List of OData Action Link documents

### *getAuthorName() method*

Returns The value of the 'name' OData element of the 'author' OData element.

#### *Syntax*

```
public String getAuthorName ()
```

#### *Returns*

The value of the 'name' OData element of the 'author' OData element

### *getCachestate() method*

#### *Syntax*

```
public cacheState getCachestate ()
```

### *getCacheTimestamp() method*

#### *Syntax*

```
public Long getCacheTimestamp ()
```

### *getCollectionId() method*

Returns the Id of the OCata Collection that this Entry belongs to.

#### *Syntax*

```
public String getCollectionId ()
```

#### *Returns*

The Id of the OCata Collection that this Entry belongs to

### *getContentType() method*

Returns the content type of the entry.

#### *Syntax*

```
public String getContentType ()
```

**Returns**

Content Type of the entry

***getEtag() method***

Returns the Id of the OData Collection that this Entry belongs to.

**Syntax**

```
public String getEtag ()
```

**Returns**

The Id of the OData Collection that this Entry belongs to

***getFilterUrl() method***

Returns the full execution URL hat can be used for filtering collection search for this single entry.

**Syntax**

```
public String getFilterUrl ()
```

**Returns**

The full filter URL

***getGPUseInSearchPropertiesData() method***

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.

**Syntax**

```
public List< IODataProperty > getGPUseInSearchPropertiesData  
()
```

**Returns**

The meta-informations and values of the appropriate properties

***getGPVisibleInDetailPropertiesData() method***

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.

**Syntax**

```
public List< IODataProperty >  
getGPVisibleInDetailPropertiesData ()
```

### *Returns*

The meta-informations and values of the appropriate properties

### *getGPVisibleInListPropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.

### *Syntax*

```
public List< IODataProperty >  
getGPVisibleInListPropertiesData ()
```

### *Returns*

The meta-informations and values of the appropriate properties

### *getIcons() method*

Returns the list of the appropriate OData elements.

### *Syntax*

```
public List< IODataIcon > getIcons ()
```

### *Returns*

The list of the appropriate OData elements

### *getId() method*

Returns The Id of this OData Entry (value of appropriate OData Id element)

### *Syntax*

```
public String getId ()
```

### *Returns*

The Id of this OData Entry

### *getIsLocal() method*

### *Syntax*

```
public boolean getIsLocal ()
```

*getKeyPropertyValues() method*

Returns the values of the properties that are marked as key properties in the OData Schema document.

*Syntax*

```
public Map< String, String > getKeyPropertyValues ()
```

*Returns*

The name-value pairs of the key properties

*getLastUpdated() method*

Returns The parsed value of the 'updated' OData Element.

*Syntax*

```
public Date getLastUpdated ()
```

*Returns*

The parsed value of the value of the 'updated' OData element or null is parsing failed

*getLinks() method*

Returns the list of the appropriate OData elements.

*Syntax*

```
public List< IODataLink > getLinks ()
```

*Returns*

The list of the appropriate OData elements

*getMediaSrc() method*

Returns the media source if the entry has a media content.

*Syntax*

```
public String getMediaSrc ()
```

*Returns*

Media source link of the entry

*getPropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.

*Syntax*

```
public List< IODataProperty > getPropertiesData ()
```

### *Returns*

The meta-informations and values of the contained properties

### *getPropertiesDataWithAttribute(String, String) method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

### *Syntax*

```
public List< IODataProperty > getPropertiesDataWithAttribute  
( String attributeName , String attributeValue )
```

### *Parameters*

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### *Returns*

The meta-informations and values of the appropriate properties

### *getPropertiesDataWithAttribute(String, String, boolean) method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

### *Syntax*

```
public List< IODataProperty > getPropertiesDataWithAttribute  
( String attributeName , String attributeValue , boolean addByDefault )
```

### *Parameters*

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

### *Returns*

The meta-informations and values of the appropriate properties

### *getPropertiesDocument() method*

Returns the representer document of OData 'properties' (Metadata name-space) document  
This method is created for performance reasons mostly to use in search methods.

### *Syntax*

```
public IParserDocument getPropertiesDocument ()
```

*Returns*

The ParseDocument representation of OData 'properties' (Metadata name-space) document

*getPropertyValue(String...) method*

Returns the value of the appropriate property.

*Syntax*

```
public String getPropertyValue (String... propertyPath )
```

*Parameters*

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

*Returns*

The value of the property

*Exceptions*

- **IllegalArgumentException** – if the property name is null or ambiguous.

*Usage*

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

*getPropertyValueParsed(String...) method*

Returns the value of the appropriate property parsed to it's real type.

*Syntax*

```
public< T > T getPropertyValueParsed (String... propertyPath ) throws  
ClassCastException
```

*Parameters*

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

*Returns*

The value of the property

*Exceptions*

- **IllegalArgumentException** – if the property name is null or ambiguous

- **ClassCastException** – if the property value can not be parsed to the expected type

### *Usage*

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

### *getPropertyValues(List< String[]>) method*

Return list of property values for the given property paths.

### *Syntax*

```
public List< String > getPropertyValues ( List< String[]>  
propertyPathes )
```

### *Parameters*

- **propertyPathes** – Name of the property or path including the name of the enclosing Complex Types

### *Returns*

The list of the values of the properties

### *getPropertyValues() method*

Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

### *Syntax*

```
public Map< String, String > getPropertyValues ()
```

### *Returns*

The name/path and value pairs of the contained properties

### *Usage*

The name of the properties will contain their current name-space prefixes.

### *getRelatedDataLinks() method*

Returns OData Link objects that represents links to Related Data.

### *Syntax*

```
public List< IODataLink > getRelatedDataLinks ()
```

### *Returns*

List of OData Related Link documents

*getSAPSearchablePropertiesData() method*

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.

*Syntax*

```
public List< IODataProperty > getSAPSearchablePropertiesData
()
```

*Returns*

The meta-informations and values of the appropriate properties

*getSchema() method*

Returns the appropriate OData Schema object.

*Syntax*

```
public IODataSchema getSchema ()
```

*Returns*

The appropriate OData Schema object.

*getSelfLink() method*

Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

*Syntax*

```
public IODataLink getSelfLink ()
```

*Returns*

OData self Link

*getSubscriptionLink() method*

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

*Syntax*

```
public IODataLink getSubscriptionLink ()
```

*Returns*

OData Link for subscribe

### *getSummary() method*

Returns The value of the appropriate OData element.

#### *Syntax*

```
public String getSummary ()
```

#### *Returns*

The value of the appropriate OData element

### *getTitle() method*

Returns The value of the appropriate OData element.

#### *Syntax*

```
public String getTitle ()
```

#### *Returns*

The value of the appropriate OData element

### *materialize() method*

#### *Syntax*

```
protected void materialize ()
```

### *parseCollectionId() method*

#### *Syntax*

```
protected void parseCollectionId ()
```

### *parseEdmTime(String) method*

#### *Syntax*

```
protected long parseEdmTime (String value )
```

### *putComplexPropertyValue(String, String...) method*

Puts the new property element as a sub-element of the 'complex properties' OData element.

#### *Syntax*

```
public void putComplexPropertyValue (String propertyValue ,  
String... propertyName )
```

*Parameters*

- **propertyName** – The route of the property with or without name-space until the complex type.
- **propertyValue** – The value of the property

*Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

*putContentType(String) method*

Puts the content type for a new entry object.

*Syntax*

```
public void putContentType (String contentType)
```

*Parameters*

- **contentType** – - Content Type of the entry

*putDocument(IParserDocument, String...) method*

Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.

*Syntax*

```
public void putDocument (IParserDocument document , String...  
route) throws IllegalArgumentException
```

*Parameters*

- **document** – The new document
- **route** – The route to the parent element of the new document

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*putId(String) method*

Sets id of this OData Entry document (value of appropriate OData Id element)

*Syntax*

```
public void putId (String id)
```

### *Parameters*

- **id** – The new id.

### *putMediaSrc(String) method*

Puts the media source for a new entry object.

### *Syntax*

```
public void putMediaSrc ( String mediaSrc )
```

### *Parameters*

- **mediaSrc** – - Media source of the entry

### *putPropertyValue(String, String) method*

Puts the new property element as a sub-element of the 'properties' OData element.

### *Syntax*

```
public void putPropertyValue ( String propertyName , String propertyValue )
```

### *Parameters*

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

### *putPropertyValue(String, String, boolean) method*

Puts the new property element as a sub-element of the 'properties' OData element.

### *Syntax*

```
public void putPropertyValue ( String propertyName , String propertyValue , boolean useDefaultPrefix )
```

### *Parameters*

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

### *read(BufferedReader) method*

#### *Syntax*

```
public void read (BufferedReader reader) throws  
PersistenceException
```

#### *Parameters*

- **reader** – The buffered reader to read the object from.

#### *Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

### *resolveTargetCollection(IONDataLink) method*

#### *Syntax*

```
protected String resolveTargetCollection (IONDataLink link)
```

### *setAuthorName(String) method*

Sets the value of the 'name' OData element of the 'author' OData element.

#### *Syntax*

```
public void setAuthorName (String authorName)
```

#### *Parameters*

- **authorName** – The new value of the element

### *setCachestate(cacheState) method*

#### *Syntax*

```
public void setCachestate (cacheState cachestate)
```

### *setCacheTimestamp(Long) method*

#### *Syntax*

```
public void setCacheTimestamp (Long timestamp)
```

### *setCollectionId(String) method*

Maintains the Id of the OCata Collection that this Entry belongs to.

#### *Syntax*

```
public void setCollectionId ( String collectionId )
```

#### *Parameters*

- **collectionId** – The Id of the OCata Collection that this Entry belongs to

### *setIsLocal(boolean) method*

#### *Syntax*

```
public void setIsLocal ( boolean isLocal )
```

### *setSchema(IODataSchema) method*

Maintains the reference to the appropriate OData Schema object.

#### *Syntax*

```
public void setSchema ( IODataSchema schema )
```

#### *Parameters*

- **schema** – The appropriate OData Schema object.

### *setSummary(String) method*

Sets the value of the appropriate OData element.

#### *Syntax*

```
public void setSummary ( String summary )
```

#### *Parameters*

- **summary** – The new value of the element

### *setTitle(String) method*

Sets the value of the appropriate OData element.

#### *Syntax*

```
public void setTitle ( String title )
```

#### *Parameters*

- **title** – The new value of the element

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException** – if data can not be written into the writer

*cache\_timestamp variable**Syntax*

```
protected Long cache_timestamp
```

*Cachestate variable**Syntax*

```
protected cacheState Cachestate
```

*collectionId variable**Syntax*

```
protected String collectionId
```

*FALSE variable**Syntax*

```
protected static transient static final int FALSE
```

*FILTER variable**Syntax*

```
protected static transient static final String FILTER
```

*FILTER\_AND variable**Syntax*

```
protected static transient static final String FILTER_AND
```

*FILTER\_EQ variable*

*Syntax*

```
protected static transient static final String FILTER_EQ
```

*isLocalEntry variable*

*Syntax*

```
protected boolean isLocalEntry
```

*jsonObject variable*

JSON related variables

*Syntax*

```
protected transient JsonObject jsonObject
```

*NOT\_TESTED variable*

*Syntax*

```
protected static transient static final int NOT_TESTED
```

*schema variable*

*Syntax*

```
protected transient IODataSchema schema
```

*TRUE variable*

*Syntax*

```
protected static transient static final int TRUE
```

*ODataError class*

*Syntax*

```
public class ODataError extends ParserDocument, IODataError
```

*Members*

All members of ODataError, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataError()</i> on page 619	

Modifier and Type	Constructor	Description
public	<i>ODataError(ParserDocument)</i> on page 619	
protected	<i>ODataError(int[], String[])</i> on page 619	

### Methods

Modifier and Type	Method	Description
public String	<i>getErrorCode()</i> on page 619	Returns The value of the 'code' OData element.
public String	<i>getLang()</i> on page 619	Returns The value of the appropriate OData attribute of the 'message' element.
public String	<i>getMessage()</i> on page 619	Return the localized error message.

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	

Modifier and Type	Member	Description
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	

Modifier and Type	Member	Description
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	

Modifier and Type	Member	Description
public void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	

Modifier and Type	Member	Description
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataError

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_LANGUAGE</i> on page 228	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ERROR</i> on page 228	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ERRORCODE</i> on page 228	Name of the appropriate OData element.
public static final String	<i>ELEMENT_MESSAGE</i> on page 228	Name of the appropriate OData element.

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <i>IParserDocument</i>	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParseDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParseDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*OnError() constructor**Syntax*

```
public OnError ()
```

*OnError(ParserDocument) constructor**Syntax*

```
public OnError ( ParserDocument document )
```

*OnError(int[], String[]) constructor**Syntax*

```
protected OnError ( int[] routes , String[] values )
```

*getErrorCode() method*

Returns The value of the 'code' OData element.

*Syntax*

```
public String getErrorCode ()
```

*Returns*

The value of the 'code' OData element

*getLang() method*

Returns The value of the appropriate OData attribute of the 'message' element.

*Syntax*

```
public String getLang ()
```

*Returns*

The value of the appropriate OData attribute of the 'message' element

*getMessage() method*

Return the localized error message.

*Syntax*

```
public String getMessage ()
```

*Returns*

The value of the 'message' OData element

*ODataFeed class**Syntax*

```
public class ODataFeed extends IODataFeed
```

*Members*

All members of ODataFeed, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>getAuthor()</i> on page 620	Returns the name of the Author of the OData Feed.
public List< String >	<i>getDeletedEntries()</i> on page 621	Returns the list of links of the Deleted Entries.
public IODataLink	<i>getDeltaLink()</i> on page 621	Returns the latest delta link token.
public List< IODataEntry >	<i>getEntries()</i> on page 621	Returns the entries in the feed that have been updated/ entire list of entries in the collection.
public String	<i>getId()</i> on page 621	Returns the id of the OData Feed.
public String	<i>getLastUpdated()</i> on page 621	Returns the date/time of last update on the OData Feed.
public List< IODataLink >	<i>getLinks()</i> on page 622	
protected IODataSchema	<i>getSchema()</i> on page 622	
public String	<i>getTitle()</i> on page 622	Returns the Title of the OData Feed.
protected void	<i>setDeltaLink(IODataLink)</i> on page 622	
protected void	<i>setSchema(IODataSchema)</i> on page 622	

*getAuthor() method*

Returns the name of the Author of the OData Feed.

*Syntax*

```
public String getAuthor ()
```

**Returns**

String Author Name

***getDeletedEntries() method***

Returns the list of links of the Deleted Entries.

**Syntax**

```
public List< String > getDeletedEntries ()
```

**Returns**

List<ISDMODataLink> - List of links of the deleted entries

***getDeltaLink() method***

Returns the latest delta link token.

**Syntax**

```
public IODataLink getDeltaLink ()
```

***getEntries() method***

Returns the entries in the feed that have been updated/ entire list of entries in the collection.

**Syntax**

```
public List< IODataEntry > getEntries ()
```

**Returns**

List<ISDMODataEntry> - List of ODataEntries

***getId() method***

Returns the id of the OData Feed.

**Syntax**

```
public String getId ()
```

**Returns**

String Id

***getLastUpdated() method***

Returns the date/time of last update on the OData Feed.

**Syntax**

```
public String getLastUpdated ()
```

### *Returns*

String Date-time

### *getLinks() method*

#### *Syntax*

```
public List< IODataLink > getLinks ()
```

### *getSchema() method*

#### *Syntax*

```
protected IODataSchema getSchema ()
```

### *Returns*

the schema

### *getTitle() method*

Returns the Title of the OData Feed.

#### *Syntax*

```
public String getTitle ()
```

### *Returns*

String Title

### *setDeltaLink(IODataLink) method*

#### *Syntax*

```
protected void setDeltaLink ( IODataLink deltaLink2 )
```

#### *Parameters*

- **deltaLink2** – the deltaLink to set

### *setSchema(IODataSchema) method*

#### *Syntax*

```
protected void setSchema ( IODataSchema schema )
```

#### *Parameters*

- **schema** – the schema to set

*ODataFunctionImport* class**Syntax**

```
public class ODataFunctionImport extends ParserDocument,
IODataFunctionImport
```

**Members**

All members of *ODataFunctionImport*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 641	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataFunctionImport()</i> on page 638	
public	<i>ODataFunctionImport(ParserDocument)</i> on page 638	
protected	<i>ODataFunctionImport(int[], String[])</i> on page 638	

**Methods**

Modifier and Type	Method	Description
public String	<i>getActionFor()</i> on page 638	Returns The value of the appropriate OData attribute.
public String	<i>getCollectionId()</i> on page 638	Returns The value of the 'EntitySet' OData attribute.
public String	<i>getEntitySet()</i> on page 639	Returns The value of the 'EntitySet' OData attribute.
public String	<i>getExecutionUrl(Map&lt; String, String &gt;)</i> on page 639	Calculate the full execution URL for executing this Function Import according to the passed parameters.
public String	<i>getHTTPMethod()</i> on page 639	Returns The value of the appropriate OData attribute.

Modifier and Type	Method	Description
public List< String >	<i>getInputParameterNames()</i> on page 639	Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.
public String	<i>getName()</i> on page 640	Returns The value of the appropriate OData attribute.
public List< String >	<i>getOutputParameterNames()</i> on page 640	Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.
public List< IODataParameter >	<i>getParameters()</i> on page 640	Returns The list of the appropriate OData element.
public String	<i>getReturnType()</i> on page 640	Returns The value of the appropriate OData attribute.
public RETURNTYPE_ENUM	<i>getReturnTypeEnum()</i> on page 640	Returns The return type of this Function Import OData document.
public void	<i>read(BufferedReader)</i> on page 641	
public void	<i>setBaseUrl(String)</i> on page 641	
public void	<i>write(BufferedWriter)</i> on page 641	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	

Modifier and Type	Member	Description
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.

Modifier and Type	Member	Description
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataFunctionImport

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ACTION_FOR</i> on page 241	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 241	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_HTTPMETHOD</i> on page 241	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 242	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_RETURNTYPE</i> on page 242	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_FUNCTIONAL_IMPORT</i> on page 242	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 242	Name of the appropriate OData element.

#### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <i>IParserDocument</i>	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIX_MAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataFunctionImport()* constructor*Syntax*

```
public ODataFunctionImport ()
```

*ODataFunctionImport(ParserDocument)* constructor*Syntax*

```
public ODataFunctionImport ( ParserDocument document )
```

*ODataFunctionImport(int[], String[])* constructor*Syntax*

```
protected ODataFunctionImport ( int[] routes , String[] values )
```

*getActionFor()* method

Returns The value of the appropriate OData attribute.

*Syntax*

```
public String getActionFor ()
```

*Returns*

The value of the appropriate OData attribute

*getCollectionId()* method

Returns The value of the 'EntitySet' OData attribute.

*Syntax*

```
public String getCollectionId ()
```

**Returns**

The value of the 'EntitySet' OData attribute

***getEntitySet() method***

Returns The value of the 'EntitySet' OData attribute.

**Syntax**

```
public String getEntitySet ()
```

**Returns**

The value of the 'EntitySet' OData attribute

***getExecutionUrl(Map< String, String >) method***

Calculate the full execution URL for executing this Function Import according to the passed paramteres.

**Syntax**

```
public String getExecutionUrl (Map< String, String >
parameters )
```

**Returns**

The full execution URL

***getHTTPMethod() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getHTTPMethod ()
```

**Returns**

The value of the appropriate OData attribute

***getInputParameterNames() method***

Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.

**Syntax**

```
public List< String > getInputParameterNames ()
```

**Returns**

The list of the appropriate OData element with 'In' or 'InOut' attribute value

### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getOutputParameterNames() method*

Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.

#### *Syntax*

```
public List< String > getOutputParameterNames ()
```

#### *Returns*

The list of the appropriate OData element with 'Out' or 'InOut' attribute value

### *getParameters() method*

Returns The list of the appropriate OData element.

#### *Syntax*

```
public List< IODataParameter > getParameters ()
```

#### *Returns*

The list of the appropriate OData element

### *getReturnType() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getReturnType ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getReturnTypeEnum() method*

Returns The return type of this Function Import OData document.

#### *Syntax*

```
public RETURNNTYPE_ENUM getReturnTypeEnum ()
```

*Returns*

The return type of this Function Import OData document

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

*Parameters*

- **reader** – The buffered reader to read the object from.

*Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

*setBaseUrl(String) method**Syntax*

```
public void setBaseUrl (String baseUrl)
```

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException** – if data can not be written into the writer

*baseUrl variable**Syntax*

```
protected String baseUrl
```

*ODataIcon class**Syntax*

```
public class ODataIcon extends ParserDocument, IODataIcon
```

*Members*All members of `ODataIcon`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 658	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataIcon()</i> on page 656	
public	<i>ODataIcon(ParserDocument)</i> on page 656	
protected	<i>ODataIcon(int[], String[])</i> on page 656	

**Methods**

Modifier and Type	Method	Description
public int	<i>getHeight()</i> on page 656	Returns The value of the appropriate OData attribute.
public String	<i>getUrl()</i> on page 657	Returns The value of the appropriate OData attribute.
public int	<i>getWidth()</i> on page 657	Returns The value of the appropriate OData attribute.
public void	<i>read(BufferedReader)</i> on page 657	
protected void	<i>setBaseUrl(String)</i> on page 657	
public void	<i>write(BufferedWriter)</i> on page 657

**Inherited members from IODataIcon**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HEIGHT</i> on page 249	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_WIDTH</i> on page 249	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ICON</i> on page 249	Name of the appropriate OData element.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataIcon()* constructor*Syntax*

```
public ODataIcon ()
```

*ODataIcon(ParserDocument)* constructor*Syntax*

```
public ODataIcon ( ParserDocument document )
```

*ODataIcon(int[], String[])* constructor*Syntax*

```
protected ODataIcon ( int[] routes , String[] values )
```

*getHeight()* method

Returns The value of the appropriate OData attribute.

*Syntax*

```
public int getHeight ()
```

*Returns*

The value of the appropriate OData attribute

*getUrl() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public String getUrl ()
```

*Returns*

The value of the appropriate OData attribute

*getWidth() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public int getWidth ()
```

*Returns*

The value of the appropriate OData attribute

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws  
PersistenceException
```

*Parameters*

- **reader** – The buffered reader to read the object from.

*Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

*setBaseUrl(String) method**Syntax*

```
protected void setBaseUrl (String baseUrl)
```

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException** – if data can not be written into the writer

*baseUrl variable*

*Syntax*

```
protected String baseUrl
```

*ODataLink class*

*Syntax*

```
public class ODataLink extends ParserDocument, IODataLink
```

*Members*

All members of ODataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 678	
protected IODataSchema	<i>schema</i> on page 678	
protected String	<i>targetCollectionId</i> on page 678	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataLink()</i> on page 674	
public	<i>ODataLink(ParserDocument)</i> on page 674	
protected	<i>ODataLink(int[], String[])</i> on page 674	

**Methods**

Modifier and Type	Method	Description
public String	<i>getHref()</i> on page 674	Returns the value of the appropriate OData attribute.
public List< IODataEntry >	<i>getInlineEntries()</i> on page 674	Returns the list of OData Entries contained by the appropriate OData 'inline' element.
public List< String >	<i>getInputParameterNames()</i> on page 675	Returns the list of the appropriate OData Parameter elements that should be used as input parameter.
public List< String >	<i>getOutputParameterNames()</i> on page 675	Returns the list of the appropriate OData Parameter elements that should be used as output parameter.
public List< IODataParameter >	<i>getParameters()</i> on page 675	Returns the list of the appropriate OData Parameter elements.
public String	<i>getRel()</i> on page 675	Returns the value of the appropriate OData attribute.
public IODataSchema	<i>getSchema()</i> on page 676	Returns the Schema that is to be used for 'Inline entries'.
public String	<i>getSemantics()</i> on page 676	Returns The value of the appropriate OData extension (vCard) attribute.
public String	<i>getTargetCollectionId()</i> on page 676	Returns the Id of the collection that this link points to (if any)
public String	<i>getTitle()</i> on page 676	Returns the value of the appropriate OData attribute.
public String	<i>getUrl()</i> on page 676	Returns the full URL for this OData Link object without parameters.
public String	<i>getUrlWithParameters(Map&lt; String, String &gt;)</i> on page 677	Returns the full URL for this OData Link object extended with the given parameter names and values.
public void	<i>read(BufferedReader)</i> on page 677	

Modifier and Type	Method	Description
protected void	<i>setBaseUrl(String)</i> on page 677	
public void	<i>setSchema(IODataSchema)</i> on page 677	Sets the Schema that is to be used for 'Inline entries'.
public void	<i>setTargetCollectionId(String)</i> on page 678	Maintains the Id of the collection that this link points to (if any)
public void	<i>write(BufferedWriter)</i> on page 678	

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.

Modifier and Type	Member	Description
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	

Modifier and Type	Member	Description
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	

Modifier and Type	Member	Description
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	

Modifier and Type	Member	Description
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	

Modifier and Type	Member	Description
public static void	<i>setPrefixMapping</i> ( <i>Map</i> < <i>String</i> , <i>String</i> >) on page 961	
protected void	<i>setString</i> ( <i>String</i> , <i>String</i> ...) on page 961	
protected void	<i>setStrings</i> ( <i>List</i> < <i>String</i> >, <i>String</i> ...) on page 961	
public void	<i>setValue</i> ( <i>String</i> , <i>String</i> ...) on page 961	
public void	<i>setValues</i> ( <i>List</i> < <i>String</i> >, <i>String</i> ...) on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected <i>String</i> []	<i>strings</i> on page 964	
public <i>String</i>	<i>toXMLString</i> () on page 962	Returns the XML string representation of this object.
protected static final <i>String</i>	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final <i>String</i>	<i>VALUE_STRING</i> on page 964	
public void	<i>writeExternal</i> ( <i>ObjectOutput</i> ) on page 962	
public static void	<i>writeNameMap</i> ( <i>BufferedWriter</i> ) on page 963	

#### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final <i>String</i>	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataLink

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HREF</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_REL</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_REL_VALUE_EDIT</i> on page 260	Value option for the appropriate OData parameter.
public static final String	<i>ATTRIBUTE_REL_VALUE_SELF</i> on page 260	Value option for the appropriate OData parameter.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 260	Name of the appropriate OData attribute.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_TITLE</i> on page 260	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE-PART_DELTA</i> on page 260	String that should be part of every rel attribute of a Delta.
public static final String	<i>ATTRIBUTE_VALUE-PART_RELATED</i> on page 261	String that should be part of every rel attribute of a Related Data Link.
public static final String	<i>ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION</i> on page 261	String that should be end of every rel attribute of a Subscription Link.
public static final String	<i>ELEMENT_INLINE</i> on page 261	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 261	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 261	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PARAMETER-SET</i> on page 261	Name of the appropriate OData element.

#### Inherited members from `IParserDocument`

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <code>IParserDocument</code>	<i>clone()</i> on page 374	Creates a copy of this object.
public static <code>Map&lt; String, String &gt;</code>	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final <code>String[]</code>	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataLink()* constructor*Syntax*

```
public ODataLink ()
```

*ODataLink(ParserDocument)* constructor*Syntax*

```
public ODataLink ( ParserDocument document )
```

*ODataLink(int[], String[])* constructor*Syntax*

```
protected ODataLink ( int[] routes , String[] values )
```

*getHref()* method

Returns the value of the appropriate OData attribute.

*Syntax*

```
public String getHref ()
```

*Returns*

The value of the appropriate OData attribute

*getInlineEntries()* method

Returns the list of OData Entries contained by the appropriate OData 'inline' element.

*Syntax*

```
public List< IODataEntry > getInlineEntries ()
```

**Returns**

The List of 'inline' OData Entries

***getInputParameterNames() method***

Returns the list of the appropriate OData Parameter elements that should be used as input parameter.

**Syntax**

```
public List< String > getInputParameterNames ()
```

**Returns**

The list of the appropriate OData Parameter elements that should be used as input parameter

***getOutputParameterNames() method***

Returns the list of the appropriate OData Parameter elements that should be used as output parameter.

**Syntax**

```
public List< String > getOutputParameterNames ()
```

**Returns**

The list of the appropriate OData Parameter elements that should be used as output parameter

***getParameters() method***

Returns the list of the appropriate OData Parameter elements.

**Syntax**

```
public List< IODataParameter > getParameters ()
```

**Returns**

The list of the appropriate OData Parameter elements

***getRel() method***

Returns the value of the appropriate OData attribute.

**Syntax**

```
public String getRel ()
```

**Returns**

The value of the appropriate OData attribute

### *getSchema() method*

Returns the Schema that is to be used for 'Inline entries'.

#### *Syntax*

```
public IODataSchema getSchema ()
```

#### *Returns*

The relevant schema

### *getSemantics() method*

Returns The value of the appropriate OData extension (vCard) attribute.

#### *Syntax*

```
public String getSemantics ()
```

#### *Returns*

The value of the appropriate OData extension (vCard) attribute

### *getTargetCollectionId() method*

Returns the Id of the collection that this link points to (if any)

#### *Syntax*

```
public String getTargetCollectionId ()
```

#### *Returns*

The Id of the collection that this link points to

### *getTitle() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public String getTitle ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getUrl() method*

Returns the full URL for this OData Link object without parameters.

#### *Syntax*

```
public String getUrl ()
```

*Returns*

The full URL of this link without parameters

*getUrlWithParameters(Map< String, String >) method*

Returns the full URL for this OData Link object extended with the given parameter names and values.

*Syntax*

```
public String getUrlWithParameters (Map< String, String >
parameters )
```

*Returns*

The full URL of this link with parameters

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

*Parameters*

- **reader** – The buffered reader to read the object from.

*Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

*setBaseUrl(String) method**Syntax*

```
protected void setBaseUrl (String baseUrl)
```

*setSchema(IODataSchema) method*

Sets the Schema that is to be used for 'Inline entries'.

*Syntax*

```
public void setSchema (IODataSchema schema)
```

*Parameters*

- **schema** – The relevant schema

### *setTargetCollectionId(String) method*

Maintains the Id of the collection that this link points to (if any)

#### *Syntax*

```
public void setTargetCollectionId ( String targetCollectionId )
```

#### *Parameters*

- **targetCollectionId** – The Id of the collection that this link points to

### *write(BufferedWriter) method*

#### *Syntax*

```
public void write ( BufferedWriter writer ) throws  
PersistenceException
```

#### *Parameters*

- **writer** – The buffered writer that object data needs to be written into.

#### *Exceptions*

- **PersistenceException** – if data can not be written into the writer

### *baseUrl variable*

#### *Syntax*

```
protected String baseUrl
```

### *schema variable*

#### *Syntax*

```
protected IODataSchema schema
```

### *targetCollectionId variable*

#### *Syntax*

```
protected String targetCollectionId
```

### *ODataNavigationProperty class*

#### *Syntax*

```
public class ODataNavigationProperty extends ParserDocument,  
IODataNavigationProperty
```

### Members

All members of `ODataNavigationProperty`, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<code>ODataNavigationProperty()</code> on page 693	
public	<code>ODataNavigationProperty(ParserDocument)</code> on page 693	
protected	<code>ODataNavigationProperty(int[], String[])</code> on page 694	

### Methods

Modifier and Type	Method	Description
public String	<code>getFromRole()</code> on page 694	Returns The value of the appropriate OData attribute.
public String	<code>getName()</code> on page 694	Returns The value of the appropriate OData attribute.
public String	<code>getRelationship()</code> on page 694	Returns The value of the appropriate OData attribute.
public String	<code>getToRole()</code> on page 694	Returns The value of the appropriate OData attribute.

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<code>ANY_STRING</code> on page 963	
static transient final int	<code>ATTRIBUTE_ID</code> on page 963	
static transient final String	<code>ATTRIBUTE_STRING</code> on page 963	
public ParserDocument	<code>clone()</code> on page 945	Creates a copy of this object.
protected Map< String, String >	<code>extensions</code> on page 963	
public String	<code>getAttribute(String...)</code> on page 945	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public void	<i>removeExtension(String)</i> on page 958	

Modifier and Type	Member	Description
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	

Modifier and Type	Member	Description
public void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt; IParserDocument &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt; String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt; String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValues(List&lt;String&gt;, String...)</i> on page 962	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from `IParserDocument`

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataNavigationProperty**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_FROMROLE</i> on page 268	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 268	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_RELATIONSHIP</i> on page 269	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TOROLE</i> on page 269	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_NAVIGATIONPROPERTY</i> on page 269	Name of the appropriate OData element.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ONavigationProperty()* constructor

##### Syntax

```
public ONavigationProperty ()
```

#### *ONavigationProperty(ParserDocument)* constructor

##### Syntax

```
public ONavigationProperty ( ParserDocument document )
```

*ODataNavigationProperty(int[], String[]) constructor*

**Syntax**

```
protected ODataNavigationProperty ( int[] routes , String[] values )
```

*getFromRole() method*

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getFromRole ()
```

**Returns**

The value of the appropriate OData attribute

*getName() method*

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getName ()
```

**Returns**

The value of the appropriate OData attribute

*getRelationship() method*

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getRelationship ()
```

**Returns**

The value of the appropriate OData attribute

*getToRole() method*

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getToRole ()
```

**Returns**

The value of the appropriate OData attribute

*ODataOpenSearchDescription class***Syntax**

```
public class ODataOpenSearchDescription extends
ParserDocument, IODataOpenSearchDescription
```

**Members**

All members of ODataOpenSearchDescription, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 711	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataOpenSearchDescription()</i> on page 709	
public	<i>ODataOpenSearchDescription(ParserDocument)</i> on page 709	
protected	<i>ODataOpenSearchDescription(int[], String[])</i> on page 709	

**Methods**

Modifier and Type	Method	Description
public String	<i>getDescription()</i> on page 709	Returns The value of the appropriate OData element.
public String	<i>getShortName()</i> on page 710	Returns The value of the appropriate OData element.
public List< IODataURL >	<i>getUrls()</i> on page 710	Returns The list of the appropriate OData element.
public void	<i>read(BufferedReader)</i> on page 710	
protected void	<i>setBaseUrl(String)</i> on page 710	

Modifier and Type	Method	Description
public void	<i>write(BufferedWriter)</i> on page 710	

**Inherited members from ParserDocument**

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	

Modifier and Type	Member	Description
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	

Modifier and Type	Member	Description
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945

protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String&gt;, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataOpenSearchDescription**

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_DESCRIPTION</i> on page 275	Name of the appropriate OData element.
public static final String	<i>ELEMENT_OPENSEARCH-DESCRIPTION</i> on page 275	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SHORTNAME</i> on page 276	Name of the appropriate OData element.
public static final String	<i>ELEMENT_URL</i> on page 276	Name of the appropriate OData element.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

#### *ODataOpenSearchDescription()* constructor

##### Syntax

```
public ODataOpenSearchDescription ()
```

#### *ODataOpenSearchDescription(ParserDocument)* constructor

##### Syntax

```
public ODataOpenSearchDescription ( ParserDocument document )
```

#### *ODataOpenSearchDescription(int[], String[])* constructor

##### Syntax

```
protected ODataOpenSearchDescription ( int[] routes , String[] values )
```

#### *getDescription()* method

Returns The value of the appropriate OData element.

##### Syntax

```
public String getDescription ()
```

### *Returns*

The value of the appropriate OData element

### *getShortName() method*

Returns The value of the appropriate OData element.

### *Syntax*

```
public String getShortName ()
```

### *Returns*

The value of the appropriate OData element

### *getUrls() method*

Returns The list of the appropriate OData element.

### *Syntax*

```
public List< IODataURL > getUrls ()
```

### *Returns*

The list of the appropriate OData element

### *read(BufferedReader) method*

### *Syntax*

```
public void read (BufferedReader reader) throws  
PersistenceException
```

### *Parameters*

- **reader** – The buffered reader to read the object from.

### *Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

### *setBaseUrl(String) method*

### *Syntax*

```
protected void setBaseUrl (String baseUrl)
```

### *write(BufferedWriter) method*

### *Syntax*

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

### Parameters

- **writer** – The buffered writer that object data needs to be written into.

### Exceptions

- **PersistenceException** – if data can not be written into the writer

### baseUrl variable

### Syntax

```
protected String baseUrl
```

### ODataParameter class

### Syntax

```
public class ODataParameter extends ParserDocument,
IODataParameter
```

### Members

All members of ODataParameter, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataParameter()</i> on page 725	
public	<i>ODataParameter(ParserDocument)</i> on page 725	
protected	<i>ODataParameter(int[], String[])</i> on page 726	

### Methods

Modifier and Type	Method	Description
public String	<i>getMode()</i> on page 726	Returns The value of the appropriate OData attribute.
public String	<i>getName()</i> on page 726	Returns The value of the appropriate OData attribute.
public String	<i>getType()</i> on page 726	Returns The value of the appropriate OData attribute.

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.

Modifier and Type	Member	Description
protected List< int[]>	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	

Modifier and Type	Member	Description
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	

Modifier and Type	Member	Description
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	

Modifier and Type	Member	Description
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	

Modifier and Type	Member	Description
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String&gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValues(List&lt;String&gt;, String...)</i> on page 962	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from `IParserDocument`

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIX_MAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataParameter**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_MODE</i> on page 282	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 282	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 283	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_PARAMETER</i> on page 283	Name of the appropriate OData element.
public static final String	<i>VALUE_MODE_IN</i> on page 283	Value option for the 'Mode' OData attribute.
public static final String	<i>VALUE_MODE_OUT</i> on page 283	Value option for the 'Mode' OData attribute.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataParameter()* constructor

##### Syntax

```
public ODataParameter ()
```

#### *ODataParameter(ParserDocument)* constructor

##### Syntax

```
public ODataParameter ( ParserDocument document )
```

### *ODataParameter(int[], String[]) constructor*

#### *Syntax*

```
protected ODataParameter ( int[] routes , String[] values )
```

#### *getMode() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getMode ()
```

#### *Returns*

The value of the appropriate OData attribute

#### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

#### *getType() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getType ()
```

#### *Returns*

The value of the appropriate OData attribute

### *ODataProperty class*

#### *Syntax*

```
public class ODataProperty extends ParserDocument,  
IODataProperty
```

#### *Members*

All members of ODataProperty, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>DetailDisplayOrderComparator</i> on page 744	
public class	<i>ListDisplayOrderComparator</i> on page 744	

### Constructors

Modifier and Type	Constructor	Description
public	<i>ODataProperty()</i> on page 745	
public	<i>ODataProperty(ParserDocument)</i> on page 745	
protected	<i>ODataProperty(int[], String[])</i> on page 745	

### Methods

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getChildPropertiesData()</i> on page 745	Returns all the child properties added to this document with putChildProperty method.
public List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 745	Returns list of appropriate contained Property OData elements with the given attribute value.
public List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 746	Returns list of appropriate contained Property OData elements with the given attribute value.
public IODataProperty	<i>getChildPropertyData(String)</i> on page 746	Return a single child property added with putChildProperty method.
public String	<i>getCollation()</i> on page 746	Returns the value of the appropriate OData attribute.
public String	<i>getDefault Value()</i> on page 747	Returns the value of the appropriate OData attribute.

Modifier and Type	Method	Description
public int	<i>getDetailDisplayOrder()</i> on page 747	In current version it return the same value as <i>getListDisplayOrder</i> .
public String	<i>getLabel()</i> on page 747	Returns The value of the appropriate OData attribute.
public int	<i>getListDisplayOrder()</i> on page 747	In current version it returns the same value as <i>getDetailDisplayOrder</i> .
public int	<i>getMaxLength()</i> on page 748	Returns the value of the appropriate OData attribute with defaultValue = 0;.
public String	<i>getName()</i> on page 748	Returns The value of the appropriate OData attribute.
public String	<i>getPrecision()</i> on page 748	Returns the value of the appropriate OData attribute.
public String	<i>getScale()</i> on page 748	Returns the value of the appropriate OData attribute.
public String	<i>getSemantics()</i> on page 748	Returns the value of the appropriate OData attribute with defaultValue = 0;.
public String	<i>getType()</i> on page 749	Returns The value of the appropriate OData attribute.
public String	<i>getValue()</i> on page 749	Returns the value of the property if there is a single property instance that is represented by this object and value is set with <i>setValue</i> method.
public boolean	<i>hasFixedLength()</i> on page 749	Returns The value of the appropriate OData attribute.
public boolean	<i>isComplex()</i> on page 749	Returns if the property has complex type and has child properties.
public boolean	<i>isCreatable()</i> on page 750	Returns The value of the appropriate OData attribute.

Modifier and Type	Method	Description
public boolean	<i>isDeletable()</i> on page 750	Returns The value of the appropriate OData attribute.
public boolean	<i>isFilterable()</i> on page 750	Returns The value of the appropriate OData attribute.
public boolean	<i>isNullable()</i> on page 750	Returns The value of the appropriate OData attribute.
public boolean	<i>isSearchable()</i> on page 751	Returns The value of the appropriate OData attribute.
public boolean	<i>isUnicode()</i> on page 751	Returns the value of the appropriate OData attribute.
public boolean	<i>isUpdatable()</i> on page 751	Returns The value of the appropriate OData attribute.
public void	<i>putChildPropertyData(IODataProperty)</i> on page 751	Put new child property to this property document.
public void	<i>setValue(String)</i> on page 751	Sets the value of the property, represented by this object.

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	

Modifier and Type	Member	Description
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	

Modifier and Type	Member	Description
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	

Modifier and Type	Member	Description
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958

protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	

Modifier and Type	Member	Description
public void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	

Modifier and Type	Member	Description
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataProperty

<b>Modifier and Type</b>	<b>Member</b>	<b>Description</b>
public static final String	<i>ATTRIBUTE_COLLATION</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DEFAULTVALUE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_DETAIL_DISPLAYORDER</i> on page 299	Name of the display-order OData attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_FIXEDLENGTH</i> on page 299	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_LABEL</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_LIST_DISPLAYORDER</i> on page 300	Name of the display-order OData attribute.
public static final String	<i>ATTRIBUTE_MAXLENGTH</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NULLABLE</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_PRECISION</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SCALE</i> on page 300	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 301	Name of the appropriate OData attribute.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_TYPE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UNICODE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_USEIN-SEARCH</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEINDE-TAIL</i> on page 301	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEIN-LIST</i> on page 302	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_PROPERTY</i> on page 302	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPRE-FIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocu-ment	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specifica-tion but still widely used.
public static final String[]	<i>EDMDATETIMEOFF-SET_PATTERNS</i> on page 386	Possible EDM TimeOffset pat-terns Note: Some pattern are not supported by OData specifica-tion but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataProperty.DetailDisplayOrderComparator* class**Syntax**

```
public class DetailDisplayOrderComparator extends
java.util.Comparator< IODataProperty >
```

**Members**

All members of DetailDisplayOrderComparator, including inherited members. **Methods**

Modifier and Type	Method	Description
public int	<i>compare(IODataProperty, IODataProperty)</i> on page 744	

*compare(IODataProperty, IODataProperty)* method**Syntax**

```
public int compare ( IODataProperty arg0 , IODataProperty arg1 )
```

*ODataProperty.ListDisplayOrderComparator* class**Syntax**

```
public class ListDisplayOrderComparator extends
java.util.Comparator< IODataProperty >
```

**Members**

All members of ListDisplayOrderComparator, including inherited members. **Methods**

Modifier and Type	Method	Description
public int	<i>compare(IODataProperty, IO-DataProperty)</i> on page 745	

*compare(IODataProperty, IODataProperty) method*

**Syntax**

```
public int compare ( IODataProperty arg0 , IODataProperty arg1 )
```

*ODataProperty() constructor*

**Syntax**

```
public ODataProperty ()
```

*ODataProperty(ParserDocument) constructor*

**Syntax**

```
public ODataProperty ( ParserDocument document )
```

*ODataProperty(int[], String[]) constructor*

**Syntax**

```
protected ODataProperty ( int[] routes , String[] values )
```

*getChildPropertiesData() method*

Returns all the child properties added to this document with putChildProperty method.

**Syntax**

```
public List< IODataProperty > getChildPropertiesData ()
```

**Returns**

List of child properties.

*getChildPropertiesDataWithAttribute(String, String) method*

Returns list of appropriate contained Property OData elements with the given attribute value.

**Syntax**

```
public List< IODataProperty >
getChildPropertiesDataWithAttribute ( String attributeName , String
attributeValue )
```

### *Parameters*

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

### *Returns*

list of appropriate contained Property OData elements with the given attribute value

### *getChildPropertiesDataWithAttribute(String, String, boolean) method*

Returns list of appropriate contained Property OData elements with the given attribute value.

### *Syntax*

```
public List< IODataProperty >  
getChildPropertiesDataWithAttribute (String attributeName , String  
attributeValue , boolean addByDefault )
```

### *Parameters*

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

### *Returns*

list of appropriate contained Property OData elements with the given attribute value

### *getChildPropertyData(String) method*

Return a single child property added with putChildProperty method.

### *Syntax*

```
public IODataProperty getChildPropertyData (String  
propertyName )
```

### *Parameters*

- **propertyName** – The name of the child property that should be returned.

### *Returns*

The found child property or null if there is no child property with the given name.

### *getCollation() method*

Returns the value of the appropriate OData attribute.

### *Syntax*

```
public String getCollation ()
```

**Returns**

The value of the appropriate OData attribute

***getDefaultValue() method***

Returns the value of the appropriate OData attribute.

**Syntax**

```
public String getDefaultValue ()
```

**Returns**

The value of the appropriate OData attribute

***getDetailDisplayOrder() method***

In current version it return the same value as getListDisplayOrder.

**Syntax**

```
public int getDetailDisplayOrder ()
```

**Returns**

The value of 'display-order' attribute with default value = 0;

***getLabel() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getLabel ()
```

**Returns**

The value of the appropriate OData attribute

***getListDisplayOrder() method***

In current version it returns the same value as getDetailDisplayOrder.

**Syntax**

```
public int getListDisplayOrder ()
```

**Returns**

The value of 'display-order' attribute with default value = 0;

### *getMaxLength() method*

Returns the value of the appropriate OData attribute with defaultValue = 0;.

#### *Syntax*

```
public int getMaxLength ()
```

#### *Returns*

The value of the appropriate OData attribute with defaultValue = 0;

### *getName() method*

Returns The value of the appropriate OData attribute.

#### *Syntax*

```
public String getName ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getPrecision() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public String getPrecision ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getScale() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public String getScale ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getSemantics() method*

Returns the value of the appropriate OData attribute with defaultValue = 0;.

#### *Syntax*

```
public String getSemantics ()
```

**Returns**

The value of the appropriate OData attribute with default Value = 0;

***getType() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public String getType ()
```

**Returns**

The value of the appropriate OData attribute

***getValue() method***

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

**Syntax**

```
public String getValue ()
```

**Returns**

the value of the property instance represented by this object.

**Usage**

Otherwise it returns null.

Typically this object contains value only if this object was returned by an OData Entry.

***hasFixedLength() method***

Returns The value of the appropriate OData attribute.

**Syntax**

```
public boolean hasFixedLength ()
```

**Returns**

The value of the appropriate OData attribute

***isComplex() method***

Returns if the property has complex type and has child properties.

**Syntax**

```
public boolean isComplex ()
```

### *Returns*

true if the property has complex type and has child properties.

### *isCreatable() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public boolean isCreatable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isDeletable() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public boolean isDeletable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isFilterable() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public boolean isFilterable ()
```

### *Returns*

The value of the appropriate OData attribute

### *isNullable() method*

Returns The value of the appropriate OData attribute.

### *Syntax*

```
public boolean isNullable ()
```

### *Returns*

The value of the appropriate OData attribute

*isSearchable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public boolean isSearchable ()
```

*Returns*

The value of the appropriate OData attribute

*isUnicode() method*

Returns the value of the appropriate OData attribute.

*Syntax*

```
public boolean isUnicode ()
```

*Returns*

The value of the appropriate OData attribute

*isUpdatable() method*

Returns The value of the appropriate OData attribute.

*Syntax*

```
public boolean isUpdatable ()
```

*Returns*

The value of the appropriate OData attribute

*putChildPropertyData(IODataProperty) method*

Put new child property to this property document.

*Syntax*

```
public void putChildPropertyData ( IODataProperty property )
```

*Parameters*

- **property** – The child property

*setValue(String) method*

Sets the value of the property, represented by this object.

*Syntax*

```
public void setValue ( String value )
```

*Parameters*

- **value** – The value of the property instance represented by this object.

*Usage*

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an OData Entry object.

*ODataReturnTypeEntry class**Syntax*

```
public class ODataReturnTypeEntry extends ODataEntry,
IODataEntry
```

*Members*

All members of ODataReturnTypeEntry, including inherited members. **Nested classes**

Modifier and Type	Class	Description
protected class	<i>ODataReturnSchema</i> on page 778	

**Variables**

Modifier and Type	Variable	Description
protected static final String	<i>_RETURN_TYPE_COLLECTION</i> on page 814	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataReturnTypeEntry(boole- an)</i> on page 812	
public	<i>ODataReturnTypeEntry(Par- serDocument, IODataFunc- tionImport, IODataSchema, bo- olean)</i> on page 812	

**Methods**

Modifier and Type	Method	Description
public void	<i>putPropertyValue(String, String)</i> on page 812	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 813	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>read(BufferedReader)</i> on page 813	
public void	<i>setCollectionId(String)</i> on page 814	Maintains the Id of the OCata Collection that this Entry belongs to.
public void	<i>setSchema(IODataSchema)</i> on page 814	Maintains the reference to the appropriate OData Schema object.
public void	<i>write(BufferedWriter)</i> on page 814	

#### Inherited members from ODataEntry

Modifier and Type	Member	Description
protected void	<i>addPropertyValues(IODataProperty, Map&lt; String, String &gt;, String)</i> on page 589	
protected Long	<i>cache_timestamp</i> on page 603	
protected cacheState	<i>Cachestate</i> on page 603	
public ODataEntry	<i>clone()</i> on page 589	Creates a copy of this object.
protected String	<i>collectionId</i> on page 603	
protected static transient static final int	<i>FALSE</i> on page 603	
protected void	<i>fillPropertyData(IODataProperty, String...)</i> on page 589	
protected void	<i>fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...)</i> on page 589	

Modifier and Type	Member	Description
protected static transient static final String	<i>FILTER</i> on page 603	
protected static transient static final String	<i>FILTER_AND</i> on page 603	
protected static transient static final String	<i>FILTER_EQ</i> on page 604	
public List< IODataLink >	<i>getActionLinks()</i> on page 590	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 590	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 590	
public Long	<i>getCacheTimestamp()</i> on page 590	
public String	<i>getCollectionId()</i> on page 590	Returns the Id of the OCata Collection that this Entry belongs to.
public String	<i>getContenttype()</i> on page 590	Returns the content type of the entry.
public String	<i>getEtag()</i> on page 591	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 591	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public List< IODataProperty >	<i>getGPUseInSearchProperties-Data()</i> on page 591	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player name-space) attribute value.

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 591	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 592	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public List< IODataIcon >	<i>getIcons()</i> on page 592	Returns the list of the appropriate OData elements.
public String	<i>getId()</i> on page 592	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 592	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 593	Returns the values of the properties that are marked as key properties in the OData Schema document.
public Date	<i>getLastUpdated()</i> on page 593	Returns The parsed value of the 'updated' OData Element.
public List< IODataLink >	<i>getLinks()</i> on page 593	Returns the list of the appropriate OData elements.
public String	<i>getMediaSrc()</i> on page 593	Returns the media source if the entry has a media content.
public List< IODataProperty >	<i>getPropertiesData()</i> on page 593	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 594	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 594	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public IParserDocument	<i>getPropertiesDocument()</i> on page 594	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public String	<i>getPropertyValue(String...)</i> on page 595	Returns the value of the appropriate property.
public< T > T	<i>getPropertyValueParsed(String...)</i> on page 595	Returns the value of the appropriate property parsed to it's real type.
public List< String >	<i>getPropertyValues(List&lt; String[]&gt;)</i> on page 596	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 596	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< IODataLink >	<i>getRelatedDataLinks()</i> on page 596	Returns OData Link objects that represents links to Related Data.

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 597	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public IODataSchema	<i>getSchema()</i> on page 597	Returns the appropriate OData Schema object.
public IODataLink	<i>getSelfLink()</i> on page 597	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public IODataLink	<i>getSubscriptionLink()</i> on page 597	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 598	Returns The value of the appropriate OData element.
public String	<i>getTitle()</i> on page 598	Returns The value of the appropriate OData element.
protected boolean	<i>isLocalEntry</i> on page 604	
protected transient JsonObject	<i>jsonObject</i> on page 604	JSON related variables
protected void	<i>materialize()</i> on page 598	
protected static transient static final int	<i>NOT_TESTED</i> on page 604	
public	<i>ODataEntry()</i> on page 588	
public	<i>ODataEntry(boolean)</i> on page 588	
protected	<i>ODataEntry(int[], String[])</i> on page 589	
public	<i>ODataEntry(IODataSchema)</i> on page 588	

Modifier and Type	Member	Description
public	<i>ODataEntry(ParserDocument)</i> on page 588	
public	<i>ODataEntry(ParserDocument, IODataSchema)</i> on page 588	
public	<i>ODataEntry(JsonObject)</i> on page 589	Json Related
protected void	<i>parseCollectionId()</i> on page 598	
protected long	<i>parseEdmTime(String)</i> on page 598	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 598	Puts the new property element as a sub-element of the 'complex properties' OData element.
public void	<i>putContentType(String)</i> on page 599	Puts the content type for a new entry object.
public void	<i>putDocument(IParserDocument, String...)</i> on page 599	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 599	Sets id of this OData Entry document (value of appropriate OData Id element)
public void	<i>putMediaSrc(String)</i> on page 600	Puts the media source for a new entry object.
protected String	<i>resolveTargetCollection(IODataLink)</i> on page 601	
protected transient IODataSchema	<i>schema</i> on page 604	
public void	<i>setAuthorName(String)</i> on page 601	Sets the value of the 'name' OData element of the 'author' OData element.

Modifier and Type	Member	Description
public void	<i>setCacheState(cacheState)</i> on page 601	
public void	<i>setCacheTimestamp(Long)</i> on page 601	
public void	<i>setIsLocal(boolean)</i> on page 602	
public void	<i>setSummary(String)</i> on page 602	Sets the value of the appropriate OData element.
public void	<i>setTitle(String)</i> on page 602	Sets the value of the appropriate OData element.
protected static transient static final int	<i>TRUE</i> on page 604	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.

Modifier and Type	Member	Description
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	

Modifier and Type	Member	Description
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 957	

Modifier and Type	Member	Description
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	

Modifier and Type	Member	Description
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String&gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValues(List&lt;String&gt;, String...)</i> on page 962	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIX_MAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataEntry**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	

#### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <i>IParserDocument</i>	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataEntry

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	

### Inherited members from `IParserDocument`

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataReturnEntry.ODataReturnSchema* class

##### Syntax

```
protected class ODataReturnSchema extends ODataSchema,
    ILocalSchema
```

##### Members

All members of *ODataReturnSchema*, including inherited members. **Nested classes**

Modifier and Type	Class	Description
protected class	<i>ODataReturnEntityType</i> on page 795	

### Variables

Modifier and Type	Variable	Description
protected ODataComplexType	<i>complexType</i> on page 812	
protected List<IODataProperty >	<i>referenceProperties</i> on page 812	

### Constructors

Modifier and Type	Constructor	Description
public	<i>ODataReturnSchema()</i> on page 811	
public	<i>ODataReturnSchema(List&lt;IODataProperty &gt;)</i> on page 811	
public	<i>ODataReturnSchema(List&lt;IODataProperty &gt;, ODataComplexType)</i> on page 811	

### Methods

Modifier and Type	Method	Description
public void	<i>addProperty(IODataProperty)</i> on page 811	
public ODataComplexType	<i>getComplexType(String)</i> on page 811	
public ODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 811	
public void	<i>read(BufferedReader)</i> on page 812	
public void	<i>write(BufferedWriter)</i> on page 812	

### Inherited members from ODataSchema

Modifier and Type	Member	Description
public ODataAssociation	<i>getAssociation(String)</i> on page 831	Returns the appropriate OData Association element with the given relationship attribute.
public List< IODataAssociation >	<i>getAssociations()</i> on page 831	Returns the list of the appropriate OData elements.
public ODataAssociationSet	<i>getAssociationSet(String)</i> on page 831	Returns the appropriate AssociationSet with for given association.
public List< IODataAssociationSet >	<i>getAssociationSets()</i> on page 831	Returns the list of the appropriate OData elements.
public List< IODataComplexType >	<i>getComplexTypes()</i> on page 832	Returns The list of the appropriate OData element.
public ODataEntitySet	<i>getEntitySet(String)</i> on page 832	Returns The appropriate OData EntitySet.
public ODataEntityType	<i>getEntityType(String)</i> on page 832	Returns The 'EntityType' OData element associated with the reference argument.
public List< IODataFunctionImport >	<i>getFunctionImports()</i> on page 833	Returns The list of the 'FunctionImport' OData element.
public List< IODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 833	Returns List of FunctionImports valid for the appropriate collection.
public IODataServiceDocument	<i>getServiceDocument()</i> on page 834	Returns the appropriate OData Service Document.
public String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 834	Resolves the target collection Id of the given OData Navigation Property element.
public	<i>ODataSchema()</i> on page 830	
protected	<i>ODataSchema(int[], String[])</i> on page 831	
public	<i>ODataSchema(ParserDocument)</i> on page 830	
protected IODataServiceDocument	<i>serviceDocument</i> on page 834	

Modifier and Type	Member	Description
public void	<i>setServiceDocument(IOData-ServiceDocument)</i> on page 834	Maintains reference to the appropriate OData Service Document.

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	

Modifier and Type	Member	Description
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	

Modifier and Type	Member	Description
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	

Modifier and Type	Member	Description
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String&gt;, String...)</i> on page 961	

Modifier and Type	Member	Description
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataSchema**

Modifier and Type	Member	Description
public static final String	<i>ACTION_FOR</i> on page 313	name of the appropriate Odata attribute
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ENTITYTYPE</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAMESPACE</i> on page 314	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_DATASERVICES</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_EDMX</i> on page 314	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ENTITYCONTAINER</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_FUNCTIONALIMPORT</i> on page 315	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SCHEMA</i> on page 315	Name of the appropriate OData element.

#### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <i>IParserDocument</i>	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataReturnEntry.ODataReturnSchema.ODataReturnEntityType* class**Syntax**

```
protected class ODataReturnEntityType extends ODataEntityType
```

**Members**

All members of ODataReturnEntityType, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected List< IODataProperty >	<i>referenceProperties</i> on page 811	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataReturnEntityType(List&lt; IODataProperty &gt;)</i> on page 810	

**Methods**

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getProperties()</i> on page 810	

**Inherited members from ODataEntityType**

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getGPUUseInSearchPropertiesData()</i> on page 563	Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 564	Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 564	Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Modifier and Type	Member	Description
public List< String >	<i>getKeyPropertyNames()</i> on page 564	Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.
public String	<i>getName()</i> on page 564	Returns The value of the appropriate OData attribute.
public List< IODataNavigationProperty >	<i>getNavigationProperties()</i> on page 565	Returns The list of appropriate OData elements.
public IODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 565	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 565	Returns The list of appropriate OData elements with given attribute value.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 566	Returns The list of appropriate OData elements with given attribute value.
public IODataProperty	<i>getProperty(String)</i> on page 566	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 566	Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.
protected IODataSchema	<i>getSchema()</i> on page 566	
public List< IODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 567	Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.
public boolean	<i>hasStream()</i> on page 567	Returns The value of the appropriate OData attribute.
public	<i>ODataEntityType()</i> on page 563	
protected	<i>ODataEntityType(int[], String[])</i> on page 563	

Modifier and Type	Member	Description
public	<i>ODataEntityType(ParserDocument)</i> on page 563	
protected void	<i>setSchema(IODataSchema)</i> on page 567	

### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	

Modifier and Type	Member	Description
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	

Modifier and Type	Member	Description
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	

Modifier and Type	Member	Description
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	

Modifier and Type	Member	Description
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataEntityType

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HASSTREAM</i> on page 196	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 196	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_KEY</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 196	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTYREF</i> on page 196	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataReturnEntityType(List< IODataProperty >)* constructor

##### Syntax

```
public ODataReturnEntityType ( List< IODataProperty >
referenceProperties )
```

#### *getProperties()* method

##### Syntax

```
public List< IODataProperty > getProperties ()
```

*referenceProperties* variable

**Syntax**

```
protected List< IODataProperty > referenceProperties
```

*ODataReturnSchema()* constructor

**Syntax**

```
public ODataReturnSchema ()
```

*ODataReturnSchema(List< IODataProperty >)* constructor

**Syntax**

```
public ODataReturnSchema ( List< IODataProperty >
referenceProperties )
```

*ODataReturnSchema(List< IODataProperty >, ODataComplexType)* constructor

**Syntax**

```
public ODataReturnSchema ( List< IODataProperty >
referenceProperties , ODataComplexType complexType )
```

*addProperty(IODataProperty)* method

**Syntax**

```
public void addProperty ( IODataProperty property )
```

*getComplexType(String)* method

**Syntax**

```
public ODataComplexType getComplexType ( String
complexTypeReference )
```

*getEntityTypeForCollection(String)* method

**Syntax**

```
public ODataEntityType getEntityTypeForCollection ( String
collectionId )
```

### *read(BufferedReader) method*

#### **Syntax**

```
public void read (BufferedReader reader) throws  
PersistenceException
```

### *write(BufferedWriter) method*

#### **Syntax**

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

### *complexType variable*

#### **Syntax**

```
protected ODataComplexType complexType
```

### *referenceProperties variable*

#### **Syntax**

```
protected List< IODataProperty > referenceProperties
```

### *ODataReturnTypeInfo(boolean) constructor*

#### **Syntax**

```
public ODataReturnTypeInfo (boolean isComplex)
```

### *ODataReturnTypeInfo(ParserDocument, IODataFunctionImport, IODataSchema, boolean) constructor*

#### **Syntax**

```
public ODataReturnTypeInfo (ParserDocument document ,  
IODataFunctionImport functionImport , IODataSchema schema , boolean  
isComplex)
```

### *putPropertyValue(String, String) method*

Puts the new property element as a sub-element of the 'properties' OData element.

#### **Syntax**

```
public void putPropertyValue (String propertyName , String  
propertyValue)
```

### *Parameters*

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

### *putPropertyValue(String, String, boolean) method*

Puts the new property element as a sub-element of the 'properties' OData element.

### *Syntax*

```
public void putPropertyValue (String propertyName , String
propertyValue , boolean useDefaultPrefix )
```

### *Parameters*

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

### *read(BufferedReader) method*

### *Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

### *Parameters*

- **reader** – The buffered reader to read the object from.

### *Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

### *setCollectionId(String) method*

Maintains the Id of the OCata Collection that this Entry belongs to.

#### *Syntax*

```
public void setCollectionId ( String collectionId )
```

#### *Parameters*

- **collectionId** – The Id of the OCata Collection that this Entry belongs to

### *setSchema(IODataSchema) method*

Maintains the reference to the appropriate OData Schema object.

#### *Syntax*

```
public void setSchema ( IODataSchema schema )
```

#### *Parameters*

- **schema** – The appropriate OData Schema object.

### *write(BufferedWriter) method*

#### *Syntax*

```
public void write ( BufferedWriter writer ) throws  
PersistenceException
```

#### *Parameters*

- **writer** – The buffered writer that object data needs to be written into.

#### *Exceptions*

- **PersistenceException** – if data can not be written into the writer

### *\_RETURN\_TYPE\_COLLECTION variable*

#### *Syntax*

```
protected static final String _RETURN_TYPE_COLLECTION
```

### *IODataSchema class*

#### *Syntax*

```
public class IODataSchema extends ParserDocument, IODataSchema,  
Externalizable
```

*Derived classes*

- *ODataReturnSchema* on page 778

*Members*

All members of *ODataSchema*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected <i>IODataServiceDocument</i>	<i>serviceDocument</i> on page 834	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataSchema()</i> on page 830	
public	<i>ODataSchema(ParserDocument)</i> on page 830	
protected	<i>ODataSchema(int[], String[])</i> on page 831	

**Methods**

Modifier and Type	Method	Description
public <i>ODataAssociation</i>	<i>getAssociation(String)</i> on page 831	Returns the appropriate OData Association element with the given relationship attribute.
public List< <i>IODataAssociation</i> >	<i>getAssociations()</i> on page 831	Returns the list of the appropriate OData elements.
public <i>ODataAssociationSet</i>	<i>getAssociationSet(String)</i> on page 831	Returns the appropriate AssociationSet with for given association.
public List< <i>IODataAssociationSet</i> >	<i>getAssociationSets()</i> on page 831	Returns the list of the appropriate OData elements.
public <i>ODataComplexType</i>	<i>getComplexType(String)</i> on page 832	Returns The 'ComplexType' OData element associated with the reference.
public List< <i>IODataComplexType</i> >	<i>getComplexTypes()</i> on page 832	Returns The list of the appropriate OData element.

Modifier and Type	Method	Description
public ODataEntitySet	<i>getEntitySet(String)</i> on page 832	Returns The appropriate OData EntitySet.
public ODataEntityType	<i>getEntityType(String)</i> on page 832	Returns The 'EntityType' OData element associated with the reference argument.
public ODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 833	Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.
public List< IODataFunctionImport >	<i>getFunctionImports()</i> on page 833	Returns The list of the 'FunctionImport' OData element.
public List< IODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 833	Returns List of FunctionImports valid for the appropriate collection.
public IODataServiceDocument	<i>getServiceDocument()</i> on page 834	Returns the appropriate OData Service Document.
public String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 834	Resolves the target collection Id of the given OData Navigation Property element.
public void	<i>setServiceDocument(IODataServiceDocument)</i> on page 834	Maintains reference to the appropriate OData Service Document.

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	

Modifier and Type	Member	Description
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.

Modifier and Type	Member	Description
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>write(BufferedWriter)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataSchema

Modifier and Type	Member	Description
public static final String	<i>ACTION_FOR</i> on page 313	name of the appropriate Odata attribute
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_ENTITYTYPE</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 313	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_NAMESPACE</i> on page 314	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_DATASERVICES</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_EDMX</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYCONTAINER</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 314	Name of the appropriate OData element.
public static final String	<i>ELEMENT_FUNCTIONALIMPORT</i> on page 315	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SCHEMA</i> on page 315	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ODataSchema()* constructor

##### Syntax

```
public ODataSchema ()
```

#### *ODataSchema(ParserDocument)* constructor

##### Syntax

```
public ODataSchema ( ParserDocument document )
```

*ODataSchema(int[], String[]) constructor**Syntax*

```
protected ODataSchema ( int[] routes , String[] values )
```

*getAssociation(String) method*

Returns the appropriate OData Association element with the given relationship attribute.

*Syntax*

```
public ODataAssociation getAssociation ( String relationShip )
```

*getAssociations() method*

Returns the list of the appropriate OData elements.

*Syntax*

```
public List< IODataAssociation > getAssociations ()
```

*Returns*

List of the appropriate OData elements

*getAssociationSet(String) method*

Returns the appropriate AssociationSet with for given association.

*Syntax*

```
public ODataAssociationSet getAssociationSet ( String association )
```

*Parameters*

- **association** – The association of the AssociationSet

*Returns*

The appropriate AssociationSet with for given association

*getAssociationSets() method*

Returns the list of the appropriate OData elements.

*Syntax*

```
public List< IODataAssociationSet > getAssociationSets ()
```

*Returns*

List of the appropriate OData elements

*getComplexType(String) method*

Returns The 'ComplexType' OData element associated with the reference.

*Syntax*

```
public ODataComplexType getComplexType ( String  
complexTypeReference )
```

*Parameters*

- **complexTypeReference** – Reference to the appropriate Complex Type (example: 'namespace.complextypename')

*Returns*

The 'ComplexType' OData element associated with the reference

*getComplexTypes() method*

Returns The list of the appropriate OData element.

*Syntax*

```
public List< IODataComplexType > getComplexTypes ()
```

*Returns*

The list of the appropriate OData element

*getEntitySet(String) method*

Returns The appropriate OData EntitySet.

*Syntax*

```
public ODataEntitySet getEntitySet ( String collectionId )
```

*Parameters*

- **collectionId** – The href of the collection to find the OData EntitySet for

*Returns*

The appropriate OData EntitySet

*getEntityType(String) method*

Returns The 'EntityType' OData element associated with the reference argument.

*Syntax*

```
public ODataEntityType getEntityType ( String entityTypeReference )
```

*Parameters*

- **entityTypeReference** – Reference to the appropriate Entity Type (example: 'namespace.entitytypename')

*Returns*

The 'EntityType' OData element associated with the reference argument

*getEntityTypeForCollection(String) method*

Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.

*Syntax*

```
public ODataEntityType getEntityTypeForCollection (String
collectionId )
```

*Parameters*

- **collectionId** – The Id to be compared with the name of 'EntitySet' elements

*Returns*

The matching EntityType

*getFunctionImports() method*

Returns The list of the 'FunctionImport' OData element.

*Syntax*

```
public List< IODataFunctionImport > getFunctionImports ()
```

*Returns*

The list of the 'FunctionImport' OData element

*getFunctionImportsForCollection(String) method*

Returns List of FunctionImports valid for the appropriate collection.

*Syntax*

```
public List< IODataFunctionImport >
getFunctionImportsForCollection (String collectionId )
```

*Parameters*

- **collectionId** – The href of the appropriate collection.

*Returns*

List of FunctionImports valid for the appropriate collection.

### *getServiceDocument() method*

Returns the appropriate OData Service Document.

#### *Syntax*

```
public IODataServiceDocument getServiceDocument ()
```

#### *Returns*

The appropriate OData Service Document

### *getTargetCollectionIdForNavigationProperty(String, String) method*

Resolves the target collection Id of the given OData Navigation Property element.

#### *Syntax*

```
public String getTargetCollectionIdForNavigationProperty  
(String sourceCollectionId , String navigationPropertyName )
```

#### *Parameters*

- **sourceCollectionId** – The source Id of the source collection that is linked with the target collection
- **navigationPropertyName** – The name of the Navigation Property

#### *Returns*

The Id of the target collection

### *setServiceDocument(IODataServiceDocument) method*

Maintains reference to the appropriate OData Service Document.

#### *Syntax*

```
public void setServiceDocument ( IODataServiceDocument  
serviceDocument )
```

#### *Parameters*

- **serviceDocument** – The appropriate OData Service Document

*serviceDocument* variable

#### *Syntax*

```
protected IODataServiceDocument serviceDocument
```

*ODataServiceDocument class***Syntax**

```
public class ODataServiceDocument extends ParserDocument,
IODataServiceDocument, Externalizable
```

**Members**

All members of ODataServiceDocument, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected JsonObject	<i>gwServiceDocument</i> on page 853	
protected boolean	<i>isJson</i> on page 853	
protected Map< String, IODataOpenSearchDescription >	<i>openSearchDescriptions</i> on page 853	
protected IODataSchema	<i>schema</i> on page 853	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataServiceDocument()</i> on page 850	
public	<i>ODataServiceDocument(ParserDocument)</i> on page 850	
public	<i>ODataServiceDocument(JsonObject)</i> on page 850	
protected	<i>ODataServiceDocument(int[], String[])</i> on page 850	

**Methods**

Modifier and Type	Method	Description
public List< IODataCollection >	<i>getAllCollections()</i> on page 850	Returns the list of all 'collection' OData element contained by the 'workspace' elements.
public String	<i>getBaseUrl()</i> on page 850	Returns The value of the 'base' OData attribute.

Modifier and Type	Method	Description
public String	<i>getEtag()</i> on page 850	Returns The value of the 'etag' OData attribute.
public String	<i>getLanguage()</i> on page 851	Returns the value of the 'lang' OData attribute.
public IODataOpenSearchDescription	<i>getOpenSearchDescription(String)</i> on page 851	Returns the appropriate OpenSearch Description Document for the given collection.
public IODataSchema	<i>getSchema()</i> on page 851	Returns the appropriate OData Schema document.
public String	<i>getSchemaUrl()</i> on page 851	Returns The full URL that can be used for retrieving the OData Schema document.
public List< IODataWorkspace >	<i>getWorkspaces()</i> on page 852	Returns the list of appropriate OData elements.
public void	<i>read(BufferedReader)</i> on page 852	
public void	<i>setOpenSearchDescription(String, IODataOpenSearchDescription)</i> on page 852	Maintains the appropriate OpenSearch Description Document for the given collection.
public void	<i>setSchema(IODataSchema)</i> on page 852	Maintains the appropriate OData Schema document.
public void	<i>write(BufferedWriter)</i> on page 853	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.

Modifier and Type	Member	Description
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963

public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	

Modifier and Type	Member	Description
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	

Modifier and Type	Member	Description
public void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	

Modifier and Type	Member	Description
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .

public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataServiceDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_BASE</i> on page 324	Name of the appropriate OData attribute.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_LANG</i> on page 324	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_COLLECTION</i> on page 324	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SERVICE</i> on page 324	Name of the appropriate OData element.
public static final String	<i>ELEMENT_WORKSPACE</i> on page 324	Name of the appropriate OData element.
public static final String	<i>URL_SUFFIX_METADATA</i> on page 324	URL value suffix for retrieving OData Schema document.

#### Inherited members from *IParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract <i>IParserDocument</i>	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

### *ODataServiceDocument()* constructor

#### *Syntax*

```
public ODataServiceDocument ()
```

### *ODataServiceDocument(ParserDocument)* constructor

#### *Syntax*

```
public ODataServiceDocument ( ParserDocument document )
```

### *ODataServiceDocument(JsonObject)* constructor

#### *Syntax*

```
public ODataServiceDocument ( JsonObject document )
```

### *ODataServiceDocument(int[], String[])* constructor

#### *Syntax*

```
protected ODataServiceDocument ( int[] routes , String[] values )
```

### *getAllCollections()* method

Returns the list of all 'collection' OData element contained by the 'workspace' elements.

#### *Syntax*

```
public List< IODataCollection > getAllCollections ()
```

#### *Returns*

The list of all 'collection' OData element contained by the 'workspace' elements

### *getBaseUrl()* method

Returns The value of the 'base' OData attribute.

#### *Syntax*

```
public String getBaseUrl ()
```

#### *Returns*

The value of the 'base' OData attribute

### *getEtag()* method

Returns The value of the 'etag' OData attribute.

#### *Syntax*

```
public String getEtag ()
```

*Returns*

The value of the 'etag' OData attribute

*getLanguage() method*

Returns the value of the 'lang' OData attribute.

*Syntax*

```
public String getLanguage ()
```

*Returns*

The value of the 'lang' OData attribute

*getOpenSearchDescription(String) method*

Returns the appropriate OpenSearch Description Document for the given collection.

*Syntax*

```
public IODataOpenSearchDescription getOpenSearchDescription (
String collectionId )
```

*Parameters*

- **collectionId** – The Id of the collection

*Returns*

The appropriate OpenSearch Description Document

*getSchema() method*

Returns the appropriate OData Schema document.

*Syntax*

```
public IODataSchema getSchema ()
```

*Returns*

The appropriate OData Schema document

*getSchemaUrl() method*

Returns The full URL that can be used for retrieving the OData Schema document.

*Syntax*

```
public String getSchemaUrl ()
```

*Returns*

The full URL that can be used for retrieving the OData Schema document

### *getWorkspaces() method*

Returns the list of appropriate OData elements.

#### *Syntax*

```
public List< IODataWorkspace > getWorkspaces ()
```

#### *Returns*

The list of appropriate OData elements

### *read(BufferedReader) method*

#### *Syntax*

```
public void read (BufferedReader reader) throws  
PersistenceException
```

#### *Parameters*

- **reader** – The buffered reader to read the object from.

#### *Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

### *setOpenSearchDescription(String, IODataOpenSearchDescription) method*

Maintains the appropriate OpenSearch Description Document for the given collection.

#### *Syntax*

```
public void setOpenSearchDescription (String collectionId ,  
IODataOpenSearchDescription openSearchDescription )
```

#### *Parameters*

- **collectionId** – The Id of the collection
- **openSearchDescription** – The appropriate OpenSearch Description Document

### *setSchema(IODataSchema) method*

Maintains the appropriate OData Schema document.

#### *Syntax*

```
public void setSchema ( IODataSchema schema )
```

#### *Parameters*

- **schema** – The appropriate OData Schema document

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **PersistenceException** – if data can not be written into the writer

*gwServiceDocument variable**Syntax*

```
protected JsonObject gwServiceDocument
```

*isJson variable**Syntax*

```
protected boolean isJson
```

*openSearchDescriptions variable**Syntax*

```
protected Map< String, IODataOpenSearchDescription >
openSearchDescriptions
```

*schema variable**Syntax*

```
protected IODataSchema schema
```

*ODataSubscriptionEntry class**Syntax*

```
public class ODataSubscriptionEntry extends ODataEntry,
IODataSubscriptionEntry
```

*Members*

All members of ODataSubscriptionEntry, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataSubscriptionEntry()</i> on page 885	
public	<i>ODataSubscriptionEntry(String, String)</i> on page 886	
public	<i>ODataSubscriptionEntry(String, String, String, String, String, String)</i> on page 886	
public	<i>ODataSubscriptionEntry(ParserDocument)</i> on page 886	
protected	<i>ODataSubscriptionEntry(int[], String[])</i> on page 886	

### Methods

Modifier and Type	Method	Description
public String	<i>getCollection()</i> on page 886	Returns The value of the appropriate entry property.
public String	<i>getDeliveryAddress()</i> on page 886	Returns The value of the appropriate entry property.
public String	<i>getFilter()</i> on page 887	Returns The value of the appropriate entry property.
public String	<i>getSelect()</i> on page 887	Returns The value of the appropriate entry property.
public void	<i>setCollection(String)</i> on page 887	Sets the value of the appropriate entry property.
public void	<i>setDeliveryAddress(String)</i> on page 887	Sets the value of the appropriate entry property.
public void	<i>setFilter(String)</i> on page 887	Sets the value of the appropriate entry property.
public void	<i>setSelect(String)</i> on page 888	Sets the value of the appropriate entry property.

### Inherited members from ODataEntry

Modifier and Type	Member	Description
protected void	<i>addPropertyValues(IODataProperty, Map&lt;String, String &gt;, String)</i> on page 589	
protected Long	<i>cache_timestamp</i> on page 603	
protected cacheState	<i>Cachestate</i> on page 603	
public ODataEntry	<i>clone()</i> on page 589	Creates a copy of this object.
protected String	<i>collectionId</i> on page 603	
protected static transient static final int	<i>FALSE</i> on page 603	
protected void	<i>fillPropertyData(IODataProperty, String...)</i> on page 589	
protected void	<i>fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...)</i> on page 589	
protected static transient static final String	<i>FILTER</i> on page 603	
protected static transient static final String	<i>FILTER_AND</i> on page 603	
protected static transient static final String	<i>FILTER_EQ</i> on page 604	
public List< IODataLink >	<i>getActionLinks()</i> on page 590	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 590	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 590	
public Long	<i>getCacheTimestamp()</i> on page 590	

Modifier and Type	Member	Description
public String	<i>getCollectionId()</i> on page 590	Returns the Id of the OCata Collection that this Entry belongs to.
public String	<i>getContentType()</i> on page 590	Returns the content type of the entry.
public String	<i>getEtag()</i> on page 591	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 591	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 591	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 591	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 592	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public List< IODataIcon >	<i>getIcons()</i> on page 592	Returns the list of the appropriate OData elements.

Modifier and Type	Member	Description
public String	<i>getId()</i> on page 592	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 592	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 593	Returns the values of the properties that are marked as key properties in the OData Schema document.
public Date	<i>getLastUpdated()</i> on page 593	Returns The parsed value of the 'updated' OData Element.
public List< IODataLink >	<i>getLinks()</i> on page 593	Returns the list of the appropriate OData elements.
public String	<i>getMediaSrc()</i> on page 593	Returns the media source if the entry has a media content.
public List< IODataProperty >	<i>getPropertiesData()</i> on page 593	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 594	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 594	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public IParserDocument	<i>getPropertiesDocument()</i> on page 594	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

Modifier and Type	Member	Description
public String	<i>getPropertyValue(String...)</i> on page 595	Returns the value of the appropriate property.
public< T > T	<i>getPropertyValue-Parsed(String...)</i> on page 595	Returns the value of the appropriate property parsed to it's real type.
public List< String >	<i>getPropertyValues(List&lt; String[]&gt;)</i> on page 596	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 596	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< IODataLink >	<i>getRelatedDataLinks()</i> on page 596	Returns OData Link objects that represents links to Related Data.
public List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 597	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public IODataSchema	<i>getSchema()</i> on page 597	Returns the appropriate OData Schema object.
public IODataLink	<i>getSelfLink()</i> on page 597	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public IODataLink	<i>getSubscriptionLink()</i> on page 597	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 598	Returns The value of the appropriate OData element.
public String	<i>getTitle()</i> on page 598	Returns The value of the appropriate OData element.

Modifier and Type	Member	Description
protected boolean	<i>isLocalEntry</i> on page 604	
protected transient JsonObject	<i>jsonObject</i> on page 604	JSON related variables
protected void	<i>materialize()</i> on page 598	
protected static transient static final int	<i>NOT_TESTED</i> on page 604	
public	<i>ODataEntry()</i> on page 588	
public	<i>ODataEntry(boolean)</i> on page 588	
protected	<i>ODataEntry(int[], String[])</i> on page 589	
public	<i>ODataEntry(IONDataSchema)</i> on page 588	
public	<i>ODataEntry(ParserDocument)</i> on page 588	
public	<i>ODataEntry(ParserDocument, IONDataSchema)</i> on page 588	
public	<i>ODataEntry(JsonObject)</i> on page 589	Json Related
protected void	<i>parseCollectionId()</i> on page 598	
protected long	<i>parseEdmTime(String)</i> on page 598	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 598	Puts the new property element as a sub-element of the 'complex properties' OData element.
public void	<i>putContentType(String)</i> on page 599	Puts the content type for a new entry object.

Modifier and Type	Member	Description
public void	<i>putDocument(IParserDocument, String...)</i> on page 599	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 599	Sets id of this OData Entry document (value of appropriate OData Id element)
public void	<i>putMediaSrc(String)</i> on page 600	Puts the media source for a new entry object.
public void	<i>putPropertyValue(String, String)</i> on page 600	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 600	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>read(BufferedReader)</i> on page 601	
protected String	<i>resolveTargetCollection(IODataLink)</i> on page 601	
protected transient IODataSchema	<i>schema</i> on page 604	
public void	<i>setAuthorName(String)</i> on page 601	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cacheState)</i> on page 601	
public void	<i>setCacheTimestamp(Long)</i> on page 601	
public void	<i>setCollectionId(String)</i> on page 602	Maintains the Id of the OCata Collection that this Entry belongs to.

Modifier and Type	Member	Description
public void	<i>setIsLocal(boolean)</i> on page 602	
public void	<i>setSchema(IODataSchema)</i> on page 602	Maintains the reference to the appropriate OData Schema object.
public void	<i>setSummary(String)</i> on page 602	Sets the value of the appropriate OData element.
public void	<i>setTitle(String)</i> on page 602	Sets the value of the appropriate OData element.
protected static transient static final int	<i>TRUE</i> on page 604	
public void	<i>write(BufferedWriter)</i> on page 603	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	

Modifier and Type	Member	Description
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	

Modifier and Type	Member	Description
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String&gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String&gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	

Modifier and Type	Member	Description
protected void	<i>setStrings(List&lt; String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt; String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataEntry

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;IParserDocument&gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt;String&gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataSubscriptionEntry**

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_COLLECTION</i> on page 338	Name of the appropriate OData element.
public static final String	<i>ELEMENT_DELIVERYADDRESS</i> on page 338	Name of the appropriate OData element.
public static final String	<i>ELEMENT_FILTER</i> on page 338	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SELECT</i> on page 338	Name of the appropriate OData element.

**Inherited members from IODataEntry**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 220	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 220	Value option for appropriate OData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 220	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_CATEGORY</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 220	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_LINK</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_NAME</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_TITLE</i> on page 221	Name of the appropriate OData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 221	Name of the appropriate OData element.
public abstract List< IOData-Link >	<i>getActionLinks()</i> on page 208	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 208	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 208	
public Long	<i>getCacheTimestamp()</i> on page 208	
public abstract String	<i>getCollectionId()</i> on page 208	Returns the Id of the OCata Collection that this Entry belongs to.
public abstract String	<i>getContentType()</i> on page 209	Returns the content type of the entry.

Modifier and Type	Member	Description
public abstract String	<i>getEtag()</i> on page 209	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 209	Returns the full execution URL that can be used for filtering collection search for this single entry.
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 209	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 210	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 210	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public abstract List< IODataIcon >	<i>getIcons()</i> on page 210	Returns the list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 210	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 211	

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 211	Returns the values of the properties that are marked as key properties in the OData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 211	Returns The parsed value of the 'updated' OData Element.
public abstract List< IOData-Link >	<i>getLinks()</i> on page 211	Returns the list of the appropriate OData elements.
public abstract String	<i>getMediaSrc()</i> on page 211	Returns the media source if the entry has a media content.
public abstract List< IODataProperty >	<i>getPropertiesData()</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 212	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract IParserDocument	<i>getPropertiesDocument()</i> on page 213	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 213	Returns the value of the appropriate property.

Modifier and Type	Member	Description
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 213	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 214	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List&lt; String[]&gt;)</i> on page 214	Return list of property values for the given property paths.
public abstract List< IODataLink >	<i>getRelatedDataLinks()</i> on page 215	Returns OData Link objects that represents links to Related Data.
public abstract List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 215	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract IODataSchema	<i>getSchema()</i> on page 215	Returns the appropriate OData Schema object.
public abstract IODataLink	<i>getSelfLink()</i> on page 215	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 216	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 216	Returns The value of the appropriate OData element.
public abstract String	<i>getTitle()</i> on page 216	Returns The value of the appropriate OData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 222	

Modifier and Type	Member	Description
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 216	Puts the new property element as a sub-element of the 'complex properties' OData element.
public abstract void	<i>putContentType(String)</i> on page 217	Puts the content type for a new entry object.
public abstract void	<i>putId(String)</i> on page 217	Sets id of this OData Entry document (value of appropriate OData Id element)
public abstract void	<i>putMediaSrc(String)</i> on page 217	Puts the media source for a new entry object.
public abstract void	<i>putPropertyValue(String, String)</i> on page 217	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 218	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>setAuthorName(String)</i> on page 218	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cacheState)</i> on page 218	
public void	<i>setCacheTimestamp(Long)</i> on page 219	
public abstract void	<i>setCollectionId(String)</i> on page 219	Maintains the Id of the OCata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 219	
public abstract void	<i>setSchema(IODataSchema)</i> on page 219	Maintains the reference to the appropriate OData Schema object.
public abstract void	<i>setSummary(String)</i> on page 219	Sets the value of the appropriate OData element.

Modifier and Type	Member	Description
public abstract void	<i>setTitle(String)</i> on page 219	Sets the value of the appropriate OData element.

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataSubscriptionEntry()* constructor

**Syntax**

```
public ODataSubscriptionEntry ()
```

*ODataSubscriptionEntry(String, String) constructor*

**Syntax**

```
public ODataSubscriptionEntry ( String deliveryAddress , String collection )
```

*ODataSubscriptionEntry(String, String, String, String, String, String) constructor*

**Syntax**

```
public ODataSubscriptionEntry ( String deliveryAddress , String collection , String filter , String select , String title , String author )
```

*ODataSubscriptionEntry(ParserDocument) constructor*

**Syntax**

```
public ODataSubscriptionEntry ( ParserDocument document )
```

*ODataSubscriptionEntry(int[], String[]) constructor*

**Syntax**

```
protected ODataSubscriptionEntry ( int[] routes , String[] values )
```

*getCollection() method*

Returns The value of the appropriate entry property.

**Syntax**

```
public String getCollection ()
```

**Returns**

The value of the appropriate entry property

*getDeliveryAddress() method*

Returns The value of the appropriate entry property.

**Syntax**

```
public String getDeliveryAddress ()
```

**Returns**

The value of the appropriate entry property

*getFilter() method*

Returns The value of the appropriate entry property.

*Syntax*

```
public String getFilter ()
```

*Returns*

The value of the appropriate entry property

*getSelect() method*

Returns The value of the appropriate entry property.

*Syntax*

```
public String getSelect ()
```

*Returns*

The value of the appropriate entry property

*setCollection(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public void setCollection (String collection )
```

*Parameters*

- **collection** – The new value of the appropriate entry property

*setDeliveryAddress(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public void setDeliveryAddress (String deliveryAddress )
```

*Parameters*

- **deliveryAddress** –

*setFilter(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public void setFilter (String filterString )
```

*Parameters*

- **filterString** – The new value of the appropriate entry property

*setSelect(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public void setSelect ( String selectString )
```

*Parameters*

- **selectString** – The new value of the appropriate entry property

*ODataURL class**Syntax*

```
public class ODataURL extends ParserDocument, IODataURL
```

*Members*

All members of ODataURL, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 905	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataURL()</i> on page 902	
public	<i>ODataURL(ParserDocument)</i> on page 903	
protected	<i>ODataURL(int[], String[])</i> on page 903	

**Methods**

Modifier and Type	Method	Description
public List< String >	<i>getMandatoryTemplateParameters()</i> on page 903	Returns the list of mandatory template parameter names.
protected List< String >	<i>getMandatoryTemplateParameters(String)</i> on page 903	

Modifier and Type	Method	Description
public List< String >	<i>getOptionalTemplateParameters()</i> on page 903	Returns the list of optional template parameter names.
protected List< String >	<i>getOptionalTemplateParameters(String)</i> on page 903	
public String	<i>getTemplate()</i> on page 904	Returns the value of the appropriate OData attribute.
public List< String >	<i>getTemplateParameters()</i> on page 904	Returns the list of all template parameter names.
public String	<i>getType()</i> on page 904	Returns the value of the appropriate OData attribute.
public String	<i>getUrl()</i> on page 904	Returns the full URL of this OData attribute without parameters.
public String	<i>getUrlFromTemplate(Map&lt; String, String &gt;)</i> on page 904	Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.
public void	<i>read(BufferedReader)</i> on page 905	
protected void	<i>setBaseUrl(String)</i> on page 905	
public void	<i>write(BufferedWriter)</i> on page 905	

#### Inherited members from ParserDocument

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.

Modifier and Type	Member	Description
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
protected boolean	<i>isMatched(String, String)</i> on page 954	
static List< String >	<i>nameMap</i> on page 963	
	<i>ParserDocument()</i> on page 945	
	<i>ParserDocument(boolean)</i> on page 945	
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	
static Map< String, String >	<i>prefixMapping</i> on page 964	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	

Modifier and Type	Member	Description
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
protected int[]	<i>routes</i> on page 964	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	
public void	<i>setDocuments(List&lt;IParserDocument &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 964	
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.

Modifier and Type	Member	Description
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.

Modifier and Type	Member	Description
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### Inherited members from IODataURL

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_TEMPLATE</i> on page 346	Name of the appropriate OData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 346	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_URL</i> on page 346	Name of the appropriate OData element.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataURL()* constructor**Syntax**

```
public ODataURL ()
```

*ODataURL(ParserDocument) constructor***Syntax**

```
public ODataURL ( ParserDocument document )
```

*ODataURL(int[], String[]) constructor***Syntax**

```
protected ODataURL ( int[] routes , String[] values )
```

*getMandatoryTemplateParameters() method*

Returns the list of mandatory template parameter names.

**Syntax**

```
public List< String > getMandatoryTemplateParameters ( )
```

**Returns**

the list of mandatory template parameter names

*getMandatoryTemplateParameters(String) method***Syntax**

```
protected List< String > getMandatoryTemplateParameters  
( String template )
```

*getOptionalTemplateParameters() method*

Returns the list of optional template parameter names.

**Syntax**

```
public List< String > getOptionalTemplateParameters ( )
```

**Returns**

the list of optional template parameter names

*getOptionalTemplateParameters(String) method***Syntax**

```
protected List< String > getOptionalTemplateParameters  
( String template )
```

### *getTemplate() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public String getTemplate ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getTemplateParameters() method*

Returns the list of all template parameter names.

#### *Syntax*

```
public List< String > getTemplateParameters ()
```

#### *Returns*

the list of all template parameter names

### *getType() method*

Returns the value of the appropriate OData attribute.

#### *Syntax*

```
public String getType ()
```

#### *Returns*

The value of the appropriate OData attribute

### *getUrl() method*

Returns the full URL of this OData attribute without parameters.

#### *Syntax*

```
public String getUrl ()
```

#### *Returns*

The full URL this OData attribute without parameters

### *getUrlFromTemplate(Map< String, String >) method*

Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.

#### *Syntax*

```
public String getUrlFromTemplate (Map< String, String >  
parameters )
```

### Returns

The full URL this OData attribute with parameters names and values

### *read(BufferedReader) method*

#### Syntax

```
public void read (BufferedReader reader) throws  
PersistenceException
```

#### Parameters

- **reader** – The buffered reader to read the object from.

#### Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

### *setBaseUrl(String) method*

#### Syntax

```
protected void setBaseUrl (String baseUrl)
```

### *write(BufferedWriter) method*

#### Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

#### Parameters

- **writer** – The buffered writer that object data needs to be written into.

#### Exceptions

- **PersistenceException** – if data can not be written into the writer

### *baseUrl variable*

#### Syntax

```
protected String baseUrl
```

*ODataWorkspace* class**Syntax**

```
public class ODataWorkspace extends ParserDocument,
IODataWorkspace
```

**Members**

All members of ODataWorkspace, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<i>baseUrl</i> on page 921	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataWorkspace()</i> on page 920	
public	<i>ODataWorkspace(ParserDocument)</i> on page 920	
protected	<i>ODataWorkspace(int[], String[])</i> on page 920	

**Methods**

Modifier and Type	Method	Description
public List< IODataCollection >	<i>getCollections()</i> on page 920	Returns The list of of 'collection' OData element.
public String	<i>getSemantics()</i> on page 921	Returns the value of the appropriate OData attribute.
public String	<i>getTitle()</i> on page 921	Returns the value of the appropriate OData element.
protected void	<i>setBaseUrl(String)</i> on page 921	

**Inherited members from ParserDocument**

Modifier and Type	Member	Description
static transient final String	<i>ANY_STRING</i> on page 963	

Modifier and Type	Member	Description
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 963	
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	

Modifier and Type	Member	Description
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	

Modifier and Type	Member	Description
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.

#### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

**Inherited members from IODataWorkspace**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 353	Name of the appropriate OData attribute.
public static final String	<i>ELEMENT_TITLE</i> on page 353	Name of the appropriate OData element.
public static final String	<i>ELEMENT_WORKSPACE</i> on page 353	Name of the appropriate OData element.

**Inherited members from IParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public abstract IParserDocument	<i>clone()</i> on page 374	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public abstract String	<i>getAttribute(String...)</i> on page 374	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 374	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 375	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 375	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 375	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 376	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 377	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 377	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 378	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 379	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 380	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 380	
public abstract String	<i>getPrefixForUri(String)</i> on page 380	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 381	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 381	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 381	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 382	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 382	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 382	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 383	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 383	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 383	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 384	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 384	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 385	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 385	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 385	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from IPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

*ODataWorkspace()* constructor*Syntax*

```
public ODataWorkspace ()
```

*ODataWorkspace(ParserDocument)* constructor*Syntax*

```
public ODataWorkspace ( ParserDocument document )
```

*ODataWorkspace(int[], String[])* constructor*Syntax*

```
protected ODataWorkspace ( int[] routes , String[] values )
```

*getCollections()* method

Returns The list of of 'collection' OData element.

*Syntax*

```
public List< IODataCollection > getCollections ()
```

**Returns**

The list of of 'collection' OData element.

**getSemantics() method**

Returns the value of the appropriate OData attribute.

**Syntax**

```
public String getSemantics ()
```

**Returns**

The value of the appropriate OData attribute

**getTitle() method**

Returns the value of the appropriate OData element.

**Syntax**

```
public String getTitle ()
```

**Returns**

The value of the appropriate OData element

**setBaseUrl(String) method****Syntax**

```
protected void setBaseUrl (String baseUrl)
```

**baseUrl variable****Syntax**

```
protected String baseUrl
```

**Parser class****Syntax**

```
public class Parser extends IParser
```

**Members**

All members of Parser, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected File	<i>defaultFolder</i> on page 934	
static Object	<i>lockObject</i> on page 934	

Modifier and Type	Variable	Description
protected ILogger	<i>logger</i> on page 934

protected IPreferences	<i>preferences</i> on page 935	

### Constructors

Modifier and Type	Constructor	Description
public	<i>Parser(IPreferences, ILogger)</i> on page 924	

### Methods

Modifier and Type	Method	Description
	<i>[instance initializer]()</i> on page 925	
public String	<i>buildODataDocument(IParserDocument)</i> on page 925	Builds a valid OData Entry XML Post body from the entry argument.
public String	<i>buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int)</i> on page 925	Builds a valid OData Entry JSON Post body from the entry argument.
public void	<i>enableParserPerformanceLog(boolean, Context)</i> on page 926	This method is to be called if performance data point are to be enabled for Parser.
void	<i>init()</i> on page 926	
public IParserDocument	<i>parse(InputStream)</i> on page 926	Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.

Modifier and Type	Method	Description
public IParserDocument	<i>parse(String)</i> on page 927	Parses the Source and converts it to a Java Object containing all the information that were contained by the source.
public List< IODataEntry >	<i>parseFunctionImportResult(String, IODataFunctionImport, IODataSchema)</i> on page 927	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.
public List< IODataEntry >	<i>parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema)</i> on page 928	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.
public List< IODataEntry >	<i>parseODataEntries(String, String, IODataSchema)</i> on page 928	Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.
public List< IODataEntry >	<i>parseODataEntries(InputStream, String, IODataSchema)</i> on page 929	Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.
public IODataError	<i>parseODataError(String)</i> on page 929	Parses the OData Error.
public IODataError	<i>parseODataError(InputStream)</i> on page 930	Parses the OData Error from stream.
public IODataFeed	<i>parseODataFeed(String, String, IODataSchema)</i> on page 930	Parse OData Feed, support for Delta Query.
public IODataFeed	<i>parseODataFeed(InputStream, String, IODataSchema)</i> on page 931	Parse OData Feed from stream, support for Delta Query.

Modifier and Type	Method	Description
public IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(String, String, IODataServiceDocument)</i> on page 931	Parses the OData Open Search Description.
public IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument)</i> on page 931	Parses the OData Open Search Description from stream.
public IODataSchema	<i>parseODataSchema(String, IODataServiceDocument)</i> on page 932	Parses the OData Schema.
public IODataSchema	<i>parseODataSchema(InputStream, IODataServiceDocument)</i> on page 932	Parses the OData Schema from stream.
public IODataServiceDocument	<i>parseODataServiceDocument(String)</i> on page 933	Parses the OData Service Document.
public IODataServiceDocument	<i>parseODataServiceDocument(InputStream)</i> on page 933	Parses the OData Service Document from stream.
protected synchronized void	<i>readNameMap()</i> on page 934	
protected void	<i>writeNameMap(int)</i> on page 934	

#### Inherited members from IParser

Modifier and Type	Member	Description
public static final int	<i>FORMAT_JSON</i> on page 365	JSON Format for Building Post Body.
public static final int	<i>FORMAT_XML</i> on page 365	XML Format for Building Post Body.

*Parser(IPreferences, ILogger) constructor*

#### Syntax

```
public Parser ( IPreferences preferences , ILogger logger ) throws
ParserException
```

*[instance initializer]() method*

**Syntax**

[instance initializer] ()

*buildODataDocument(IParserDocument) method*

Builds a valid OData Entry XML Post body from the entry argument.

**Syntax**

```
public String buildODataDocument ( IParserDocument document )
throws ParseException
```

**Parameters**

- **entry** – The ODataEntry object to build the from
- **document** – The ParserDocument object to build the from

**Returns**

The built documentThe built document

**Exceptions**

- **ParseException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds and representation of the document argument
- **ParseException class** – If building document has failed
- **IllegalArgumentException** – If the argument is null

*buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int) method*

Builds a valid OData Entry JSON Post body from the entry argument.

**Syntax**

```
public String buildODataEntryRequestBody ( IODataEntry entry ,
String collectionId , IODataSchema schema , int formatType ) throws
ParseException
```

**Parameters**

- **entry** – The ODataEntry object to build the from
- **collectionID** –
- **entry** – The ODataEntry object to build the from
- **collectionID** – Collection t which the entry would be posted
- **schema** – Schema of the service

- **formatType** – Format of the post body to be built 1 - Atom/XML 2 - JSON

### Returns

The built document

### Exceptions

- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds a valid OData Entry XML or JSON Post body from the entry argument
- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null

### *enableParserPerformanceLog(boolean, Context) method*

This method is to be called if performance data point are to be enabled for Parser.

### Syntax

```
public void enableParserPerformanceLog ( boolean perflog ,  
Context applicationContext )
```

### Parameters

- **perflog** –
- **applicationContext** –

### *init() method*

### Syntax

```
void init () throws ParserException
```

### *parse(InputStream) method*

Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.

### Syntax

```
public IParserDocument parse ( InputStream stream ) throws  
ParserException
```

### Parameters

- **stream** – A stream that holds a syntactically valid document

### Returns

The Object representation of the parsed document

### Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *parse(String) method*

Parses the Source and converts it to a Java Object containing all the information that were contained by the source.

### Syntax

```
public IParserDocument parse (String document) throws
ParserException
```

### Parameters

- **A** – syntactically valid document

### Returns

The Object representation of the parsed document

### Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseFunctionImportResult(String, IODataFunctionImport, IODataSchema) method*

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.

### Syntax

```
public List< IODataEntry > parseFunctionImportResult (String
document , IODataFunctionImport functionImport , IODataSchema schema )
throws ParserException, IllegalArgumentException
```

### Parameters

- **document** – The Function Import result document
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

### Returns

List of OData Entry containing the result values

### *Exceptions*

- **ParserException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

### *parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema) method*

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.

### *Syntax*

```
public List< IODataEntry > parseFunctionImportResult  
( InputStream stream , IODataFunctionImport functionImport ,  
IODataSchema schema ) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – The function Import result stream
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

### *Returns*

List of OData Entry containing the result values

### *Exceptions*

- **ParserException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

### *parseODataEntries(String, String, IODataSchema) method*

Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

### *Syntax*

```
public List< IODataEntry > parseODataEntries ( String entries ,  
String collectionId , IODataSchema schema ) throws  
ParserException, IllegalArgumentException
```

### *Parameters*

- **entries** – The source of either a single OData Entry or OData Feed of several OData entries

- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

#### Returns

The list of the OData Entries contained by the source

#### Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

#### *parseODataEntries(InputStream, String, IODataSchema) method*

Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.

#### Syntax

```
public List< IODataEntry > parseODataEntries ( InputStream
stream , String collectionId , IODataSchema schema ) throws
ParserException, IllegalArgumentException
```

#### Parameters

- **stream** – The stream that holds the source of either a single OData Entry or OData Feed of several OData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

#### Returns

The list of the OData Entries contained by the source

#### Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

#### *parseODataError(String) method*

Parses the OData Error.

#### Syntax

```
public IODataError parseODataError ( String error ) throws
ParserException
```

#### Parameters

- **error** – The OData Error

### *Returns*

The OData Error document

### *Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataError(InputStream) method*

Parses the OData Error from stream.

### *Syntax*

```
public IODataError parseODataError ( InputStream stream ) throws  
ParserException
```

### *Parameters*

- **stream** – The OData Error as stream

### *Returns*

The OData Error document

### *Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *parseODataFeed(String, String, IODataSchema) method*

Parse OData Feed, support for Delta Query.

### *Syntax*

```
public IODataFeed parseODataFeed ( String feed , String collectionId ,  
IODataSchema schema ) throws ParserException
```

### *Parameters*

- **feed** –
- **collectionId** –
- **schema** –

### *Exceptions*

- **SDMParserException** –

*parseODataFeed(InputStream, String, IODataSchema) method*

Parse OData Feed from stream, support for Delta Query.

*Syntax*

```
public IODataFeed parseODataFeed ( InputStream stream , String
collectionId , IODataSchema schema ) throws ParserException
```

*Parameters*

- **stream** –
- **collectionId** –
- **schema** –

*Exceptions*

- **ParserException class** –

*parseODataOpenSearchDescription(String, String, IODataServiceDocument) method*

Parses the OData Open Search Description.

*Syntax*

```
public IODataOpenSearchDescription
parseODataOpenSearchDescription ( String openSearchDescription ,
String collectionId , IODataServiceDocument serviceDocument ) throws
ParserException, IllegalArgumentException
```

*Parameters*

- **openSearchDescription** – The OData Open Search Description

*Returns*

OData Open Search Description document

*Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

*parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument) method*

Parses the OData Open Search Description from stream.

*Syntax*

```
public IODataOpenSearchDescription
parseODataOpenSearchDescription ( InputStream stream , String
```

*collectionId* , *IODataServiceDocument serviceDocument* ) throws  
*ParserException, IllegalArgumentException*

### Parameters

- **stream** – The stream that holds the OData Open Search Description .

### Returns

OData Open Search Description document

### Exceptions

- **ParserException class** – If the stream source is invalid.
- **IllegalArgumentException** – If the argument is null.

*parseODataSchema(String, IODataServiceDocument) method*

Parses the OData Schema.

### Syntax

```
public IODataSchema parseODataSchema ( String schema ,  
IODataServiceDocument serviceDocument ) throws  
ParserException, IllegalArgumentException
```

### Parameters

- **schema** – The OData Schema
- **serviceDocument** – The appropriate OData Service Document object

### Returns

The OData Schema document

### Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

*parseODataSchema(InputStream, IODataServiceDocument) method*

Parses the OData Schema from stream.

### Syntax

```
public IODataSchema parseODataSchema ( InputStream stream ,  
IODataServiceDocument serviceDocument ) throws  
ParserException, IllegalArgumentException
```

*Parameters*

- **stream** – The stream that holds OData Schema
- **serviceDocument** – The appropriate OData Service Document object

*Returns*

The OData Schema document

*Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

*parseODataServiceDocument(String) method*

Parses the OData Service Document.

*Syntax*

```
public IODataServiceDocument parseODataServiceDocument
( String serviceDocument ) throws
ParserException, IllegalArgumentException
```

*Parameters*

- **serviceDocument** – The OData Service Document

*Returns*

The OData Service Document

*Exceptions*

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

*parseODataServiceDocument(InputStream) method*

Parses the OData Service Document from stream.

*Syntax*

```
public IODataServiceDocument parseODataServiceDocument
( InputStream stream ) throws ParserException,
IllegalArgumentException
```

*Parameters*

- **stream** – The stream that holds OData Service Document

### *Returns*

The OData Service Document

### *Exceptions*

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *readNameMap() method*

#### *Syntax*

```
protected synchronized void readNameMap () throws IOException
```

### *writeNameMap(int) method*

#### *Syntax*

```
protected void writeNameMap ( int starpos ) throws IOException
```

### *defaultFolder variable*

#### *Syntax*

```
protected File defaultFolder
```

### *lockObject variable*

#### *Syntax*

```
static Object lockObject
```

### *logger variable*

#### *Syntax*

```
protected ILogger logger
```

### *logLevel variable*

#### *Syntax*

```
protected int logLevel
```

### *NAMEMAP\_FILENAME variable*

#### *Syntax*

```
protected static final String NAMEMAP_FILENAME
```

*pa variable***Syntax**

```
Object pa
```

*parser variable***Syntax**

```
protected SAXParser parser
```

*preferences variable***Syntax**

```
protected IPreferences preferences
```

*ParserDocument class***Syntax**

```
public class ParserDocument extends IParserDocument,
Externalizable
```

### Members

All members of `ParserDocument`, including inherited members. **Variables**

Modifier and Type	Variable	Description
static transient final String	<i>ANY_STRING</i> on page 963	
static transient final int	<i>ATTRIBUTE_ID</i> on page 963	
static transient final String	<i>ATTRIBUTE_STRING</i> on page 963	
protected Map< String, String >	<i>extensions</i> on page 963	
boolean	<i>isComplexEntity</i> on page 963	
boolean	<i>isJson</i> on page 963	
static List< String >	<i>nameMap</i> on page 963	
static Map< String, String >	<i>prefixMapping</i> on page 964	
protected int[]	<i>routes</i> on page 964	
protected String[]	<i>strings</i> on page 964	
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 964	
static transient final int	<i>VALUE_ID</i> on page 964	
static transient final String	<i>VALUE_STRING</i> on page 964	

### Constructors

Modifier and Type	Constructor	Description
public	<i>ParserDocument(String)</i> on page 944	
public	<i>ParserDocument(ParserDocument)</i> on page 944	
	<i>ParserDocument()</i> on page 945	

Modifier and Type	Constructor	Description
	<i>ParserDocument(boolean)</i> on page 945	
protected	<i>ParserDocument(int[], String[])</i> on page 945	
protected	<i>ParserDocument(String, boolean)</i> on page 945	

## Methods

Modifier and Type	Method	Description
public ParserDocument	<i>clone()</i> on page 945	Creates a copy of this object.
public String	<i>getAttribute(String...)</i> on page 945	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 946	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 946	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 946	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 947	Returns all the values of attributes contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 947	Returns the elements contained by the element with the given route.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 947	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 948	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Method	Description
public ParserDocument	<i>getDocument(String...)</i> on page 948	Returns the first element with the given route.
protected List< int[]>	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 949	
public List< IParserDocument >	<i>getDocuments(String...)</i> on page 949	Returns all the elements with the given route.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 949	Returns the elements with the given route that contains the given attribute with the given value.
public List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 950	Returns the elements with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 950	Returns the first element with the given route that contains the given attribute with the given value.
public IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 951	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 951	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 952	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 952	
static int	<i>getNameId(String, boolean, boolean)</i> on page 952	
public static List< String >	<i>getNameMap()</i> on page 952	
public static String	<i>getPrefix(String)</i> on page 952	

Modifier and Type	Method	Description
public String	<i>getPrefixForUri(String)</i> on page 952	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 953	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 953	
public String[]	<i>getStrings()</i> on page 953	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 953	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 953	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 954	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 954	
protected void	<i>insertStringsPositions(int, String[])</i> on page 954	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 954	
protected boolean	<i>isMatched(String, String)</i> on page 954	
public void	<i>putAttribute(String, String...)</i> on page 955	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Method	Description
public void	<i>putDocument(IParserDocument, String...)</i> on page 955	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 955	
protected void	<i>putString(int, String, int, String...)</i> on page 956	
public void	<i>putValue(String, String...)</i> on page 956	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 956	
public void	<i>readExternal(ObjectInput)</i> on page 956	
public static void	<i>readNameMap(BufferedReader)</i> on page 957	
public boolean	<i>removeAttribute(String...)</i> on page 957	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 957	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 957	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 958	
protected void	<i>removeRoutesPositions(int, int)</i> on page 958	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 958	

Modifier and Type	Method	Description
protected boolean	<i>removeString(String...)</i> on page 958	
protected boolean	<i>removeStrings(String...)</i> on page 958	
protected void	<i>removeStringsPositions(int, int)</i> on page 958	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 958	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 959	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 959	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 959	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 959	
public static String	<i>resolveUrl(String, String)</i> on page 959	
public void	<i>setAttribute(String, String...)</i> on page 959	
public void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 960	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(IParserDocument, String...)</i> on page 960	

Modifier and Type	Method	Description
public void	<i>setDocuments(List&lt; IParser-Document &gt;, String...)</i> on page 960	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 961	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List&lt;String &gt;)</i> on page 961	
public static void	<i>setPrefixMapping(Map&lt;String, String &gt;)</i> on page 961	
protected void	<i>setString(String, String...)</i> on page 961	
protected void	<i>setStrings(List&lt;String &gt;, String...)</i> on page 961	
public void	<i>setValue(String, String...)</i> on page 961	
public void	<i>setValues(List&lt;String &gt;, String...)</i> on page 962	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public String	<i>toXMLString()</i> on page 962	Returns the XML string representation of this object.
public void	<i>write(BufferedWriter)</i> on page 962	
public void	<i>writeExternal(ObjectOutput)</i> on page 962	

Modifier and Type	Method	Description
public static void	<i>writeNameMap(BufferedWriter)</i> on page 963	

### Inherited members from IParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 386	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 386	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 386	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 386	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 386	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 386	Name of the appropriate OData element.
public static final String	<i>ELEMENT_ID</i> on page 387	Name of the appropriate OData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 387	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 387	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 388	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 388	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 389	
public void	<i>write(BufferedWriter)</i> on page 389	

#### *ParserDocument(String)* constructor

##### Syntax

```
public ParserDocument ( String name )
```

#### *ParserDocument(ParserDocument)* constructor

##### Syntax

```
public ParserDocument ( ParserDocument document )
```

*ParserDocument()* constructor*Syntax*

```
ParserDocument ()
```

*ParserDocument(boolean)* constructor*Syntax*

```
ParserDocument ( boolean isComplex )
```

*ParserDocument(int[], String[])* constructor*Syntax*

```
protected ParserDocument ( int[] routes , String[] values )
```

*ParserDocument(String, boolean)* constructor*Syntax*

```
protected ParserDocument ( String name , boolean jsonFlag )
```

*clone()* method

Creates a copy of this object.

*Syntax*

```
public ParserDocument clone () throws  
CloneNotSupportedException
```

*Returns*

The new copy of this object

*getAttribute(String...)* method

Returns the value of the first attribute with the given route.

*Syntax*

```
public String getAttribute ( String... route )
```

*Parameters*

- **route** – The route to the attribute

*Returns*

The value of the first attribute or null if there is no such attribute

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getAttributes(String...) method*

Returns all the values of attributes with the given route.

*Syntax*

```
public List< String > getAttributes ( String... route )
```

*Parameters*

- **route** – The route to the attributes

*Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getAttributesEndPosition(int[], int, int) method*

*Syntax*

```
protected int getAttributesEndPosition ( int[] array , int start ,  
int end )
```

*getChildAttributeMap(String...) method*

Returns all the name-value pairs of attributes contained by the element with the given route.

*Syntax*

```
public Map< String, String > getChildAttributeMap ( String...  
route )
```

*Parameters*

- **route** – The route to the element with the child attributes

*Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildAttributes(String...) method*

Returns all the values of attributes contained by the element with the given route.

*Syntax*

```
public List< String > getChildAttributes ( String... route )
```

*Parameters*

- **route** – The route to the element with the child attributes

*Returns*

The list of values

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildDocuments(String...) method*

Returns the elements contained by the element with the given route.

*Syntax*

```
public List< IParserDocument > getChildDocuments ( String... route )
```

*Parameters*

- **route** – The route to the element with the child elements

*Returns*

List of elements as new IParser documents

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildDocumentsWithAttribute(String, String, String...) method*

Returns the elements contained by the element with the given route and having the given attribute with the given value.

*Syntax*

```
public List< IParserDocument > getChildDocumentsWithAttribute ( String attributeName , String attributeValue , String... route )
```

### *Parameters*

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### *Returns*

List of elements as new IParser documents

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *getChildDocumentsWithAttribute(String, String, boolean, String...) method*

Returns the elements contained by the element with the given route and having the given attribute with the given value.

### *Syntax*

```
public List< IParserDocument > getChildDocumentsWithAttribute  
( String attributeName , String attributeValue , boolean addByDefault ,  
String... route )
```

### *Parameters*

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

### *Returns*

List of elements as new IParser documents

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocument(String...) method*

Returns the first element with the given route.

### *Syntax*

```
public ParserDocument getDocument ( String... route )
```

*Parameters*

- **route** – The route to the element

*Returns*

The element as a new IParser document or null if there is no such element

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getDocumentPositions(String[], int, boolean, boolean) method*

*Syntax*

```
protected List< int[] > getDocumentPositions ( String[] route ,
int resultCount , boolean addMaxRoutePos , boolean skipAttributes )
```

*getDocuments(String...) method*

Returns all the elements with the given route.

*Syntax*

```
public List< IParserDocument > getDocuments ( String... route )
```

*Parameters*

- **route** – The route to the elements

*Returns*

List of elements as new IParser documents

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getDocumentsWithAttribute(String, String, String...) method*

Returns the elements with the given route that contains the given attribute with the given value.

*Syntax*

```
public List< IParserDocument > getDocumentsWithAttribute
( String attributeName , String attributeValue , String... route )
```

*Parameters*

- **route** – The route to the elements

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### Returns

List of elements as new IParser documents

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentsWithAttribute(String, String, boolean, String...) method*

Returns the elements with the given route that contains the given attribute with the given value.

### Syntax

```
public List< IParserDocument > getDocumentsWithAttribute  
( String attributeName , String attributeValue , boolean addByDefault ,  
String... route )
```

### Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

### Returns

List of elements as new IParser documents

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentWithAttribute(String, String, String...) method*

Returns the first element with the given route that contains the given attribute with the given value.

### Syntax

```
public IParserDocument getDocumentWithAttribute ( String  
attributeName , String attributeValue , String... route )
```

### Parameters

- **route** – The route to the element

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

#### Returns

The element as a new IParser document or null if there is no such element

#### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

#### *getDocumentWithAttribute(String, String, boolean, String...)* method

Returns the first element with the given route that contains the given attribute with the given value.

#### Syntax

```
public IParserDocument getDocumentWithAttribute (String
attributeName , String attributeValue , boolean addByDefault , String...
route )
```

#### Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

#### Returns

The element as a new IParser document or null if there is no such element

#### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

#### *getElementName()* method

Returns The name of the root element of this document.

#### Syntax

```
public String getElementName ()
```

#### Returns

The name of the root element of this document

*getExtension(String) method*

*Syntax*

```
public String getExtension ( String extensionId )
```

*getFunctionImportComplexPropertyValue(String...) method*

*Syntax*

```
public String getFunctionImportComplexPropertyValue  
( String... route )
```

*getNameId(String, boolean, boolean) method*

*Syntax*

```
static int getNameId ( String name , boolean checkWithoutPrefix ,  
boolean addIfNotExist )
```

*getNameMap() method*

*Syntax*

```
public static List< String > getNameMap ( )
```

*getPrefix(String) method*

*Syntax*

```
public static String getPrefix ( String uri )
```

*getPrefixForUri(String) method*

Returns the appropriate name-space prefix for the given XML name-space URI.

*Syntax*

```
public String getPrefixForUri ( String uri )
```

*Parameters*

- **uri** – An XML names-pace URI

*Returns*

The appropriate name-space prefix

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getPrefixMapping() method**Syntax*

```
public static Map< String, String > getPrefixMapping ()
```

*getStringPositions(String[], int, boolean, boolean) method**Syntax*

```
protected List< Integer > getStringPositions ( String[] route ,
int resultCount , boolean addFieldId , boolean addMaxRoutePos )
```

*getStrings() method*

Returns all the string values contained by this document.

*Syntax*

```
public String[] getStrings ()
```

*Returns*

all the string values contained by this document

*getValue(String...) method*

Returns the value of the first element with the given route.

*Syntax*

```
public String getValue ( String... route )
```

*Parameters*

- **route** – The route to the element

*Returns*

The value of the first element or null if there is no such element

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getValues(String...) method*

Returns all the values of elements with the given route.

*Syntax*

```
public List< String > getValues ( String... route )
```

### *Parameters*

- **route** – The route to the elements

### *Returns*

The list of values

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *insertRoutePositions(int[], int, int[]) method*

#### *Syntax*

```
protected int[] insertRoutePositions ( int[] array , int start ,  
int[] subRoutes )
```

### *insertRoutesPositions(int, int[]) method*

#### *Syntax*

```
protected void insertRoutesPositions ( int start , int[]  
subRoutes )
```

### *insertStringsPositions(int, String[]) method*

#### *Syntax*

```
protected void insertStringsPositions ( int start , String[]  
subStrings )
```

### *insertStringsPositions(String[], int, String[]) method*

#### *Syntax*

```
protected String[] insertStringsPositions ( String[] array , int  
start , String[] subStrings )
```

### *isMatched(String, String) method*

#### *Syntax*

```
protected boolean isMatched ( String xmlName , String routeName )
```

*putAttribute(String, String...) method*

Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non-existing elements in the route.

*Syntax*

```
public void putAttribute ( String value , String... route ) throws
IllegalArgumentException
```

*Parameters*

- **value** – The new value
- **route** – The route to the attribute

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*putDocument(IParserDocument, String...) method*

Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.

*Syntax*

```
public void putDocument ( IParserDocument document , String...
route ) throws IllegalArgumentException
```

*Parameters*

- **document** – The new document
- **route** – The route to the parent element of the new document

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*putExtension(String, String) method**Syntax*

```
public void putExtension ( String extensionId , String
extensionValue )
```

### *putString(int, String, int, String...) method*

#### *Syntax*

```
protected void putString ( int stringId , String value , int  
existLength , String... route )
```

### *putValue(String, String...) method*

Sets the value of the first element with the given route.

#### *Syntax*

```
public void putValue ( String value , String... route ) throws  
IllegalArgumentException
```

#### *Parameters*

- **value** – The new value
- **route** – The route to the element

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *read(BufferedReader) method*

#### *Syntax*

```
public void read ( BufferedReader reader ) throws  
PersistenceException
```

#### *Parameters*

- **reader** – The buffered reader to read the object from.

#### *Exceptions*

- **PersistenceException** – if data can not be loaded from the reader.

### *readExternal(ObjectInput) method*

#### *Syntax*

```
public void readExternal ( ObjectInput in ) throws IOException,  
ClassNotFoundException
```

*readNameMap(BufferedReader) method**Syntax*

```
public static void readNameMap (BufferedReader reader) throws
IOException
```

*removeAttribute(String...) method*

Removes first element with the given route.

*Syntax*

```
public boolean removeAttribute (String... route)
```

*Parameters*

- **route** – The route to the attribute to remove

*Returns*

true if at least one attribute has been removed or false otherwise

*removeAttributes(String...) method*

Removes all the attribute with the given route.

*Syntax*

```
public boolean removeAttributes (String... route)
```

*Parameters*

- **route** – The route to the attributes to remove

*Returns*

true if at least one attribute has been removed or false otherwise

*removeDocument(String...) method*

Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

*Syntax*

```
public boolean removeDocument (String... route) throws
IllegalArgumentException
```

*Parameters*

- **route** – The route to the element to remove

*Returns*

true if at least one element has been removed or false otherwise

*removeExtension(String) method*

*Syntax*

```
public void removeExtension (String extensionId)
```

*removeRoutesPositions(int, int) method*

*Syntax*

```
protected void removeRoutesPositions (int start , int end)
```

*removeRoutesPositions(int[], int, int) method*

*Syntax*

```
protected int[] removeRoutesPositions (int[] array , int start ,  
int end)
```

*removeString(String...) method*

*Syntax*

```
protected boolean removeString (String... route)
```

*removeStrings(String...) method*

*Syntax*

```
protected boolean removeStrings (String... route)
```

*removeStringsPositions(int, int) method*

*Syntax*

```
protected void removeStringsPositions (int start , int end)
```

*removeStringsPositions(String[], int, int) method*

*Syntax*

```
protected String[] removeStringsPositions (String[] array , int  
start , int end)
```

*replaceRoutesPositions(int, int, int[]) method*

**Syntax**

```
protected int replaceRoutesPositions (int start , int end , int[]
subRoutes )
```

*replaceRoutesPositions(int[], int, int, int[]) method*

**Syntax**

```
protected int[] replaceRoutesPositions (int[] array , int start ,
int end , int[] subRoutes )
```

*replaceStringsPositions(int, int, String[]) method*

**Syntax**

```
protected int replaceStringsPositions (int start , int end ,
String[] subStrings )
```

*replaceStringsPositions(String[], int, int, String[]) method*

**Syntax**

```
protected String[] replaceStringsPositions (String[] array , int
start , int end , String[] subStrings )
```

*resolveUrl(String, String) method*

**Syntax**

```
public static String resolveUrl (String baseUrl , String url )
```

*setAttribute(String, String...) method*

**Syntax**

```
public void setAttribute (String value , String... route ) throws
IllegalArgumentException
```

### *setAttributes(List< String >, String...) method*

Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

#### *Syntax*

```
public void setAttributes ( List< String > values , String...  
route ) throws IllegalArgumentException
```

#### *Parameters*

- **values** – The new values of the attributes
- **route** – The route to the attributes

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *setDocument(IParserDocument, String...) method*

#### *Syntax*

```
public boolean setDocument ( IParserDocument document , String...  
route ) throws IllegalArgumentException
```

### *setDocuments(List< IParserDocument >, String...) method*

Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

#### *Syntax*

```
public void setDocuments ( List< IParserDocument > documents ,  
String... route ) throws IllegalArgumentException
```

#### *Parameters*

- **documents** – The list of new documents or nulls if one or more document should be removed
- **route** – The route to the elements

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*setElementName(String, String...) method*

Sets the name of the root element with the given route Use empty route for setting root name of this document.

*Syntax*

```
public void setElementName (String name , String... route )
```

*Parameters*

- **name** – The new name of the root element
- **route** – The route to the element

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*setNameMap(List< String >) method**Syntax*

```
public static void setNameMap (List< String > nameMap )
```

*setPrefixMapping(Map< String, String >) method**Syntax*

```
public static void setPrefixMapping (Map< String, String > prefixMapping )
```

*setString(String, String...) method**Syntax*

```
protected void setString (String value , String... route )
```

*setStrings(List< String >, String...) method**Syntax*

```
protected void setStrings (List< String > values , String... route )
```

*setValue(String, String...) method**Syntax*

```
public void setValue (String value , String... route ) throws  
IllegalArgumentException
```

### *setValues(List< String >, String...) method*

Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

#### *Syntax*

```
public void setValues ( List< String > values , String... route )  
throws IllegalArgumentException
```

#### *Parameters*

- **values** – The new values of the elements
- **route** – The route to the elements

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *toXMLString() method*

Returns the XML string representation of this object.

#### *Syntax*

```
public String toXMLString ()
```

#### *Returns*

The XML string representation of this object

### *write(BufferedWriter) method*

#### *Syntax*

```
public void write ( BufferedWriter writer ) throws  
PersistenceException
```

#### *Parameters*

- **writer** – The buffered writer that object data needs to be written into.

#### *Exceptions*

- **PersistenceException** – if data can not be written into the writer

### *writeExternal(ObjectOutput) method*

#### *Syntax*

```
public void writeExternal ( ObjectOutput out ) throws IOException
```

*writeNameMap(BufferedWriter) method***Syntax**

```
public static void writeNameMap (BufferedWriter writer) throws
IOException
```

*ANY\_STRING variable***Syntax**

```
static transient final String ANY_STRING
```

*ATTRIBUTE\_ID variable***Syntax**

```
static transient final int ATTRIBUTE_ID
```

*ATTRIBUTE\_STRING variable***Syntax**

```
static transient final String ATTRIBUTE_STRING
```

*extensions variable***Syntax**

```
protected Map< String, String > extensions
```

*isComplexEntity variable***Syntax**

```
boolean isComplexEntity
```

*isJson variable***Syntax**

```
boolean isJson
```

*nameMap variable***Syntax**

```
static List< String > nameMap
```

*prefixMapping variable*

*Syntax*

```
static Map< String, String > prefixMapping
```

*routes variable*

*Syntax*

```
protected int[] routes
```

*strings variable*

*Syntax*

```
protected String[] strings
```

*URL\_PROTOCOL\_PREFIX variable*

*Syntax*

```
protected static final String URL_PROTOCOL_PREFIX
```

*VALUE\_ID variable*

*Syntax*

```
static transient final int VALUE_ID
```

*VALUE\_STRING variable*

*Syntax*

```
static transient final String VALUE_STRING
```

*ParserException class*

Main exception throwable by Parser or Odata documents.

*Syntax*

```
public class ParserException extends Exception
```

*Members*

All members of ParserException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ParserException()</i> on page 965	Constructor.

Modifier and Type	Constructor	Description
public	<i>ParserException(String)</i> on page 965	Constructor.
public	<i>ParserException(Throwable)</i> on page 965	Constructor.
public	<i>ParserException(String, Throwable)</i> on page 966	Constructor.
public	<i>ParserException(int, String, Throwable)</i> on page 966	
public	<i>ParserException(int, String)</i> on page 966	

### Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 966	

#### *ParserException()* constructor

Constructor.

#### Syntax

```
public ParserException ()
```

#### *ParserException(String)* constructor

Constructor.

#### Syntax

```
public ParserException ( String detailMessage )
```

#### Parameters

- **detailMessage** – Error message

#### *ParserException(Throwable)* constructor

Constructor.

#### Syntax

```
public ParserException ( Throwable throwable )
```

*Parameters*

- **throwable** – Route exception

*ParserException(String, Throwable) constructor*

Constructor.

*Syntax*

```
public ParserException ( String detailMessage , Throwable throwable )
```

*Parameters*

- **detailMessage** – Error message
- **throwable** – Route exception

*ParserException(int, String, Throwable) constructor*

*Syntax*

```
public ParserException ( int iErrorCode , String detailMessage , Throwable throwable )
```

*ParserException(int, String) constructor*

*Syntax*

```
public ParserException ( int iErrorCode , String detailMessage )
```

*getErrorCode() method*

*Syntax*

```
public int getErrorCode ()
```

*ParserHandler class*

*Syntax*

```
public class ParserHandler extends DefaultHandler
```

*Members*

All members of ParserHandler, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected StringBuffer	<i>buffer</i> on page 969	

Modifier and Type	Variable	Description
protected List< Integer >	<i>routes</i> on page 969	
protected List< String >	<i>values</i> on page 969	

### Methods

Modifier and Type	Method	Description
protected void	<i>addValue()</i> on page 967	
public void	<i>characters(char[], int, int)</i> on page 967	
public void	<i>endElement(String, String, String)</i> on page 968	
public ParserDocument	<i>getDocument()</i> on page 968	
protected String	<i>resolveAttributeName(Attributes, int)</i> on page 968	
protected String	<i>resolveName(String, String, String)</i> on page 968	
public void	<i>startDocument()</i> on page 968	
public void	<i>startElement(String, String, String, Attributes)</i> on page 968	
public void	<i>startPrefixMapping(String, String)</i> on page 968	

#### *addValue()* method

##### Syntax

```
protected void addValue ()
```

#### *characters(char[], int, int)* method

##### Syntax

```
public void characters ( char[] ch , int start , int length ) throws SAXException
```

*endElement(String, String, String) method*

**Syntax**

```
public void endElement (String uri , String localName , String qName ) throws SAXException
```

*getDocument() method*

**Syntax**

```
public ParserDocument getDocument ()
```

*resolveAttributeName(Attributes, int) method*

**Syntax**

```
protected String resolveAttributeName (Attributes attributes , int i )
```

*resolveName(String, String, String) method*

**Syntax**

```
protected String resolveName (String uri , String localName , String qName )
```

*startDocument() method*

**Syntax**

```
public void startDocument () throws SAXException
```

*startElement(String, String, String, Attributes) method*

**Syntax**

```
public void startElement (String uri , String localName , String qName , Attributes attributes ) throws SAXException
```

*startPrefixMapping(String, String) method*

**Syntax**

```
public void startPrefixMapping (String prefix , String uri ) throws SAXException
```

*buffer variable**Syntax*

```
protected StringBuffer buffer
```

*routes variable**Syntax*

```
protected List< Integer > routes
```

*values variable**Syntax*

```
protected List< String > values
```

*Preferences class**Syntax*

```
public class Preferences extends IPreferences, Constants,
OnSharedPreferenceChangeListener
```

*Members*

All members of Preferences, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static String	<i>DEFAULT_PARSER_STRING_SUBFOLDER_NAME</i> on page 982	Default subfolder for Parser.
public static String	<i>DEFAULT_PERSISTENCE_STRING_SUBFOLDER_NAME</i> on page 982	Default subfolder for Persistence.
protected Hashtable< String, Object >	<i>defaultPreferences</i> on page 982	Store for default Preferences.
protected ILogger	<i>logger</i> on page 983	
protected int	<i>logLevel</i> on page 983	
protected Hashtable< String, Set< IPreferenceChangeListener >>	<i>preferenceChangeListeners</i> on page 983	Listeners for Preference changes.

Modifier and Type	Variable	Description
protected static final String	<i>PREFERENCES</i> on page 983	

### Constructors

Modifier and Type	Constructor	Description
public	<i>Preferences(Context, ILogger)</i> on page 975	

### Methods

Modifier and Type	Method	Description
protected void	<i>addDefaultPreferences()</i> on page 975	Can be used to add application specific default preferences.
protected Object	<i>confirmPreference(String)</i> on page 975	Validates changed preference if it can be changed.
public boolean	<i>containsPreference(String)</i> on page 976	Checks the existence of the given preference.
public Map< String, ?>	<i>getAllPreferences()</i> on page 976	
public Boolean	<i>getBooleanPreference(String)</i> on page 976	Returns the value of the given preference or null if there is no preference with the given key.
public Context	<i>getContext()</i> on page 977	Returns the context.
public Float	<i>getFloatPreference(String)</i> on page 977	Returns the value of the given preference or null if there is no preference with the given key.
public Integer	<i>getIntPreference(String)</i> on page 977	Returns the value of the given preference or null if there is no preference with the given key.
public Long	<i>getLongPreference(String)</i> on page 978	Returns the value of the given preference or null if there is no preference with the given key.
private< T > T	<i>getPreference(String)</i> on page 978	

Modifier and Type	Method	Description
public String	<i>getStringPreference(String)</i> on page 978	Returns the value of the given preference or null if there is no preference with the given key.
public void	<i>onSharedPreferenceChanged(SharedPreferences, final String)</i> on page 979	
public synchronized void	<i>registerPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 979	You can register a class implementing the <code>IPreferenceChangeListener</code> interface for the change of a preference with the given key.
public void	<i>removePreference(String)</i> on page 979	Removes the preferences with the given key.
public void	<i>resetPreference(String)</i> on page 980	Resets the preference's value to its default value or to null if there is no default value for the given preference.
public void	<i>setBooleanPreference(String, boolean)</i> on page 980	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setFloatPreference(String, float)</i> on page 980	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setIntPreference(String, int)</i> on page 981	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setLongPreference(String, long)</i> on page 981	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setStringPreference(String, String)</i> on page 981	Sets and validates and persists the value of the preferences with the given type.
public synchronized void	<i>unRegisterPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 982	You can unregister a change listener.

### Inherited members from `IPreferences`

Modifier and Type	Member	Description
public static final String	<i>BUSINESSTRANSAC- TION_ENABLED</i> on page 400	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	<i>BYPASS_PROXY</i> on page 400	Preference for the indicator to decide which URLs need the proxy bypassed.
public static final String	<i>CACHE_CAPACITY</i> on page 400	Preference for the maximum number of documents can be stored in cache.
public static final String	<i>CACHE_MAX_SEARCH_RE- SULTS</i> on page 400	Preference for the maximum entries that can be returned as a result of a search.
public static final String	<i>CACHE_PARS- ER_SEARCH_ATTRIBUTE</i> on page 400	Preference for the name of the XML attribute that should be used to decide if a property is searchable.
public static final String	<i>CACHE_SEARCH_ATTRIB- UTE_XMLNS</i> on page 401	Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.
public static final String	<i>CONNECTIVITY_CONNTI- MEOUT</i> on page 401	Preference for connection time out.
public static final String	<i>CONNECTIVITY_HAN- DLER_CLASS_NAME</i> on page 401	Preference for full name (including package) of the class that should be initialized as connectivity handler.
public static final String	<i>CONNECTIVI- TY_HTTP_PORT</i> on page 401	Preference for default HTTP port.
public static final String	<i>CONNECTIVI- TY_HTTPS_PORT</i> on page 401	Preference for default HTTPS port.
public static final String	<i>CONNECTIVI- TY_PROXY_HOST</i> on page 401	Preference for proxy host if there is a proxy should be used.

Modifier and Type	Member	Description
public static final String	<i>CONNECTIVITY_PROXY_PORT</i> on page 401	Preference for proxy port if there is a proxy should be used.
public static final String	<i>CONNECTIVITY_SCONNECTION_TIMEOUT</i> on page 402	Preference for socket connection time out.
public static final String	<i>LOG_LEVEL</i> on page 402	Preference for the current log severity.
public static final String	<i>PARSER_FOLDER_PATH</i> on page 402	Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.
public static final String	<i>PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 402	Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.
public static final String	<i>PERSISTENCE_CIPHER_TRANSFORMATION</i> on page 402	Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.
public static final String	<i>PERSISTENCE_FOLDER_PATH</i> on page 402	Preference for the default folder where data should be persisted.
public static final String	<i>PERSISTENCE_SECURE_MODE</i> on page 403	Preference for indicator if persisted data should be encrypted.
public static final String	<i>SAP_APPLICATION_ID_HEADER_VALUE</i> on page 403	Preference for application ID (used in request headers)
public static final String	<i>SAP_PASSPORT_ENABLED</i> on page 403	Preference for the indicator to decide if SAP passport should be enabled or not.

### Inherited members from Constants

Modifier and Type	Member	Description
public static final boolean	<i>DEFAULT_BUSINESS_TRANSACTION_ENABLED</i> on page 95	SAP Business Transaction XML enablement default setting.
public static final String	<i>DEFAULT_CIPHER_TRANSFORMATION</i> on page 95	Default cipher transformation.
public static final int	<i>DEFAULT_CONNECTION_TIMEOUT</i> on page 95	Default connection timeout.
public static final String	<i>DEFAULT_HANDLER_CLASS_NAME</i> on page 96	Default handler class.
public static final int	<i>DEFAULT_HTTP_PORT</i> on page 96	Default HTTP port.
public static final int	<i>DEFAULT_HTTPS_PORT</i> on page 96	Default HTTPS port.
public static final int	<i>DEFAULT_LOG_LEVEL</i> on page 96	Default log level.
public static final boolean	<i>DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE</i> on page 96	Default security mode.
public static final int	<i>DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 96	Default buffer size.
public static final String	<i>DEFAULT_PROXY_HOST</i> on page 96	Default proxy host.
public static final int	<i>DEFAULT_PROXY_PORT</i> on page 97	Default proxy port.
public static final String	<i>DEFAULT_SAP_APPLICATIONID_HEADER_VALUE</i> on page 97	Default application ID.
public static final boolean	<i>DEFAULT_SAPPASSPORT_ENABLED</i> on page 97	SAP Passport enablement default setting.
public static final int	<i>DEFAULT_SEARCH_LIMIT</i> on page 97	Default for maximum search results retrieved from cache.

Modifier and Type	Member	Description
public static final int	<i>DEFAULT_SOCKET_CONNECTION_TIMEOUT</i> on page 97	Default socket connection timeout.
public static final int	<i>DEFAULT_STORE_CAPACITY</i> on page 97	Default cache capacity.
public static final String	<i>HTTP_HANDLER_CLASS</i> on page 97	Socket Connection handler class.
public static final String	<i>IMO_HANDLER_CLASS</i> on page 98	IMO Connection handler class.
public static final int	<i>MAX_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 98	Maximum buffer size.
public static final int	<i>MAXIMUM_STORE_CAPACITY</i> on page 98	Maximum cache capacity.
public static final int	<i>MIN_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 98	Minimum buffer size.
public static final String	<i>SHARED_PREFERENCES</i> on page 98	Shared preferences.

### *Preferences(Context, ILogger) constructor*

#### *Syntax*

```
public Preferences ( Context context , ILogger logger )
```

### *addDefaultPreferences() method*

Can be used to add application specific default preferences.

#### *Syntax*

```
protected void addDefaultPreferences ( )
```

### *confirmPreference(String) method*

Validates changed preference if it can be changed.

#### *Syntax*

```
protected Object confirmPreference ( String key )
```

### *Parameters*

- **key** – The key of the preferences

### *Returns*

The changed value

### *containsPreference(String) method*

Checks the existence of the given preference.

### *Syntax*

```
public boolean containsPreference ( String key )
```

### *Parameters*

- **key** – The key of the preference

### *Returns*

true if Preference contains the given key or false otherwise

### *getAllPreferences() method*

### *Syntax*

```
public Map< String, ?> getAllPreferences () throws  
PreferencesException
```

### *getBooleanPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

### *Syntax*

```
public Boolean getBooleanPreference ( String key ) throws  
PreferencesException
```

### *Parameters*

- **key** – The key of the preference

### *Returns*

the boolean type preference with the given key

### *Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

*getContext() method*

Returns the context.

*Syntax*

```
public Context getContext ()
```

*getFloatPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Float getFloatPreference (String key) throws  
PreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the float type preference with the given key

*Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

*getIntPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Integer getIntPreference (String key) throws  
PreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the integer type preference with the given key

*Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

### *getLongPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

#### *Syntax*

```
public Long getLongPreference ( String key ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference

#### *Returns*

the long type preference with the given key

#### *Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

### *getPreference(String) method*

#### *Syntax*

```
private< T > T getPreference ( String key )
```

### *getStringPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

#### *Syntax*

```
public String getStringPreference ( String key ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference

#### *Returns*

the String type preference with the given key

#### *Exceptions*

- **PreferencesException class** – if preference exists with the given key but with value of different type

*onSharedPreferenceChanged(SharedPreferences, final String) method***Syntax**

```
public void onSharedPreferenceChanged ( SharedPreferences
sharedPreferences , final String key )
```

*registerPreferenceChangeListener(String, IPreferenceChangeListener) method*

You can register a class implementing the IPreferenceChangeListener interface for the change of a preference with the given key.

**Syntax**

```
public synchronized void registerPreferenceChangeListener
( String key , IPreferenceChangeListener changeListener )
```

**Parameters**

- **key** – key of the preference
- **changeListener** – listener object to be registered

**Exceptions**

- **IllegalArgumentException** – if the argument is null.

**Usage**

If any of the arguments are null, an IllegalArgumentException is thrown.

*removePreference(String) method*

Removes the preferences with the given key.

**Syntax**

```
public void removePreference ( String key ) throws
PreferencesException
```

**Parameters**

- **key** – The key of the preference

**Exceptions**

- **PreferencesException class** – If the preference does not exist or it can not be removed( e.g. an preference )

**Usage**

Also notifies the listeners with null value.

### *resetPreference(String) method*

Resets the preference's value to its default value or to null if there is no default value for the given preference.

#### *Syntax*

```
public void resetPreference ( String key )
```

#### *Parameters*

- **key** – The key of the preference

### *setBooleanPreference(String, boolean) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setBooleanPreference ( String key , boolean value )  
throws PreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

#### *Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

### *setFloatPreference(String, float) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setFloatPreference ( String key , float value ) throws  
PreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

#### *Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*setIntPreference(String, int) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setIntPreference ( String key , int value ) throws
PreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*setLongPreference(String, long) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setLongPreference ( String key , long value ) throws
PreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*setStringPreference(String, String) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setStringPreference ( String key , String value ) throws
PreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

### *Exceptions*

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

*unRegisterPreferenceChangeListener(String, IPreferenceChangeListener) method*

You can unregister a change listener.

### *Syntax*

```
public synchronized void unRegisterPreferenceChangeListener (
String key , IPreferenceChangeListener changeListener )
```

### *Parameters*

- **key** – key of the preference
- **changeListener** – listener object to be unregistered

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *Usage*

If any of the arguments are null, an IllegalArgumentException is thrown.

*DEFAULT\_PARSER\_STRING\_SUBFOLDER\_NAME variable*

Default subfolder for Parser.

### *Syntax*

```
public static String DEFAULT_PARSER_STRING_SUBFOLDER_NAME
```

*DEFAULT\_PERSISTENCE\_STRING\_SUBFOLDER\_NAME variable*

Default subfolder for Persistence.

### *Syntax*

```
public static String
DEFAULT_PERSISTENCE_STRING_SUBFOLDER_NAME
```

*defaultPreferences variable*

Store for default Preferences.

### *Syntax*

```
protected Hashtable< String, Object > defaultPreferences
```

*logger variable**Syntax*

```
protected ILogger logger
```

*logLevel variable**Syntax*

```
protected int logLevel
```

*preferenceChangeListeners variable*

Listeners for Preference changes.

*Syntax*

```
protected Hashtable< String, Set< IPreferenceChangeListener > > preferenceChangeListeners
```

*PREFERENCES variable**Syntax*

```
protected static final String PREFERENCES
```

*PreferencesException class*

PreferencesException is used in Request Library.

*Syntax*

```
public class PreferencesException extends Exception
```

*Members*

All members of PreferencesException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>PreferencesException()</i> on page 984	
public	<i>PreferencesException(String)</i> on page 984	
public	<i>PreferencesException(Throwable)</i> on page 984	
public	<i>PreferencesException(String, Throwable)</i> on page 984	

Modifier and Type	Constructor	Description
public	<i>PreferencesException(int, String, Throwable)</i> on page 984	
public	<i>PreferencesException(int, String)</i> on page 985	

**Methods**

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 985	

*PreferencesException()* constructor*Syntax*

```
public PreferencesException ()
```

*PreferencesException(String)* constructor*Syntax*

```
public PreferencesException ( String detailMessage )
```

*PreferencesException(Throwable)* constructor*Syntax*

```
public PreferencesException ( Throwable throwable )
```

*PreferencesException(String, Throwable)* constructor*Syntax*

```
public PreferencesException ( String detailMessage , Throwable throwable )
```

*PreferencesException(int, String, Throwable)* constructor*Syntax*

```
public PreferencesException ( int iErrorCode , String detailMessage , Throwable throwable )
```

*PreferencesException(int, String) constructor**Syntax*

```
public PreferencesException ( int iErrorCode , String
detailMessage )
```

*getErrorCode() method**Syntax*

```
public int getErrorCode ()
```

*PropertyID class**Syntax*

```
public class PropertyID
```

*Members*

All members of PropertyID, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>TrcLvl_HIGH</i> on page 985	Constant to indicate High Trace level for End to End Tracing.
public static final int	<i>TrcLvl_LOW</i> on page 985	Constant to indicate Low Trace level for End to End Tracing.
public static final int	<i>TrcLvl_MEDIUM</i> on page 986	Constant to indicate Medium Trace level for End to End Tracing.
public static final int	<i>TrcLvl_NONE</i> on page 986	Constant to indicate None Trace level for End to End Tracing.

*TrcLvl\_HIGH variable*

Constant to indicate High Trace level for End to End Tracing.

*Syntax*

```
public static final int TrcLvl_HIGH
```

*TrcLvl\_LOW variable*

Constant to indicate Low Trace level for End to End Tracing.

*Syntax*

```
public static final int TrcLvl_LOW
```

*TrcLvl\_MEDIUM variable*

Constant to indicate Medium Trace level for End to End Tracing.

*Syntax*

```
public static final int TrcLvl_MEDIUM
```

*TrcLvl\_NONE variable*

Constant to indicate None Trace level for End to End Tracing.

*Syntax*

```
public static final int TrcLvl_NONE
```

*PushRequest class*

This class represents the need for receiving push messages.

*Syntax*

```
public class PushRequest extends IRequest
```

*Members*

All members of PushRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
String	<i>blobId</i> on page 993	
boolean	<i>isPersistRequest</i> on page 993	

**Methods**

Modifier and Type	Method	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 988	Disables delta query handling.
public byte[]	<i>getData()</i> on page 989	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 989	Returns the request headers set.
public INetListener	<i>getListener()</i> on page 989	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

Modifier and Type	Method	Description
public int	<i>getPriority()</i> on page 990	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 990	Retrieves the request method type.
public String	<i>getRequestUrl()</i> on page 991	Returns the URL where the request must be invoked.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 991	internal
public void	<i>setData(byte[])</i> on page 991	Sets the request data in case of an HTTP POST request.
public void	<i>setHeaders(Map&lt;String, String&gt;)</i> on page 992	Sets the request headers.
public void	<i>setListener(INetListener)</i> on page 992	
public void	<i>setPriority(int)</i> on page 992	
public void	<i>setRequestMethod(int)</i> on page 992	
public void	<i>setRequestUrl(String)</i> on page 992	
public boolean	<i>useCookies()</i> on page 992	Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

#### Inherited members from IRequest

Modifier and Type	Member	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 411	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 411	etag "if-none-match"
public static final int	<i>ETAG_IF_RANGE</i> on page 411	etag "if-range"

Modifier and Type	Member	Description
public static final int	<i>PRIORITY_HIGH</i> on page 411	High priority.
public static final int	<i>PRIORITY_NORMAL</i> on page 412	Normal priority.
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 412	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 412	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 412	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 412	HTTP PUT method.
public void	<i>setListener(final INetListener)</i> on page 409	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(final int)</i> on page 409	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 410	Sets the type of HTTP request method.
public void	<i>setRequestUrl(final String)</i> on page 410	Sets the URL for the request.

### Usage

Only an `INetListener` property is stored, who will receive the push messages. `AbstractConnectionHandler` implementation should store and use this listener for delivering push messages.

### *disableDeltaHandling(boolean)* method

Disables delta query handling.

### Syntax

```
public void disableDeltaHandling (boolean disable)
```

### Parameters

- **disable** – If set to true it disables delta handling

*Returns*

None

*Usage*

By default delta handling is enabled.

*getData() method*

If the request method is POST, this method is called from the network library.

*Syntax*

```
public byte[] getData ()
```

*Parameters*

- **None** –

*Returns*

the content data of the request.

```
BaseRequest getrequest = new BaseRequest(); byte[] data = getrequest.getData();
```

*Usage*

This method will return with the content to be sent to the server.

*getHeaders() method*

Returns the request headers set.

*Syntax*

```
public Map< String, String > getHeaders ()
```

*Parameters*

- **None** –

*Returns*

the request headers

```
BaseRequest getrequest = new BaseRequest(); Map<String, String> headers =
getrequest.getHeaders();
```

*getListener() method*

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

*Syntax*

```
public INetListener getListener ()
```

### *Parameters*

- **None** –

### *Returns*

the listener or null.

```
class example implements INetListener { .... public void makeGetRequest(...) throws  
Exception { .... BaseRequest getrequest = new BaseRequest();  
getrequest.getListener(); } ... }
```

### *Usage*

Method will return null if there is no registered listener.

### *getPriority() method*

Returns the priority of the request.

### *Syntax*

```
public int getPriority ()
```

### *Parameters*

- **None** –

### *Returns*

The priority of the request. The value is integer.

```
BaseRequest getrequest = new BaseRequest(); int priority = getrequest.getPriority();
```

### *getRequestMethod() method*

Retrieves the request method type.

### *Syntax*

```
public int getRequestMethod ()
```

### *Parameters*

- **None** –

### *Returns*

Type of the HTTP request specified by IRequest.REQUEST\_METHOD\_\* constants.

```
BaseRequest getrequest = new BaseRequest(); int method = getrequest.getRequestMethod();
```

*getRequestUrl() method*

Returns the URL where the request must be invoked.

*Syntax*

```
public String getRequestUrl ()
```

*Parameters*

- **None** –

*Returns*

the URL.

```
BaseRequest getrequest = new BaseRequest(); String url = getrequest. getRequestUrl();
```

*isDeltaHandlingDisabled() method*

internal

*Syntax*

```
public boolean isDeltaHandlingDisabled ()
```

*setData(byte[]) method*

Sets the request data in case of an HTTP POST request.

*Syntax*

```
public void setData (byte[] data )
```

*Parameters*

- **data** – the request data to set.

*Returns*

None

```
BaseRequest getrequest = new BaseRequest(); String postBody= "<atom:entry xmlns:atom=" +
 "\"http://www.w3.org/2005/Atom">" + "<atom:content type=\"application/xml\">" +
 "<m:properties xmlns:m=\"http://schemas.microsoft.com/ado/2007/08/dataservices/" +
 "metadata\" *xmlns:d=\"http://schemas.microsoft.com/ado/2007/08/dataservices\">" +
 "<d:agencynum>09964571</d:agencynum>" + "<d:NAME ></d:NAME>" +
 "<d:STREET />" + "<d:POSTBOX />" + * "<d:POSTCODE />" + "<d:CITY />" +
 "<d:COUNTRY />" + "<d:REGION />" + "<d:TELEPHONE>+9945007007</" +
 "d:TELEPHONE>" + "<d:URL />" + "<d:LANGU />" + "<d:CURRENCY />" +
 "<d:mimeType>text/html</d:mimeType>" + "</m:properties>" + "</atom:content>" + "<" +
 "atom:entry>"; post1.setData(postBody.getBytes());
```

### *setHeaders(Map< String, String >) method*

Sets the request headers.

#### *Syntax*

```
public void setHeaders ( Map< String, String > headers )
```

#### *Parameters*

- **headers** – the request headers to set.

#### *Returns*

None

```
Map<String, String> headers1 = new HashMap<String, String>(); headers1.put("Content-Type", "application/atom+xml"); BaseRequest getrequest = new BaseRequest(); getrequest.setHeaders(headers1);
```

### *setListener(INetListener) method*

#### *Syntax*

```
public void setListener ( INetListener aListener )
```

### *setPriority(int) method*

#### *Syntax*

```
public void setPriority ( int aPriority )
```

### *setRequestMethod(int) method*

#### *Syntax*

```
public void setRequestMethod ( int aRequestMethod )
```

### *setRequestUrl(String) method*

#### *Syntax*

```
public void setRequestUrl ( String aUrl )
```

### *useCookies() method*

Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

#### *Syntax*

```
public boolean useCookies ()
```

*Parameters*

- **None** – Cookies in the network library.

```
BaseRequest getRequest = new BaseRequest(); boolean usecookie = getRequest.useCookies();
```

*Usage*

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the BaseRequest implementation.

*blobId variable**Syntax*

```
String blobId
```

*isPersistRequest variable**Syntax*

```
boolean isPersistRequest
```

*RouteManagerSchema class**Syntax*

```
public class RouteManagerSchema extends IDbSchema
```

*Members*

All members of RouteManagerSchema, including inherited members. **Methods**

Modifier and Type	Method	Description
public byte[]	<i>getBlobCloumn()</i> on page 993	
public void	<i>setBlobCloumn(byte[])</i> on page 993	

*getBlobCloumn() method**Syntax*

```
public byte[] getBlobCloumn ()
```

*setBlobCloumn(byte[]) method**Syntax*

```
public void setBlobCloumn (byte[] blobCloumn)
```

*RequestManager class***Syntax**

```
public class RequestManager extends IRequestManager,
IPreferenceChangeListener
```

**Members**

All members of RequestManager, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>AuthenticationChallengeListener</i> on page 996	The listener to register for authentication failure event.
class	<i>InvalidHandlerClassException</i> on page 997	
public class	<i>MutualSSLChallengeListener</i> on page 998	Listener to set call back so that application can accept or reject the client certificate.
public class	<i>SSLChallengeListener</i> on page 998	Listener to set call back so that application can accept or reject the server certificate.

**Variables**

Modifier and Type	Variable	Description
public static AuthenticationChallengeListener	<i>authenticationListener</i> on page 1003	
protected boolean	<i>isPerformanceLoggingEnabled</i> on page 1003	
public static final int	<i>MAX_THREADS</i> on page 1003	
protected Vector< IRequest >	<i>mHQueue</i> on page 1003	
protected static ILogger	<i>mLogger</i> on page 1003	
protected IConnectionHandler[]	<i>mMainHandler</i> on page 1003	
protected String	<i>mMainHandlerClassName</i> on page 1004	

Modifier and Type	Variable	Description
protected Vector< IRequest >	<i>modifyingRequestQueue</i> on page 1004	
protected boolean	<i>mPassportEnabled</i> on page 1004	
protected Vector< Object >	<i>mQueue</i> on page 1004	
MutualSSLChallengeListener	<i>msslListener</i> on page 1004	
PerformanceAgent	<i>pa</i> on page 1004	
int	<i>prevThreadSelected</i> on page 1004	
SSLChallengeListener	<i>sslListener</i> on page 1004	
protected SuccessThread	<i>successNotifier</i> on page 1005	Success notification worker instance.
protected static final String	<i>TAG</i> on page 1005	

### Constructors

Modifier and Type	Constructor	Description
public	<i>RequestManager(ILogger, IPreferences, IConnectivityParameters, int)</i> on page 999	Instantiates the RequestManager class.

### Methods

Modifier and Type	Method	Description
public void	<i>clearPendingRequests(ILogger, Context)</i> on page 999	Clears all the persisted requests from database.
public void	<i>enablePerformanceLogging()</i> on page 1000	Enables performance logging for Core Services.
public IConnectivityParameters	<i>getConnectivityParameters()</i> on page 1000	Returns the ConnectivityParameters object containing the settings used by the Request library.
public ILogger	<i>getLogger()</i> on page 1000	

Modifier and Type	Method	Description
public boolean	<i>isPerformanceLoggingEnabled()</i> on page 1001	Returns whether the Performance Logging is enabled or not.
public void	<i>makeRequest(final IRequest)</i> on page 1001	Puts a request object into the RequestManager object.
public void	<i>makeRequest(final IBundleRequest)</i> on page 1001	Puts a bundle request object into the RequestManager object.
public static void	<i>setAuthenticationChallengeListener(IAuthenticationChallengeListener)</i> on page 1002	Sets the authentication challenge listener so that application is notified upon authentication failure.
public void	<i>setListener(INetListener)</i> on page 1002	Sets the listener for receiving success/failure call backs upon invoking a request.
public void	<i>setMutualSSLChallengeListener(IMutualSSLChallengeListener)</i> on page 1002	Sets the call back for the application to accept or reject the client certificate.
public void	<i>setSSLChallengeListener(ISSLChallengeListener)</i> on page 1003	Error notification worker.

### *RequestManager.AuthenticationChallengeListener* class

The listener to register for authentication failure event.

### Syntax

```
public class AuthenticationChallengeListener extends
IAAuthenticationChallengeListener
```

### Members

All members of AuthenticationChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public ICredential	<i>OnAuthenticationFailed(AuthenticationSchema, HttpResponse)</i> on page 997	

*OnAuthenticationFailed(AuthenticationSchema, HttpResponseMessage) method***Syntax**

```
public ICredential OnAuthenticationFailed
( AuthenticationSchema authScheme , HttpResponseMessage response )
```

*RequestManager.InvalidHandlerClassException class***Syntax**

```
class InvalidHandlerClassException extends Exception
```

**Members**

All members of InvalidHandlerClassException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>InvalidHandlerClassException()</i> on page 997	
public	<i>InvalidHandlerClassException(String)</i> on page 997	
public	<i>InvalidHandlerClassException(Throwable)</i> on page 997	
public	<i>InvalidHandlerClassException(String, Throwable)</i> on page 998	

*InvalidHandlerClassException() constructor***Syntax**

```
public InvalidHandlerClassException ( )
```

*InvalidHandlerClassException(String) constructor***Syntax**

```
public InvalidHandlerClassException ( String message )
```

*InvalidHandlerClassException(Throwable) constructor***Syntax**

```
public InvalidHandlerClassException ( Throwable exception )
```

*InvalidHandlerClassException(String, Throwable) constructor***Syntax**

```
public InvalidHandlerClassException (String message , Throwable
exception )
```

*RequestManager.MutualSSLChallengeListener class*

Listener to set call back so that application can accept or reject the client certificate.

**Syntax**

```
public class MutualSSLChallengeListener extends
com.sap.mobile.lib.request.HttpsTrustManager.ClientCertListe
ner
```

**Members**

All members of MutualSSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public HttpClientCertInfo	<i>getClientCertificate(String)</i> on page 998	

*getClientCertificate(String) method***Syntax**

```
public HttpClientCertInfo getClientCertificate (String
certAlias )
```

**Parameters**

- **certificate** – alias name for client certificate the client certificate for the alias name passed as parameter

*RequestManager.SSLChallengeListener class*

Listener to set call back so that application can accept or reject the server certificate.

**Syntax**

```
public class SSLChallengeListener extends
com.sap.mobile.lib.request.HttpsTrustManager.TrustManagerLis
tener
```

**Members**

All members of SSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>checkServerTrusted(X509Certificate[])</i> on page 999	Call back for the application to accept or reject the server certificate.

*checkServerTrusted(X509Certificate[]) method*

Call back for the application to accept or reject the server certificate.

*Syntax*

```
public boolean checkServerTrusted ( X509Certificate[]
paramArrayOfX509Certificate )
```

*Parameters*

- **paramArrayOfX509Certificate** – server certificates

*Returns*

True if the server is trusted, false otherwise

*RequestManager(ILogger, IPreferences, IConnectivityParameters, int) constructor*

Instantiates the RequestManager class.

*Syntax*

```
public RequestManager ( Ilogger aLogger , IPreferences aPreferences ,
IConnectivityParameters aParameters , int aThreads )
```

*Parameters*

- **aLogger** – com.sap.mobile.lib.supportability.ILogger implementation.
- **aPreferences** – com.sap.mobile.lib.configuration.IPreferences implementation.
- **aParameters** – com.sap.mobile.lib.request.IConnectivityParameters implementation.
- **aThreads** – the number of parallel threads.

*clearPendingRequests(ILogger, Context) method*

Clears all the persisted requests from database.

*Syntax*

```
public void clearPendingRequests ( ILogger logger , Context
context )
```

*Parameters*

- **logger** – Logger instance.

- **context** – Application context.

### *Returns*

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);  
reqMan.clearPendingRequests(logger, context);
```

### *enablePerformanceLogging() method*

Enables performance logging for Core Services.

### *Syntax*

```
public void enablePerformanceLogging ()
```

### *Parameters*

- **None** –

### *Returns*

None

### *getConnectivityParameters() method*

Returns the ConnectivityParameters object containing the settings used by the Request library.

### *Syntax*

```
public IConnectivityParameters getConnectivityParameters ()
```

### *Parameters*

- **None.** –

### *Returns*

IConnectivityParameters Object containing the settings used by the Request library.

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);  
IConnectivityParameters params = reqMan.getConnectivityParameters();
```

### *getLogger() method*

### *Syntax*

```
public ILogger getLogger ()
```

*isPerformanceLoggingEnabled()* method

Returns whether the Performance Logging is enabled or not.

*Syntax*

```
public boolean isPerformanceLoggingEnabled ()
```

*Parameters*

- **None** –

*Returns*

boolean - True/False

*makeRequest(final IRequest) method*

Puts a request object into the RequestManager object.

*Syntax*

```
public void makeRequest ( final IRequest aRequest )
```

*Parameters*

- **aRequest** – The request.

*Returns*

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BaseRequest
request = new BaseRequest(); reqMan.makeRequest(request);
```

*makeRequest(final IBundleRequest) method*

Puts a bundle request object into the RequestManager object.

*Syntax*

```
public void makeRequest ( final IBundleRequest aBundleRequest )
```

*Parameters*

- **aBundleRequest** – The request object.

*Returns*

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BundleRequest
request = new BundleRequest(); reqMan.makeRequest(request);
```

### *setAuthenticationChallengeListener(IAuthenticationChallengeListener) method*

Sets the authentication challenge listener so that application is notified upon authentication failure.

#### *Syntax*

```
public static void setAuthenticationChallengeListener  
( IAuthenticationChallengeListener olistener )
```

#### *Parameters*

- **olistener** – The listener to be registered

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);  
reqMan.setAuthenticationChallengeListener(olistener);
```

### *setListener(INetListener) method*

Sets the listener for receiving success/failure call backs upon invoking a request.

#### *Syntax*

```
public void setListener ( INetListener listener )
```

#### *Parameters*

- **listener** – The listener to be set for call backs upon invoking a request.

#### *Returns*

None

```
Class INetListenerImpl implements INetListener { public void onError(IRequest arg0,  
IResponse arg1, IRequestStateElement arg2) { }
```

```
public void onSuccess(IRequest arg0, IResponse arg1) { } } INetListenerImpl listener = new  
INetListenerImpl(); RequestManager reqMan = new RequestManager(logger, pref, param,  
1); reqMan.setListener(listener);
```

### *setMutualSSLChallengeListener(IMutualSSLChallengeListener) method*

Sets the call back for the application to accept or reject the client certificate.

#### *Syntax*

```
public void setMutualSSLChallengeListener  
( IMutualSSLChallengeListener olistener )
```

#### *Parameters*

- **olistener** – The listener to register

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
reqMan.setMutualSSLChallengeListener(olistener);
```

### *setSSLChallengeListener(ISSLChallengeListener) method*

Error notification worker.

#### *Syntax*

```
public void setSSLChallengeListener ( ISSLChallengeListener
olistener )
```

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
reqMan.setSSLChallengeListener(olistener);
```

### *authenticationListener variable*

#### *Syntax*

```
public static AuthenticationChallengeListener
authenticationListener
```

### *isPerformanceLoggingEnabled variable*

#### *Syntax*

```
protected boolean isPerformanceLoggingEnabled
```

### *MAX\_THREADS variable*

#### *Syntax*

```
public static final int MAX_THREADS
```

### *mHQueue variable*

#### *Syntax*

```
protected Vector< IRequest > mHQueue
```

### *mLogger variable*

#### *Syntax*

```
protected static ILogger mLogger
```

### *mMainHandler variable*

#### *Syntax*

```
protected IConnectionHandler[] mMainHandler
```

### *mMainHandlerClassName variable*

#### *Syntax*

```
protected String mMainHandlerClassName
```

### *modifyingRequestQueue variable*

#### *Syntax*

```
protected Vector< IRequest > modifyingRequestQueue
```

### *mPassportEnabled variable*

#### *Syntax*

```
protected boolean mPassportEnabled
```

### *mQueue variable*

#### *Syntax*

```
protected Vector< Object > mQueue
```

### *msslListener variable*

#### *Syntax*

```
MutualSSLChallengeListener msslListener
```

### *pa variable*

#### *Syntax*

```
PerformanceAgent pa
```

### *prevThreadSelected variable*

#### *Syntax*

```
int prevThreadSelected
```

### *sslListener variable*

#### *Syntax*

```
SSLChallengeListener sslListener
```

*successNotifier* variable

Success notification worker instance.

*Syntax*

```
protected SuccessThread successNotifier
```

*TAG* variable*Syntax*

```
protected static final String TAG
```

*RequestStateElement* class*Syntax*

```
public class RequestStateElement extends IRequestStateElement
```

*Members*

All members of RequestStateElement, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected int	<i>mErrorCode</i> on page 1011	Stores the error type.
protected Exception	<i>mException</i> on page 1011	Stores the exception if available.
protected int	<i>mHttpStatus</i> on page 1011	Stores the HTTP status if available.
protected HttpResponse	<i>mResponse</i> on page 1011	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>RequestStateElement()</i> on page 1007	
public	<i>RequestStateElement(final int)</i> on page 1007	
public	<i>RequestStateElement(final int, HttpResponse)</i> on page 1007	
public	<i>RequestStateElement(final int, HttpResponse, Exception)</i> on page 1007	

Modifier and Type	Constructor	Description
public	<i>RequestStateElement</i> (final int, final int) on page 1007	
public	<i>RequestStateElement</i> (final int, final int, final Exception) on page 1008	
public	<i>RequestStateElement</i> (final int, final Exception) on page 1008	

### Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode</i> () on page 1008	Returns the error code.
public Exception	<i>getException</i> () on page 1008	Returns the exception if it is set.
public HttpResponse	<i>getHttpResponse</i> () on page 1009	Returns the HttpResponse.
public int	<i>getHttpStatusCode</i> () on page 1009	Returns the HTTP status if it is set.
public void	<i>setErrorCode</i> (final int) on page 1009	Sets the error code.
public void	<i>setException</i> (final Exception) on page 1010	Sets the exception.
public void	<i>setHttpResponse</i> (HttpResponse) on page 1010	Sets the HttpResponse.
public void	<i>setHttpStatusCode</i> (int) on page 1010	

### Inherited members from IRequestStateElement

Modifier and Type	Member	Description
public static final int	<i>AUTHENTICATION_ERROR</i> on page 419	Authentication error.
public static final int	<i>CLIENT_ERROR</i> on page 420	Client error.
public static final int	<i>HTTP_ERROR</i> on page 420	Server response status > 302.

Modifier and Type	Member	Description
public static final int	<i>NETWORK_ERROR</i> on page 420	There was a network error during a read/write to/from stream.
public static final int	<i>NO_ERROR</i> on page 420	
public static final int	<i>PARSE_ERROR</i> on page 420	Problem with parsing the response xml.
public static final int	<i>REQUEST_ERROR</i> on page 420	Problem with parsing the request.
public abstract void	<i>setHttpStatusCode</i> (final int) on page 419	Sets the HTTP status.

### *RequestStateElement()* constructor

#### *Syntax*

```
public RequestStateElement ()
```

### *RequestStateElement(final int)* constructor

#### *Syntax*

```
public RequestStateElement ( final int errorCode )
```

### *RequestStateElement(final int, HttpResponse)* constructor

#### *Syntax*

```
public RequestStateElement ( final int errorCode , HttpResponse response )
```

### *RequestStateElement(final int, HttpResponse, Exception)* constructor

#### *Syntax*

```
public RequestStateElement ( final int errorCode , HttpResponse response , Exception exception )
```

### *RequestStateElement(final int, final int)* constructor

#### *Syntax*

```
public RequestStateElement ( final int errorCode , final int httpStatus )
```

*RequestStateElement(final int, final int, final Exception) constructor*

*Syntax*

```
public RequestStateElement ( final int errorCode , final int HttpStatus , final Exception exception )
```

*RequestStateElement(final int, final Exception) constructor*

*Syntax*

```
public RequestStateElement ( final int errorCode , final Exception exception )
```

*getErrorCode() method*

Returns the error code.

*Syntax*

```
public int getErrorCode ()
```

*Parameters*

- **None** –

*Returns*

error code

```
RequestStateElement element; element.getErrorCode();
```

*Usage*

The error code can be any of the following:

- HTTP\_ERROR
- PARSE\_ERROR
- NETWORK\_ERROR
- AUTHENTICATION\_ERROR

*getException() method*

Returns the exception if it is set.

*Syntax*

```
public Exception getException ()
```

*Parameters*

- **None** –

**Returns**

The exception stored in RequestStateElement.

```
RequestStateElement element; element.getException();
```

**getHttpResponse() method**

Returns the HttpResponse.

**Syntax**

```
public HttpResponse getHttpResponse ()
```

**Parameters**

- **None** –

**Returns**

The HttpResponse

```
RequestStateElement element; element.getHttpResponse();
```

**getHttpStatusCode() method**

Returns the HTTP status if it is set.

**Syntax**

```
public int getHttpStatusCode ()
```

**Parameters**

- **None** –

**Returns**

The HTTP status code, if available.

```
RequestStateElement element; int code =element.getHttpStatusCode();
```

**Usage**

If the HTTP status is not set, the default value is -1.

**setErrorCode(final int) method**

Sets the error code.

**Syntax**

```
public void setErrorCode ( final int code )
```

### *Parameters*

- **code** – Error code.

### *Returns*

None

RequestStateElement element; element.setErrorCode(0x06);

### *setException(final Exception) method*

Sets the exception.

### *Syntax*

```
public void setException ( final Exception aException )
```

### *Parameters*

- **aException** – the exception to be set.

### *Returns*

None

RequestStateElement element; element.setException(new Exception());

### *setHttpResponse(HttpResponse) method*

Sets the HttpResponse.

### *Syntax*

```
public void setHttpResponse ( HttpResponse aResponse )
```

### *Parameters*

- **aResponse** – The HttpResponse

### *Returns*

None

RequestStateElement element; HttpResponse httpResponse;  
element.setHttpResponse(httpResponse);

### *setHttpStatusCode(int) method*

### *Syntax*

```
public void setHttpStatusCode ( int httpStatus )
```

***mErrorCode variable***

Stores the error type.

***Syntax***

```
protected int mErrorCode
```

***mException variable***

Stores the exception if available.

***Syntax***

```
protected Exception mException
```

***mHttpStatus variable***

Stores the HTTP status if available.

***Syntax***

```
protected int mHttpStatus
```

***mResponse variable******Syntax***

```
protected HttpResponse mResponse
```

***ResponseImpl class******Syntax***

```
public class ResponseImpl extends BasicHttpResponse,  
IResponse
```

***Members***

All members of ResponseImpl, including inherited members. **Variables**

Modifier and Type	Variable	Description
HashMap< IRequest, HttpResponse >	<i>batchResponseMap</i> on page 1013	
ArrayList< HttpResponse >	<i>batchResponses</i> on page 1013	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>ResponseImpl(BasicStatusLine)</i> on page 1012	

**Methods**

Modifier and Type	Method	Description
protected void	<i>addBatchResponse(IRequest, HttpResponse)</i> on page 1012	
public ArrayList< HttpResponse >	<i>getBatchResponse()</i> on page 1012	Returns the list of responses from batch response.
public HashMap< IRequest, HttpResponse >	<i>getBatchResponseMap()</i> on page 1013	Returns the mapping of requests with corresponding responses within a batch response.
public Map< String, String >	<i>getHeadersMap()</i> on page 1013	Returns all the response headers as a HashMap containing header name and header value.

*ResponseImpl(BasicStatusLine) constructor**Syntax*

```
public ResponseImpl ( BasicStatusLine basicStatusLine )
```

*addBatchResponse(IRequest, HttpResponse) method**Syntax*

```
protected void addBatchResponse ( IRequest requestItem ,  
HttpResponse responseItem )
```

*getBatchResponse() method*

Returns the list of responses from batch response.

*Syntax*

```
public ArrayList< HttpResponse > getBatchResponse ( )
```

*Parameters*

- **None.** –

*Returns*

List of responses.

```
Response res; ArrayList<HttpResponse> res = res.getBatchResponse();
```

### *getBatchResponseMap() method*

Returns the mapping of requests with corresponding responses within a batch response.

#### *Syntax*

```
public HashMap< IRequest, HttpResponse > getBatchResponseMap  
( )
```

#### *Parameters*

- **None.** –

#### *Returns*

Map of requests and responses.

```
Response res; HashMap<IRequest, HttpResponse> res = res.getBatchResponseMap();
```

### *getHeadersMap() method*

Returns all the response headers as a HashMap containing header name and header value.

#### *Syntax*

```
public Map< String, String > getHeadersMap ( )
```

#### *Parameters*

- **None** –

#### *Returns*

Response headers in the form of a hashmap.

```
Response res; Map<String,string> headers = res.getHeadersMap();
```

### *batchResponseMap variable*

#### *Syntax*

```
HashMap< IRequest, HttpResponse > batchResponseMap
```

### *batchResponses variable*

#### *Syntax*

```
ArrayList< HttpResponse > batchResponses
```

### *SMPCClientListeners interface*

#### *Syntax*

```
public interface SMPCClientListeners
```

*Members*

All members of `SMPClientListeners`, including inherited members. **Nested interfaces**

Modifier and Type	Interface	Description
public interface	<i>ISMPCaptchaChallengeListener</i> on page 1014	Interface to get the Captcha Challenge.
public interface	<i>ISMPUserRegistrationListener</i> on page 1015	Interface to get the result of Asynchronous Registration call.

*SMPClientListeners.ISMPCaptchaChallengeListener interface*

Interface to get the Captcha Challenge.

*Syntax*

```
public interface ISMPCaptchaChallengeListener
```

*Members*

All members of `ISMPCaptchaChallengeListener`, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>validateCaptcha(String)</i> on page 1014	Call back method to return the CAPTCHA text for registering the user.

*validateCaptcha(String) method*

Call back method to return the CAPTCHA text for registering the user.

*Syntax*

```
public String validateCaptcha (String image)
```

*Parameters*

- **image** – Base64 encoded Captcha image.

```
public String validateCaptcha(String image){
    //Show the image to the user.
    //Get the Captcha text
    return <captchaText>;
}
```

*SMPCClientListeners.ISMPUserRegistrationListener interface*

Interface to get the result of Asynchronous Registration call.

*Syntax*

```
public interface ISMPUserRegistrationListener
```

*Members*

All members of ISMPUserRegistrationListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onAsyncRegistrationResult(State, ClientConnection, int, String)</i> on page 1016	Call back method upon Asynchronous Registration call.

*SMPCClientListeners.ISMPUserRegistrationListener.State enum*

Enum to represent the status of Asynchronous Registration call.

*Members*

All members of State, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	<i>FAILURE</i> on page 1015	
public	<i>SUCCESS</i> on page 1015	

```
if (ISMPUserRegistrationListener.State.SUCCESS == registrationState) {
    Log.i("SMP", "RegistrationState: Success");
}
```

*FAILURE variable**Syntax*

```
public FAILURE
```

*SUCCESS variable**Syntax*

```
public SUCCESS
```

### *onAsyncRegistrationResult(State, ClientConnection, int, String) method*

Call back method upon Asynchronous Registration call.

#### *Syntax*

```
public void onAsyncRegistrationResult ( State registrationState ,  
ClientConnection clientConnection , int errorCode , String errorMsg )
```

```
        Try{  
            UserManager userManager = new  
UserManager(clientConnection);  
            userManager.setUserRegistrationListener(this);  
            userManager.registerUser(false); //for  
Asynchronous registration  
        }  
        Catch(SMPEException e){  
        }  
  
        public void onAsyncRegistrationResult(State  
registrationState,ClientConnection conn, int errCode, String errMsg)  
{  
    TODO Auto-generated method stub  
        if(registrationState == State.SUCCESS)  
        {  
            Log.i("Registration State  
Success",conn.getServerHost()+conn.getApplicationID()  
+conn.getDomain()+conn.getRequestManager().toString());  
        }  
        if(registrationState == State.FAILURE)  
        {  
            Log.i("Registration State Failure",errCode+errMsg  
+conn.getServerHost());  
        }  
    }  
}
```

#### *Usage*

@param registrationState represents the status of the Asynchronous Registration call.

@param clientConnection ClientConnection object to uniquely identify the Asynchronous Registration call. @param errorCode Error Code in case of registrationState being 'FAILURE'. @param errorMsg Error Message in case of registrationState being 'FAILURE'.

#### *SMPEException class*

This Class represents the exception thrown by the SMP REST library.

#### *Syntax*

```
public class SMPEException extends Exception
```

*Members*All members of SMPEXception, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final int	<i>ANY_INPUT_FIELD_NULL</i> on page 1020	Any of the input fields passed is null.
public static final int	<i>APPLICATION_ID_NULL</i> on page 1020	Application is not initialized.
public static final int	<i>APPLICATION_USER_ALREADY_REGISTERED</i> on page 1020	Attempt to register an application user which is already registered.
public static final int	<i>APPLICATION_USER_NOT_REGISTERED</i> on page 1020	Attempt to delete the user which has not been registered.
public static final int	<i>AUTHENTICATION_ERROR</i> on page 1020	Error while authenticating user.
public static final int	<i>BTX_UPLOAD_ERROR</i> on page 1020	E2E BTX upload error.
public static final int	<i>CAPTCHA_LISTENER_NULL</i> on page 1020	Captcha listener is null.
public static final int	<i>CLASS_INITIALIZATION_FAILED</i> on page 1021	Class initialization failed.
public static final int	<i>E2E_NOT_STARTED</i> on page 1021	E2E Not started.
public static final int	<i>EMPTY_RESPONSE_FROM_SERVER</i> on page 1021	Empty response string received from server.
public static final int	<i>HTTP_ERROR</i> on page 1021	HTTP error.
public static final int	<i>INVALID_MODULE_ID</i> on page 1021	Invalid module handle ID.
public static final int	<i>JSON_PARSING_FAILED</i> on page 1021	Internal error, JSON parsing has failed.
public static final int	<i>NETWORK_ERROR</i> on page 1021	Network error: Obtained when the URL is unreachable.

Modifier and Type	Variable	Description
public static final int	<i>PARSE_ERROR</i> on page 1022	Parse error.
public static final int	<i>REGISTRATION_FAILED_UNKNOWN_ERROR</i> on page 1022	User registration timed out.
public static final int	<i>REGISTRATION_LISTENER_NULL</i> on page 1022	Asynchronous user registration listener not registered with UserManager.
public static final int	<i>SINGLETON_INITIALIZATION_FAILED</i> on page 1022	singleton Initialization failed
public static final int	<i>SUP_INTERNAL_PARSING_ERROR</i> on page 1022	SUP Internal Parsing Error.
public static final int	<i>UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS</i> on page 1022	Update Settings consists of one or more read only fields.

### Constructors

Modifier and Type	Constructor	Description
public	<i>SMPEException(int)</i> on page 1019	Constructs a SMPEException with specified error code.
public	<i>SMPEException(String)</i> on page 1019	Constructs a SMPEException with specified error message.
public	<i>SMPEException(int, String)</i> on page 1019	Constructs a SMPEException with specified error code and error message.

### Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 1019	Returns the error code of this SMPEException.
public String	<i>toString()</i> on page 1019	Returns the complete error description of this SMPEException.

*SMPEXception(int) constructor*

Constructs a SMPEXception with specified error code.

*Syntax*

```
public SMPEXception ( int errorCode )
```

*Parameters*

- **errorCode** –

*SMPEXception(String) constructor*

Constructs a SMPEXception with specified error message.

*Syntax*

```
public SMPEXception ( String message )
```

*Parameters*

- **message** – - error message

*SMPEXception(int, String) constructor*

Constructs a SMPEXception with specified error code and error message.

*Syntax*

```
public SMPEXception ( int errorCode , String message )
```

*Parameters*

- **errorCode** –
- **message** – - error message

*getErrorCode() method*

Returns the error code of this SMPEXception.

*Syntax*

```
public int getErrorCode ()
```

*toString() method*

Returns the complete error description of this SMPEXception.

*Syntax*

```
public String toString ()
```

### *ANY\_INPUT\_FIELD\_NULL variable*

Any of the input fields passed is null.

#### *Syntax*

```
public static final int ANY_INPUT_FIELD_NULL
```

### *APPLICATION\_ID\_NULL variable*

Application is not initialized.

#### *Syntax*

```
public static final int APPLICATION_ID_NULL
```

### *APPLICATION\_USER\_ALREADY\_REGISTERED variable*

Attempt to register an application user which is already registered.

#### *Syntax*

```
public static final int APPLICATION_USER_ALREADY_REGISTERED
```

### *APPLICATION\_USER\_NOT\_REGISTERED variable*

Attempt to delete the user which has not been registered.

#### *Syntax*

```
public static final int APPLICATION_USER_NOT_REGISTERED
```

### *AUTHENTICATION\_ERROR variable*

Error while authenticating user.

#### *Syntax*

```
public static final int AUTHENTICATION_ERROR
```

### *BTX\_UPLOAD\_ERROR variable*

E2E BTX upload error.

#### *Syntax*

```
public static final int BTX_UPLOAD_ERROR
```

### *CAPTCHA\_LISTENER\_NULL variable*

Captcha listener is null.

#### *Syntax*

```
public static final int CAPTCHA_LISTENER_NULL
```

***CLASS\_INITIALIZATION\_FAILED variable***

Class initialization failed.

***Syntax***

```
public static final int CLASS_INITIALIZATION_FAILED
```

***E2E\_NOT\_STARTED variable***

E2E Not started.

***Syntax***

```
public static final int E2E_NOT_STARTED
```

***EMPTY\_RESPONSE\_FROM\_SERVER variable***

Empty response string received from server.

***Syntax***

```
public static final int EMPTY_RESPONSE_FROM_SERVER
```

***HTTP\_ERROR variable***

HTTP error.

***Syntax***

```
public static final int HTTP_ERROR
```

***INVALID\_MODULE\_ID variable***

Invalid module handle ID.

***Syntax***

```
public static final int INVALID_MODULE_ID
```

***JSON\_PARSING\_FAILED variable***

Internal error, JSON parsing has failed.

***Syntax***

```
public static final int JSON_PARSING_FAILED
```

***NETWORK\_ERROR variable***

Network error: Obtained when the URL is unreachable.

***Syntax***

```
public static final int NETWORK_ERROR
```

### *Usage*

Check AndroidManifest.xml if it has proper permissions.

### *PARSE\_ERROR variable*

Parse error.

### *Syntax*

```
public static final int PARSE_ERROR
```

### *REGISTRATION\_FAILED\_UNKNOWN\_ERROR variable*

User registration timed out.

### *Syntax*

```
public static final int REGISTRATION_FAILED_UNKNOWN_ERROR
```

### *REGISTRATION\_LISTENER\_NULL variable*

Asynchronous user registration listener not registered with UserManager.

### *Syntax*

```
public static final int REGISTRATION_LISTENER_NULL
```

### *SINGLETON\_INITIALIZATION\_FAILED variable*

singleton Initialization failed

### *Syntax*

```
public static final int SINGLETON_INITIALIZATION_FAILED
```

### *SUP\_INTERNAL\_PARSING\_ERROR variable*

SUP Internal Parsing Error.

### *Syntax*

```
public static final int SUP_INTERNAL_PARSING_ERROR
```

### *UPDATE\_SETTINGS\_CONTAINS\_READONLY\_FIELDS variable*

Update Settings consists of one or more read only fields.

### *Syntax*

```
public static final int  
UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS
```

*UserManager* class**Syntax**

```
public class UserManager extends ISDMNetListener,
INetListener
```

**Members**

All members of *UserManager*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>UserManager(ClientConnection)</i> on page 1024	Initialize the <i>UserManager</i> .

**Methods**

Modifier and Type	Method	Description
public void	<i>deleteUser()</i> on page 1024	Delete the current user from the SMP server.
public String	<i>getApplicationConnectionId()</i> on page 1024	Return the application connection ID obtained from the server after successful registration.
public boolean	<i>isUserRegistered()</i> on page 1024	Deprecated. This API has been deprecated as application developer can determine with the Application Connection Id to know whether user is registered or not.
public boolean	<i>registerUser(boolean)</i> on page 1025	Register the user with SAP Mobile Server.
public boolean	<i>registerUser(String, boolean)</i> on page 1026	Register the user with the SAP Mobile Server.
public void	<i>setCaptchaChallengeListener(ISMPCaptchaChallengeListener)</i> on page 1026	Set the CAPTCHA challenge listener in case of CAPTCHA enabled by the SAP Mobile Server.
public void	<i>setUserRegistrationListener(ISMPUserRegistrationListener)</i> on page 1027	Set the registration listener for asynchronous registration.

### *UserManager(ClientConnection) constructor*

Initialize the UserManager.

#### *Syntax*

```
public  UserManager ( ClientConnection clientCon )
```

#### *Parameters*

- **clientCon** – ClientConnection

```
UserManager userManager = new UserManager(clientConnection)
```

### *deleteUser() method*

Delete the current user from the SMP server.

#### *Syntax*

```
public void deleteUser () throws SMPException
```

#### *Exceptions*

- **SMPException class** –

```
UserManager userManager = new UserManager(clientConnection);  
userManager.deleteUser();
```

### *getApplicationConnectionId() method*

Return the application connection ID obtained from the server after successful registration.

#### *Syntax*

```
public String getApplicationConnectionId () throws SMPException
```

```
UserManager userManager = new UserManager(clientConnection);  
userManager.getApplicationConnectionId();
```

### *isUserRegistered() method [deprecated]*

Deprecated. This API has been deprecated as application developer can determine with the Application Connection Id to know whether user is registered or not.

#### *Syntax*

```
public boolean isUserRegistered ()
```

#### *Usage*

Deprecated This API has been deprecated as application developer can determine with the Application Connection Id to know whether user is registered or not.

***registerUser(boolean) method***

Register the user with SAP Mobile Server.

***Syntax***

```
public boolean registerUser (boolean isSynchronous ) throws
SMPEException
```

***Parameters***

- **isSynchronous** – Specifies whether it is synchronous or asynchronous registration.

***Exceptions***

- **SMPEException class** –

```
Try{
  UserManager userManager = new UserManager(clientConnection);
  userManager.registerUser(true);           //for synchronous
  registration
}
Catch(SMPEException e){
}

Try{
  UserManager userManager = new UserManager(clientConnection);
  userManager.setUserRegistrationListener(this);
  userManager.registerUser(false);         //for Asynchronous
  registration
}
Catch(SMPEException e){
}

    public void onAsyncRegistrationResult(State
registrationState,ClientConnection conn, int errCode, String errMsg)
{
    // TODO Auto-generated method stub
    if(registrationState == State.SUCCESS)
    {
        Log.i("RegistrationState Success",conn.getServerHost()
+conn.getApplicationID()+conn.getDomain()
+conn.getRequestManager().toString());

    }
    if(registrationState == State.FAILURE)
    {
        Log.i("Registration State Failure",errCode+errMsg
+conn.getServerHost());
    }
}
```

```
    }  
}
```

### *Usage*

It requires to send username and password as a part of request manager during client connection initialization. If asynchronous, the user has to implement and register `IODPUserRegistrationListener` to retrieve a callback.

### *registerUser(String, boolean) method*

Register the user with the SAP Mobile Server.

### *Syntax*

```
public boolean registerUser (String captcha , boolean isSynchronous )  
throws SMPException
```

### *Parameters*

- **isSynchronous** – Specifies whether it is synchronous or asynchronous registration.
- **captcha** – The CAPTCHA text obtained in the first registration call.

### *Exceptions*

- **SMPException class** –

```
Try{  
    UserManager userManager = new UserManager(clientConnection);  
    UserManager.registerUser (<captcha text>,true);  
}  
Catch (SMPException e){  
}
```

### *Usage*

It requires to send username and password as a part of request manager during client connection initialization. CAPTCHA text should be passed to the user during the first registration by the CAPTCHA challenge listener callback. If asynchronous, the user has to implement and register `IODPUserRegistrationListener` to retrieve a callback.

### *setCaptchaChallengeListener(ISMPCaptchaChallengeListener) method*

Set the CAPTCHA challenge listener in case of CAPTCHA enabled by the SAP Mobile Server.

### *Syntax*

```
public void setCaptchaChallengeListener  
( ISMPCaptchaChallengeListener captchaListener )
```

### Parameters

- **captchaListener** – SMP CAPTCHA challenge listener to be registered to retrieve a callback.

```
UserManager userManager = new UserManager(clientConnection);
userManager.setCaptchaChallengeListener(<ISMPCaptchaChallengeListener
Object>);
```

### Usage

User has to implement the `IODPCaptchaChallengeListener` and set it using the above listener to get the captcha callback. The callback method `validateCaptcha` has to return the CAPTCHA text for registering the user. Alternately, it can also return null in which case, the captcha text has to be stored by the application and a subsequent `registerUser(captchaText, isSynchronous)` has to be explicitly called.

### *setUserRegistrationListener(ISMPUserRegistrationListener) method*

Set the registration listener for asynchronous registration.

### Syntax

```
public void setUserRegistrationListener
( ISMPUserRegistrationListener registrationListener )
```

### Parameters

- **registrationListener** – SMP user registration listener.

```
UserManager userManager = new UserManager(clientConnection);
userManager.setUserRegistrationListener(<ISMPUserRegistrationListener
Object>);
```

### Usage

User has to implement the `ISMPUserRegistrationListener` and set it using the above listener to get the registration callback.

### Deprecated API List

The following pages are deprecated in this version of the API.

### Deprecated Interfaces

- *ClientCertListener* on page 1046
- *TrustManagerListener* on page 1048
- *ISDMBundleRequest* on page 1048
- *ISDMCache* on page 1050
- *ISDMCacheLoadListener* on page 1061
- *ISDMConnectionHandler* on page 1062

- *ISDMConnectivityParameters* on page 1066
- *ISDMEntrySearch* on page 1070
- *ISDMLocalSchema* on page 1071
- *ISDMLogger* on page 1072
- *ISDMNetListener* on page 1090

### Deprecated Enumerations

- *ConnectionProtocolEnum* on page 1042

### AbstractConnectionHandler class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.AbstractConnectionHandler`

### Syntax

```
public abstract class AbstractConnectionHandler extends  
Thread, ISDMConnectionHandler
```

*Derived classes*

- *SocketConnectionHandler* on page 2039

*Members*

All members of *AbstractConnectionHandler*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected int	<i>codeArray</i> on page 1035	
protected static final int	<i>MAX_TIMEOUT_COUNT</i> on page 1036	
protected boolean	<i>mCleanupRequestsOnError</i> on page 1036	
protected boolean	<i>mError</i> on page 1036	
protected ISDMLogger	<i>mLogger</i> on page 1036	
protected ISDMPreferences	<i>mPreferences</i> on page 1036	
protected ISDMRequest	<i>mRequest</i> on page 1036	
protected ISDMRequestManager	<i>mRequestManager</i> on page 1036	
protected boolean	<i>mStop</i> on page 1036	
protected TrustManager[]	<i>mTrustManagers</i> on page 1037	
protected boolean	<i>mUpdateListener</i> on page 1037	
protected ISDMConnectivityParameters	<i>params</i> on page 1037	
protected static final String	<i>TAG</i> on page 1037	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>AbstractConnectionHandler</i> ( <i>final ISDMRequestManager</i> , <i>final ISDMLogger</i> , <i>final ISDMPreferences</i> ) on page 1033	The default constructor.

**Methods**

Modifier and Type	Method	Description
protected String	<i>addBackendLanguageToUrl(String)</i> on page 1033	Adds backend language URL parameter to the parameter.
protected String	<i>getBasicAuthHeader()</i> on page 1033	Calculates the http basic authentication header value.
protected String	<i>getHost(String)</i> on page 1034	Extracts the host part from URL string.
protected static String	<i>getIMEI()</i> on page 1034	
public static String	<i>getRequestTypeById(int)</i> on page 1034	
public boolean	<i>isSuccessful()</i> on page 1034	Do we have error?
public abstract int	<i>makeHttpRequest()</i> on page 1035	Make the request.
public void	<i>processRequestsFromQueue()</i> on page 1035	Pick a request/bundle from the queue and process it/them.
protected String	<i>processUrl(String)</i> on page 1035	
public void	<i>setCleanupRequestsOnError(boolean)</i> on page 1035	Sets whether the thread should clean up the request queue in case of errors.
public void	<i>terminate()</i> on page 1035	Close the thread.

#### Inherited members from ISDMConnectionHandler

Modifier and Type	Member	Description
public static final int	<i>AUTHENTICATION_ERROR</i> on page 1065	
public static final int	<i>BAD_COVERAGE</i> on page 1065	
public static final String	<i>CRLF</i> on page 1065	
public static final int	<i>ERROR</i> on page 1065	
public static final int	<i>FAILED_LOGIN</i> on page 1065	

Modifier and Type	Member	Description
public static final int	<i>FAILED_LOGOUT</i> on page 1065	
public static final int	<i>FAILURE</i> on page 1065	
public static final int	<i>LOG</i> on page 1066	
public static final int	<i>NO_ERROR</i> on page 1066	
public static final int	<i>RETRY</i> on page 1066	
public static final int	<i>SUCCESS</i> on page 1066	
public static final int	<i>TIMEOUT</i> on page 1066	

*AbstractConnectionHandler*(final *ISDMRequestManager*, final *ISDMLogger*, final *ISDMPreferences*) constructor

The default constructor.

#### Syntax

```
public AbstractConnectionHandler ( final ISDMRequestManager
requestManager , final ISDMLogger logger , final ISDMPreferences
preferences )
```

#### Parameters

- **requestManager** – the *ISDMRequestManager* instance
- **logger** – the *ISDMLogger* implementation
- **preferences** – the *ISDMPreferences* implementation

*addBackendLanguageToUrl*(String) method

Adds backend language URL parameter to the parameter.

#### Syntax

```
protected String addBackendLanguageToUrl ( String requestUrl )
```

#### Returns

String the URL containing the backend language URL parameter

*getBasicAuthHeader*() method

Calculates the http basic authentication header value.

#### Syntax

```
protected String getBasicAuthHeader () throws IOException
```

### *Returns*

String basic authentication header

### *Exceptions*

- **IOException** – Base64OutputStream.encodeAsString can throw IOException. If this IOException is thrown, then the client must stop sending the request

### *Usage*

In the SAP Data protocol, basic authentication protocol is used for authentication

### *getHost(String) method*

Extracts the host part from URL string.

### *Syntax*

```
protected String getHost ( String str )
```

### *Parameters*

- **str** – the URL string

### *Returns*

the possible host part

### *getIMEI() method*

### *Syntax*

```
protected static String getIMEI ()
```

### *getRequestTypeById(int) method*

### *Syntax*

```
public static String getRequestTypeById ( int type )
```

### *isSuccessful() method*

Do we have error?

### *Syntax*

```
public boolean isSuccessful ()
```

### *Returns*

true if we have

*makeHttpRequest() method*

Make the request.

*Syntax*

```
public abstract int makeHttpRequest ()
```

*Returns*

internal status code

*processRequestsFromQueue() method*

Pick a request/bundle from the queue and process it/them.

*Syntax*

```
public void processRequestsFromQueue ()
```

*processUrl(String) method**Syntax*

```
protected String processUrl (String requestUrl)
```

*setCleanupRequestsOnError(boolean) method*

Sets whether the thread should clean up the request queue in case of errors.

*Syntax*

```
public void setCleanupRequestsOnError (boolean value)
```

*Parameters*

- **value** – the setting

*terminate() method*

Close the thread.

*Syntax*

```
public void terminate ()
```

*Usage*

Invoked when the application exits.

*codeArray variable**Syntax*

```
protected int codeArray
```

*MAX\_TIMEOUT\_COUNT variable*

*Syntax*

```
protected static final int MAX_TIMEOUT_COUNT
```

*mCleanupRequestsOnError variable*

*Syntax*

```
protected boolean mCleanupRequestsOnError
```

*mError variable*

*Syntax*

```
protected boolean mError
```

*mLogger variable*

*Syntax*

```
protected ISDMLogger mLogger
```

*mPreferences variable*

*Syntax*

```
protected ISDMPreferences mPreferences
```

*mRequest variable*

*Syntax*

```
protected ISDMRequest mRequest
```

*mRequestManager variable*

*Syntax*

```
protected ISDMRequestManager mRequestManager
```

*mStop variable*

*Syntax*

```
protected boolean mStop
```

*mTrustManagers variable**Syntax*

```
protected TrustManager[] mTrustManagers
```

*mUpdateListener variable**Syntax*

```
protected boolean mUpdateListener
```

*params variable**Syntax*

```
protected ISDMConnectivityParameters params
```

*TAG variable**Syntax*

```
protected static final String TAG
```

*ConnectionFactory class*

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.ConnectionFactory` ConnectionFactory class implementation, which is responsible to create the connection.

*Syntax*

```
public class ConnectionFactory extends
ISDMPreferenceChangeListener
```

*Members*

All members of ConnectionFactory, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ConnectionFactory</i> (final <i>ISDMLogger</i> , final <i>ISDMRequestManager</i> , final <i>ISDMPreferences</i> ) on page 1038	

**Methods**

Modifier and Type	Method	Description
public void	<i>clearHeaders</i> () on page 1038	

Modifier and Type	Method	Description
public void	<i>close()</i> on page 1038	
public static DefaultHttpClient	<i>getHttpClient(final String)</i> on page 1039	
public HttpResponse	<i>makeRequest(final String, final byte[])</i> on page 1039	Make the request.
public void	<i>onPreferenceChanged(String, Object)</i> on page 1039	Callback method for preference change event.
public void	<i>setConnectionHeader(final String, final String)</i> on page 1039	
public void	<i>setRequestMethod(final int)</i> on page 1040	Set the HTTP request method.

### Usage

This class contains the platform related connection handling. This means, that for RIM and Android devices, the same network component can be used, only this ConnectionFactory must be different, because contains platform specific classes.

*ConnectionFactory(final ISDMLogger, final ISDMRequestManager, final ISDMPreferences)* constructor

### Syntax

```
public ConnectionFactory ( final ISDMLogger logger , final
ISDMRequestManager requestManager , final ISDMPreferences
preferences )
```

*clearHeaders()* method

### Syntax

```
public void clearHeaders ()
```

*close()* method

### Syntax

```
public void close ()
```

*getHttpClient(final String) method**Syntax*

```
public static DefaultHttpClient getHttpClient ( final String
requestUrl )
```

*makeRequest(final String, final byte[]) method*

Make the request.

*Syntax*

```
public HttpResponse makeRequest ( final String url , final byte[]
data ) throws Exception
```

*Parameters*

- **url** – the URL of the request
- **data** –

*Returns*

the server response

*Exceptions*

- **Exception** –

*onPreferenceChanged(String, Object) method*

Callback method for preference change event.

*Syntax*

```
public void onPreferenceChanged ( String key , Object value )
```

*Parameters*

- **key** – key of the preference
- **value** – value of the preference

*setConnectionHeader(final String, final String) method**Syntax*

```
public void setConnectionHeader ( final String key , final
String value )
```

*setRequestMethod(final int) method*

Set the HTTP request method.

*Syntax*

```
public void setRequestMethod ( final int method )
```

*Parameters*

- **method** –

*CookieJar class*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.CookieJar

*Syntax*

```
public class CookieJar extends CookieStore
```

*Members*

All members of CookieJar, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static Map< String, Map >	<i>cookieArray</i> on page 1041	
protected static Map< String, Cookie >	<i>httpCookieList</i> on page 1042	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>CookieJar()</i> on page 1041	

**Methods**

Modifier and Type	Method	Description
public void	<i>addCookie(Cookie)</i> on page 1041	
public void	<i>clear()</i> on page 1041	
public boolean	<i>clearExpired(Date)</i> on page 1041	
public List< Cookie >	<i>getCookies()</i> on page 1041	

Modifier and Type	Method	Description
protected void	<i>setCookie(DefaultHttpClient, Object)</i> on page 1041	

*CookieJar()* constructor

**Syntax**

```
public CookieJar ()
```

*addCookie(Cookie)* method

**Syntax**

```
public void addCookie ( Cookie httpCookie )
```

*clear()* method

**Syntax**

```
public void clear ()
```

*clearExpired(Date)* method

**Syntax**

```
public boolean clearExpired ( Date date )
```

*getCookies()* method

**Syntax**

```
public List< Cookie > getCookies ()
```

*setCookie(DefaultHttpClient, Object)* method

**Syntax**

```
protected void setCookie ( DefaultHttpClient client , Object cookieObjectMap )
```

*cookieArray* variable

**Syntax**

```
protected static Map< String, Map > cookieArray
```

*httpCookieList* variable**Syntax**

```
protected static Map< String, Cookie > httpCookieList
```

**ConnectionProtocolEnum** enum

Deprecated. since 3.0, Use com.sap.mobile.lib.request.ConnectionProtocolEnum

**Members**

All members of ConnectionProtocolEnum, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	<i>HTTP</i> on page 1042	
public	<i>HTTPS</i> on page 1042	

*HTTP* variable**Syntax**

```
public HTTP
```

*HTTPS* variable**Syntax**

```
public HTTPS
```

**HttpsTrustManager** class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpsTrustManager

**Syntax**

```
public class HttpsTrustManager extends X509TrustManager,
X509KeyManager
```

**Members**

All members of HttpsTrustManager, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static ClientCertList- tender	<i>c_oAppListener</i> on page 1045	
protected static TrustManager- Listener	<i>s_oAppListener</i> on page 1046	

Modifier and Type	Variable	Description
public static HttpClientCertInfo	<i>s_oLastClientCertInfo</i> on page 1046	
protected static final String	<i>TAG</i> on page 1046	

### Constructors

Modifier and Type	Constructor	Description
public	<i>HttpsTrustManager(TrustManager[])</i> on page 1044	

### Methods

Modifier and Type	Method	Description
public void	<i>checkClientTrusted(X509Certificate[], String)</i> on page 1044	
public void	<i>checkServerTrusted(X509Certificate[], String)</i> on page 1044	
public String	<i>chooseClientAlias(String[], Principal[], Socket)</i> on page 1044	
public String	<i>chooseServerAlias(String, Principal[], Socket)</i> on page 1044	
public X509Certificate[]	<i>getAcceptedIssuers()</i> on page 1044	
public X509Certificate[]	<i>getCertificateChain(String)</i> on page 1045	
public String[]	<i>getClientAliases(String, Principal[])</i> on page 1045	
public PrivateKey	<i>getPrivateKey(String)</i> on page 1045	
public String[]	<i>getServerAliases(String, Principal[])</i> on page 1045	

Modifier and Type	Method	Description
public static synchronized void	<i>setClientCertificateListener(ClientCertListener)</i> on page 1045	
public static synchronized void	<i>setTrustManagerListener(TrustManagerListener)</i> on page 1045	

### *HttpsTrustManager(TrustManager[]) constructor*

#### *Syntax*

```
public HttpsTrustManager ( TrustManager[] trustManagers ) throws
GeneralSecurityException
```

### *checkClientTrusted(X509Certificate[], String) method*

#### *Syntax*

```
public void checkClientTrusted ( X509Certificate[] aoChain ,
String sAuthType ) throws CertificateException
```

### *checkServerTrusted(X509Certificate[], String) method*

#### *Syntax*

```
public void checkServerTrusted ( X509Certificate[] chain , String
sAuthType ) throws CertificateException
```

### *chooseClientAlias(String[], Principal[], Socket) method*

#### *Syntax*

```
public String chooseClientAlias ( String[] keyType , Principal[]
issuers , Socket socket )
```

### *chooseServerAlias(String, Principal[], Socket) method*

#### *Syntax*

```
public String chooseServerAlias ( String keyType , Principal[]
issuers , Socket socket )
```

### *getAcceptedIssuers() method*

#### *Syntax*

```
public X509Certificate[] getAcceptedIssuers ( )
```

*getCertificateChain(String) method***Syntax**

```
public X509Certificate[] getCertificateChain ( String alias )
```

*getClientAliases(String, Principal[]) method***Syntax**

```
public String[] getClientAliases ( String keyType , Principal[]  
issuers )
```

*getPrivateKey(String) method***Syntax**

```
public PrivateKey getPrivateKey ( String alias )
```

*getServerAliases(String, Principal[]) method***Syntax**

```
public String[] getServerAliases ( String keyType , Principal[]  
issuers )
```

*setClientCertificateListener(ClientCertListener) method***Syntax**

```
public static synchronized void setClientCertificateListener  
( ClientCertListener clientListener )
```

*setTrustManagerListener(TrustManagerListener) method***Syntax**

```
public static synchronized void setTrustManagerListener  
( TrustManagerListener oListener )
```

*c\_oAppListener variable***Syntax**

```
protected static ClientCertListener c_oAppListener
```

*s\_oAppListener variable*

*Syntax*

```
protected static TrustManagerListener s_oAppListener
```

*s\_oLastClientCertInfo variable*

*Syntax*

```
public static HttpClientCertInfo s_oLastClientCertInfo
```

*TAG variable*

*Syntax*

```
protected static final String TAG
```

*HttpsTrustManager.ClientCertListener interface*

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.HttpsTrustManager.ClientCertListener

*Syntax*

```
public abstract interface ClientCertListener
```

*Derived classes*

- *MutualSSLChallengeListener* on page 2004

*Members*

All members of ClientCertListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract HttpClientCertInfo	<i>getClientCertificate(String)</i> on page 1046	

*getClientCertificate(String) method*

*Syntax*

```
public abstract HttpClientCertInfo getClientCertificate  
(String certAlias)
```

*HttpsTrustManager.HttpsClientCertInfo class*

Deprecated. since 3.0, Use

`com.sap.mobile.lib.request.HttpsTrustManager.HttpsClientCertInfo`**Syntax**

```
public class HttpsClientCertInfo
```

**Members**All members of `HttpsClientCertInfo`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected PrivateKey	<i>PrivateKey</i> on page 1047	
protected X509Certificate	<i>X509Certificate</i> on page 1047	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>HttpsClientCertInfo(java.security.cert.X509Certificate, PrivateKey)</i> on page 1047	

*HttpsClientCertInfo(java.security.cert.X509Certificate, PrivateKey) constructor***Syntax**

```
public HttpsClientCertInfo
( java.security.cert.X509Certificate xcer , PrivateKey pk )
```

*PrivateKey variable***Syntax**

```
protected PrivateKey PrivateKey
```

*X509Certificate variable***Syntax**

```
protected X509Certificate X509Certificate
```

*HttpsTrustManager.TrustManagerListener interface*

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.HttpsTrustManager.TrustManagerListener

*Syntax*

```
public abstract interface TrustManagerListener
```

*Derived classes*

- *SSLChallengeListener* on page 2005

*Members*

All members of TrustManagerListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract boolean	<i>checkServerTrusted(X509Certificate[])</i> on page 1048	

*checkServerTrusted(X509Certificate[]) method**Syntax*

```
public abstract boolean checkServerTrusted ( X509Certificate[]  
paramArrayOfX509Certificate )
```

*ISDMBundleRequest interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IBundleRequest Interface for request bundle.

*Syntax*

```
public interface ISDMBundleRequest
```

*Derived classes*

- *SDMBundleRequest* on page 1387

*Members*

All members of ISDMBundleRequest, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>addRequest(ISDMRequest)</i> on page 1049	Adds a request to the storage.
public void	<i>clearRequests()</i> on page 1049	Cleans out the request storage.

Modifier and Type	Method	Description
public ISDMRequest[]	<i>getRequests()</i> on page 1049	Returns all requests from the storage.
public void	<i>removeRequest(ISDMRequest)</i> on page 1049	Removes the specific request from the storage.

***addRequest(ISDMRequest) method***

Adds a request to the storage.

***Syntax***

```
public void addRequest ( ISDMRequest request )
```

***Parameters***

- **request** – the request to be added

***Usage***

NOTE! Request priority

( com.sap.mobile.lib.sdmconnectivity.ISDMRequest#setPriority(int)) is ignored during request processing! Because requests are processed in the order they are added to the bundle, the order is considered to handle the priority.

***clearRequests() method***

Cleans out the request storage.

***Syntax***

```
public void clearRequests ()
```

***getRequests() method***

Returns all requests from the storage.

***Syntax***

```
public ISDMRequest[] getRequests ()
```

***Returns***

the array of requests

***removeRequest(ISDMRequest) method***

Removes the specific request from the storage.

***Syntax***

```
public void removeRequest ( ISDMRequest request )
```

*Parameters*

- **request** – the request to be removed

*ISDMCache interface*

The SDMCache component is responsible for storing and accessing OData related objects in the memory of the device.

*Syntax*

```
public interface ISDMCache extends ISDMPersistable
```

*Derived classes*

- *SDMCache* on page 1389

*Members*

All members of ISDMCache, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>DEFAULT_SEARCH</i> on page 1059	Constant ID of default algorithm:
public static final int	<i>FULLTERM_CONTAIN_SEARCH</i> on page 1060	Constant ID of Full Term Contain-search algorithm: Searching for the full search-term as a part of searchable values.
public static final int	<i>FULLTERM_PREFIX_SEARCH</i> on page 1060	Constant ID of Full Term Prefix-search algorithm: Searching for the full search-term as a prefix of searchable values.
public static final int	<i>REGEX_SEARCH</i> on page 1060	Constant ID of regex search algorithm.
public static final int	<i>TOKENIZED_CONTAIN_ALL_SEARCH</i> on page 1060	Constant ID of All Token Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.

Modifier and Type	Variable	Description
public static final int	<i>TOKENIZED_CONTAIN_SEARCH</i> on page 1060	Constant ID of Tokenized Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.
public static final int	<i>TOKENIZED_PREFIX_SEARCH</i> on page 1061	Constant ID of Tokenized Prefix-search algorithm: Searching for all the tokens of the search-term as a prefix of searchable values.

### Methods

Modifier and Type	Method	Description
public void	<i>clear()</i> on page 1053	Removes all objects (including SDMODData Service Document and SDMODData Schema) from SDMCache.
public ISDMEntrySearch	<i>getEntrySearch()</i> on page 1053	Returns the current search object that implements the search method that should be used during searching in entries.
public ISDMParserDocument	<i>getSDMODDataDocument(String)</i> on page 1054	Returns an SDMParserDocument object with the specified key if it is stored in SDMCache or null otherwise.
public List< ISDMODDataEntry >	<i>getSDMODDataEntries(String)</i> on page 1054	Returns all of the SDMODData Entries that belong to the specified collection.
public ISDMODDataEntry	<i>getSDMODDataEntry(String)</i> on page 1054	Returns an SDMODData Entry with the specified key if it is stored in SDMCache or null otherwise.
public ISDMODDataSchema	<i>getSDMODDataSchema()</i> on page 1055	Returns the SDMODData Schema (aka Metadata) if it is stored in SDMCache or null otherwise.

Modifier and Type	Method	Description
public ISDMODataServiceDocument	<i>getSDMODataServiceDocument()</i> on page 1055	Returns the SDMOData Service Document if it is stored in SDMCache or null otherwise.
public int	<i>getSearchAlgorithm()</i> on page 1055	Returns the constant ID of the current search algorithm.
public List< ISDMParserDocument >	<i>getStoredDocuments()</i> on page 1055	Returns all of the SDMParserDocuments from the store (including SDMODataEntries).
public boolean	<i>removeSDMODataDocument(String)</i> on page 1056	Removes stored object from SDMCache with the specified key if it is stored.
public boolean	<i>removeSDMODataEntries(String)</i> on page 1056	Removes SDMOData Entries from SDMCache that belong to the specified collection.
public void	<i>removeStoredDocuments()</i> on page 1056	Removes all stored documents (except from Service Document and Schema) from SDMCache.
public List< ISDMODataEntry >	<i>searchSDMODataEntries(String, String)</i> on page 1057	Returns all of the SDMOData Entries that belong to the specified collection and either of its searchable fields' value's token (tokenized with space) that starts with the searchTerm.
public void	<i>setEntrySearch(ISDMEntrySearch)</i> on page 1057	Seats the new search object that implements the search method that should be used during searching in entries.
public void	<i>setSDMODataDocument(String, ISDMParserDocument)</i> on page 1057	Stores an SDMParserDocument object in SDMCache.
public void	<i>setSDMODataEntries(List&lt; ISDMODataEntry &gt;)</i> on page 1058	Stores several SDMOData Entries in SDMCache.
public void	<i>setSDMODataEntry(ISDMODataEntry)</i> on page 1058	Stores an SDMOData Entry in SDMCache.

Modifier and Type	Method	Description
public void	<i>setSDMODDataSchema(ISD-MODDataSchema)</i> on page 1059	Stores SDMODData Schema in SDMCache.
public void	<i>setSDMODDataServiceDocument(ISDMODDataServiceDocument)</i> on page 1059	Stores SDMODData Service Document in SDMCache.
public void	<i>setSearchAlgorithm(int)</i> on page 1059	Sets the constant ID of the search algorithm that should be used during search in entries.

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### Usage

List of features:

- Storing OData objects in the memory
- Accessing OData entries in the memory directly by their key
- Searching for OData entries in the memory using tokenized prefix search on their searchable fields
- Managing the number of stored OData entries based on the maximum size of the capacity, removing the a non-recently used OData entry first

#### *clear()* method

Removes all objects (including SDMODData Service Document and SDMODData Schema) from SDMCache.

#### Syntax

```
public void clear ()
```

#### *getEntrySearch()* method

Returns the current search object that implements the search method that should be used during searching in entries.

#### Syntax

```
public ISDMEnterSearch getEntrySearch ()
```

### *Returns*

The current search object.

### *getSDMODataDocument(String) method*

Returns an SDMParserDocument object with the specified key if it is stored in SDMCache or null otherwise.

### *Syntax*

```
public ISDMParserDocument getSDMODataDocument ( String key )
```

### *Parameters*

- **key** – key of the document to be searched

### *Returns*

SDMParserDocument or null

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getSDMODataEntries(String) method*

Returns all of the SDMOData Entries that belong to the specified collection.

### *Syntax*

```
public List< ISDMODataEntry > getSDMODataEntries ( String  
collectionId )
```

### *Parameters*

- **collectionId** – id of the collection

### *Returns*

stored SDMODataEntries of the specific collection or null

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getSDMODataEntry(String) method*

Returns an SDMOData Entry with the specified key if it is stored in SDMCache or null otherwise.

### *Syntax*

```
public ISDMODataEntry getSDMODataEntry ( String key )
```

*Parameters*

- **key** – key of the entry to be searched

*Returns*

SDMODataEntry or null

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getSDMODataSchema() method*

Returns the SDMOData Schema (aka Metadata) if it is stored in SDMCache or null otherwise.

*Syntax*

```
public ISDMODataSchema getSDMODataSchema ()
```

*Returns*

Schema or null

*getSDMODataServiceDocument() method*

Returns the SDMOData Service Document if it is stored in SDMCache or null otherwise.

*Syntax*

```
public ISDMODataServiceDocument getSDMODataServiceDocument  
( )
```

*Returns*

Service Document or null

*getSearchAlgorithm() method*

Returns the constant ID of the current search algorithm.

*Syntax*

```
public int getSearchAlgorithm ()
```

*Returns*

The constant ID of the current search algorithm.

*getStoredDocuments() method*

Returns all of the SDMParserDocuments from the store (including SDMODataEntries).

*Syntax*

```
public List< ISDMParserDocument > getStoredDocuments ()
```

### *Returns*

List of stored SDMParserDocuments

### *removeSDMODataDocument(String) method*

Removes stored object from SDMCache with the specified key if it is stored.

### *Syntax*

```
public boolean removeSDMODataDocument ( String key )
```

### *Parameters*

- **key** – key of the entry to be removed

### *Returns*

true of document has been found or false otherwise

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *removeSDMODataEntries(String) method*

Removes SDMOData Entries from SDMCache that belong to the specified collection.

### *Syntax*

```
public boolean removeSDMODataEntries ( String collectionId )
```

### *Parameters*

- **collectionId** – id of the collection

### *Returns*

true of any document has been found in the collection or false otherwise

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *removeStoredDocuments() method*

Removes all stored documents (except from Service Document and Schema) from SDMCache.

### *Syntax*

```
public void removeStoredDocuments ()
```

*searchSDMODataEntries(String, String) method*

Returns all of the SDMOData Entries that belong to the specified collection and either of its searchable fields' value's token (tokenized with space) that starts with the searchTerm.

*Syntax*

```
public List< ISDMODataEntry > searchSDMODataEntries ( String
searchTerm , String collectionId )
```

*Parameters*

- **searchTerm** – search string
- **collectionId** – id of the collection to search in

*Returns*

stored SDMODataEntries of the specific collection which start with the search string or null

*Exceptions*

- **IllegalArgumentException** – if any of the arguments is null.

*Usage*

If the searchTerm consists of more tokens (tokenized with space) all of the search term's token should be found as above. The property tag which will determine if a field is searchable or not can be set in the preferences using the key:

ISDMPreferences.CACHE\_PARSER\_SEARCH\_ATTRIBUTE\_STRING. By default sap:searchable will be used.

*setEntrySearch(ISDMEntrySearch) method*

Seats the new search object that implements the search method that should be used during searching in entries.

*Syntax*

```
public void setEntrySearch ( ISDMEntrySearch entrySearch )
```

*Parameters*

- **entrySearch** – The new search object.

*setSDMODataDocument(String, ISDMParserDocument) method*

Stores an SDMParserDocument object in SDMCache.

*Syntax*

```
public void setSDMODataDocument ( String key ,
ISDMParserDocument document )
```

### *Parameters*

- **document** – SDMParserDocument to be stored

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *Usage*

It can be used to store data other than SDMODDataEntries in the cache.

### *setSDMODDataEntries(List< ISDMODDataEntry >) method*

Stores several SDMODData Entries in SDMCache.

### *Syntax*

```
public void setSDMODDataEntries ( List< ISDMODDataEntry >
entries )
```

### *Parameters*

- **entries** – SDMODData Entries to be stored

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *Usage*

The collection ID is read out from the entry.

### *setSDMODDataEntry(ISDMODDataEntry) method*

Stores an SDMODData Entry in SDMCache.

### *Syntax*

```
public void setSDMODDataEntry ( ISDMODDataEntry entry )
```

### *Parameters*

- **entry** – SDMODData Entry to be stored

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *Usage*

The collection ID is read out from the entry.

*setSDMODDataSchema(ISDMODDataSchema) method*

Stores SDMODData Schema in SDMCache.

*Syntax*

```
public void setSDMODDataSchema ( ISDMODDataSchema schema )
```

*Parameters*

- **schema** – SDMODData Schema to be stored

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*setSDMODDataServiceDocument(ISDMODDataServiceDocument) method*

Stores SDMODData Service Document in SDMCache.

*Syntax*

```
public void setSDMODDataServiceDocument  
( ISDMODDataServiceDocument serviceDocument )
```

*Parameters*

- **serviceDocument** – serviceDocument to be stored

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*setSearchAlgorithm(int) method*

Sets the constant ID of the search algorithm that should be used during search in entries.

*Syntax*

```
public void setSearchAlgorithm ( int searchAlgorithm )
```

*Parameters*

- **searchAlgorithm** – The constant ID of the new search algorithm.

*DEFAULT\_SEARCH variable*

Constant ID of default algorithm:

*Syntax*

```
public static final int DEFAULT_SEARCH
```

### *FULLTERM\_CONTAIN\_SEARCH variable*

Constant ID of Full Term Contain-search algorithm: Searching for the full search-term as a part of searchable values.

#### *Syntax*

```
public static final int FULLTERM_CONTAIN_SEARCH
```

### *FULLTERM\_PREFIX\_SEARCH variable*

Constant ID of Full Term Prefix-search algorithm: Searching for the full search-term as a prefix of searchable values.

#### *Syntax*

```
public static final int FULLTERM_PREFIX_SEARCH
```

### *REGEX\_SEARCH variable*

Constant ID of regex search algorithm.

#### *Syntax*

```
public static final int REGEX_SEARCH
```

### *TOKENIZED\_CONTAIN\_ALL\_SEARCH variable*

Constant ID of All Token Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.

#### *Syntax*

```
public static final int TOKENIZED_CONTAIN_ALL_SEARCH
```

#### *Usage*

All tokens must be found in the same value.

### *TOKENIZED\_CONTAIN\_SEARCH variable*

Constant ID of Tokenized Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.

#### *Syntax*

```
public static final int TOKENIZED_CONTAIN_SEARCH
```

#### *Usage*

Tokens can be found in different values of the same entry.

***TOKENIZED\_PREFIX\_SEARCH* variable**

Constant ID of Tokenized Prefix-search algorithm: Searching for all the tokens of the search-term as a prefix of searchable values.

***Syntax***

```
public static final int TOKENIZED_PREFIX_SEARCH
```

***Usage***

Tokens can be found in different values of the same entry.

***ISDMCacheLoadListener* interface**

Deprecated. since 3.0 SDMCacheLoadListener should be responsible for reacting on notifications send after number of SDMODData entries loaded from the file system.

***Syntax***

```
public interface ISDMCacheLoadListener
```

***Members***

All members of ISDMCacheLoadListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onLoadFinished(ISDMCache)</i> on page 1061	
public void	<i>onSDMODDataEntriesLoaded(ISDMCache, List&lt; ISDMODDataEntry &gt;)</i> on page 1062	
public void	<i>onSDMODDataSchemaLoaded(ISDMCache, ISDMODataSchema)</i> on page 1062	
public void	<i>onSDMODDataServiceDocumentLoaded(ISDMCache, ISDMODDataServiceDocument)</i> on page 1062	

***onLoadFinished(ISDMCache) method******Syntax***

```
public void onLoadFinished ( ISDMCache cache )
```

### *Parameters*

- **cache** – The cache is finished loading from the file system.

*onSDMODataEntriesLoaded(ISDMCache, List< ISDMODataEntry >) method*

### *Syntax*

```
public void onSDMODataEntriesLoaded ( ISDMCache cache , List<
ISDMODataEntry > entries )
```

### *Parameters*

- **cache** – The cache the SDMOData Entries were inserted into.
- **entries** – The entries that were loaded from the file system.

*onSDMODataSchemaLoaded(ISDMCache, ISDMODataSchema) method*

### *Syntax*

```
public void onSDMODataSchemaLoaded ( ISDMCache cache ,
ISDMODataSchema schema )
```

### *Parameters*

- **cache** – The cache the SDMOData Schema was inserted into.
- **schema** – The SDMOData Schema loaded from the file system.

*onSDMODataServiceDocumentLoaded(ISDMCache, ISDMODataServiceDocument) method*

### *Syntax*

```
public void onSDMODataServiceDocumentLoaded ( ISDMCache cache ,
ISDMODataServiceDocument serviceDocument )
```

### *Parameters*

- **cache** – The cache the SDMOData Service Document was inserted into.
- **serviceDocument** – The SDMOData Service Document loaded from the file system.

### *ISDMConnectionHandler interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IConnectionHandler Interface for connection handler implementations.

### *Syntax*

```
public abstract interface ISDMConnectionHandler
```

*Derived classes*

- *AbstractConnectionHandler* on page 1030

*Members*

All members of *ISDMConnectionHandler*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>AUTHENTICATION_ERROR</i> on page 1065	
public static final int	<i>BAD_COVERAGE</i> on page 1065	
public static final String	<i>CRLF</i> on page 1065	
public static final int	<i>ERROR</i> on page 1065	
public static final int	<i>FAILED_LOGIN</i> on page 1065	
public static final int	<i>FAILED_LOGOUT</i> on page 1065	
public static final int	<i>FAILURE</i> on page 1065	
public static final int	<i>LOG</i> on page 1066	
public static final int	<i>NO_ERROR</i> on page 1066	
public static final int	<i>RETRY</i> on page 1066	
public static final int	<i>SUCCESS</i> on page 1066	
public static final int	<i>TIMEOUT</i> on page 1066	

**Methods**

Modifier and Type	Method	Description
public abstract boolean	<i>isSuccessful()</i> on page 1064	Do we have error?
public abstract int	<i>makeHttpRequest()</i> on page 1064	Make the request.
public abstract void	<i>processRequestsFromQueue()</i> on page 1064	Pick a request/bundle from the queue and process it/them.

Modifier and Type	Method	Description
public abstract void	<i>setCleanupRequestsOnError(boolean)</i> on page 1064	Sets whether the thread should clean up the request queue in case of errors.
public abstract void	<i>terminate()</i> on page 1065	Close the thread.

*isSuccessful() method*

Do we have error?

*Syntax*

```
public abstract boolean isSuccessful ()
```

*Returns*

true if we have

*makeHttpRequest() method*

Make the request.

*Syntax*

```
public abstract int makeHttpRequest ()
```

*Returns*

internal status code

*processRequestsFromQueue() method*

Pick a request/bundle from the queue and process it/them.

*Syntax*

```
public abstract void processRequestsFromQueue ()
```

*setCleanupRequestsOnError(boolean) method*

Sets whether the thread should clean up the request queue in case of errors.

*Syntax*

```
public abstract void setCleanupRequestsOnError (boolean  
value )
```

*Parameters*

- **value** – the setting

*terminate() method*

Close the thread.

*Syntax*

```
public abstract void terminate ()
```

*Usage*

Invoked when the application exits.

*AUTHENTICATION\_ERROR variable**Syntax*

```
public static final int AUTHENTICATION_ERROR
```

*BAD\_COVERAGE variable**Syntax*

```
public static final int BAD_COVERAGE
```

*CRLF variable**Syntax*

```
public static final String CRLF
```

*ERROR variable**Syntax*

```
public static final int ERROR
```

*FAILED\_LOGIN variable**Syntax*

```
public static final int FAILED_LOGIN
```

*FAILED\_LOGOUT variable**Syntax*

```
public static final int FAILED_LOGOUT
```

*FAILURE variable**Syntax*

```
public static final int FAILURE
```

*LOG variable*

*Syntax*

```
public static final int LOG
```

*NO\_ERROR variable*

*Syntax*

```
public static final int NO_ERROR
```

*RETRY variable*

*Syntax*

```
public static final int RETRY
```

*SUCCESS variable*

*Syntax*

```
public static final int SUCCESS
```

*TIMEOUT variable*

*Syntax*

```
public static final int TIMEOUT
```

*ISDMConnectivityParameters interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IConnectivityParameters

*Syntax*

```
public interface ISDMConnectivityParameters
```

*Derived classes*

- *SDMConnectivityParameters* on page 1403

*Members*

All members of ISDMConnectivityParameters, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 1067	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 1068	

Modifier and Type	Method	Description
public String	<i>getLanguage()</i> on page 1068	Returns the language setting.
public TrustManager[]	<i>getTrustManagers()</i> on page 1068	Returns an array filled with TrustManager instances.
public String	<i>getUserName()</i> on page 1068	Returns the username.
public String	<i>getUserPassword()</i> on page 1068	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 1069	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 1069	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 1069	Sets the base URL for requests.
public void	<i>setLanguage(String)</i> on page 1069	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 1069	Sets the server certificate.
public void	<i>setServerCertificate(final Certificate)</i> on page 1070	Sets a single server certificate.
public void	<i>setUserName(String)</i> on page 1070	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 1070	Sets the password.

#### *enableXsrf(Boolean) method*

Sets the XSRFEnabled flag.

#### *Syntax*

```
public void enableXsrf ( Boolean isXsrfEnabled )
```

#### *Parameters*

- **isXsrfEnabled** – the boolean to set.

### *getBaseUrl() method*

#### *Syntax*

```
public String getBaseUrl ()
```

#### *Returns*

the base URL for the requests.

### *getLanguage() method*

Returns the language setting.

#### *Syntax*

```
public String getLanguage ()
```

#### *Returns*

the language setting

### *getTrustManagers() method*

Returns an array filled with TrustManager instances.

#### *Syntax*

```
public TrustManager[] getTrustManagers ()
```

#### *Returns*

the array.

### *getUserName() method*

Returns the username.

#### *Syntax*

```
public String getUserName ()
```

#### *Returns*

the user name.

### *getUserPassword() method*

Returns the password.

#### *Syntax*

```
public String getUserPassword ()
```

#### *Returns*

the password.

*isAutoRedirectEnabled()* method

Returns whether auto redirect is enabled.

*Syntax*

```
public boolean isAutoRedirectEnabled ()
```

*setAutoRedirectEnabled(boolean)* method

Enables or disables auto redirect.

*Syntax*

```
public void setAutoRedirectEnabled ( boolean paramboolean )
```

*Parameters*

- **paramboolean** – the boolean to set

*setBaseUrl(String)* method

Sets the base URL for requests.

*Syntax*

```
public void setBaseUrl ( String baseUrl )
```

*Parameters*

- **baseUrl** –

*setLanguage(String)* method

Sets the language used in connection.

*Syntax*

```
public void setLanguage ( String language )
```

*Parameters*

- **language** – to set

*setServerCertificate(final Certificate[])* method

Sets the server certificate.

*Syntax*

```
public void setServerCertificate ( final Certificate[] certificate )  
throws KeyStoreException
```

### *Parameters*

- **certificate** – to set.

### *Exceptions*

- **KeyStoreException** –

### *setServerCertificate(final Certificate) method*

Sets a single server certificate.

### *Syntax*

```
public void setServerCertificate ( final Certificate certificate )
```

### *Parameters*

- **certificate** – to set

### *setUserName(String) method*

Sets the username which must be used during authentication.

### *Syntax*

```
public void setUsername ( String aUserName )
```

### *Parameters*

- **aUserName** – the user name to set.

### *setUserPassword(String) method*

Sets the password.

### *Syntax*

```
public void setUserPassword ( String aPassword )
```

### *Parameters*

- **aPassword** – the password to set.

### *ISDMEntrySearch interface*

Interface for search objects that can be used to search for entries in SDMCache.

### *Syntax*

```
public interface ISDMEntrySearch
```

*Derived classes*

- *SDMCache* on page 1389

*Members*

All members of ISDMEntrySearch, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>searchInEntry(String, String, List&lt; String &gt;, ISDMODataEntry, List&lt; String[]&gt;, int)</i> on page 1071	Verifies whether the entry should be found during searching for the incoming search term.

*searchInEntry(String, String, List< String >, ISDMODataEntry, List< String[]>, int)*  
method

Verifies whether the entry should be found during searching for the incoming search term.

*Syntax*

```
public boolean searchInEntry (String searchTerm , String
collectionId , List< String > searchTokens , ISDMODataEntry entry , List<
String[]> searchablePropertyPathes , int searchAlgorithm )
```

*Parameters*

- **searchTerm** – The full search-term that the search initiated with,
- **collectionId** – The id of the searched collection
- **searchTokens** – The tokens of splitted lower-case search-term.
- **entry** – The entry that should be checked.
- **searchablePropertyPathes** – The properties of the entry that's values should be used during search.
- **searchAlgorithm** – The constant ID of the search algorithm.

*Returns*

True if the entry 'matches' with the given search-term, and false otherwise.

*ISDMLocalSchema interface*

Deprecated. since 3.0, Use ILocalSchema

*Syntax*

```
public interface ISDMLocalSchema
```

*Derived classes*

- *SDMODataReturnSchema* on page 1769

*ISDMLogger interface*

Deprecated. since 3.0, Use `com.sap.mobile.lib.supportability.ILogger`

*Syntax*

```
public interface ISDMLogger
```

*Derived classes*

- *SDMLogger* on page 1421

*Members*

All members of `ISDMLogger`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>ASSERT</i> on page 1089	Log level ASSERT.
public static final int	<i>DEBUG</i> on page 1089	Log level DEBUG.
public static final int	<i>ERROR</i> on page 1089	Log level ERROR.
public static final int	<i>FATAL</i> on page 1089	Log level FATAL.
public static final int	<i>INFO</i> on page 1089	Log level INFO.
public static final int	<i>PERFORMANCE</i> on page 1089	Log level PERFORMANCE.
public static final int	<i>VERBOSE</i> on page 1090	Log level VERBOSE.
public static final int	<i>WARN</i> on page 1090	Log level WARN.

**Methods**

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 1075	Implementer should override this method!
public void	<i>d(final String, final String)</i> on page 1076	Sends a DEBUG log message.
public void	<i>d(final String, final String, final String)</i> on page 1076	Sends a DEBUG log message.

Modifier and Type	Method	Description
public void	<i>d</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1076	Sends a DEBUG log message and logs the exception.
public void	<i>d</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1077	Sends a DEBUG log message and logs the exception.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> ) on page 1077	Sends an ERROR log message.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1077	Sends an ERROR log message.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1078	Sends an ERROR log message and logs the exception.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1078	Sends an ERROR log message and logs the exception.
public int	<i>getLogLevel</i> () on page 1079	Returns the log level.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> ) on page 1079	Sends an INFO log message.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1079	Sends an INFO log message.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1080	Sends a INFO log message and logs the exception.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1080	Sends a INFO log message and logs the exception.
public void	<i>logFullLocation</i> ( <i>boolean</i> ) on page 1080	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation</i> () on page 1081	To get the setting which controls log output should contain full location (class and method name) or not.
public void	<i>p</i> ( <i>final String</i> , <i>final String</i> ) on page 1081	Sends a PERFORMANCE log message.

Modifier and Type	Method	Description
public void	<i>p</i> ( <i>final String, final String, final String</i> ) on page 1081	Sends a PERFORMANCE log message.
public void	<i>setHeaderData</i> ( <i>final String, final String, final String, final String, final String, final String, final String, final String, final String</i> ) on page 1082	Sets the log header fields.
public void	<i>setLogLevel</i> ( <i>final int</i> ) on page 1082	Set the log level.
public void	<i>v</i> ( <i>final String, final String</i> ) on page 1082	Sends a VERBOSE log message.
public void	<i>v</i> ( <i>final String, final String, final String</i> ) on page 1083	Sends a VERBOSE log message.
public void	<i>v</i> ( <i>final String, final String, final Throwable</i> ) on page 1083	Sends a VERBOSE log message and logs the exception.
public void	<i>v</i> ( <i>final String, final String, final Throwable, final String</i> ) on page 1084	Sends a VERBOSE log message and logs the exception.
public void	<i>w</i> ( <i>final String, final Throwable</i> ) on page 1084	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String, final Throwable, final String</i> ) on page 1084	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String, final String, final Throwable</i> ) on page 1085	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String, final String, final Throwable, final String</i> ) on page 1085	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String, final String</i> ) on page 1085	Sends a WARN log message.
public void	<i>w</i> ( <i>final String, final String, final String</i> ) on page 1086	Sends a WARN log message.

Modifier and Type	Method	Description
public void	<i>wtf</i> ( <i>final String</i> , <i>final Throwable</i> ) on page 1086	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1087	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> ) on page 1087	Use com.sap.mobile.lib.supportability.ILogger#w(String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1087	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1088	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1088	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.

***canLog()* method**

Implementer should override this method!

**Syntax**

```
public boolean canLog ()
```

### *Returns*

State of ability to log.

### *d(final String, final String) method*

Sends a DEBUG log message.

### *Syntax*

```
public void d ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,String)`

### *d(final String, final String, final String) method*

Sends a DEBUG log message.

### *Syntax*

```
public void d ( final String tag , final String msg , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *d(final String, final String, final Throwable) method*

Sends a DEBUG log message and logs the exception.

### *Syntax*

```
public void d ( final String tag , final String msg , final Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,Throwable,String)`

### *d(final String, final String, final Throwable, final String) method*

Sends a DEBUG log message and logs the exception.

### Syntax

```
public void d ( final String tag , final String msg , final
Throwable tr , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *e(final String, final String) method*

Sends an ERROR log message.

### Syntax

```
public void e ( final String tag , final String msg )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,String)`

### *e(final String, final String, final String) method*

Sends an ERROR log message.

### Syntax

```
public void e ( final String tag , final String msg , final String
location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *e(final String, final String, final Throwable) method*

Sends an ERROR log message and logs the exception.

### *Syntax*

```
public void e ( final String tag , final String msg , final  
Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,Throwable,String)`

### *e(final String, final String, final Throwable, final String) method*

Sends an ERROR log message and logs the exception.

### *Syntax*

```
public void e ( final String tag , final String msg , final  
Throwable tr , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*getLogLevel() method*

Returns the log level.

*Syntax*

```
public int getLogLevel ()
```

*Returns*

the log level.

*i(final String, final String) method*

Sends an INFO log message.

*Syntax*

```
public void i ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,String)`

*i(final String, final String, final String) method*

Sends an INFO log message.

*Syntax*

```
public void i ( final String tag , final String msg , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *i(final String, final String, final Throwable) method*

Sends a INFO log message and logs the exception.

#### *Syntax*

```
public void i ( final String tag , final String msg , final
Throwable tr )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,Throwable,String)`

### *i(final String, final String, final Throwable, final String) method*

Sends a INFO log message and logs the exception.

#### *Syntax*

```
public void i ( final String tag , final String msg , final
Throwable tr , final String location )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *logFullLocation(boolean) method*

Setting to control log full location (class-path and method name).

#### *Syntax*

```
public void logFullLocation ( boolean logFullLocation )
```

#### *Parameters*

- **logFullLocation** – log i or do not log it.

*logsFullLocation() method*

To get the setting which controls log output should contain full location (class and method name) or not.

*Syntax*

```
public boolean logsFullLocation ()
```

*Returns*

logging with full location or not.

*p(final String, final String) method*

Sends a PERFORMANCE log message.

*Syntax*

```
public void p ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#p(String,String,String)`

*p(final String, final String, final String) method*

Sends a PERFORMANCE log message.

*Syntax*

```
public void p ( final String tag , final String msg , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*setHeaderData(final String, final String, final String, final String, final String, final String, final String, final String) method*

Sets the log header fields.

### Syntax

```
public void setHeaderData ( final String osVersion , final String appName , final String appVersion , final String thirdParty , final String hwVersion , final String user , final String timezone , final String language , final String baseUrl )
```

### Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (SDMConnectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (SDMConnectivity sets it)
- **baseUrl** – the URL used in Connectivity (SDMconnectivity sets it)

### Usage

A header field is set only if it is not *null*. Also, it is set only once; subsequent calls will not overwrite the first write.

*setLogLevel(final int) method*

Set the log level.

### Syntax

```
public void setLogLevel ( final int level )
```

### Parameters

- **level** – the log level

*v(final String, final String) method*

Sends a VERBOSE log message.

### Syntax

```
public void v ( final String tag , final String msg )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#v(String,String,String)`

### *v(final String, final String, final String) method*

Sends a VERBOSE log message.

### Syntax

```
public void v ( final String tag , final String msg , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *v(final String, final String, final Throwable) method*

Sends a VERBOSE log message and logs the exception.

### Syntax

```
public void v ( final String tag , final String msg , final Throwable tr )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#v(String,String,Throwable,String)`

### *v(final String, final String, final Throwable, final String) method*

Sends a VERBOSE log message and logs the exception.

#### *Syntax*

```
public void v ( final String tag , final String msg , final
Throwable tr , final String location )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *w(final String, final Throwable) method*

Sends a WARN log message and logs the exception.

#### *Syntax*

```
public void w ( final String tag , final Throwable tr )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,Throwable,String)`

### *w(final String, final Throwable, final String) method*

Sends a WARN log message and logs the exception.

#### *Syntax*

```
public void w ( final String tag , final Throwable tr , final
String location )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

- **location** – The line-level location of the log source (full class name of the class).

*w(final String, final String, final Throwable) method*

Sends a WARN log message and logs the exception.

*Syntax*

```
public void w ( final String tag , final String msg , final
Throwable tr )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,String,Throwable,String)`

*w(final String, final String, final Throwable, final String) method*

Sends a WARN log message and logs the exception.

*Syntax*

```
public void w ( final String tag , final String msg , final
Throwable tr , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*w(final String, final String) method*

Sends a WARN log message.

*Syntax*

```
public void w ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,String,String)`

### *w(final String, final String, final String) method*

Sends a WARN log message.

### *Syntax*

```
public void w (final String tag , final String msg , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *wtf(final String, final Throwable) method*

Use `com.sap.mobile.lib.supportability.ILogger#w(String, Throwable)` What a Terrible Failure: Reports an exception that should never happen.

### *Syntax*

```
public void wtf (final String tag , final Throwable tr)
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

### *Usage*

Similar to `wtf(String, final String)`, with an exception to log. Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,Throwable,String)`

*wtf(final String, final Throwable, final String) method*

Use `com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String)` What a Terrible Failure: Reports an exception that should never happen.

*Syntax*

```
public void wtf ( final String tag , final Throwable tr , final
String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*Usage*

Similar to `wtf(String, final String)`, with an exception to log.

*wtf(final String, final String) method*

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String)` What a Terrible Failure: Reports a condition that should never happen.

*Syntax*

```
public void wtf ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

*Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,String,String)`

*wtf(final String, final String, final String) method*

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, String)` What a Terrible Failure: Reports a condition that should never happen.

*Syntax*

```
public void wtf ( final String tag , final String msg , final
String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *wtf(final String, final String, final Throwable) method*

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable)` What a Terrible Failure: Reports an exception that should never happen.

### *Syntax*

```
public void wtf ( final String tag , final String msg , final
Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### *Usage*

Similar to `wtf(finalString, Throwable)`, also with a message. Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,String,Throwable,String)`

### *wtf(final String, final String, final Throwable, final String) method*

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String)` What a Terrible Failure: Reports an exception that should never happen.

### *Syntax*

```
public void wtf ( final String tag , final String msg , final
Throwable tr , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

**Usage**

Similar to `wtf(finalString, Throwable)`, also with a message.

**ASSERT variable**

Log level ASSERT.

**Syntax**

```
public static final int ASSERT
```

**DEBUG variable**

Log level DEBUG.

**Syntax**

```
public static final int DEBUG
```

**ERROR variable**

Log level ERROR.

**Syntax**

```
public static final int ERROR
```

**FATAL variable**

Log level FATAL.

**Syntax**

```
public static final int FATAL
```

**INFO variable**

Log level INFO.

**Syntax**

```
public static final int INFO
```

**PERFORMANCE variable**

Log level PERFORMANCE.

**Syntax**

```
public static final int PERFORMANCE
```

## *VERBOSE variable*

Log level VERBOSE.

### *Syntax*

```
public static final int VERBOSE
```

## *WARN variable*

Log level WARN.

### *Syntax*

```
public static final int WARN
```

## *ISDMNetListener interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.INetListener The NetListener interface.

### *Syntax*

```
public interface ISDMNetListener
```

## *Derived classes*

- *AppSettings* on page 34
- *ClientConnection* on page 79
- *UserManager* on page 1023

## *Members*

All members of ISDMNetListener, including inherited members. **Methods**

<b>Modifier and Type</b>	<b>Method</b>	<b>Description</b>
public void	<i>onError(ISDMRequest, ISDMResponse, ISDMRequestStateElement)</i> on page 1091	This method is used by the connectivity layer when an error occurs during a request operation.
public void	<i>onSuccess(ISDMRequest, ISDMResponse)</i> on page 1091	This is used by the connectivity library in case of a successful request.

*onError(ISDMRequest, ISDMResponse, ISDMRequestStateElement) method*

This method is used by the connectivity layer when an error occurs during a request operation.

*Syntax*

```
public void onError ( ISDMRequest aRequest , ISDMResponse
aResponse , ISDMRequestStateElement aRequestStateElement )
```

*Parameters*

- **aRequest** – the request.
- **aResponse** – the response.
- **aRequestStateElement** – the SDMRequestStateElement object.

*Usage*

As parameter the listener object will receive the request object, the SDMHttpResponse object containing the details about the server response and a SDMRequestStateElement object, which provides more details about the occurred error. In case the error happened before sending any request to the server, the SDMHttpResponse object can be null.

*onSuccess(ISDMRequest, ISDMResponse) method*

This is used by the connectivity library in case of a successful request.

*Syntax*

```
public void onSuccess ( ISDMRequest aRequest , ISDMResponse
aResponse )
```

*Parameters*

- **aRequest** – the request.
- **aResponse** – the response.

*Usage*

As parameter the listener will receive the request itself, and an SDMHttpResponse object containing all the details about the server response.

*ISDMODataAssociation interface*

Deprecated. since 3.0, Use IODataAssociation Represents the appropriate SDMOData element.

*Syntax*

```
public abstract interface ISDMODataAssociation extends
ISDMParserDocument
```

*Derived classes*

- *ISDMODataAssociationSet* on page 1101
- *SDMODataAssociation* on page 1442

*Members*

All members of *ISDMODataAssociation*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 1098	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1098	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 1098	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_ASSOCIATIONEND</i> on page 1099	Name of the appropriate <i>SDMOData</i> element.

**Methods**

Modifier and Type	Method	Description
public abstract <i>ISDMODataAssociationEnd</i>	<i>getAssociationEnd(String)</i> on page 1097	Returns the value of the appropriate Association End <i>SDMOData</i> element with the given role.
public abstract List< <i>ISDMODataAssociationEnd</i> >	<i>getAssociationEnds()</i> on page 1098	Returns list of the appropriate <i>SDMOData</i> elements.
public abstract String	<i>getName()</i> on page 1098	Returns the value of the appropriate <i>SDMOData</i> attribute.

**Inherited members from *ISDMParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getAssociationEnd(String)* method

Returns the value of the appropriate Association End SDMOData element with the given role.

#### Syntax

```
public abstract ISDMODataAssociationEnd getAssociationEnd
( String role )
```

### *Parameters*

- **role** – The expected value of the appropriate SDMODData attribute

### *Returns*

the value of the appropriate Association End SDMODData element

### *getAssociationEnds() method*

Returns list of the appropriate SDMODData elements.

### *Syntax*

```
public abstract List< ISDMODDataAssociationEnd >  
getAssociationEnds ()
```

### *Returns*

list of the appropriate SDMODData elements

### *getName() method*

Returns the value of the appropriate SDMODData attribute.

### *Syntax*

```
public abstract String getName ()
```

### *Returns*

the value of the appropriate SDMODData attribute

### *ATTRIBUTE\_ASSOCIATION variable*

Name of the appropriate SDMODData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_ASSOCIATION
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate SDMODData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

### *ELEMENT\_ASSOCIATION variable*

Name of the appropriate SDMODData element.

### *Syntax*

```
public static final String ELEMENT_ASSOCIATION
```

***ELEMENT\_ASSOCIATIONEND* variable**

Name of the appropriate SDMODData element.

**Syntax**

```
public static final String ELEMENT_ASSOCIATIONEND
```

***ISDMODDataAssociation.ISDMODDataAssociationEnd* interface**

Deprecated. since 3.0, Use IODataAssociationEnd Represents the appropriate SDMODData element.

**Syntax**

```
public abstract interface ISDMODDataAssociationEnd
```

**Derived classes**

- *SDMODDataAssociationEnd* on page 1458

**Members**

All members of ISDMODDataAssociationEnd, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 1101	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_MULTIPLICITY</i> on page 1101	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_ROLE</i> on page 1101	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 1101	Name of the appropriate SDMODData attribute.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getCollectionId()</i> on page 1100	Returns the value of the appropriate EntitySet SDMODData attribute.
public abstract String	<i>getEntitySet()</i> on page 1100	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getMultiplicity()</i> on page 1100	Returns the value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getRole()</i> on page 1100	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getType()</i> on page 1101	Returns the value of the appropriate SDMOData attribute.

***getCollectionId() method***

Returns the value of the appropriate EntitySet SDMOData attribute.

***Syntax***

```
public abstract String getCollectionId ()
```

***Returns***

the value of the appropriate EntitySet SDMOData attribute

***getEntitySet() method***

Returns the value of the appropriate SDMOData attribute.

***Syntax***

```
public abstract String getEntitySet ()
```

***Returns***

the value of the appropriate SDMOData attribute

***getMultiplicity() method***

Returns the value of the appropriate SDMOData attribute.

***Syntax***

```
public abstract String getMultiplicity ()
```

***Returns***

the value of the appropriate SDMOData attribute

***getRole() method***

Returns the value of the appropriate SDMOData attribute.

***Syntax***

```
public abstract String getRole ()
```

***Returns***

the value of the appropriate SDMOData attribute

***getType() method***

Returns the value of the appropriate SDMODData attribute.

***Syntax***

```
public abstract String getType ()
```

***Returns***

the value of the appropriate SDMODData attribute

***ATTRIBUTE\_ENTITYSET variable***

Name of the appropriate SDMODData attribute.

***Syntax***

```
public static final String ATTRIBUTE_ENTITYSET
```

***ATTRIBUTE\_MULTIPLICITY variable***

Name of the appropriate SDMODData attribute.

***Syntax***

```
public static final String ATTRIBUTE_MULTIPLICITY
```

***ATTRIBUTE\_ROLE variable***

Name of the appropriate SDMODData attribute.

***Syntax***

```
public static final String ATTRIBUTE_ROLE
```

***ATTRIBUTE\_TYPE variable***

Name of the appropriate SDMODData attribute.

***Syntax***

```
public static final String ATTRIBUTE_TYPE
```

***ISDMODDataAssociationSet interface***

Deprecated. since 3.0, Use IODataAssociationSet Represents the appropriate SDMODData element.

***Syntax***

```
public abstract interface ISDMODDataAssociationSet extends
ISDMODDataAssociation
```

*Derived classes*

- *SDMODataAssociationSet* on page 1468

*Members*

All members of *ISDMODataAssociationSet*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_ASSOCIATION-SET</i> on page 1108	Name of the appropriate <i>SDMOData</i> element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getAssociation()</i> on page 1107	Returns the value of appropriate <i>SDMOData</i> element.

**Inherited members from *ISDMODataAssociation***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 1098	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1098	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 1098	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_ASSOCIATION-NEED</i> on page 1099	Name of the appropriate <i>SDMOData</i> element.
public abstract <i>ISDMODataAssociationEnd</i>	<i>getAssociationEnd(String)</i> on page 1097	Returns the value of the appropriate Association End <i>SDMOData</i> element with the given role.
public abstract List< <i>ISDMODataAssociationEnd</i> >	<i>getAssociationEnds()</i> on page 1098	Returns list of the appropriate <i>SDMOData</i> elements.
public abstract String	<i>getName()</i> on page 1098	Returns the value of the appropriate <i>SDMOData</i> attribute.

**Inherited members from *ISDMParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getAssociation()* method

Returns the value of appropriate SDMOData element.

#### Syntax

```
public abstract String getAssociation ()
```

#### Returns

the value of appropriate SDMOData element

*ELEMENT\_ASSOCIATIONSET* variable

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_ASSOCIATIONSET
```

*ISDMODDataCollection* interface

Deprecated. since 3.0, Use IODataCollection Represents the 'Collection' element of the SDMODData Service Document.

*Syntax*

```
public abstract interface ISDMODDataCollection extends
ISDMParserDocument
```

*Derived classes*

- *SDMODDataCollection* on page 1489

*Members*

All members of ISDMODDataCollection, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 1119	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 1119	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_DISPLAYOR- DER</i> on page 1119	Name of the appropriate SDMODData extension attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 1119	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_HREF</i> on page 1120	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 1120	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 1120	Name of the appropriate SDMSDMODData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 1120	Name of the appropriate SDMODData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_VALUE_REL_SEARCH</i> on page 1120	Possible value of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_COLLECTION</i> on page 1120	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_LINK</i> on page 1120	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_MEMBERTITLE</i> on page 1121	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_TITLE</i> on page 1121	Name of the appropriate SDMODData element.

### Methods

Modifier and Type	Method	Description
public abstract int	<i>getDisplayOrder()</i> on page 1115	Returns the value of the appropriate SDMODData extension attribute.
public abstract String	<i>getHref()</i> on page 1115	Returns the value of the 'href' SDMODData attribute.
public abstract List< ISDMODDataIcon >	<i>getIcons()</i> on page 1116	Returns list of the appropriate SDMODData elements.
public abstract String	<i>getId()</i> on page 1116	Returns the value of the 'href' SDMODData attribute as a relative href (matchable with appropriate entitySet)
public abstract List< ISDMODDataLink >	<i>getLinks()</i> on page 1116	Returns the value of the appropriate SDMODData elements.
public abstract String	<i>getMemberTitle()</i> on page 1116	Returns the value of the appropriate SDMSDMODData element.
public abstract ISDMODDataLink	<i>getSearchLink()</i> on page 1116	Returns SDMSDMODData Link object that should be used for retrieving Open Search Description XML.

Modifier and Type	Method	Description
public abstract String	<i>getSemantics()</i> on page 1117	Returns the value of the appropriate SDMODData attribute.
public abstract ISDMODData-Link	<i>getSubscriptionLink()</i> on page 1117	Returns SDMSDMODData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getTitle()</i> on page 1117	Returns the value of the appropriate SDMODData element.
public abstract String	<i>getUrl()</i> on page 1117	Returns SDMSDMODData Link object that should be used for self related operations.
public abstract boolean	<i>isCreatable()</i> on page 1118	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isDeletable()</i> on page 1118	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isFilterable()</i> on page 1118	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isSearchable()</i> on page 1118	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 1118	Returns the value of the appropriate SDMODData attribute.
public abstract void	<i>setEntitySet(ISDMODDataEntitySet)</i> on page 1119	Sets the data held by the appropriate element of the SDMODData Schema.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getDisplayOrder()* method

Returns the value of the appropriate SDMODData extension attribute.

#### *Syntax*

```
public abstract int getDisplayOrder ()
```

#### *Returns*

The value of the appropriate SDMODData extension attribute

#### *getHref()* method

Returns the value of the 'href' SDMODData attribute.

#### *Syntax*

```
public abstract String getHref ()
```

#### *Returns*

The value of the 'href' SDMODData attribute

### *getIcons() method*

Returns list of the appropriate SDMODData elements.

#### *Syntax*

```
public abstract List< ISDMODDataIcon > getIcons ()
```

#### *Returns*

list of the appropriate SDMODData elements

### *getId() method*

Returns the value of the 'href' SDMODData attribute as a relative href (matchable with appropriate entitySet)

#### *Syntax*

```
public abstract String getId ()
```

#### *Returns*

The value of the 'href' SDMODData attribute

### *getLinks() method*

Returns the value of the appropriate SDMODData elements.

#### *Syntax*

```
public abstract List< ISDMODDataLink > getLinks ()
```

#### *Returns*

The value of the appropriate SDMODData elements

### *getMemberTitle() method*

Returns the value of the appropriate SDMSDMODData element.

#### *Syntax*

```
public abstract String getMemberTitle ()
```

#### *Returns*

The value of the appropriate SDMSDMODData element

### *getSearchLink() method*

Returns SDMSDMODData Link object that should be used for retrieving Open Search Description XML.

#### *Syntax*

```
public abstract ISDMODDataLink getSearchLink ()
```

*Returns*

SDMSDMOData Link for search

*getSemantics() method*

Returns the value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getSemantics ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getSubscriptionLink() method*

Returns SDMSDMOData Link object that should be used for subscription or null if there is no subscription link defined.

*Syntax*

```
public abstract ISDMODataLink getSubscriptionLink ()
```

*Returns*

SDMSDMOData Link for subscribe

*getTitle() method*

Returns the value of the appropriate SDMOData element.

*Syntax*

```
public abstract String getTitle ()
```

*Returns*

The value of the appropriate SDMOData element

*getUrl() method*

Returns SDMSDMOData Link object that should be used for self related operations.

*Syntax*

```
public abstract String getUrl ()
```

*Returns*

SDMSDMOData Link for self Returns the full URL of the collectionThe full URL of the collection

### *isCreatable() method*

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isCreatable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isDeletable() method*

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isDeletable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isFilterable() method*

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isFilterable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isSearchable() method*

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isSearchable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isUpdatable() method*

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isUpdatable ()
```

**Returns**

The value of the appropriate SDMOData attribute

**setEntitySet(ISDMODataEntitySet) method**

Sets the data held by the appropriate element of the SDMOData Schema.

**Syntax**

```
public abstract void setEntitySet ( ISDMODataEntitySet
entitySet )
```

**Parameters**

- **entitySet** – The SDMOData EntitySet to use the data from.

**Usage**

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

**ATTRIBUTE\_CREATABLE variable**

Name of the appropriate SDMOData attribute.

**Syntax**

```
public static final String ATTRIBUTE_CREATABLE
```

**ATTRIBUTE\_DELETABLE variable**

Name of the appropriate SDMOData attribute.

**Syntax**

```
public static final String ATTRIBUTE_DELETABLE
```

**ATTRIBUTE\_DISPLAYORDER variable**

Name of the appropriate SDMOData extension attribute.

**Syntax**

```
public static final String ATTRIBUTE_DISPLAYORDER
```

**ATTRIBUTE\_FILTERABLE variable**

Name of the appropriate SDMOData attribute.

**Syntax**

```
public static final String ATTRIBUTE_FILTERABLE
```

### *ATTRIBUTE\_HREF variable*

Name of the appropriate SDMOData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_HREF
```

### *ATTRIBUTE\_SEARCHABLE variable*

Name of the appropriate SDMOData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEARCHABLE
```

### *ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate SDMSDMOData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

### *ATTRIBUTE\_UPDATABLE variable*

Name of the appropriate SDMOData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_UPDATABLE
```

### *ATTRIBUTE\_VALUE\_REL\_SEARCH variable*

Possible value of the appropriate SDMOData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_VALUE_REL_SEARCH
```

### *ELEMENT\_COLLECTION variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_COLLECTION
```

### *ELEMENT\_LINK variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_LINK
```

***ELEMENT\_MEMBERTITLE* variable**

Name of the appropriate SDMODData element.

**Syntax**

```
public static final String ELEMENT_MEMBERTITLE
```

***ELEMENT\_TITLE* variable**

Name of the appropriate SDMODData element.

**Syntax**

```
public static final String ELEMENT_TITLE
```

***ISDMODDataComplexType* interface**

Deprecated. since 3.0, Use IODataComplexType Represents the appropriate SDMODData element.

**Syntax**

```
public abstract interface ISDMODDataComplexType extends
ISDMParserDocument
```

**Derived classes**

- *SDMODDataComplexType* on page 1511

**Members**

All members of ISDMODDataComplexType, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_NAME</i> on page 1127	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 1127	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 1127	Name of the appropriate SDMODData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 1127	Returns the value of the appropriate SDMODData element.

Modifier and Type	Method	Description
public abstract List< ISDMO-DataProperty >	<i>getProperties()</i> on page 1127	Returns the list of the appropriate SDMOData elements.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

*getName() method*

Returns the value of the appropriate SDMODData element.

*Syntax*

```
public abstract String getName ()
```

*Returns*

The value of the appropriate SDMODData element

*getProperties() method*

Returns the list of the appropriate SDMODData elements.

*Syntax*

```
public abstract List< ISDMODDataProperty > getProperties ()
```

*Returns*

The list of the appropriate SDMODData elements

*ATTRIBUTE\_NAME variable*

Name of the appropriate SDMODData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAME
```

*ELEMENT\_COMPLEXTYPE variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_COMPLEXTYPE
```

*ELEMENT\_PROPERTY variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_PROPERTY
```

*ISDMODDataEntitySet interface*

Deprecated. since 3.0, Use IODataEntitySet Represents the appropriate SDMODData element.

*Syntax*

```
public abstract interface ISDMODDataEntitySet extends
ISDMParserDocument
```

*Derived classes*

- *SDMODataEntitySet* on page 1526

*Members*

All members of *ISDMODataEntitySet*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 1135	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 1135	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1135	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 1135	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 1135	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 1135	Name of the appropriate <i>SDMOData</i> element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 1133	
public abstract boolean	<i>isCreatable()</i> on page 1134	
public abstract boolean	<i>isDeletable()</i> on page 1134	
public abstract boolean	<i>isSearchable()</i> on page 1134	
public abstract boolean	<i>isSearchable(String)</i> on page 1134	Returns the value of the given <i>SDMOData</i> attribute.
public abstract boolean	<i>isUpdatable()</i> on page 1134	

**Inherited members from *ISDMParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate <i>SDMOData</i> element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1317	Creates a copy of this object.

public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getName()* method

##### Syntax

```
public abstract String getName ()
```

##### Returns

The value of the appropriate SDMOData attribute

*isCreatable() method*

*Syntax*

```
public abstract boolean isCreatable ()
```

*Returns*

The value of the appropriate SDMOData attribute

*isDeletable() method*

*Syntax*

```
public abstract boolean isDeletable ()
```

*Returns*

The value of the appropriate SDMOData attribute

*isSearchable() method*

*Syntax*

```
public abstract boolean isSearchable ()
```

*Returns*

The value of the appropriate SDMOData attribute

*isSearchable(String) method*

Returns the value of the given SDMOData attribute.

*Syntax*

```
public abstract boolean isSearchable (String searchAttributeName)
```

*Parameters*

- **searchAttributeName** – The name of the SDMOData attribute

*Returns*

The value of the given SDMOData attribute

*isUpdatable() method*

*Syntax*

```
public abstract boolean isUpdatable ()
```

*Returns*

The value of the appropriate SDMOData attribute

***ATTRIBUTE\_CREATABLE* variable**

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_CREATABLE
```

***ATTRIBUTE\_DELETABLE* variable**

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_DELETABLE
```

***ATTRIBUTE\_NAME* variable**

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NAME
```

***ATTRIBUTE\_SEARCHABLE* variable**

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_SEARCHABLE
```

***ATTRIBUTE\_UPDATABLE* variable**

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_UPDATABLE
```

***ELEMENT\_ENTITYSET* variable**

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_ENTITYSET
```

***ISDMODataEntityType* interface**

Deprecated. since 3.0, Use IODataEntityType Represents the appropriate SDMOData element.

***Syntax***

```
public abstract interface ISDMODataEntityType extends
ISDMParserDocument
```

*Derived classes*

- *SDMODataEntityType* on page 1542

*Members*

All members of *ISDMODataEntityType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_HASSTREAM</i> on page 1146	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1146	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 1146	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_KEY</i> on page 1146	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 1146	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_PROPERTYREF</i> on page 1147	Name of the appropriate <i>SDMOData</i> element.

**Methods**

Modifier and Type	Method	Description
public abstract List< <i>ISDMODataProperty</i> >	<i>getGPUseInSearchPropertiesData()</i> on page 1142	Returns The list of appropriate <i>SDMOData</i> elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public abstract List< <i>ISDMODataProperty</i> >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1143	Returns The list of appropriate <i>SDMOData</i> elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public abstract List< <i>ISDMODataProperty</i> >	<i>getGPVisibleInListPropertiesData()</i> on page 1143	Returns The list of appropriate <i>SDMOData</i> elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Modifier and Type	Method	Description
public abstract List< String >	<i>getKeyPropertyNames()</i> on page 1143	Returns the list of the values of the 'PropertyRef' SDMODData element contained by the 'Key' SDMODData element.
public abstract String	<i>getName()</i> on page 1143	Returns The value of the appropriate SDMODData attribute.
public abstract List< ISDMO-DataNavigationProperty >	<i>getNavigationProperties()</i> on page 1144	Returns The list of appropriate SDMODData elements.
public abstract ISDMODDataNavigationProperty	<i>getNavigationProperty(String)</i> on page 1144	Returns The appropriate SDMODData element with the given name.
public abstract List< ISDMO-DataProperty >	<i>getProperties()</i> on page 1144	Returns The list of appropriate SDMODData elements.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 1144	Returns The list of appropriate SDMODData elements with given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 1145	Returns The list of appropriate SDMODData elements with given attribute value.
public abstract ISDMODDataProperty	<i>getProperty(String)</i> on page 1145	Returns The appropriate SDMODData element with the given name.
public abstract List< ISDMO-DataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 1145	Returns The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getSearchablePropertiesData(String)</i> on page 1145	Returns The list of appropriate SDMODData elements with 'true' attribute value of the given attribute.
public abstract boolean	<i>hasStream()</i> on page 1146	Returns The value of the appropriate SDMODData attribute.

### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getGPUseInSearchPropertiesData()* method

Returns The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

#### *Syntax*

```
public abstract List< ISDMODataProperty >
getGPUseInSearchPropertiesData ()
```

#### *Returns*

The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value

*getGPVisibleInDetailPropertiesData() method*

Returns The list of appropriate SDMODData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

*Syntax*

```
public abstract List< ISDMODDataProperty >
getGPVisibleInDetailPropertiesData ()
```

*Returns*

The list of appropriate SDMODData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value

*getGPVisibleInListPropertiesData() method*

Returns The list of appropriate SDMODData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

*Syntax*

```
public abstract List< ISDMODDataProperty >
getGPVisibleInListPropertiesData ()
```

*Returns*

The list of appropriate SDMODData elements with 'true' visible-in-list (Generic Player names-pace) attribute value

*getKeyPropertyNames() method*

Returns the list of the values of the 'PropertyRef' SDMODData element contained by the 'Key' SDMODData element.

*Syntax*

```
public abstract List< String > getKeyPropertyNames ()
```

*Returns*

The list of the values of the 'PropertyRef' SDMODData element

*getName() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract String getName ()
```

*Returns*

The value of the appropriate SDMODData attribute

### *getNavigationProperties() method*

Returns The list of appropriate SDMODData elements.

#### *Syntax*

```
public abstract List< ISDMODDataNavigationProperty >  
getNavigationProperties ()
```

#### *Returns*

The list of appropriate SDMODData elements

### *getNavigationProperty(String) method*

Returns The appropriate SDMODData element with the given name.

#### *Syntax*

```
public abstract ISDMODDataNavigationProperty  
getNavigationProperty ( String name )
```

#### *Returns*

The appropriate SDMODData element with the given name

### *getProperties() method*

Returns The list of appropriate SDMODData elements.

#### *Syntax*

```
public abstract List< ISDMODDataProperty > getProperties ()
```

#### *Returns*

The list of appropriate SDMODData elements

### *getPropertiesWithAttribute(String, String) method*

Returns The list of appropriate SDMODData elements with given attribute value.

#### *Syntax*

```
public abstract List< ISDMODDataProperty >  
getPropertiesWithAttribute ( String attributeName , String  
attributeValue )
```

#### *Returns*

The list of appropriate SDMODData elements with given attribute value

***getPropertiesWithAttribute(String, String, boolean) method***

Returns The list of appropriate SDMODData elements with given attribute value.

***Syntax***

```
public abstract List< ISDMODDataProperty >
getPropertiesWithAttribute ( String attributeName , String
attributeValue , boolean addByDefault )
```

***Returns***

The list of appropriate SDMODData elements with given attribute value

***getProperty(String) method***

Returns The appropriate SDMODData element with the given name.

***Syntax***

```
public abstract ISDMODDataProperty getProperty ( String
propertyName )
```

***Returns***

The appropriate SDMODData element with the given name

***getSAPSearchablePropertiesData() method***

Returns The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value.

***Syntax***

```
public abstract List< ISDMODDataProperty >
getSAPSearchablePropertiesData ( )
```

***Returns***

The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value

***getSearchablePropertiesData(String) method***

Returns The list of appropriate SDMODData elements with 'true' attribute value of the given attribute.

***Syntax***

```
public abstract List< ISDMODDataProperty >
getSearchablePropertiesData ( String searchAttributeName )
```

### *Returns*

The list of appropriate SDMODData elements with 'true' attribute value of the given attribute

### *hasStream() method*

Returns The value of the appropriate SDMODData attribute.

### *Syntax*

```
public abstract boolean hasStream ()
```

### *Returns*

The value of the appropriate SDMODData attribute

### *ATTRIBUTE\_HASSTREAM variable*

Name of the appropriate SDMODData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_HASSTREAM
```

### *ATTRIBUTE\_NAME variable*

Name of the appropriate SDMODData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_NAME
```

### *ELEMENT\_ENTITYTYPE variable*

Name of the appropriate SDMODData element.

### *Syntax*

```
public static final String ELEMENT_ENTITYTYPE
```

### *ELEMENT\_KEY variable*

Name of the appropriate SDMODData element.

### *Syntax*

```
public static final String ELEMENT_KEY
```

### *ELEMENT\_PROPERTY variable*

Name of the appropriate SDMODData element.

### *Syntax*

```
public static final String ELEMENT_PROPERTY
```

***ELEMENT\_PROPERTYREF* variable**

Name of the appropriate SDMODData element.

**Syntax**

```
public static final String ELEMENT_PROPERTYREF
```

***ISDMODDataEntry* interface**

Deprecated. since 3.0, Use IODataEntry Represents the 'entry' SDMODData element with maintained reference to the appropriate SDMODData Schema document.

**Syntax**

```
public abstract interface ISDMODDataEntry extends
ISDMParserDocument, Serializable
```

**Derived classes**

- *ISDMODDataSubscriptionEntry* on page 1270
- *SDMODDataEntry* on page 1562
- *SDMODDataReturnTypeInfoEntry* on page 1741

**Members**

All members of ISDMODDataEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 1168	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 1169	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 1169	Value option for appropriate SDMODData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 1169	Name of the appropriate SDMODData element.

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_LINK</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_NAME</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_TITLE</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 1170	

### Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataLink >	<i>getActionLinks()</i> on page 1157	Returns SDMODData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 1157	Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.
public cacheState	<i>getCachestate()</i> on page 1158	
public Long	<i>getCacheTimestamp()</i> on page 1158	
public abstract String	<i>getCollectionId()</i> on page 1158	Returns the Id of the SDMOCa-ta Collection that this Entry belongs to.
public abstract String	<i>getEtag()</i> on page 1158	Returns the Id of the SDMODa-ta Collection that this Entry belongs to.

Modifier and Type	Method	Description
public abstract String	<i>getFilterUrl()</i> on page 1158	Returns the full execution URL that can be used for filtering collection search for this single entry.
public abstract List< ISDMO-DataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 1159	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' use-in-search (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1159	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 1159	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataIcon >	<i>getIcons()</i> on page 1159	Returns the list of the appropriate SDMOData elements.
public abstract String	<i>getId()</i> on page 1160	Returns The Id of this SDMO-Data Entry (value of appropriate SDMOData Id element)
public boolean	<i>getIsLocal()</i> on page 1160	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 1160	Returns the values of the properties that are marked as key properties in the SDMOData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 1160	Returns The parsed value of the 'updated' SDMOData Element.

Modifier and Type	Method	Description
public abstract List< ISDMO-DataLink >	<i>getLinks()</i> on page 1160	Returns the list of the appropriate SDMODData elements.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesData()</i> on page 1161	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-data Entry document.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 1161	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 1161	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract ISDMParserDocument	<i>getPropertiesDocument()</i> on page 1162	Returns the representer document of SDMODData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 1162	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValue-Parsed(String...)</i> on page 1163	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 1163	Returns the all the values of properties contained by this SDMODData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

Modifier and Type	Method	Description
public abstract List< String >	<i>getPropertyValues(List&lt;String[]&gt;)</i> on page 1163	Return list of property values for the given property paths.
public abstract List< ISDMO-DataLink >	<i>getRelatedDataLinks()</i> on page 1164	Returns SDMOData Link objects that represents links to Related Data.
public abstract List< ISDMO-DataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 1164	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract ISDMOData-Schema	<i>getSchema()</i> on page 1164	Returns the appropriate SDMOData Schema object.
public abstract ISDMOData-Link	<i>getSelfLink()</i> on page 1164	Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract ISDMOData-Link	<i>getSubscriptionLink()</i> on page 1165	Returns SDMOData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 1165	Returns The value of the appropriate SDMOData element.
public abstract String	<i>getTitle()</i> on page 1165	Returns The value of the appropriate SDMOData element.
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 1165	Puts the new property element as a sub-element of the 'complex properties' SDMOData element.
public abstract void	<i>putId(String)</i> on page 1166	Sets id of this SDMOData Entry document (value of appropriate SDMOData Id element)
public abstract void	<i>putPropertyValue(String, String)</i> on page 1166	Puts the new property element as a sub-element of the 'properties' SDMOData element.

Modifier and Type	Method	Description
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 1166	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public abstract void	<i>setAuthorName(String)</i> on page 1167	Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.
public void	<i>setCacheState(cacheState)</i> on page 1167	
public void	<i>setCacheTimestamp(Long)</i> on page 1167	
public abstract void	<i>setCollectionId(String)</i> on page 1167	Maintains the Id of the SDMO-Cata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 1168	
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 1168	Maintains the reference to the appropriate SDMODData Schema object.
public abstract void	<i>setSummary(String)</i> on page 1168	Sets the value of the appropriate SDMODData element.
public abstract void	<i>setTitle(String)</i> on page 1168	Sets the value of the appropriate SDMODData element.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getActionLinks()* method

Returns SDMODData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')

#### *Syntax*

```
public abstract List< ISDMODDataLink > getActionLinks ()
```

#### *Returns*

List of SDMODData Action Link documents

#### *getAuthorName()* method

Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.

#### *Syntax*

```
public abstract String getAuthorName ()
```

#### *Returns*

The value of the 'name' SDMODData element of the 'author' SDMODData element

*getCacheState() method*

*Syntax*

```
public cacheState getCacheState ()
```

*getCacheTimestamp() method*

*Syntax*

```
public Long getCacheTimestamp ()
```

*getCollectionId() method*

Returns the Id of the SDMOCata Collection that this Entry belongs to.

*Syntax*

```
public abstract String getCollectionId ()
```

*Returns*

The Id of the SDMOCata Collection that this Entry belongs to

*getEtag() method*

Returns the Id of the SDMOData Collection that this Entry belongs to.

*Syntax*

```
public abstract String getEtag ()
```

*Returns*

The Id of the SDMOData Collection that this Entry belongs to

*getFilterUrl() method*

Returns the full execution URL hat can be used for filtering collection search for this single entry.

*Syntax*

```
public abstract String getFilterUrl ()
```

*Returns*

The full filter URL

***getGPUseInSearchPropertiesData() method***

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' use-in-search (Generic Player name-space) attribute value.

***Syntax***

```
public abstract List< ISDMODataProperty >
getGPUseInSearchPropertiesData ()
```

***Returns***

The meta-informations and values of the appropriate properties

***getGPVisibleInDetailPropertiesData() method***

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.

***Syntax***

```
public abstract List< ISDMODataProperty >
getGPVisibleInDetailPropertiesData ()
```

***Returns***

The meta-informations and values of the appropriate properties

***getGPVisibleInListPropertiesData() method***

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.

***Syntax***

```
public abstract List< ISDMODataProperty >
getGPVisibleInListPropertiesData ()
```

***Returns***

The meta-informations and values of the appropriate properties

***getIcons() method***

Returns the list of the appropriate SDMOData elements.

***Syntax***

```
public abstract List< ISDMODataIcon > getIcons ()
```

### *Returns*

The list of the appropriate SDMOData elements

### *getId() method*

Returns The Id of this SDMOData Entry (value of appropriate SDMOData Id element)

### *Syntax*

```
public abstract String getId ()
```

### *Returns*

The Id of this SDMOData Entry

### *getIsLocal() method*

### *Syntax*

```
public boolean getIsLocal ()
```

### *getKeyPropertyValues() method*

Returns the values of the properties that are marked as key properties in the SDMOData Schema document.

### *Syntax*

```
public abstract Map< String, String > getKeyPropertyValues  
( )
```

### *Returns*

The name-value pairs of the key properties

### *getLastUpdated() method*

Returns The parsed value of the 'updated' SDMOData Element.

### *Syntax*

```
public abstract Date getLastUpdated ()
```

### *Returns*

The parsed value of the value of the 'updated' SDMOData element or null is parsing failed

### *getLinks() method*

Returns the list of the appropriate SDMOData elements.

### *Syntax*

```
public abstract List< ISDMODataLink > getLinks ()
```

**Returns**

The list of the appropriate SDMOData elements

***getPropertiesData()* method**

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document.

**Syntax**

```
public abstract List< ISDMODataProperty > getPropertiesData
()
```

**Returns**

The meta-informations and values of the contained properties

***getPropertiesDataWithAttribute(String, String)* method**

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.

**Syntax**

```
public abstract List< ISDMODataProperty >
getPropertiesDataWithAttribute ( String attributeName , String
attributeValue )
```

**Parameters**

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

**Returns**

The meta-informations and values of the appropriate properties

***getPropertiesDataWithAttribute(String, String, boolean)* method**

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.

**Syntax**

```
public abstract List< ISDMODataProperty >
getPropertiesDataWithAttribute ( String attributeName , String
attributeValue , boolean addByDefault )
```

**Parameters**

- **attributeName** – The name of the attribute

- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

### Returns

The meta-informations and values of the appropriate properties

### *getPropertiesDocument()* method

Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

### Syntax

```
public abstract ISDMParseDocument getPropertiesDocument ()
```

### Returns

The SDMParseDocument representation of SDMOData 'properties' (Metadata name-space) document

### *getPropertyValue(String...)* method

Returns the value of the appropriate property.

### Syntax

```
public abstract String getPropertyValue (String... propertyPath )  
throws IllegalArgumentException
```

### Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

### Returns

The value of the property

### Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous.

### Usage

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

*getPropertyValueParsed(String...) method*

Returns the value of the appropriate property parsed to it's real type.

*Syntax*

```
public abstract< T > T getPropertyValueParsed ( String...
propertyPath ) throws ClassCastException
```

*Parameters*

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

*Returns*

The value of the property

*Exceptions*

- **IllegalArgumentException** – if the property name is null or ambiguous
- **ClassCastException** – if the property value can not be parsed to the expected type

*Usage*

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

*getPropertyValues() method*

Returns the all the values of properties contained by this SDMOData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

*Syntax*

```
public abstract Map< String, String > getPropertyValues ()
```

*Returns*

The name/path and value pairs of the contained properties

*Usage*

The name of the properties will contain their current name-space prefixes.

*getPropertyValues(List< String[]>) method*

Return list of property values for the given property paths.

*Syntax*

```
public abstract List< String > getPropertyValues ( List<
String[]> propertyPathes )
```

### *Parameters*

- **propertyPathes** – Name of the property or path including the name of the enclosing Complex Types

### *Returns*

The list of the values of the properties

### *getRelatedDataLinks() method*

Returns SDMOData Link objects that represents links to Related Data.

### *Syntax*

```
public abstract List< ISDMODataLink > getRelatedDataLinks ()
```

### *Returns*

List of SDMOData Related Link documents

### *getSAPSearchablePropertiesData() method*

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' searchable (SAP name-space) attribute value.

### *Syntax*

```
public abstract List< ISDMODataProperty >  
getSAPSearchablePropertiesData ()
```

### *Returns*

The meta-informations and values of the appropriate properties

### *getSchema() method*

Returns the appropriate SDMOData Schema object.

### *Syntax*

```
public abstract ISDMODataSchema getSchema ()
```

### *Returns*

The appropriate SDMOData Schema object.

### *getSelfLink() method*

Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

### *Syntax*

```
public abstract ISDMODataLink getSelfLink ()
```

*Returns*

SDMSDMODData self Link

*getSubscriptionLink() method*

Returns SDMODData Link object that should be used for subscription or null if there is no subscription link defined.

*Syntax*

```
public abstract ISDMODDataLink getSubscriptionLink ()
```

*Returns*

SDMODData Link for subscribe

*getSummary() method*

Returns The value of the appropriate SDMODData element.

*Syntax*

```
public abstract String getSummary ()
```

*Returns*

The value of the appropriate SDMODData element

*getTitle() method*

Returns The value of the appropriate SDMODData element.

*Syntax*

```
public abstract String getTitle ()
```

*Returns*

The value of the appropriate SDMODData element

*putComplexPropertyValue(String, String...) method*

Puts the new property element as a sub-element of the 'complex properties' SDMODData element.

*Syntax*

```
public abstract void putComplexPropertyValue (String
propertyValue , String... propertyName )
```

*Parameters*

- **propertyName** – The route of the property with or without name-space until the complex type.

- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

### *putId(String) method*

Sets id of this SDMODData Entry document (value of appropriate SDMODData Id element)

### *Syntax*

```
public abstract void putId ( String id ) throws  
IllegalArgumentException
```

### *Parameters*

- **id** – The new id.

### *putPropertyValue(String, String) method*

Puts the new property element as a sub-element of the 'properties' SDMODData element.

### *Syntax*

```
public abstract void putPropertyValue ( String propertyName ,  
String propertyValue )
```

### *Parameters*

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

### *Usage*

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

### *putPropertyValue(String, String, boolean) method*

Puts the new property element as a sub-element of the 'properties' SDMODData element.

### *Syntax*

```
public abstract void putPropertyValue ( String propertyName ,  
String propertyValue , boolean useDefaultPrefix )
```

*Parameters*

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

*Usage*

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

*setAuthorName(String) method*

Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.

*Syntax*

```
public abstract void setAuthorName ( String authorName )
```

*Parameters*

- **authorName** – The new value of the element

*setCacheState(cacheState) method**Syntax*

```
public void setCacheState ( cacheState cacheState )
```

*setCacheTimestamp(Long) method**Syntax*

```
public void setCacheTimestamp ( Long timestamp )
```

*setCollectionId(String) method*

Maintains the Id of the SDMOCata Collection that this Entry belongs to.

*Syntax*

```
public abstract void setCollectionId ( String collectionId )
```

*Parameters*

- **collectionId** – The Id of the SDMOCata Collection that this Entry belongs to

### *setIsLocal(boolean) method*

#### *Syntax*

```
public void setIsLocal (boolean isLocal)
```

### *setSchema(ISDMODataSchema) method*

Maintains the reference to the appropriate SDMODData Schema object.

#### *Syntax*

```
public abstract void setSchema ( ISDMODataSchema schema )
```

#### *Parameters*

- **schema** – The appropriate SDMODData Schema object.

### *setSummary(String) method*

Sets the value of the appropriate SDMODData element.

#### *Syntax*

```
public abstract void setSummary (String summary)
```

#### *Parameters*

- **summary** – The new value of the element

### *setTitle(String) method*

Sets the value of the appropriate SDMODData element.

#### *Syntax*

```
public abstract void setTitle (String title)
```

#### *Parameters*

- **title** – The new value of the element

### *ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

***ATTRIBUTE\_TERM variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_TERM
```

***ATTRIBUTE\_VALUE\_SEMANTICS\_ACTION variable***

Value option for appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_VALUE_SEMANTICS_ACTION
```

***ELEMENT\_AUTHOR variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_AUTHOR
```

***ELEMENT\_CATEGORY variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_CATEGORY
```

***ELEMENT\_CONTENT variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_CONTENT
```

***ELEMENT\_ENTRY variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_ENTRY
```

***ELEMENT\_LINK variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_LINK
```

### *ELEMENT\_NAME variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_NAME
```

### *ELEMENT\_PROPERTIES variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_PROPERTIES
```

### *ELEMENT\_SUMMARY variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_SUMMARY
```

### *ELEMENT\_TITLE variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_TITLE
```

### *ELEMENT\_UPDATED variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_UPDATED
```

### *PROPERTY\_LEVEL\_SEPARATOR variable*

#### *Syntax*

```
public static final String PROPERTY_LEVEL_SEPARATOR
```

### *ISDMODataError interface*

Deprecated. since 3.0, Use IODataError Represents the appropriate SDMODData element.

#### *Syntax*

```
public abstract interface ISDMODataError extends  
ISDMParserDocument
```

*Derived classes*

- *SDMODataError* on page 1598

*Members*

All members of *ISDMODataError*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_LANGUAGE</i> on page 1177	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	<i>ELEMENT_ERROR</i> on page 1177	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_ERRORCODE</i> on page 1177	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ELEMENT_MESSAGE</i> on page 1177	Name of the appropriate <i>SDMOData</i> element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getErrorCode()</i> on page 1176	Returns The value of the 'code' <i>SDMOData</i> element.
public abstract String	<i>getLang()</i> on page 1176	Returns The value of the appropriate <i>SDMOData</i> attribute of the 'message' element.
public abstract String	<i>getMessage()</i> on page 1177	Return the localized error message.

**Inherited members from *ISDMParserDocument***

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract <i>ISDMParserDocument</i>	<i>clone()</i> on page 1317	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getErrorCode()* method

Returns The value of the 'code' SDMODData element.

#### *Syntax*

```
public abstract String getErrorCode ()
```

#### *Returns*

The value of the 'code' SDMODData element

#### *getLang()* method

Returns The value of the appropriate SDMODData attribute of the 'message' element.

#### *Syntax*

```
public abstract String getLang ()
```

#### *Returns*

The value of the appropriate SDMODData attribute of the 'message' element

***getMessage() method***

Return the localized error message.

***Syntax***

```
public abstract String getMessage ()
```

***Returns***

The value of the 'message' SDMODData element

***ATTRIBUTE\_LANGUAGE variable***

Name of the appropriate SDMODData attribute.

***Syntax***

```
public static final String ATTRIBUTE_LANGUAGE
```

***ELEMENT\_ERROR variable***

Name of the appropriate SDMODData element.

***Syntax***

```
public static final String ELEMENT_ERROR
```

***ELEMENT\_ERRORCODE variable***

Name of the appropriate SDMODData element.

***Syntax***

```
public static final String ELEMENT_ERRORCODE
```

***ELEMENT\_MESSAGE variable***

Name of the appropriate SDMODData element.

***Syntax***

```
public static final String ELEMENT_MESSAGE
```

***ISDMODDataFunctionImport interface***

Deprecated. since 3.0, Use IODataFunctionImport Represents the 'FunctionImport' SDMODData element.

***Syntax***

```
public abstract interface ISDMODDataFunctionImport extends
ISDMParserDocument
```

*Derived classes*

- *SDMODataFunctionImport* on page 1613

*Members*

All members of ISDMODataFunctionImport, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ACTION_FOR</i> on page 1186	Name of the appropriate SDMSMODData attribute.
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 1186	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_HTTPMETHOD</i> on page 1187	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1187	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_RETURNTYPE</i> on page 1187	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_FUNCTIONALIMPORT</i> on page 1187	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 1187	Name of the appropriate SDMODData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getActionFor()</i> on page 1184	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getCollectionId()</i> on page 1184	Returns The value of the 'EntitySet' SDMODData attribute.
public abstract String	<i>getEntitySet()</i> on page 1184	Returns The value of the 'EntitySet' SDMODData attribute.
public abstract String	<i>getExecutionUrl(Map&lt; String, String &gt;)</i> on page 1185	Calculate the full execution URL for executing this Function Import according to the passed parameters.

Modifier and Type	Method	Description
public abstract String	<i>getHTTPMethod()</i> on page 1185	Returns The value of the appropriate SDMODData attribute.
public abstract List< String >	<i>getInputParameterNames()</i> on page 1185	Returns The list of the appropriate SDMODData element with 'In' or 'InOut' attribute value.
public abstract String	<i>getName()</i> on page 1185	Returns The value of the appropriate SDMODData attribute.
public abstract List< String >	<i>getOutputParameterNames()</i> on page 1185	Returns The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value.
public abstract List< ISDMO-DataParameter >	<i>getParameters()</i> on page 1186	Returns The list of the appropriate SDMODData element.
public abstract String	<i>getReturnType()</i> on page 1186	Returns The value of the appropriate SDMODData attribute.
public RETURNTYPE_ENUM	<i>getReturnTypeEnum()</i> on page 1186	Returns The return type of this Function Import SDMODData document.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;ISDMParseDocument&gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

**Inherited members from ISDMPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

*getActionFor() method*

Returns The value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getActionFor ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getCollectionId() method*

Returns The value of the 'EntitySet' SDMOData attribute.

*Syntax*

```
public abstract String getCollectionId ()
```

*Returns*

The value of the 'EntitySet' SDMOData attribute

*getEntitySet() method*

Returns The value of the 'EntitySet' SDMOData attribute.

*Syntax*

```
public abstract String getEntitySet ()
```

*Returns*

The value of the 'EntitySet' SDMOData attribute

*getExecutionUrl(Map< String, String >) method*

Calculate the full execution URL for executing this Function Import according to the passed parameters.

*Syntax*

```
public abstract String getExecutionUrl (Map< String, String >
parameters )
```

*Returns*

The full execution URL

*getHTTPMethod() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract String getHTTPMethod ()
```

*Returns*

The value of the appropriate SDMODData attribute

*getInputParameterNames() method*

Returns The list of the appropriate SDMODData element with 'In' or 'InOut' attribute value.

*Syntax*

```
public abstract List< String > getInputParameterNames ()
```

*Returns*

The list of the appropriate SDMODData element with 'In' or 'InOut' attribute value

*getName() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract String getName ()
```

*Returns*

The value of the appropriate SDMODData attribute

*getOutputParameterNames() method*

Returns The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value.

*Syntax*

```
public abstract List< String > getOutputParameterNames ()
```

### *Returns*

The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value

### *getParameters() method*

Returns The list of the appropriate SDMODData element.

### *Syntax*

```
public abstract List< ISDMODDataParameter > getParameters ()
```

### *Returns*

The list of the appropriate SDMODData element

### *getReturnType() method*

Returns The value of the appropriate SDMODData attribute.

### *Syntax*

```
public abstract String getReturnType ()
```

### *Returns*

The value of the appropriate SDMODData attribute

### *getReturnTypeEnum() method*

Returns The return type of this Function Import SDMODData document.

### *Syntax*

```
public RETURNNTYPE_ENUM getReturnTypeEnum ()
```

### *Returns*

The return type of this Function Import SDMODData document

### *ATTRIBUTE\_ACTION\_FOR variable*

Name of the appropriate SDMSDMODData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_ACTION_FOR
```

### *ATTRIBUTE\_ENTITYSET variable*

Name of the appropriate SDMODData attribute.

### *Syntax*

```
public static final String ATTRIBUTE_ENTITYSET
```

*ATTRIBUTE\_HTTPMETHOD variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_HTTPMETHOD
```

*ATTRIBUTE\_NAME variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAME
```

*ATTRIBUTE\_RETURNTYPE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_RETURNTYPE
```

*ELEMENT\_FUNCTIONALIMPORT variable*

Name of the appropriate SDMOData element.

*Syntax*

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

*ELEMENT\_PARAMETER variable*

Name of the appropriate SDMOData element.

*Syntax*

```
public static final String ELEMENT_PARAMETER
```

*ISDMODataIcon interface*

Deprecated. since 3.0, Use IODataIcon Represents the appropriate SDMOData element.

*Syntax*

```
public interface ISDMODataIcon extends ISDMParserDocument
```

*Derived classes*

- *SDMODataIcon* on page 1632

*Members*

All members of ISDMODataIcon, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_HEIGHT</i> on page 1194	Name of the appropriate SDMSDMOData attribute.
public static final String	<i>ATTRIBUTE_WIDTH</i> on page 1194	Name of the appropriate SDMSDMOData attribute.
public static final String	<i>ELEMENT_ICON</i> on page 1194	Name of the appropriate SDMSDMOData element.

### Methods

Modifier and Type	Method	Description
public int	<i>getHeight()</i> on page 1193	Returns The value of the appropriate SDMOData attribute.
public String	<i>getUrl()</i> on page 1193	Returns The value of the appropriate SDMOData attribute.
public int	<i>getWidth()</i> on page 1193	Returns The value of the appropriate SDMOData attribute.

### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;ISDMParseDocument&gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getHeight()* method

Returns The value of the appropriate SDMOData attribute.

#### *Syntax*

```
public int getHeight ()
```

#### *Returns*

The value of the appropriate SDMOData attribute

#### *getUrl()* method

Returns The value of the appropriate SDMOData attribute.

#### *Syntax*

```
public String getUrl ()
```

#### *Returns*

The value of the appropriate SDMOData attribute

#### *getWidth()* method

Returns The value of the appropriate SDMOData attribute.

#### *Syntax*

```
public int getWidth ()
```

#### *Returns*

The value of the appropriate SDMOData attribute

*ATTRIBUTE\_HEIGHT variable*

Name of the appropriate SDMSDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_HEIGHT
```

*ATTRIBUTE\_WIDTH variable*

Name of the appropriate SDMSDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_WIDTH
```

*ELEMENT\_ICON variable*

Name of the appropriate SDMSDMOData element.

*Syntax*

```
public static final String ELEMENT_ICON
```

*ISDMODataLink interface*

Deprecated. since 3.0, Use IODataLink Represents the appropriate SDMOData element.

*Syntax*

```
public abstract interface ISDMODataLink extends  
ISDMParserDocument
```

*Derived classes*

- *SDMODataLink* on page 1648

*Members*

All members of ISDMODataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_HREF</i> on page 1205	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_REL</i> on page 1205	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_REL_VAL-UE_EDIT</i> on page 1205	Value option for the appropriate SDMOData parameter.
public static final String	<i>ATTRIBUTE_REL_VAL-UE_SELF</i> on page 1205	Value option for the appropriate SDMOData parameter.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 1205	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TITLE</i> on page 1205	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VALUE-PART_RELATED</i> on page 1205	String that should be part of every rel attribute of a Related Data Link.
public static final String	<i>ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION</i> on page 1206	String that should be end of every rel attribute of a Subscription Link.
public static final String	<i>ELEMENT_INLINE</i> on page 1206	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_LINK</i> on page 1206	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 1206	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_PARAMETER-SET</i> on page 1206	Name of the appropriate SDMODData element.

## Methods

Modifier and Type	Method	Description
public abstract String	<i>getHref()</i> on page 1201	Returns the value of the appropriate SDMODData attribute.
public abstract List< ISDMODDataEntry >	<i>getInlineEntries()</i> on page 1202	Returns the list of SDMODData Entries contained by the appropriate SDMODData 'inline' element.
public abstract List< String >	<i>getInputParameterNames()</i> on page 1202	Returns the list of the appropriate SDMODData Parameter elements that should be used as input parameter.
public abstract List< String >	<i>getOutputParameterNames()</i> on page 1202	Returns the list of the appropriate SDMODData Parameter elements that should be used as output parameter.

Modifier and Type	Method	Description
public abstract List< ISDMO-DataParameter >	<i>getParameters()</i> on page 1202	Returns the list of the appropriate SDMODData Parameter elements.
public abstract String	<i>getRel()</i> on page 1203	Returns the value of the appropriate SDMODData attribute.
public abstract ISDMODData-Schema	<i>getSchema()</i> on page 1203	Returns the Schema that is to be used for 'Inline entries'.
public abstract String	<i>getSemantics()</i> on page 1203	Returns The value of the appropriate SDMODData extension (vCard) attribute.
public abstract String	<i>getTargetCollectionId()</i> on page 1203	Returns the Id of the collection that this link points to (if any)
public abstract String	<i>getTitle()</i> on page 1203	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getUrl()</i> on page 1204	Returns the full URL for this SDMODData Link object without parameters.
public abstract String	<i>getUrlWithParameters(Map&lt;String, String &gt;)</i> on page 1204	Returns the full URL for this SDMODData Link object extended with the given parameter names and values.
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 1204	Sets the Schema that is to be used for 'Inline entries'.
public abstract void	<i>setTargetCollectionId(String)</i> on page 1204	Maintains the Id of the collection that this link points to (if any)

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getHref()* method

Returns the value of the appropriate SDMOData attribute.

#### Syntax

```
public abstract String getHref ()
```

#### Returns

The value of the appropriate SDMOData attribute

### *getInlineEntries() method*

Returns the list of SDMOData Entries contained by the appropriate SDMOData 'inline' element.

#### *Syntax*

```
public abstract List< ISDMODataEntry > getInlineEntries ()
```

#### *Returns*

The List of 'inline' SDMOData Entries

### *getInputParameterNames() method*

Returns the list of the appropriate SDMOData Parameter elements that should be used as input parameter.

#### *Syntax*

```
public abstract List< String > getInputParameterNames ()
```

#### *Returns*

The list of the appropriate SDMOData Parameter elements that should be used as input parameter

### *getOutputParameterNames() method*

Returns the list of the appropriate SDMOData Parameter elements that should be used as output parameter.

#### *Syntax*

```
public abstract List< String > getOutputParameterNames ()
```

#### *Returns*

The list of the appropriate SDMOData Parameter elements that should be used as output parameter

### *getParameters() method*

Returns the list of the appropriate SDMOData Parameter elements.

#### *Syntax*

```
public abstract List< ISDMODataParameter > getParameters ()
```

#### *Returns*

The list of the appropriate SDMOData Parameter elements

*getRel() method*

Returns the value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getRel ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getSchema() method*

Returns the Schema that is to be used for 'Inline entries'.

*Syntax*

```
public abstract ISDMODataSchema getSchema ()
```

*Returns*

The relevant schema

*getSemantics() method*

Returns The value of the appropriate SDMOData extension (vCard) attribute.

*Syntax*

```
public abstract String getSemantics ()
```

*Returns*

The value of the appropriate SDMOData extension (vCard) attribute

*getTargetCollectionId() method*

Returns the Id of the collection that this link points to (if any)

*Syntax*

```
public abstract String getTargetCollectionId ()
```

*Returns*

The Id of the collection that this link points to

*getTitle() method*

Returns the value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getTitle ()
```

### *Returns*

The value of the appropriate SDMOData attribute

### *getUrl() method*

Returns the full URL for this SDMOData Link object without parameters.

### *Syntax*

```
public abstract String getUrl ()
```

### *Returns*

The full URL of this link without parameters

### *getUrlWithParameters(Map< String, String >) method*

Returns the full URL for this SDMOData Link object extended with the given parameter names and values.

### *Syntax*

```
public abstract String getUrlWithParameters (Map< String,  
String > parameters )
```

### *Returns*

The full URL of this link with parameters

### *setSchema(ISDMODataSchema) method*

Sets the Schema that is to be used for 'Inline entries'.

### *Syntax*

```
public abstract void setSchema ( ISDMODataSchema schema )
```

### *Parameters*

- **schema** – The relevant schema

### *setTargetCollectionId(String) method*

Maintains the Id of the collection that this link points to (if any)

### *Syntax*

```
public abstract void setTargetCollectionId (String  
targetCollectionId )
```

### *Parameters*

- **targetCollectionId** – The Id of the collection that this link points to

***ATTRIBUTE\_HREF variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_HREF
```

***ATTRIBUTE\_REL variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_REL
```

***ATTRIBUTE\_REL\_VALUE\_EDIT variable***

Value option for the appropriate SDMOData parameter.

***Syntax***

```
public static final String ATTRIBUTE_REL_VALUE_EDIT
```

***ATTRIBUTE\_REL\_VALUE\_SELF variable***

Value option for the appropriate SDMOData parameter.

***Syntax***

```
public static final String ATTRIBUTE_REL_VALUE_SELF
```

***ATTRIBUTE\_SEMANTICS variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_SEMANTICS
```

***ATTRIBUTE\_TITLE variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_TITLE
```

***ATTRIBUTE\_VALUEPART\_RELATED variable***

String that should be part of every rel attribute of a Related Data Link.

***Syntax***

```
public static final String ATTRIBUTE_VALUEPART_RELATED
```

### *ATTRIBUTE\_VALUESUFFIX\_SUBSCRIPTION variable*

String that should be end of every rel attribute of a Subscription Link.

#### *Syntax*

```
public static final String  
ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION
```

### *ELEMENT\_INLINE variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_INLINE
```

### *ELEMENT\_LINK variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_LINK
```

### *ELEMENT\_PARAMETER variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_PARAMETER
```

### *ELEMENT\_PARAMETERSET variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_PARAMETERSET
```

### *ISDMODataNavigationProperty interface*

Deprecated. since 3.0, Use IODataNavigationProperty Represents the appropriate SDMOData element.

#### *Syntax*

```
public abstract interface ISDMODataNavigationProperty extends  
ISDMParserDocument
```

#### *Derived classes*

- *SDMODataNavigationProperty* on page 1669

**Members**

All members of ISDMODataNavigationProperty, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_FROMROLE</i> on page 1213	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1213	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_RELATIONSHIP</i> on page 1213	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TOROLE</i> on page 1213	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_NAVIGATIONPROPERTY</i> on page 1214	Name of the appropriate SDMODData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getFromRole()</i> on page 1212	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getName()</i> on page 1212	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getRelationship()</i> on page 1213	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getToRole()</i> on page 1213	Returns The value of the appropriate SDMODData attribute.

**Inherited members from ISDMParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getFromRole()* method

Returns The value of the appropriate SDMOData attribute.

#### *Syntax*

```
public abstract String getFromRole ()
```

#### *Returns*

The value of the appropriate SDMOData attribute

#### *getName()* method

Returns The value of the appropriate SDMOData attribute.

#### *Syntax*

```
public abstract String getName ()
```

#### *Returns*

The value of the appropriate SDMOData attribute

*getRelationship() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract String getRelationship ()
```

*Returns*

The value of the appropriate SDMODData attribute

*getToRole() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract String getToRole ()
```

*Returns*

The value of the appropriate SDMODData attribute

*ATTRIBUTE\_FROMROLE variable*

Name of the appropriate SDMODData attribute.

*Syntax*

```
public static final String ATTRIBUTE_FROMROLE
```

*ATTRIBUTE\_NAME variable*

Name of the appropriate SDMODData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAME
```

*ATTRIBUTE\_RELATIONSHIP variable*

Name of the appropriate SDMODData attribute.

*Syntax*

```
public static final String ATTRIBUTE_RELATIONSHIP
```

*ATTRIBUTE\_TOROLE variable*

Name of the appropriate SDMODData attribute.

*Syntax*

```
public static final String ATTRIBUTE_TOROLE
```

***ELEMENT\_NAVIGATIONPROPERTY* variable**

Name of the appropriate SDMODData element.

**Syntax**

```
public static final String ELEMENT_NAVIGATIONPROPERTY
```

***ISDMODDataOpenSearchDescription* interface**

Deprecated. since 3.0, Use IODataOpenSearchDescription Represents the appropriate SDMODData element.

**Syntax**

```
public abstract interface ISDMODDataOpenSearchDescription
extends ISDMParserDocument, Serializable
```

**Derived classes**

- *SDMODDataOpenSearchDescription* on page 1685

**Members**

All members of ISDMODDataOpenSearchDescription, including inherited members.

**Variables**

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_DESCRIPTION</i> on page 1220	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_OPENSEARCH-DESCRIPTION</i> on page 1220	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_SHORTNAME</i> on page 1221	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_URL</i> on page 1221	Name of the appropriate SDMODData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getDescription()</i> on page 1220	Returns The value of the appropriate SDMODData element.
public abstract String	<i>getShortName()</i> on page 1220	Returns The value of the appropriate SDMODData element.

Modifier and Type	Method	Description
public abstract List< ISDMO-DataURL >	<i>getUrls()</i> on page 1220	Returns The list of the appropriate SDMODData element.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMODData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

### *getDescription() method*

Returns The value of the appropriate SDMODData element.

#### *Syntax*

```
public abstract String getDescription ()
```

#### *Returns*

The value of the appropriate SDMODData element

### *getShortName() method*

Returns The value of the appropriate SDMODData element.

#### *Syntax*

```
public abstract String getShortName ()
```

#### *Returns*

The value of the appropriate SDMODData element

### *getUrls() method*

Returns The list of the appropriate SDMODData element.

#### *Syntax*

```
public abstract List< ISDMODDataURL > getUrls ()
```

#### *Returns*

The list of the appropriate SDMODData element

### *ELEMENT\_DESCRIPTION variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_DESCRIPTION
```

### *ELEMENT\_OPENSEARCHDESCRIPTION variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_OPENSEARCHDESCRIPTION
```

***ELEMENT\_SHORTNAME* variable**

Name of the appropriate SDMOData element.

**Syntax**

```
public static final String ELEMENT_SHORTNAME
```

***ELEMENT\_URL* variable**

Name of the appropriate SDMOData element.

**Syntax**

```
public static final String ELEMENT_URL
```

***ISDMODataParameter* interface**

Deprecated. since 3.0, Use IODataParameter Represents the appropriate SDMOData element.

**Syntax**

```
public abstract interface ISDMODataParameter extends
ISDMParserDocument
```

**Derived classes**

- *SDMODataParameter* on page 1701

**Members**

All members of ISDMODataParameter, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_MODE</i> on page 1227	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1227	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 1228	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_PARAMETER</i> on page 1228	Name of the appropriate SDMOData element.
public static final String	<i>VALUE_MODE_IN</i> on page 1228	Value option for the 'Mode' SDMOData attribute.
public static final String	<i>VALUE_MODE_OUT</i> on page 1228	Value option for the 'Mode' SDMOData attribute.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getMode()</i> on page 1227	Returns The value of the appropriate SDMOData attribute.
public abstract String	<i>getName()</i> on page 1227	Returns The value of the appropriate SDMOData attribute.
public abstract String	<i>getType()</i> on page 1227	Returns The value of the appropriate SDMOData attribute.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.

Modifier and Type	Member	Description
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

*getMode() method*

Returns The value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getMode ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getName() method*

Returns The value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getName ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getType() method*

Returns The value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getType ()
```

*Returns*

The value of the appropriate SDMOData attribute

*ATTRIBUTE\_MODE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_MODE
```

*ATTRIBUTE\_NAME variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_NAME
```

*ATTRIBUTE\_TYPE variable*

Name of the appropriate SDMODData attribute.

*Syntax*

```
public static final String ATTRIBUTE_TYPE
```

*ELEMENT\_PARAMETER variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_PARAMETER
```

*VALUE\_MODE\_IN variable*

Value option for the 'Mode' SDMODData attribute.

*Syntax*

```
public static final String VALUE_MODE_IN
```

*VALUE\_MODE\_OUT variable*

Value option for the 'Mode' SDMODData attribute.

*Syntax*

```
public static final String VALUE_MODE_OUT
```

*ISDMODDataProperty interface*

Deprecated. since 3.0, Use IODataProperty Represents the appropriate SDMODData element.

*Syntax*

```
public abstract interface ISDMODDataProperty extends  
ISDMParserDocument
```

*Derived classes*

- *SDMODDataProperty* on page 1716

*Members*

All members of ISDMODDataProperty, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_COLLATION</i> on page 1244	Name of the appropriate SDMODData attribute.

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 1244	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DEFAULTVALUE</i> on page 1244	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 1244	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DETAIL_DISPLAYORDER</i> on page 1244	Name of the display-order SDMOData attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 1244	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_FIXEDLENGTH</i> on page 1244	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_LABEL</i> on page 1245	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_LIST_DISPLAYORDER</i> on page 1245	Name of the display-order SDMOData attribute.
public static final String	<i>ATTRIBUTE_MAXLENGTH</i> on page 1245	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1245	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NULLABLE</i> on page 1245	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_PRECISION</i> on page 1245	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_SCALE</i> on page 1245	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 1246	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 1246	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 1246	Name of the appropriate SDMOData attribute.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_UNICODE</i> on page 1246	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 1246	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_USEIN-SEARCH</i> on page 1246	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEINDE-TAIL</i> on page 1246	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEIN-LIST</i> on page 1247	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_PROPERTY</i> on page 1247	Name of the appropriate SDMODData element.

### Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataProperty >	<i>getChildPropertiesData()</i> on page 1237	Returns all the child properties added to this document with putChildProperty method.
public abstract List< ISDMO-DataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 1237	Returns list of appropriate contained Property SDMODData elements with the given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 1238	Returns list of appropriate contained Property SDMODData elements with the given attribute value.
public abstract ISDMODDataProperty	<i>getChildPropertyData(String)</i> on page 1238	Return a single child property added with putChildProperty method.
public abstract String	<i>getCollation()</i> on page 1238	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getDefaultValue()</i> on page 1239	Returns the value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public abstract int	<i>getDetailDisplayOrder()</i> on page 1239	In current version it return the same value as <i>getListDisplayOrder</i> .
public abstract String	<i>getLabel()</i> on page 1239	Returns The value of the appropriate SDMOData attribute.
public abstract int	<i>getListDisplayOrder()</i> on page 1239	In current version it returns the same value as <i>getDetailDisplayOrder</i> .
public abstract int	<i>getMaxLength()</i> on page 1239	Returns the value of the appropriate SDMOData attribute with <code>defaultValue = 0;</code> .
public abstract String	<i>getName()</i> on page 1240	Returns The value of the appropriate SDMOData attribute.
public abstract String	<i>getPrecision()</i> on page 1240	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getScale()</i> on page 1240	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getSemantics()</i> on page 1240	Returns the value of the appropriate SDMOData attribute with <code>defaultValue = 0;</code> .
public abstract String	<i>getType()</i> on page 1241	Returns The value of the appropriate SDMOData attribute.
public abstract String	<i>getValue()</i> on page 1241	Returns the value of the property if there is a single property instance that is represented by this object and value is set with <code>setValue</code> method.
public abstract boolean	<i>hasFixedLength()</i> on page 1241	Returns The value of the appropriate SDMOData attribute.
public abstract boolean	<i>isComplex()</i> on page 1241	Returns if the property has complex type and has child properties.
public abstract boolean	<i>isCreatable()</i> on page 1242	Returns The value of the appropriate SDMOData attribute.

Modifier and Type	Method	Description
public abstract boolean	<i>isDeletable()</i> on page 1242	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isFilterable()</i> on page 1242	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isNullable()</i> on page 1242	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isSearchable()</i> on page 1242	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isUnicode()</i> on page 1243	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 1243	Returns The value of the appropriate SDMODData attribute.
public abstract void	<i>putChildPropertyData(ISDMODDataProperty)</i> on page 1243	Put new child property to this property document.
public abstract void	<i>setValue(String)</i> on page 1243	Sets the value of the property, represented by this object.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt;ISDMParseDocument&gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### Usage

May contain additional data retrieved from several source documents

#### *getChildPropertiesData()* method

Returns all the child properties added to this document with putChildProperty method.

#### Syntax

```
public abstract List< ISDMODataProperty >
getChildPropertiesData ()
```

#### Returns

List of child properties.

#### *getChildPropertiesDataWithAttribute(String, String)* method

Returns list of appropriate contained Property SDMODData elements with the given attribute value.

#### Syntax

```
public abstract List< ISDMODataProperty >
getChildPropertiesDataWithAttribute (String attributeName , String
attributeValue )
```

#### Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

#### Returns

list of appropriate contained Property SDMODData elements with the given attribute value

### *getChildPropertiesDataWithAttribute(String, String, boolean) method*

Returns list of appropriate contained Property SDMODData elements with the given attribute value.

#### *Syntax*

```
public abstract List< ISDMODDataProperty >  
getChildPropertiesDataWithAttribute ( String attributeName , String  
attributeValue , boolean addByDefault )
```

#### *Parameters*

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

#### *Returns*

list of appropriate contained Property SDMODData elements with the given attribute value

### *getChildPropertyData(String) method*

Return a single child property added with putChildProperty method.

#### *Syntax*

```
public abstract ISDMODDataProperty getChildPropertyData  
( String propertyName )
```

#### *Parameters*

- **propertyName** – The name of the child property that should be returned.

#### *Returns*

The found child property or null if there is no child property with the given name.

### *getCollation() method*

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract String getCollation ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

*getDefaultValue() method*

Returns the value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getDefaultValue ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getDetailDisplayOrder() method*

In current version it return the same value as getListDisplayOrder.

*Syntax*

```
public abstract int getDetailDisplayOrder ()
```

*Returns*

The value of 'display-order' attribute with default value = 0;

*getLabel() method*

Returns The value of the appropriate SDMOData attribute.

*Syntax*

```
public abstract String getLabel ()
```

*Returns*

The value of the appropriate SDMOData attribute

*getListDisplayOrder() method*

In current version it returns the same value as getDetailDisplayOrder.

*Syntax*

```
public abstract int getListDisplayOrder ()
```

*Returns*

The value of 'display-order' attribute with default value = 0;

*getMaxLength() method*

Returns the value of the appropriate SDMOData attribute with default value = 0;.

*Syntax*

```
public abstract int getMaxLength ()
```

### *Returns*

The value of the appropriate SDMOData attribute with defaultValue = 0;

### *getName() method*

Returns The value of the appropriate SDMOData attribute.

### *Syntax*

```
public abstract String getName ()
```

### *Returns*

The value of the appropriate SDMOData attribute

### *getPrecision() method*

Returns the value of the appropriate SDMOData attribute.

### *Syntax*

```
public abstract String getPrecision ()
```

### *Returns*

The value of the appropriate SDMOData attribute

### *getScale() method*

Returns the value of the appropriate SDMOData attribute.

### *Syntax*

```
public abstract String getScale ()
```

### *Returns*

The value of the appropriate SDMOData attribute

### *getSemantics() method*

Returns the value of the appropriate SDMOData attribute with defaultValue = 0;.

### *Syntax*

```
public abstract String getSemantics ()
```

### *Returns*

The value of the appropriate SDMOData attribute with defaultValue = 0;

*getType() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract String getType ()
```

*Returns*

The value of the appropriate SDMODData attribute

*getValue() method*

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

*Syntax*

```
public abstract String getValue ()
```

*Returns*

the value of the property instance represented by this object.

*Usage*

Otherwise it returns null.

Typically this object contains value only if this object was returned by an SDMODData Entry.

*hasFixedLength() method*

Returns The value of the appropriate SDMODData attribute.

*Syntax*

```
public abstract boolean hasFixedLength ()
```

*Returns*

The value of the appropriate SDMODData attribute

*isComplex() method*

Returns if the property has complex type and has child properties.

*Syntax*

```
public abstract boolean isComplex ()
```

*Returns*

true if the property has complex type and has child properties.

### *isCreatable() method*

Returns The value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isCreatable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isDeletable() method*

Returns The value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isDeletable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isFilterable() method*

Returns The value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isFilterable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isNullable() method*

Returns The value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isNullable ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *isSearchable() method*

Returns The value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract boolean isSearchable ()
```

**Returns**

The value of the appropriate SDMOData attribute

**isUnicode() method**

Returns the value of the appropriate SDMOData attribute.

**Syntax**

```
public abstract boolean isUnicode ()
```

**Returns**

The value of the appropriate SDMOData attribute

**isUpdatable() method**

Returns The value of the appropriate SDMOData attribute.

**Syntax**

```
public abstract boolean isUpdatable ()
```

**Returns**

The value of the appropriate SDMOData attribute

**putChildPropertyData(ISDMODataProperty) method**

Put new child property to this property document.

**Syntax**

```
public abstract void putChildPropertyData ( ISDMODataProperty
property )
```

**Parameters**

- **property** – The child property

**setValue(String) method**

Sets the value of the property, represented by this object.

**Syntax**

```
public abstract void setValue (String value )
```

**Parameters**

- **value** – The value of the property instance represented by this object.

**Usage**

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an SDMODData Entry object.

### *ATTRIBUTE\_COLLATION variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_COLLATION
```

### *ATTRIBUTE\_CREATABLE variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_CREATABLE
```

### *ATTRIBUTE\_DEFAULTVALUE variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_DEFAULTVALUE
```

### *ATTRIBUTE\_DELETABLE variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_DELETABLE
```

### *ATTRIBUTE\_DETAIL\_DISPLAYORDER variable*

Name of the display-order SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_DETAIL_DISPLAYORDER
```

### *ATTRIBUTE\_FILTERABLE variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_FILTERABLE
```

### *ATTRIBUTE\_FIXEDLENGTH variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_FIXEDLENGTH
```

***ATTRIBUTE\_LABEL variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_LABEL
```

***ATTRIBUTE\_LIST\_DISPLAYORDER variable***

Name of the display-order SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_LIST_DISPLAYORDER
```

***ATTRIBUTE\_MAXLENGTH variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_MAXLENGTH
```

***ATTRIBUTE\_NAME variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NAME
```

***ATTRIBUTE\_NULLABLE variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NULLABLE
```

***ATTRIBUTE\_PRECISION variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_PRECISION
```

***ATTRIBUTE\_SCALE variable***

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_SCALE
```

*ATTRIBUTE\_SEARCHABLE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_SEARCHABLE
```

*ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

*ATTRIBUTE\_TYPE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_TYPE
```

*ATTRIBUTE\_UNICODE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_UNICODE
```

*ATTRIBUTE\_UPDATABLE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_UPDATABLE
```

*ATTRIBUTE\_USEINSEARCH variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_USEINSEARCH
```

*ATTRIBUTE\_VISIBLEINDETAIL variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_VISIBLEINDETAIL
```

***ATTRIBUTE\_VISIBLEINLIST* variable**

Name of the appropriate SDMODData attribute.

***Syntax***

```
public static final String ATTRIBUTE_VISIBLEINLIST
```

***ELEMENT\_PROPERTY* variable**

Name of the appropriate SDMODData element.

***Syntax***

```
public static final String ELEMENT_PROPERTY
```

***ISDMODDataSchema* interface**

Deprecated. since 3.0, Use IODataSchema Represents the SDMODData Service Document.

***Syntax***

```
public abstract interface ISDMODDataSchema extends
ISDMParserDocument
```

***Derived classes***

- *SDMODDataSchema* on page 1804

***Members***

All members of ISDMODDataSchema, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>ACTION_FOR</i> on page 1258	name of the appropriate SDMO-data attribute
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 1259	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_ENTITYTYPE</i> on page 1259	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 1259	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAMESPACE</i> on page 1259	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 1259	Name of the appropriate SDMODData element.

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_DATASERVICES</i> on page 1259	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_EDMX</i> on page 1259	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ENTITYCONTAINER</i> on page 1260	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 1260	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 1260	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_FUNCTIONALIMPORT</i> on page 1260	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_SCHEMA</i> on page 1260	Name of the appropriate SDMODData element.

### Methods

Modifier and Type	Method	Description
public abstract ISDMODDataAssociation	<i>getAssociation(String)</i> on page 1254	Returns the appropriate SDMODData Association element with the given relationship attribute.
public abstract List< ISDMODDataAssociation >	<i>getAssociations()</i> on page 1254	Returns the list of the appropriate SDMODData elements.
public abstract ISDMODDataAssociationSet	<i>getAssociationSet(String)</i> on page 1255	Returns the appropriate AssociationSet with for given association.
public abstract List< ISDMODDataAssociationSet >	<i>getAssociationSets()</i> on page 1255	Returns the list of the appropriate SDMODData elements.
public abstract ISDMODDataComplexType	<i>getComplexType(String)</i> on page 1255	Returns The 'ComplexType' SDMODData element associated with the reference.
public abstract List< ISDMODDataComplexType >	<i>getComplexTypes()</i> on page 1256	Returns The list of the appropriate SDMODData element.
public abstract ISDMODDataEntitySet	<i>getEntitySet(String)</i> on page 1256	Returns The appropriate SDMODData EntitySet.

Modifier and Type	Method	Description
public abstract ISDMODataEntityType	<i>getEntityType(String)</i> on page 1256	Returns The 'EntityType' SDMODData element associated with the reference argument.
public abstract ISDMODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 1257	Returns the 'EntityType' SDMODData element contained by the 'EntitySet' element that is associated with the collectionId matching.
public abstract List< ISDMODataFunctionImport >	<i>getFunctionImports()</i> on page 1257	Returns The list of the 'FunctionImport' SDMODData element.
public abstract List< ISDMODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 1257	Returns List of FunctionImports valid for the appropriate collection.
public abstract ISDMODataServiceDocument	<i>getServiceDocument()</i> on page 1258	Returns the appropriate SDMODData Service Document.
public abstract String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 1258	Resolves the target collection Id of the given SDMODData Navigation Property element.
public abstract void	<i>setServiceDocument(ISDMODataServiceDocument)</i> on page 1258	Maintains reference to the appropriate SDMODData Service Document.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMODData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getAssociation(String)* method

Returns the appropriate SDMOData Association element with the given relationship attribute.

#### *Syntax*

```
public abstract ISDMODataAssociation getAssociation (String
relationShip )
```

#### *getAssociations()* method

Returns the list of the appropriate SDMOData elements.

#### *Syntax*

```
public abstract List< ISDMODataAssociation > getAssociations
()
```

#### *Returns*

List of the appropriate SDMOData elements

*getAssociationSet(String) method*

Returns the appropriate AssociationSet with for given association.

*Syntax*

```
public abstract ISDMODataAssociationSet getAssociationSet
( String association )
```

*Parameters*

- **association** – The association of the AssociationSet

*Returns*

The appropriate AssociationSet with for given association

*getAssociationSets() method*

Returns the list of the appropriate SDMOData elements.

*Syntax*

```
public abstract List< ISDMODataAssociationSet >
getAssociationSets ()
```

*Returns*

List of the appropriate SDMOData elements

*getComplexType(String) method*

Returns The 'ComplexType' SDMOData element associated with the reference.

*Syntax*

```
public abstract ISDMODataComplexType getComplexType (String
complexTypeReference )
```

*Parameters*

- **complexTypeReference** – Reference to the appropriate Complex Type (example: 'namespace.complextypename')

*Returns*

The 'ComplexType' SDMOData element associated with the reference

### *getComplexTypes() method*

Returns The list of the appropriate SDMODData element.

#### *Syntax*

```
public abstract List< ISDMODataComplexType > getComplexTypes  
( )
```

#### *Returns*

The list of the appropriate SDMODData element

### *getEntitySet(String) method*

Returns The appropriate SDMODData EntitySet.

#### *Syntax*

```
public abstract ISDMODataEntitySet getEntitySet ( String  
collectionId )
```

#### *Parameters*

- **collectionId** – The href of the collection to find the SDMODData EntitySet for

#### *Returns*

The appropriate SDMODData EntitySet

### *getEntityType(String) method*

Returns The 'EntityType' SDMODData element associated with the reference argument.

#### *Syntax*

```
public abstract ISDMODataEntityType getEntityType ( String  
entityTypeReference )
```

#### *Parameters*

- **entityTypeReference** – Reference to the appropriate Entity Type (example: 'namespace.entitytypename')

#### *Returns*

The 'EntityType' SDMODData element associated with the reference argument

*getEntityTypeForCollection(String) method*

Returns the 'EntityType' SDMOData element contained by the 'EntitySet' element that is associated with the collectionId matching.

*Syntax*

```
public abstract ISDMODataEntityType
getEntityTypeForCollection ( String collectionId )
```

*Parameters*

- **collectionId** – The Id to be compared with the name of 'EntitySet' elements

*Returns*

The matching EntityType

*getFunctionImports() method*

Returns The list of the 'FunctionImport' SDMOData element.

*Syntax*

```
public abstract List< ISDMODataFunctionImport >
getFunctionImports ( )
```

*Returns*

The list of the 'FunctionImport' SDMOData element

*getFunctionImportsForCollection(String) method*

Returns List of FunctionImports valid for the appropriate collection.

*Syntax*

```
public abstract List< ISDMODataFunctionImport >
getFunctionImportsForCollection ( String collectionId )
```

*Parameters*

- **collectionId** – The href of the appropriate collection.

*Returns*

List of FunctionImports valid for the appropriate collection.

### *getServiceDocument() method*

Returns the appropriate SDMOData Service Document.

#### *Syntax*

```
public abstract ISDMODataServiceDocument getServiceDocument  
( )
```

#### *Returns*

The appropriate SDMOData Service Document

### *getTargetCollectionIdForNavigationProperty(String, String) method*

Resolves the target collection Id of the given SDMOData Navigation Property element.

#### *Syntax*

```
public abstract String  
getTargetCollectionIdForNavigationProperty ( String  
sourceCollectionId , String navigationPropertyName )
```

#### *Parameters*

- **sourceCollectionId** – The source Id of the source collection that is linked with the target collection
- **navigationPropertyName** – The name of the Navigation Property

#### *Returns*

The Id of the target collection

### *setServiceDocument(ISDMODataServiceDocument) method*

Maintains reference to the appropriate SDMOData Service Document.

#### *Syntax*

```
public abstract void setServiceDocument  
( ISDMODataServiceDocument serviceDocument )
```

#### *Parameters*

- **serviceDocument** – The appropriate SDMOData Service Document

### *ACTION\_FOR variable*

name of the appropriate SDMOData attribute

#### *Syntax*

```
public static final String ACTION_FOR
```

***ATTRIBUTE\_ENTITYSET*** variable

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_ENTITYSET
```

***ATTRIBUTE\_ENTITYTYPE*** variable

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_ENTITYTYPE
```

***ATTRIBUTE\_NAME*** variable

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NAME
```

***ATTRIBUTE\_NAMESPACE*** variable

Name of the appropriate SDMOData attribute.

***Syntax***

```
public static final String ATTRIBUTE_NAMESPACE
```

***ELEMENT\_COMPLEXTYPE*** variable

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_COMPLEXTYPE
```

***ELEMENT\_DATASERVICES*** variable

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_DATASERVICES
```

***ELEMENT\_EDMX*** variable

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ELEMENT_EDMX
```

### *ELEMENT\_ENTITYCONTAINER variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_ENTITYCONTAINER
```

### *ELEMENT\_ENTITYSET variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_ENTITYSET
```

### *ELEMENT\_ENTITYTYPE variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_ENTITYTYPE
```

### *ELEMENT\_FUNCTIONALIMPORT variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

### *ELEMENT\_SCHEMA variable*

Name of the appropriate SDMOData element.

#### *Syntax*

```
public static final String ELEMENT_SCHEMA
```

### *ISDMODataServiceDocument interface*

Deprecated. since 3.0, Use IODataServiceDocument Represents the SDMOData Service Document.

#### *Syntax*

```
public abstract interface ISDMODataServiceDocument extends  
ISDMParserDocument
```

#### *Derived classes*

- *SDMODataServiceDocument* on page 1824

#### *Members*

All members of ISDMODataServiceDocument, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_BASE</i> on page 1269	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_LANG</i> on page 1269	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_COLLECTION</i> on page 1269	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_SERVICE</i> on page 1269	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_WORKSPACE</i> on page 1269	Name of the appropriate SDMODData element.
public static final String	<i>URL_SUFFIX_METADATA</i> on page 1270	URL value suffix for retrieving SDMODData Schema document.

## Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataCollection >	<i>getAllCollections()</i> on page 1267	Returns the list of all 'collection' SDMODData element contained by the 'workspace' elements.
public abstract String	<i>getBaseUrl()</i> on page 1267	Returns The value of the 'base' SDMODData attribute.
public abstract String	<i>getEtag()</i> on page 1267	Returns The value of the 'etag' SDMODData attribute.
public abstract String	<i>getLanguage()</i> on page 1267	Returns the value of the 'lang' SDMODData attribute.
public abstract ISDMODDataOpenSearchDescription	<i>getOpenSearchDescription(String)</i> on page 1267	Returns the appropriate Open-Search Description Document for the given collection.
public abstract ISDMODDataSchema	<i>getSchema()</i> on page 1268	Returns the appropriate SDMO-Data Schema document.
public abstract String	<i>getSchemaUrl()</i> on page 1268	Returns The full URL that can be used for retrieving the SDMODData Schema document.
public abstract List< ISDMO-DataWorkspace >	<i>getWorkspaces()</i> on page 1268	Returns the list of appropriate SDMODData elements.

Modifier and Type	Method	Description
public abstract void	<i>setOpenSearchDescription(String, ISDMODataOpenSearchDescription)</i> on page 1268	Maintains the appropriate OpenSearch Description Document for the given collection.
public abstract void	<i>setSchema(ISDMODataSchema)</i> on page 1269	Maintains the appropriate SDMOData Schema document.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

*getAllCollections() method*

Returns the list of all 'collection' SDMODData element contained by the 'workspace' elements.

*Syntax*

```
public abstract List< ISDMODDataCollection > getAllCollections
()
```

*Returns*

The list of all 'collection' SDMODData element contained by the 'workspace' elements

*getBaseUrl() method*

Returns The value of the 'base' SDMODData attribute.

*Syntax*

```
public abstract String getBaseUrl ()
```

*Returns*

The value of the 'base' SDMODData attribute

*getEtag() method*

Returns The value of the 'etag' SDMODData attribute.

*Syntax*

```
public abstract String getEtag ()
```

*Returns*

The value of the 'etag' SDMODData attribute

*getLanguage() method*

Returns the value of the 'lang' SDMODData attribute.

*Syntax*

```
public abstract String getLanguage ()
```

*Returns*

The value of the 'lang' SDMODData attribute

*getOpenSearchDescription(String) method*

Returns the appropriate OpenSearch Description Document for the given collection.

*Syntax*

```
public abstract ISDMODDataOpenSearchDescription
getOpenSearchDescription ( String collectionId )
```

### *Parameters*

- **collectionId** – The Id of the collection

### *Returns*

The appropriate OpenSearch Description Document

### *getSchema() method*

Returns the appropriate SDMOData Schema document.

### *Syntax*

```
public abstract ISDMODataSchema getSchema ()
```

### *Returns*

The appropriate SDMOData Schema document

### *getSchemaUrl() method*

Returns The full URL that can be used for retrieving the SDMOData Schema document.

### *Syntax*

```
public abstract String getSchemaUrl ()
```

### *Returns*

The full URL that can be used for retrieving the SDMOData Schema document

### *getWorkspaces() method*

Returns the list of appropriate SDMOData elements.

### *Syntax*

```
public abstract List< ISDMODataWorkspace > getWorkspaces ()
```

### *Returns*

The list of appropriate SDMOData elements

### *setOpenSearchDescription(String, ISDMODataOpenSearchDescription) method*

Maintains the appropriate OpenSearch Description Document for the given collection.

### *Syntax*

```
public abstract void setOpenSearchDescription (String  
collectionId , ISDMODataOpenSearchDescription openSearchDescription )
```

### *Parameters*

- **collectionId** – The Id of the collection

- **openSearchDescription** – The appropriate OpenSearch Description Document

*setSchema(ISDMODataSchema) method*

Maintains the appropriate SDMOData Schema document.

*Syntax*

```
public abstract void setSchema ( ISDMODataSchema schema )
```

*Parameters*

- **schema** – The appropriate SDMOData Schema document

*ATTRIBUTE\_BASE variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_BASE
```

*ATTRIBUTE\_LANG variable*

Name of the appropriate SDMOData attribute.

*Syntax*

```
public static final String ATTRIBUTE_LANG
```

*ELEMENT\_COLLECTION variable*

Name of the appropriate SDMOData element.

*Syntax*

```
public static final String ELEMENT_COLLECTION
```

*ELEMENT\_SERVICE variable*

Name of the appropriate SDMOData element.

*Syntax*

```
public static final String ELEMENT_SERVICE
```

*ELEMENT\_WORKSPACE variable*

Name of the appropriate SDMOData element.

*Syntax*

```
public static final String ELEMENT_WORKSPACE
```

*URL\_SUFFIX\_METADATA* variable

URL value suffix for retrieving SDMODData Schema document.

*Syntax*

```
public static final String URL_SUFFIX_METADATA
```

*ISDMODDataSubscriptionEntry* interface

Deprecated. since 3.0, Use IODataSubscriptionEntry Subclass of SDMODDataEntry to be used for subscription s.

*Syntax*

```
public abstract interface ISDMODDataSubscriptionEntry extends  
ISDMODDataEntry
```

*Derived classes*

- *SDMODDataSubscriptionEntry* on page 1843

*Members*

All members of ISDMODDataSubscriptionEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ELEMENT_COLLECTION</i> on page 1283	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_DELIVERYADDRESS</i> on page 1283	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_FILTER</i> on page 1283	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_SELECT</i> on page 1283	Name of the appropriate SDMODData element.

**Methods**

Modifier and Type	Method	Description
public abstract String	<i>getCollection()</i> on page 1281	Returns The value of the appropriate entry property.
public abstract String	<i>getDeliveryAddress()</i> on page 1281	Returns The value of the appropriate entry property.
public abstract String	<i>getFilter()</i> on page 1282	Returns The value of the appropriate entry property.

Modifier and Type	Method	Description
public abstract String	<i>getSelect()</i> on page 1282	Returns The value of the appropriate entry property.
public abstract void	<i>setCollection(String)</i> on page 1282	Sets the value of the appropriate entry property.
public abstract void	<i>setDeliveryAddress(String)</i> on page 1282	Sets the value of the appropriate entry property.
public abstract void	<i>setFilter(String)</i> on page 1282	Sets the value of the appropriate entry property.
public abstract void	<i>setSelect(String)</i> on page 1283	Sets the value of the appropriate entry property.

#### Inherited members from ISDMODataEntry

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 1168	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 1169	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 1169	Value option for appropriate SDMODData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_LINK</i> on page 1169	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_NAME</i> on page 1170	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_PROPERTIES</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_TITLE</i> on page 1170	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 1170	Name of the appropriate SDMODData element.
public abstract List< ISDMO-DataLink >	<i>getActionLinks()</i> on page 1157	Returns SDMODData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 1157	Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.
public cacheState	<i>getCachestate()</i> on page 1158	
public Long	<i>getCacheTimestamp()</i> on page 1158	
public abstract String	<i>getCollectionId()</i> on page 1158	Returns the Id of the SDMOCata Collection that this Entry belongs to.
public abstract String	<i>getEtag()</i> on page 1158	Returns the Id of the SDMOData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 1158	Returns the full execution URL that can be used for filtering collection search for this single entry.

Modifier and Type	Member	Description
public abstract List< ISDMO-DataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 1159	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' use-in-search (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1159	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 1159	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataIcon >	<i>getIcons()</i> on page 1159	Returns the list of the appropriate SDMOData elements.
public abstract String	<i>getId()</i> on page 1160	Returns The Id of this SDMO-Data Entry (value of appropriate SDMOData Id element)
public boolean	<i>getIsLocal()</i> on page 1160	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 1160	Returns the values of the properties that are marked as key properties in the SDMOData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 1160	Returns The parsed value of the 'updated' SDMOData Element.
public abstract List< ISDMO-DataLink >	<i>getLinks()</i> on page 1160	Returns the list of the appropriate SDMOData elements.

Modifier and Type	Member	Description
public abstract List< ISDMO-DataProperty >	<i>getPropertiesData()</i> on page 1161	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-data Entry document.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 1161	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 1161	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract ISDMParseDocument	<i>getPropertiesDocument()</i> on page 1162	Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 1162	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 1163	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 1163	Returns the all the values of properties contained by this SDMOData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List&lt;String[]&gt;)</i> on page 1163	Return list of property values for the given property paths.

Modifier and Type	Member	Description
public abstract List< ISDMO-DataLink >	<i>getRelatedDataLinks()</i> on page 1164	Returns SDMODData Link objects that represents links to Related Data.
public abstract List< ISDMO-DataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 1164	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract ISDMODData-Schema	<i>getSchema()</i> on page 1164	Returns the appropriate SDMO-Data Schema object.
public abstract ISDMODData-Link	<i>getSelfLink()</i> on page 1164	Returns SDMSDMODData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract ISDMODData-Link	<i>getSubscriptionLink()</i> on page 1165	Returns SDMODData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 1165	Returns The value of the appropriate SDMODData element.
public abstract String	<i>getTitle()</i> on page 1165	Returns The value of the appropriate SDMODData element.
public static final String	<i>PROPERTY_LEVEL_SEPA-RATOR</i> on page 1170	
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 1165	Puts the new property element as a sub-element of the 'complex properties' SDMODData element.
public abstract void	<i>putId(String)</i> on page 1166	Sets id of this SDMODData Entry document (value of appropriate SDMODData Id element)
public abstract void	<i>putPropertyValue(String, String)</i> on page 1166	Puts the new property element as a sub-element of the 'properties' SDMODData element.

Modifier and Type	Member	Description
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 1166	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public abstract void	<i>setAuthorName(String)</i> on page 1167	Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.
public void	<i>setCacheState(cacheState)</i> on page 1167	
public void	<i>setCacheTimestamp(Long)</i> on page 1167	
public abstract void	<i>setCollectionId(String)</i> on page 1167	Maintains the Id of the SDMO-Cata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 1168	
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 1168	Maintains the reference to the appropriate SDMODData Schema object.
public abstract void	<i>setSummary(String)</i> on page 1168	Sets the value of the appropriate SDMODData element.
public abstract void	<i>setTitle(String)</i> on page 1168	Sets the value of the appropriate SDMODData element.

#### Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getCollection()* method

Returns The value of the appropriate entry property.

#### *Syntax*

```
public abstract String getCollection ()
```

#### *Returns*

The value of the appropriate entry property

#### *getDeliveryAddress()* method

Returns The value of the appropriate entry property.

#### *Syntax*

```
public abstract String getDeliveryAddress ()
```

#### *Returns*

The value of the appropriate entry property

### *getFilter() method*

Returns The value of the appropriate entry property.

#### *Syntax*

```
public abstract String getFilter ()
```

#### *Returns*

The value of the appropriate entry property

### *getSelect() method*

Returns The value of the appropriate entry property.

#### *Syntax*

```
public abstract String getSelect ()
```

#### *Returns*

The value of the appropriate entry property

### *setCollection(String) method*

Sets the value of the appropriate entry property.

#### *Syntax*

```
public abstract void setCollection (String collection)
```

#### *Parameters*

- **collection** – The new value of the appropriate entry property

### *setDeliveryAddress(String) method*

Sets the value of the appropriate entry property.

#### *Syntax*

```
public abstract void setDeliveryAddress (String deliveryAddress)
```

#### *Parameters*

- **deliveryAddress** –

### *setFilter(String) method*

Sets the value of the appropriate entry property.

#### *Syntax*

```
public abstract void setFilter (String filterString)
```

*Parameters*

- **filterString** – The new value of the appropriate entry property

*setSelect(String) method*

Sets the value of the appropriate entry property.

*Syntax*

```
public abstract void setSelect (String selectString )
```

*Parameters*

- **selectString** – The new value of the appropriate entry property

*ELEMENT\_COLLECTION variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_COLLECTION
```

*ELEMENT\_DELIVERYADDRESS variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_DELIVERYADDRESS
```

*ELEMENT\_FILTER variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_FILTER
```

*ELEMENT\_SELECT variable*

Name of the appropriate SDMODData element.

*Syntax*

```
public static final String ELEMENT_SELECT
```

*ISDMODDataURL interface*

Deprecated. since 3.0, Use IODataURL Represents the appropriate SDMODData element.

*Syntax*

```
public abstract interface ISDMODDataURL extends  
ISDMParserDocument
```

*Derived classes*

- *SDMODataURL* on page 1878

*Members*

All members of ISDMODataURL, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_TEMPLATE</i> on page 1291	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 1291	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_URL</i> on page 1291	Name of the appropriate SDMOData element.

**Methods**

Modifier and Type	Method	Description
public abstract List< String >	<i>getMandatoryTemplateParameters()</i> on page 1289	Returns the list of mandatory template parameter names.
public abstract List< String >	<i>getOptionalTemplateParameters()</i> on page 1290	Returns the list of optional template parameter names.
public abstract String	<i>getTemplate()</i> on page 1290	Returns the value of the appropriate SDMOData attribute.
public abstract List< String >	<i>getTemplateParameters()</i> on page 1290	Returns the list of all template parameter names.
public abstract String	<i>getType()</i> on page 1290	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getUrl()</i> on page 1290	Returns the full URL of this SDMOData attribute without parameters.
public abstract String	<i>getUrlFromTemplate(Map&lt; String, String &gt;)</i> on page 1291	Returns the full URL of this SDMOData attribute extended with parameter names and values according to the given parameter map.

**Inherited members from ISDMParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getMandatoryTemplateParameters()* method

Returns the list of mandatory template parameter names.

#### Syntax

```
public abstract List< String > getMandatoryTemplateParameters
()
```

#### Returns

the list of mandatory template parameter names

### *getOptionalTemplateParameters() method*

Returns the list of optional template parameter names.

#### *Syntax*

```
public abstract List< String > getOptionalTemplateParameters  
( )
```

#### *Returns*

the list of optional template parameter names

### *getTemplate() method*

Returns the value of the appropriate SDMOData attribute.

#### *Syntax*

```
public abstract String getTemplate ( )
```

#### *Returns*

The value of the appropriate SDMOData attribute

### *getTemplateParameters() method*

Returns the list of all template parameter names.

#### *Syntax*

```
public abstract List< String > getTemplateParameters ( )
```

#### *Returns*

the list of all template parameter names

### *getType() method*

Returns the value of the appropriate SDMOData attribute.

#### *Syntax*

```
public abstract String getType ( )
```

#### *Returns*

The value of the appropriate SDMOData attribute

### *getUrl() method*

Returns the full URL of this SDMOData attribute without parameters.

#### *Syntax*

```
public abstract String getUrl ( )
```

**Returns**

The full URL this SDMOData attribute without parameters

***getUrlFromTemplate(Map< String, String >) method***

Returns the full URL of this SDMOData attribute extended with parameter names and values according to the given parameter map.

**Syntax**

```
public abstract String getUrlFromTemplate (Map< String,
String > parameters )
```

**Returns**

The full URL this SDMOData attribute with parameters names and values

***ATTRIBUTE\_TEMPLATE variable***

Name of the appropriate SDMOData attribute.

**Syntax**

```
public static final String ATTRIBUTE_TEMPLATE
```

***ATTRIBUTE\_TYPE variable***

Name of the appropriate SDMOData attribute.

**Syntax**

```
public static final String ATTRIBUTE_TYPE
```

***ELEMENT\_URL variable***

Name of the appropriate SDMOData element.

**Syntax**

```
public static final String ELEMENT_URL
```

***ISDMODataWorkspace interface***

Deprecated. since 3.0, Use IODataWorkspace

**Syntax**

```
public abstract interface ISDMODataWorkspace extends
ISDMParserDocument
```

**Derived classes**

- *SDMODataWorkspace* on page 1896

*Members*All members of ISDMODataWorkspace, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 1298	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_TITLE</i> on page 1298	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_WORKSPACE</i> on page 1298	Name of the appropriate SDMOData element.

**Methods**

Modifier and Type	Method	Description
public abstract List< ISDMO-DataCollection >	<i>getCollections()</i> on page 1297	Returns The list of of 'collection' SDMOData element.
public abstract String	<i>getSemantics()</i> on page 1297	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getTitle()</i> on page 1298	Returns the value of the appropriate SDMOData element.

**Inherited members from ISDMParserDocument**

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1325	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public abstract void	<i>setAttributes(List&lt;String&gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### *getCollections()* method

Returns The list of of 'collection' SDMODData element.

#### *Syntax*

```
public abstract List< ISDMODDataCollection > getCollections
()
```

#### *Returns*

The list of of 'collection' SDMODData element.

#### *getSemantics()* method

Returns the value of the appropriate SDMODData attribute.

#### *Syntax*

```
public abstract String getSemantics ()
```

#### *Returns*

The value of the appropriate SDMODData attribute

### *getTitle() method*

Returns the value of the appropriate SDMODData element.

#### *Syntax*

```
public abstract String getTitle ()
```

#### *Returns*

The value of the appropriate SDMODData element

### *ATTRIBUTE\_SEMANTICS variable*

Name of the appropriate SDMODData attribute.

#### *Syntax*

```
public static final String ATTRIBUTE_SEMANTICS
```

### *ELEMENT\_TITLE variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_TITLE
```

### *ELEMENT\_WORKSPACE variable*

Name of the appropriate SDMODData element.

#### *Syntax*

```
public static final String ELEMENT_WORKSPACE
```

### *ISDMParser interface*

Deprecated. since 3.0, Use IParser Main interface for SDMODData parser.

#### *Syntax*

```
public abstract interface ISDMParser
```

#### *Derived classes*

- *SDMParser* on page 1911

#### *Members*

All members of ISDMParser, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract String	<i>buildSDMODataDocumentXML(ISDMParserDocument)</i> on page 1301	Replaced by com.sap.mobile.lib.parser.IParser#buildODataDocument(IParserDocument).
public String	<i>buildSDMODataEntryJson(ISDMODataEntry, String, ISDMODataSchema)</i> on page 1301	Replaced by com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody(ODataEntry ,String , IODataSchema , int).
public abstract String	<i>buildSDMODataEntryXML(ISDMODataEntry)</i> on page 1302	Replaced by com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody(ODataEntry ,String , IODataSchema , int).
public void	<i>enableParserPerformanceLog(boolean, Context)</i> on page 1302	Replaced by com.sap.mobile.lib.parser.IParser#enableParserPerformanceLog(boolean,Context).
public abstract List< ISDMODataEntry >	<i>parseFunctionImportResultXML(String, ISDMODataFunctionImport, ISDMODataSchema)</i> on page 1302	Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(String , IODataFunctionImport , IODataSchema).
public abstract List< ISDMODataEntry >	<i>parseFunctionImportResultXML(InputStream, ISDMODataFunctionImport, ISDMODataSchema)</i> on page 1303	Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(InputStream , IODataFunctionImport , IODataSchema ).
public abstract List< ISDMODataEntry >	<i>parseSDMODataEntriesXML(String, String, ISDMODataSchema)</i> on page 1304	Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(String , String , IODataSchema ).
public abstract List< ISDMODataEntry >	<i>parseSDMODataEntriesXML(InputStream, String, ISDMODataSchema)</i> on page 1304	Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(InputStream , String , IODataSchema ).

Modifier and Type	Method	Description
public abstract ISDMODataError	<i>parseSDMODataErrorXML(String)</i> on page 1305	Replaced by com.sap.mobile.lib.parser.IParser#parseODataError(String).
public abstract ISDMODataError	<i>parseSDMODataErrorXML(InputStream)</i> on page 1306	Replaced by com.sap.mobile.lib.parser.IParser#parseODataError(InputStream).
public abstract ISDMODataOpenSearchDescription	<i>parseSDMODataOpenSearchDescriptionXML(String, String, ISDMODataServiceDocument)</i> on page 1306	Replaced by com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(String, String, IODataServiceDocument).
public abstract ISDMODataOpenSearchDescription	<i>parseSDMODataOpenSearchDescriptionXML(InputStream, String, ISDMODataServiceDocument)</i> on page 1307	Replaced by com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument).
public abstract ISDMODataSchema	<i>parseSDMODataSchemaXML(String, ISDMODataServiceDocument)</i> on page 1307	Replaced by com.sap.mobile.lib.parser.IParser#parseODataSchema(String, IODataServiceDocument).
public abstract ISDMODataSchema	<i>parseSDMODataSchemaXML(InputStream, ISDMODataServiceDocument)</i> on page 1308	Replaced by com.sap.mobile.lib.parser.IParser#parseODataSchema(InputStream, IODataServiceDocument).
public abstract ISDMODataServiceDocument	<i>parseSDMODataServiceDocumentXML(String)</i> on page 1309	Replaced by com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(String).
public abstract ISDMODataServiceDocument	<i>parseSDMODataServiceDocumentXML(InputStream)</i> on page 1309	Replaced by com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(InputStream).
public abstract ISDMParserDocument	<i>parseXML(String)</i> on page 1310	Replaced by com.sap.mobile.lib.parser.IParser#parse(String).
public abstract ISDMParserDocument	<i>parseXML(InputStream)</i> on page 1310	Replaced by com.sap.mobile.lib.parser.IParser#parse(InputStream).

*buildSDMODataDocumentXML(ISDMParserDocument) method*

Replaced by `com.sap.mobile.lib.parser.IParser#buildODataDocument(IParserDocument)`.

*Syntax*

```
public abstract String buildSDMODataDocumentXML
( ISDMParserDocument document ) throws SDMParserException,
IllegalArgumentException
```

*Parameters*

- **document** – The `SDMParserDocument` object to build the XML from

*Returns*

The built document XML

*Exceptions*

- **SDMParserException class** – If building XML has failed
- **IllegalArgumentException** – If the argument is null

*Usage*

Builds and XML representation of the document argument

*buildSDMODataEntryJson(ISDMODataEntry, String, ISDMODataSchema) method*

Replaced by

```
com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody( IODataEntry ,String ,
IODataSchema , int).
```

*Syntax*

```
public String buildSDMODataEntryJson ( ISDMODataEntry entry ,
String collectionId , ISDMODataSchema schema )
```

*Parameters*

- **entry** – The `SDMODataEntry` object to build the XML from
- **collectionId** – Collection to which the post needs to be made

*Returns*

The built document Json

*Usage*

Builds a valid `SDMODataEntry` JSON Post body from the entry argument

### *buildSDMODataEntryXML(ISDMODataEntry) method*

Replaced by

`com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody( IODataEntry ,String , IODataSchema , int).`

### *Syntax*

```
public abstract String buildSDMODataEntryXML ( ISDMODataEntry  
entry ) throws SDMParseException, IllegalArgumentException
```

### *Parameters*

- **entry** – The SDMODataEntry object to build the XML from

### *Returns*

The built document XML

### *Exceptions*

- **SDMParseException class** – If building XML has failed
- **IllegalArgumentException** – If the argument is null

### *Usage*

Builds a valid SDMOData Entry XML from the entry argument

### *enableParserPerformanceLog(boolean, Context) method*

Replaced by

`com.sap.mobile.lib.parser.IParser#enableParserPerformanceLog(boolean,Context).`

### *Syntax*

```
public void enableParserPerformanceLog ( boolean perflog ,  
Context applicationContext )
```

### *Parameters*

- **perflog** –
- **applicationContext** –

### *parseFunctionImportResultXML(String, ISDMODataFunctionImport, ISDMODataSchema) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(String , IODataFunctionImport , IODataSchema).`

### *Syntax*

```
public abstract List< ISDMODataEntry >  
parseFunctionImportResultXML ( String xml ,
```

ISDMODataFunctionImport *functionImport* , ISDMODataSchema *schema* )  
 throws SDMParseException, IllegalArgumentException

### Parameters

- **xml** – The Function Import result XML
- **functionImport** – The SDMOData Function Import document
- **schema** – The appropriate SDMOData Schema document

### Returns

List of SDMOData Entry containing the result values

### Exceptions

- **SDMParseException class** – If parsing XML has failed
- **IllegalArgumentException** – If either of the arguments is null

### Usage

Parser a non error result of the execution of a Function Import SDMOData document The result will be converted to a list of SDMOData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,

*parseFunctionImportResultXML(InputStream, ISDMODataFunctionImport, ISDMODataSchema) method*

Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(InputStream , IODataFunctionImport , IODataSchema ).

### Syntax

```
public abstract List< ISDMODataEntry >
parseFunctionImportResultXML ( InputStream stream ,
ISDMODataFunctionImport functionImport , ISDMODataSchema schema )
throws SDMParseException, IllegalArgumentException
```

### Parameters

- **stream** – The function Import result stream
- **functionImport** – The SDMOData Function Import document
- **schema** – The appropriate SDMOData Schema document

### Returns

List of SDMOData Entry containing the result values

### Exceptions

- **SDMParseException class** – If parsing XML has failed

- **IllegalArgumentException** – If either of the arguments is null

### Usage

Parser a non error result of the execution of a Function Import SDMODData document The result will be converted to a list of SDMODData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,

*parseSDMODDataEntriesXML(String, String, ISDMODDataSchema) method*

Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(String, String, IODataSchema ).

### Syntax

```
public abstract List< ISDMODDataEntry >
parseSDMODDataEntriesXML ( String entriesXML , String collectionId ,
ISDMODDataSchema schema ) throws SDMParseException,
IllegalArgumentException
```

### Parameters

- **entriesXML** – The XML source of either a single SDMODData Entry or SDMODData Feed of several SDMODData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant SDMODData schema document

### Returns

The list of the SDMODData Entries contained by the source XML

### Exceptions

- **SDMParseException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

### Usage

Parses SAPData XML structure that represent either a single SDMODData Entry or an SDMODData Feed with several SDMODData entries

*parseSDMODDataEntriesXML(InputStream, String, ISDMODDataSchema) method*

Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(InputStream, String, IODataSchema ).

### Syntax

```
public abstract List< ISDMODDataEntry >
parseSDMODDataEntriesXML ( InputStream stream , String collectionId ,
ISDMODDataSchema schema ) throws SDMParseException,
IllegalArgumentException
```

*Parameters*

- **stream** – The stream that holds the XML source of either a single SDMODData Entry or SDMODData Feed of several SDMODData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant SDMODData schema document

*Returns*

The list of the SDMODData Entries contained by the source XML

*Exceptions*

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

*Usage*

Parses SAPData XML structure from stream that represent either a single SDMODData Entry or an SDMODData Feed of several SDMODData entries

*parseSDMODDataErrorXML(String) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parseODataError(String)`.

*Syntax*

```
public abstract ISDMODDataError parseSDMODDataErrorXML (String
errorXML ) throws SDMParserException, IllegalArgumentException
```

*Parameters*

- **errorXML** – The SDMODData Error XML

*Returns*

The SDMODData Error document

*Exceptions*

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

*Usage*

Parses the SDMODData Error XML

### *parseSDMODataErrorXML(InputStream) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parseODataError(InputStream)`.

#### *Syntax*

```
public abstract ISDMODataError parseSDMODataErrorXML  
( InputStream stream ) throws SDMParserException,  
IllegalArgumentException
```

#### *Parameters*

- **stream** – The SDMOData Error XML as stream

#### *Returns*

The SDMOData Error document

#### *Exceptions*

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

#### *Usage*

Parses the SDMOData Error XML from stream

### *parseSDMODataOpenSearchDescriptionXML(String, String, ISDMODataServiceDocument) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(String, String, IODataServiceDocument)`.

#### *Syntax*

```
public abstract ISDMODataOpenSearchDescription  
parseSDMODataOpenSearchDescriptionXML ( String  
openSearchDescriptionXML , String collectionId ,  
ISDMODataServiceDocument serviceDocument ) throws  
SDMParserException, IllegalArgumentException
```

#### *Parameters*

- **openSearchDescriptionXML** – The SDMOData Open Search Description XML

#### *Returns*

SDMOData Open Search Description document

### Exceptions

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

### Usage

Parses the SDMODData Open Search Description XML

*parseSDMODDataOpenSearchDescriptionXML(InputStream, String, ISDMODDataServiceDocument) method*

Replaced by

com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(InputStream , String , IODataServiceDocument ).

### Syntax

```
public abstract ISDMODDataOpenSearchDescription
parseSDMODDataOpenSearchDescriptionXML ( InputStream stream ,
String collectionId , ISDMODDataServiceDocument serviceDocument ) throws
SDMParserException, IllegalArgumentException
```

### Parameters

- **stream** – The stream that holds the SDMODData Open Search Description XML.

### Returns

SDMODData Open Search Description document

### Exceptions

- **SDMParserException class** – If the stream source is invalid.
- **IllegalArgumentException** – If the argument is null.

### Usage

Parses the SDMODData Open Search Description XML from stream

*parseSDMODDataSchemaXML(String, ISDMODDataServiceDocument) method*

Replaced by

com.sap.mobile.lib.parser.IParser#parseODataSchema(String,IODataServiceDocument).

### Syntax

```
public abstract ISDMODDataSchema parseSDMODDataSchemaXML
( String schemaXML , ISDMODDataServiceDocument serviceDocument ) throws
SDMParserException, IllegalArgumentException
```

### *Parameters*

- **schemaXML** – The SDMOData Schema XML
- **serviceDocument** – The appropriate SDMOData Service Document object

### *Returns*

The SDMOData Schema document

### *Exceptions*

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

### *Usage*

Parses the SDMOData Schema XML

*parseSDMODataSchemaXML(InputStream, ISDMODataServiceDocument)*  
*method*

Replaced by

com.sap.mobile.lib.parser.IParser#parseODataSchema(InputStream, IODataServiceDocument).

### *Syntax*

```
public abstract ISDMODataSchema parseSDMODataSchemaXML  
( InputStream stream , ISDMODataServiceDocument serviceDocument )  
throws SDMParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – The stream that holds SDMOData Schema XML
- **serviceDocument** – The appropriate SDMOData Service Document object

### *Returns*

The SDMOData Schema document

### *Exceptions*

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *Usage*

Parses the SDMOData Schema XML from stream

*parseSDMODataServiceDocumentXML(String) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(String)`.

*Syntax*

```
public abstract ISDMODataServiceDocument
parseSDMODataServiceDocumentXML ( String serviceDocumentXML ) throws
SDMParserException, IllegalArgumentException
```

*Parameters*

- **serviceDocumentXML** – The SDMOData Service Document XML

*Returns*

The SDMOData Service Document

*Exceptions*

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

*Usage*

Parses the SDMOData Service Document XML

*parseSDMODataServiceDocumentXML(InputStream) method*

Replaced by

`com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(InputStream)`.

*Syntax*

```
public abstract ISDMODataServiceDocument
parseSDMODataServiceDocumentXML ( InputStream stream ) throws
SDMParserException, IllegalArgumentException
```

*Parameters*

- **stream** – The stream that holds SDMOData Service Document XML

*Returns*

The SDMOData Service Document

*Exceptions*

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### *Usage*

Parses the SDMOData Service Document XML from stream

### *parseXML(String) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parse(String)`.

### *Syntax*

```
public abstract ISDMParserDocument parseXML (String xml) throws  
SDMParserException, IllegalArgumentException
```

### *Parameters*

- **xml** – A syntactically valid XML

### *Returns*

The Object representation of the parsed XML

### *Exceptions*

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

### *Usage*

Parses the Source XML and converts it to a Java Object containing all the information that were contained by the source XML

### *parseXML(InputStream) method*

Replaced by `com.sap.mobile.lib.parser.IParser#parse(InputStream)`.

### *Syntax*

```
public abstract ISDMParserDocument parseXML (InputStream  
stream) throws SDMParserException, IllegalArgumentException
```

### *Parameters*

- **stream** – A stream that holds a syntactically valid XML

### *Returns*

The Object representation of the parsed XML

### *Exceptions*

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

### Usage

Parses the stream source of an XML and converts it to a Java Object containing all the information that were contained by the source XML

### *ISDMParserDocument* interface

Deprecated. since 3.0, Use IParserDocument Represents a general XML-compatible, persistable object.

### Syntax

```
public abstract interface ISDMParserDocument extends
ISDMPersistable, Serializable
```

### Derived classes

### Members

All members of ISDMParserDocument, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1329	Name of the appropriate SDMOData element.

Modifier and Type	Variable	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1329	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1329	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1329	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1329	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1329	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1329	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1330	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1330	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://www.w3.org/2005/Atom">http://www.w3.org/2005/Atom</a> .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices">http://schemas.microsoft.com/ado/2007/08/dataservices</a> .
public static final String	<i>XMLNS_EDM_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/05/edm">http://schemas.microsoft.com/ado/2007/05/edm</a> .

Modifier and Type	Variable	Description
public static final String	<i>XMLNS_EDMX_URI</i> on page 1330	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/06/edmx">http://schemas.microsoft.com/ado/2007/06/edmx</a> .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData/GenericPlayer">http://www.sap.com/Protocols/SAPData/GenericPlayer</a> .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">http://schemas.microsoft.com/ado/2007/08/dataservices/metadata</a> .
public static final String	<i>XMLNS_SAP_URI</i> on page 1331	Constant for XMLNS URI: <a href="http://www.sap.com/Protocols/SAPData">http://www.sap.com/Protocols/SAPData</a> .

## Methods

Modifier and Type	Method	Description
public abstract ISDMParseDocument	<i>clone()</i> on page 1317	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 1317	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1317	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1318	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1318	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1318	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Method	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1319	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1320	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1320	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1321	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1322	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1323	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1323	
public abstract String	<i>getPrefixForUri(String)</i> on page 1323	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1324	Returns all the string values contained by this document.

Modifier and Type	Method	Description
public abstract String	<i>getValue(String...)</i> on page 1324	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1324	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1325	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1325	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1325	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1326	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1326	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1326	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List&lt; String &gt;, String...)</i> on page 1327	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Method	Description
public abstract void	<i>setDocuments(List&lt; ISDMParserDocument &gt;, String...)</i> on page 1327	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1328	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List&lt; String &gt;, String...)</i> on page 1328	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1328	Returns the XML string representation of this object.

#### Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

#### Usage

XML like elements, values and attributes can be access via routes Routes are list of element names where each element contains the next element in the list

Elements can be retrieved as a new ISDMParserDocument containing all the attributes, values and child elements of the represented element.

Empty routes always refer to the given object the method invoked on

*clone() method*

Creates a copy of this object.

*Syntax*

```
public abstract ISDMParserDocument clone () throws
CloneNotSupportedException
```

*Returns*

The new copy of this object

*getAttribute(String...) method*

Returns the value of the first attribute with the given route.

*Syntax*

```
public abstract String getAttribute (String... route ) throws
IllegalArgumentException
```

*Parameters*

- **route** – The route to the attribute

*Returns*

The value of the first attribute or null if there is no such attribute

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getAttributes(String...) method*

Returns all the values of attributes with the given route.

*Syntax*

```
public abstract List< String > getAttributes (String... route )
throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the attributes

*Returns*

The list of values

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getChildAttributeMap(String...) method*

Returns all the name-value pairs of attributes contained by the element with the given route.

### *Syntax*

```
public abstract Map< String, String > getChildAttributeMap  
( String... route ) throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element with the child attributes

### *Returns*

The list of values

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getChildAttributes(String...) method*

Returns all the values of attributes contained by the element with the given route.

### *Syntax*

```
public abstract List< String > getChildAttributes ( String...  
route ) throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element with the child attributes

### *Returns*

The list of values

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getChildDocuments(String...) method*

Returns the elements contained by the element with the given route.

### *Syntax*

```
public abstract List< ISDMParserDocument > getChildDocuments (   
String... route ) throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the element with the child elements

*Returns*

List of elements as new ISDMParser documents

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getChildDocumentsWithAttribute(String, String, String...) method*

Returns the elements contained by the element with the given route and having the given attribute with the given value.

*Syntax*

```
public abstract List< ISDMParserDocument >
getChildDocumentsWithAttribute ( String attributeName , String
attributeValue , String... route ) throws IllegalArgumentException
```

*Parameters*

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

*Returns*

List of elements as new ISDMParser documents

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*getChildDocumentsWithAttribute(String, String, boolean, String...) method*

Returns the elements contained by the element with the given route and having the given attribute with the given value.

*Syntax*

```
public abstract List< ISDMParserDocument >
getChildDocumentsWithAttribute ( String attributeName , String
attributeValue , boolean addByDefault , String... route )
```

### *Parameters*

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

### *Returns*

List of elements as new ISDMParser documents

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocument(String...) method*

Returns the first element with the given route.

### *Syntax*

```
public abstract ISDMParserDocument getDocument (String...  
route) throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element

### *Returns*

The element as a new ISDMParser document or null if there is no such element

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getDocuments(String...) method*

Returns all the elements with the given route.

### *Syntax*

```
public abstract List< ISDMParserDocument > getDocuments  
(String... route) throws IllegalArgumentException
```

### *Parameters*

- **route** – The route to the elements

*Returns*

List of elements as new ISDMParser documents

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*getDocumentsWithAttribute(String, String, String...) method*

Returns the elements with the given route that contains the given attribute with the given value.

*Syntax*

```
public abstract List< ISDMParserDocument >
getDocumentsWithAttribute ( String attributeName , String
attributeValue , String... route )
```

*Parameters*

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

*Returns*

List of elements as new ISDMParser documents

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*getDocumentsWithAttribute(String, String, boolean, String...) method*

Returns the elements with the given route that contains the given attribute with the given value.

*Syntax*

```
public abstract List< ISDMParserDocument >
getDocumentsWithAttribute ( String attributeName , String
attributeValue , boolean addByDefault , String... route )
```

*Parameters*

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

- **addByDefault** – true if element should be returned in case it does not contain the given attribute

### Returns

List of elements as new ISDMParser documents

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentWithAttribute(String, String, String...) method*

Returns the first element with the given route that contains the given attribute with the given value.

### Syntax

```
public abstract ISDMParserDocument getDocumentWithAttribute (
String attributeName , String attributeValue , String... route )
```

### Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

### Returns

The element as a new ISDMParser document or null if there is no such element

### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

### *getDocumentWithAttribute(String, String, boolean, String...) method*

Returns the first element with the given route that contains the given attribute with the given value.

### Syntax

```
public abstract ISDMParserDocument getDocumentWithAttribute (
String attributeName , String attributeValue , boolean addByDefault ,
String... route )
```

### Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

- **addByDefault** – true if element should be returned in case it does not contain the given attribute

#### Returns

The element as a new ISDMParser document or null if there is no such element

#### Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

#### *getElementName()* method

Returns The name of the root element of this document.

#### Syntax

```
public abstract String getElementName ()
```

#### Returns

The name of the root element of this document

#### *getFunctionImportComplexPropertyValue(String...)* method

#### Syntax

```
public abstract String getFunctionImportComplexPropertyValue  
(String... route)
```

#### *getPrefixForUri(String)* method

Returns the appropriate name-space prefix for the given XML name-space URI.

#### Syntax

```
public abstract String getPrefixForUri (String uri) throws  
IllegalArgumentException
```

#### Parameters

- **uri** – An XML names-pace URI

#### Returns

The appropriate name-space prefix

#### Exceptions

- **IllegalArgumentException** – if the argument is null.

### *getStrings() method*

Returns all the string values contained by this document.

### *Syntax*

```
public abstract String[] getStrings ()
```

### *Returns*

all the string values contained by this document

### *getValue(String...) method*

Returns the value of the first element with the given route.

### *Syntax*

```
public abstract String getValue (String... route ) throws  
IllegalArgumentException
```

### *Parameters*

- **route** – The route to the element

### *Returns*

The value of the first element or null if there is no such element

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *getValues(String...) method*

Returns all the values of elements with the given route.

### *Syntax*

```
public abstract List< String > getValues (String... route ) throws  
IllegalArgumentException
```

### *Parameters*

- **route** – The route to the elements

### *Returns*

The list of values

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

*putAttribute(String, String...) method*

Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non-existing elements in the route.

*Syntax*

```
public abstract void putAttribute (String value , String... route)
throws IllegalArgumentException
```

*Parameters*

- **value** – The new value
- **route** – The route to the attribute

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*putDocument(ISDMParseDocument, String...) method*

Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.

*Syntax*

```
public abstract void putDocument (ISDMParseDocument document ,
String... route) throws IllegalArgumentException
```

*Parameters*

- **document** – The new document
- **route** – The route to the parent element of the new document

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*putValue(String, String...) method*

Sets the value of the first element with the given route.

*Syntax*

```
public abstract void putValue (String value , String... route)
throws IllegalArgumentException
```

### *Parameters*

- **value** – The new value
- **route** – The route to the element

### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *removeAttribute(String...) method*

Removes first element with the given route.

### *Syntax*

```
public abstract boolean removeAttribute (String... route)
```

### *Parameters*

- **route** – The route to the attribute to remove

### *Returns*

true if at least one attribute has been removed or false otherwise

### *removeAttributes(String...) method*

Removes all the attribute with the given route.

### *Syntax*

```
public abstract boolean removeAttributes (String... route)
```

### *Parameters*

- **route** – The route to the attributes to remove

### *Returns*

true if at least one attribute has been removed or false otherwise

### *removeDocument(String...) method*

Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

### *Syntax*

```
public abstract boolean removeDocument (String... route) throws  
IllegalArgumentException
```

*Parameters*

- **route** – The route to the element to remove

*Returns*

true if at least one element has been removed or false otherwise

*setAttributes(List< String >, String...) method*

Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

*Syntax*

```
public abstract void setAttributes ( List< String > values ,
String... route ) throws IllegalArgumentException
```

*Parameters*

- **values** – The new values of the attributes
- **route** – The route to the attributes

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

*setDocuments(List< ISDMParserDocument >, String...) method*

Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

*Syntax*

```
public abstract void setDocuments ( List< ISDMParserDocument >
documents , String... route ) throws IllegalArgumentException
```

*Parameters*

- **documents** – The list of new documents or nulls if one or more document should be removed
- **route** – The route to the elements

*Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *setElementName(String, String...) method*

Sets the name of the root element with the given route Use empty route for setting root name of this document.

#### *Syntax*

```
public abstract void setElementName ( String name , String...  
route ) throws IllegalArgumentException
```

#### *Parameters*

- **name** – The new name of the root element
- **route** – The route to the element

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *setValues(List< String >, String...) method*

Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

#### *Syntax*

```
public abstract void setValues ( List< String > values ,  
String... route ) throws IllegalArgumentException
```

#### *Parameters*

- **values** – The new values of the elements
- **route** – The route to the elements

#### *Exceptions*

- **IllegalArgumentException** – if either of the arguments is null.

### *toXMLString() method*

Returns the XML string representation of this object.

#### *Syntax*

```
public abstract String toXMLString ()
```

#### *Returns*

The XML string representation of this object

***ATTRIBUTE\_ETAG variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static final String ATTRIBUTE_ETAG
```

***ATTRIBUTE\_VALUEPREFIX\_EDMTYPE variable***

Value prefix for EDM Type type values.

***Syntax***

```
public static final String ATTRIBUTE_VALUEPREFIX_EDMTYPE
```

***DEFAULT\_PREFIXMAPPING variable***

The default XML Namespace-to-Prefix mapping used for building XMLS.

***Syntax***

```
public static Map< String, String > DEFAULT_PREFIXMAPPING
```

***EDMDATETIME\_PATTERNS variable***

Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

***Syntax***

```
public static final String[] EDMDATETIME_PATTERNS
```

***EDMDATETIMEOFFSET\_PATTERNS variable***

Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

***Syntax***

```
public static final String[] EDMDATETIMEOFFSET_PATTERNS
```

***EDMTIME\_PATTERN variable***

EDM Time pattern.

***Syntax***

```
public static final String EDMTIME_PATTERN
```

***ELEMENT\_FEED variable***

Name of the appropriate SDMOData element.

***Syntax***

```
public static String ELEMENT_FEED
```

*ELEMENT\_ID variable*

Name of the appropriate SDMOData element.

*Syntax*

```
public static final String ELEMENT_ID
```

*ROOT\_DOCUMENT\_NAME variable*

The default root element name for a new document.

*Syntax*

```
public static final String ROOT_DOCUMENT_NAME
```

*XMLNS\_APPLICATION\_URI variable*

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

*Syntax*

```
public static final String XMLNS_APPLICATION_URI
```

*XMLNS\_ATOM\_URI variable*

Constant for XMLNS URI: <http://www.w3.org/2005/Atom>.

*Syntax*

```
public static final String XMLNS_ATOM_URI
```

*XMLNS\_DATASERVICES\_URI variable*

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

*Syntax*

```
public static final String XMLNS_DATASERVICES_URI
```

*XMLNS\_EDM\_URI variable*

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/05/edm>.

*Syntax*

```
public static final String XMLNS_EDM_URI
```

*XMLNS\_EDMX\_URI variable*

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/06/edmx>.

*Syntax*

```
public static final String XMLNS_EDMX_URI
```

*XMLNS\_GENERICPLAYER\_URI variable*

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData/GenericPlayer>.

*Syntax*

```
public static final String XMLNS_GENERICPLAYER_URI
```

*XMLNS\_METADATA\_URI variable*

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices/metadata>.

*Syntax*

```
public static final String XMLNS_METADATA_URI
```

*XMLNS\_SAP\_URI variable*

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData>.

*Syntax*

```
public static final String XMLNS_SAP_URI
```

*ISDMPersistable interface*

Deprecated. since 3.0, Use `com.sap.mobile.lib.persistence.IPersistable` Interface that any object should implement that is to store by `SDMPersistence`.

*Syntax*

```
public interface ISDMPersistable
```

*Derived classes*

- *ISDMCache* on page 1050
- *ISDMParserDocument* on page 1311
- *SDMLogger* on page 1421

*Members*

All members of `ISDMPersistable`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

*read(BufferedReader) method*

*Syntax*

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

*Parameters*

- **reader** – The buffered reader to read the object from.

*Exceptions*

- **SDMPersistenceException class** – if data can not be loaded from the reader.

*write(BufferedWriter) method*

*Syntax*

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

*Parameters*

- **writer** – The buffered writer that object data needs to be written into.

*Exceptions*

- **SDMPersistenceException class** – if data can not be written into the writer

*ISDMPersistence interface*

Deprecated. since 3.0 SDMPersistency is a low-level library responsible for data persistence.

*Syntax*

```
public abstract interface ISDMPersistence
```

*Derived classes*

- *SDMPersistence* on page 1960

*Members*

All members of ISDMPersistence, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract void	<i>clear()</i> on page 1334	Deletes all data persisted by SDMPersistency.

Modifier and Type	Method	Description
public abstract boolean	<i>isDataPersisted(String)</i> on page 1334	Returns if the data with the given key is persisted.
public abstract InputStream	<i>loadDataStream(String)</i> on page 1334	Loads data stream stored in the file system.
public abstract< Textextends ISDMPersistable > boolean	<i>loadObject(String, T)</i> on page 1334	Loads an object stored in the file system.
public abstract byte[]	<i>loadRawData(String)</i> on page 1335	Loads raw data stored in the file system.
public abstract boolean	<i>loadSDMCache(ISDMCache)</i> on page 1335	Loads SDMCache from the file system.
public abstract boolean	<i>loadSDMCache(String, ISDMCache)</i> on page 1336	Loads SDMCache with the specified key extension from the file system.
public abstract boolean	<i>removeData(String)</i> on page 1336	
public abstract boolean	<i>removeSDMCache()</i> on page 1337	Removes the SDMCache from the file system.
public abstract boolean	<i>removeSDMCache(String)</i> on page 1337	Removes the SDMCache with the specified key extension from the file system.
public void	<i>setEncryptionKey(byte[], String)</i> on page 1337	Set the encryption key in a byte[] format.
public abstract void	<i>storeDataStream(String, InputStream)</i> on page 1338	Stores a data stream, in the file system.
public abstract void	<i>storeObject(String, ISDMPersistable)</i> on page 1338	Stores an ISDMPersistable object in the file system.
public abstract void	<i>storeRawData(String, byte[])</i> on page 1339	Stores a raw data in the file system.
public abstract void	<i>storeSDMCache(ISDMCache)</i> on page 1339	Stores SDMCache in the file system.
public abstract void	<i>storeSDMCache(String, ISDMCache)</i> on page 1339	Stores the SDMCache with the specified key extension in the file system.

### *clear() method*

Deletes all data persisted by SDMPersistence.

### *Syntax*

```
public abstract void clear ()
```

### *isDataPersisted(String) method*

Returns if the data with the given key is persisted.

### *Syntax*

```
public abstract boolean isDataPersisted ( String key )
```

### *Parameters*

- **key** – The key of the data

### *Returns*

True if the data persisted false if not.

### *loadDataStream(String) method*

Loads data stream stored in the file system.

### *Syntax*

```
public abstract InputStream loadDataStream ( String key ) throws  
SDMPersistenceException, IllegalArgumentException
```

### *Parameters*

- **key** – The key used for identifying the object and the input file.

### *Returns*

The data stream

### *Exceptions*

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'key' is null.

### *loadObject(String, T) method*

Loads an object stored in the file system.

### *Syntax*

```
public abstract< TextendsISDMPersistable > boolean loadObject  
( String key , T object ) throws SDMPersistenceException,  
IllegalArgumentException
```

*Parameters*

- **<T>** – The class type of the stored object.
- **key** – The key used for identifying the object and the input file.
- **object** – The object to fill by the stored data.

*Returns*

true if the object has found and successfully loaded and false otherwise.

*Exceptions*

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'object' or parameter 'key' is null.

*loadRawData(String) method*

Loads raw data stored in the file system.

*Syntax*

```
public abstract byte[] loadRawData (String key) throws
SDMPersistenceException, IllegalArgumentException
```

*Parameters*

- **key** – The key used for identifying the object and the input file.

*Returns*

The loaded raw data

*Exceptions*

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'key' is null.

*loadSDMCache(ISDMCache) method*

Loads SDMCache from the file system.

*Syntax*

```
public abstract boolean loadSDMCache ( ISDMCache cache ) throws
SDMPersistenceException, IllegalArgumentException
```

*Parameters*

- **cache** – The SDMCache object to fill by the data.

### *Returns*

true if persisted SDMCache has found and successfully loaded, false otherwise.

### *Exceptions*

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

### *loadSDMCache(String, ISDMCache) method*

Loads SDMCache with the specified key extension from the file system.

### *Syntax*

```
public abstract boolean loadSDMCache (String key, ISDMCache  
cache) throws SDMPersistenceException
```

### *Parameters*

- **key** – The key extension of the SDMCache
- **cache** – The SDMCache object to fill by the data.

### *Returns*

true if persisted SDMCache has found and successfully loaded, false otherwise.

### *Exceptions*

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

### *removeData(String) method*

### *Syntax*

```
public abstract boolean removeData (String key) throws  
SDMPersistenceException, IllegalArgumentException
```

### *Parameters*

- **key** – The key used for identifying the object and the file to delete.

### *Returns*

boolean if persisted data with the given key found and successfully removed, false otherwise.

### *Exceptions*

- **SDMPersistenceException class** – if persisted data can not be deleted for any reason.

- **IllegalArgumentException** – if parameter 'key' is null.

#### *removeSDMCache() method*

Removes the SDMCache from the file system.

#### *Syntax*

```
public abstract boolean removeSDMCache () throws  
SDMPersistenceException
```

#### *Returns*

true if persisted SDMCache has found and successfully removes, false otherwise.

#### *Exceptions*

- **SDMPersistenceException class** – if persisted SDMCache can not be deleted for any reason.

#### *removeSDMCache(String) method*

Removes the SDMCache with the specified key extension from the file system.

#### *Syntax*

```
public abstract boolean removeSDMCache (String key) throws  
SDMPersistenceException
```

#### *Parameters*

- **key** – The key extension of the SDMCache

#### *Returns*

true if persisted SDMCache has found and successfully removes, false otherwise.

#### *Exceptions*

- **SDMPersistenceException class** – if persisted SDMCache can not be deleted for any reason.

#### *setEncryptionKey(byte[], String) method*

Set the encryption key in a byte[] format.

#### *Syntax*

```
public void setEncryptionKey (byte[] secretKey , String  
secretKeyAlgorithm ) throws SDMPersistenceException
```

### *Parameters*

- **secretKey** – The secret key for encryption
- **secretKeyAlgorithm** – The algorithm of the Secret Key

### *Exceptions*

- **SDMPersistenceException class** – if any error in encryption occurs

### *storeDataStream(String, InputStream) method*

Stores a data stream, in the file system.

### *Syntax*

```
public abstract void storeDataStream (String key, InputStream stream) throws SDMPersistenceException, IllegalArgumentException
```

### *Parameters*

- **key** – The key used for identifying the object and as a name for the output file.
- **stream** – The data stream to store

### *Exceptions*

- **SDMPersistenceException class** – if data stream can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'stream' or parameter 'key' is null, or parameter 'key' contains illegal characters.

### *storeObject(String, ISDMPersistable) method*

Stores an ISDMPersistable object in the file system.

### *Syntax*

```
public abstract void storeObject (String key, ISDMPersistable object) throws SDMPersistenceException, IllegalArgumentException
```

### *Parameters*

- **key** – The key used for identifying the object and as a name for the output file.
- **object** – The object to store.

### *Exceptions*

- **SDMPersistenceException class** – if object can not be persisted for any reasons.
- **IllegalArgumentException** – if parameter 'object' or parameter 'key' is null, or parameter 'key' contains illegal characters.

*storeRawData(String, byte[]) method*

Stores a raw data in the file system.

*Syntax*

```
public abstract void storeRawData (String key, byte[] data) throws
SDMPersistenceException, IllegalArgumentException
```

*Parameters*

- **key** – The key used for identifying the object and as a name for the output file.
- **data** – The data to store

*Exceptions*

- **SDMPersistenceException class** – if the data can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'data' or parameter 'key' is null, or parameter 'key' contains illegal characters.

*storeSDMCache(ISDMCache) method*

Stores SDMCache in the file system.

*Syntax*

```
public abstract void storeSDMCache ( ISDMCache cache ) throws
SDMPersistenceException, IllegalArgumentException
```

*Parameters*

- **cache** – The SDMCache to store

*Exceptions*

- **SDMPersistenceException class** – if SDMCache can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

*storeSDMCache(String, ISDMCache) method*

Stores the SDMCache with the specified key extension in the file system.

*Syntax*

```
public abstract void storeSDMCache (String key, ISDMCache cache )
throws SDMPersistenceException
```

*Parameters*

- **key** – The key extension of the SDMCache

- **cache** – The SDMCache to store

### Exceptions

- **SDMPersistenceException** class – if SDMCache can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

### ISDMPreferenceChangeListener interface

Deprecated. since 3.0, Use com.sap.mobile.lib.configuration.IPreferenceChangeListener Interface for classes that are to listen changes of preferences.

### Syntax

```
public interface ISDMPreferenceChangeListener
```

### Derived classes

- *SDMCache* on page 1389
- *ConnectionFactory* on page 1037
- *SDMRequestManager* on page 1994
- *SDMPersistence* on page 1960

### Members

All members of ISDMPreferenceChangeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onPreferenceChanged(String, Object)</i> on page 1340	Callback method for preference change event.

### *onPreferenceChanged(String, Object)* method

Callback method for preference change event.

### Syntax

```
public void onPreferenceChanged (String key , Object value )
```

### Parameters

- **key** – key of the preference
- **value** – value of the preference

### ISDMPreferences interface

Deprecated. since 3.0, Use com.sap.mobile.lib.configuration.IPreferences Main interface for SDMConfiguration.

### Syntax

```
public interface ISDMPreferences
```

*Derived classes*

- *SDMPreferences* on page 1971

*Members*

All members of *ISDMPreferences*, including inherited members. **Variables**

<b>Modifier and Type</b>	<b>Variable</b>	<b>Description</b>
public static final String	<i>BUSINESSSTRANSAC-TION_ENABLED</i> on page 1350	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	<i>BYPASS_PROXY</i> on page 1350	Preference for the indicator to decide which URLs need the proxy bypassed.
public static final String	<i>SAP_APPLICATIONID_HEADER_VALUE</i> on page 1350	Preference for application ID (used in request headers)
public static final String	<i>SAPPASSPORT_ENABLED</i> on page 1351	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	<i>SDM_CACHE_CAPACITY</i> on page 1351	Preference for the maximum number of documents can be stored in cache.
public static final String	<i>SDM_CACHE_MAX_SEARCH_RESULTS</i> on page 1351	Preference for the maximum entries that can be returned as a result of a search.
public static final String	<i>SDM_CACHE_PARSER_SEARCH_ATTRIBUTE</i> on page 1351	Preference for the name of the XML attribute that should be used to decide if a property is searchable.
public static final String	<i>SDM_CACHE_SEARCH_ATTRIBUTE_XMLNS</i> on page 1351	Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.
public static final String	<i>SDM_CONNECTIVITY_CONNTIMEOUT</i> on page 1351	Preference for connection time out.

Modifier and Type	Variable	Description
public static final String	<i>SDM_CONNECTIVITY_HANDLER_CLASS_NAME</i> on page 1352	Preference for full name (including package) of the class that should be initialized as connectivity handler.
public static final String	<i>SDM_CONNECTIVITY_HTTP_PORT</i> on page 1352	Preference for default HTTP port.
public static final String	<i>SDM_CONNECTIVITY_HTTPS_PORT</i> on page 1352	Preference for default HTTPS port.
public static final String	<i>SDM_CONNECTIVITY_PROXY_HOST</i> on page 1352	Preference for proxy host if there is a proxy should be used.
public static final String	<i>SDM_CONNECTIVITY_PROXY_PORT</i> on page 1352	Preference for proxy port if there is a proxy should be used.
public static final String	<i>SDM_CONNECTIVITY_SCONNTIMEOUT</i> on page 1352	Preference for socket connection time out.
public static final String	<i>SDM_LOG_LEVEL</i> on page 1352	Preference for the current log severity.
public static final String	<i>SDM_PARSER_FOLDER_PATH</i> on page 1353	Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.
public static final String	<i>SDM_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 1353	Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.
public static final String	<i>SDM_PERSISTENCE_CIPHER_TRANSFORMATION</i> on page 1353	Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.

Modifier and Type	Variable	Description
public static final String	<i>SDM_PERSISTENCE_FOLDER_PATH</i> on page 1353	Preference for the default folder where data should be persisted.
public static final String	<i>SDM_PERSISTENCE_SECUREMODE</i> on page 1353	Preference for indicator if persisted data should be encrypted.

## Methods

Modifier and Type	Method	Description
public boolean	<i>containsPreference(String)</i> on page 1344	Checks the existence of the given preference.
public Boolean	<i>getBooleanPreference(String)</i> on page 1345	Returns the value of the given preference or null if there is no preference with the given key.
public Float	<i>getFloatPreference(String)</i> on page 1345	Returns the value of the given preference or null if there is no preference with the given key.
public Integer	<i>getIntPreference(String)</i> on page 1345	Returns the value of the given preference or null if there is no preference with the given key.
public Long	<i>getLongPreference(String)</i> on page 1346	Returns the value of the given preference or null if there is no preference with the given key.
public String	<i>getStringPreference(String)</i> on page 1346	Returns the value of the given preference or null if there is no preference with the given key.
public void	<i>registerPreferenceChangeListener(String, ISDMPreferenceChangeListener)</i> on page 1347	You can register a class implementing the <i>ISDMPreferenceChangeListener</i> interface for the change of a preference with the given key.
public void	<i>removePreference(String)</i> on page 1347	Removes the preferences with the given key.

Modifier and Type	Method	Description
public void	<i>resetPreference(String)</i> on page 1348	Resets the preference's value to it's default value or to null if there is no default value for the given preference.
public void	<i>setBooleanPreference(String, boolean)</i> on page 1348	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setFloatPreference(String, float)</i> on page 1348	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setIntPreference(String, int)</i> on page 1349	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setLongPreference(String, long)</i> on page 1349	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setStringPreference(String, String)</i> on page 1349	Sets and validates and persists the value of the preferences with the given type.
public void	<i>unRegisterPreferenceChangeListener(String, ISDMPreferenceChangeListener)</i> on page 1350	You can unregister a change listener.

#### *containsPreference(String) method*

Checks the existence of the given preference.

#### *Syntax*

```
public boolean containsPreference (String key)
```

#### *Parameters*

- **key** – The key of the preference

#### *Returns*

true if SDMPreference contains the given key or false otherwise

*getBooleanPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Boolean getBooleanPreference ( String key ) throws  
SDMPreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the boolean type preference with the given key

*Exceptions*

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

*getFloatPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Float getFloatPreference ( String key ) throws  
SDMPreferencesException
```

*Parameters*

- **key** – The key of the preference

*Returns*

the float type preference with the given key

*Exceptions*

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

*getIntPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

*Syntax*

```
public Integer getIntPreference ( String key ) throws  
SDMPreferencesException
```

### *Parameters*

- **key** – The key of the preference

### *Returns*

the integer type preference with the given key

### *Exceptions*

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

### *getLongPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

### *Syntax*

```
public Long getLongPreference (String key) throws  
SDMPreferencesException
```

### *Parameters*

- **key** – The key of the preference

### *Returns*

the long type preference with the given key

### *Exceptions*

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

### *getStringPreference(String) method*

Returns the value of the given preference or null if there is no preference with the given key.

### *Syntax*

```
public String getStringPreference (String key) throws  
SDMPreferencesException
```

### *Parameters*

- **key** – The key of the preference

### *Returns*

the String type preference with the given key

*Exceptions*

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

*registerPreferenceChangeListener(String, ISDMPreferenceChangeListener) method*

You can register a class implementing the ISDMPreferenceChangeListener interface for the change of a preference with the given key.

*Syntax*

```
public void registerPreferenceChangeListener ( String key ,
ISDMPreferenceChangeListener changeListener )
```

*Parameters*

- **key** – key of the preference
- **changeListener** – listener object to be registered

*Exceptions*

- **IllegalArgumentException** – if the argument is null.

*Usage*

If any of the arguments are null, an IllegalArgumentException is thrown.

*removePreference(String) method*

Removes the preferences with the given key.

*Syntax*

```
public void removePreference ( String key ) throws
SDMPreferencesException
```

*Parameters*

- **key** – The key of the preference

*Exceptions*

- **SDMPreferencesException class** – If the preference does not exist or it cannot be removed (e.g. an SDM preference)

### *resetPreference(String) method*

Resets the preference's value to its default value or to null if there is no default value for the given preference.

#### *Syntax*

```
public void resetPreference ( String key )
```

#### *Parameters*

- **key** – The key of the preference

### *setBooleanPreference(String, boolean) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setBooleanPreference ( String key , boolean value )  
throws SDMPreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

#### *Exceptions*

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

### *setFloatPreference(String, float) method*

Sets and validates and persists the value of the preferences with the given type.

#### *Syntax*

```
public void setFloatPreference ( String key , float value ) throws  
SDMPreferencesException
```

#### *Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

#### *Exceptions*

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

*setIntPreference(String, int) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setIntPreference ( String key , int value ) throws  
SDMPreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

*setLongPreference(String, long) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setLongPreference ( String key , long value ) throws  
SDMPreferencesException
```

*Parameters*

- **key** – The key of the preference
- **value** – The new value of the preference

*Exceptions*

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

*setStringPreference(String, String) method*

Sets and validates and persists the value of the preferences with the given type.

*Syntax*

```
public void setStringPreference ( String key , String value ) throws  
SDMPreferencesException
```

*Parameters*

- **key** – The key of the preference

- **value** – The new value of the preference

### *Exceptions*

- **SDMPreferenceException class** – if the new value of the preference is invalid for any reasons

*unRegisterPreferenceChangeListener(String, ISDMPreferenceChangeListener)*  
*method*

You can unregister a change listener.

### *Syntax*

```
public void unRegisterPreferenceChangeListener ( String key ,  
ISDMPreferenceChangeListener changeListener )
```

### *Parameters*

- **key** – key of the preference
- **changeListener** – listener object to be unregistered

### *Exceptions*

- **IllegalArgumentException** – if the argument is null.

### *Usage*

If any of the arguments are null, an IllegalArgumentException is thrown.

### *BUSINESSTRANSACTION\_ENABLED variable*

Preference for the indicator to decide if SAP passport should be enabled or not.

### *Syntax*

```
public static final String BUSINESSSTRANSACTION_ENABLED
```

### *BYPASS\_PROXY variable*

Preference for the indicator to decide which URLs need the proxy bypassed.

### *Syntax*

```
public static final String BYPASS_PROXY
```

### *SAP\_APPLICATIONID\_HEADER\_VALUE variable*

Preference for application ID (used in request headers)

### *Syntax*

```
public static final String SAP_APPLICATIONID_HEADER_VALUE
```

***SAPPASSPORT\_ENABLED variable***

Preference for the indicator to decide if SAP passport should be enabled or not.

***Syntax***

```
public static final String SAPPASSPORT_ENABLED
```

***SDM\_CACHE\_CAPACITY variable***

Preference for the maximum number of documents can be stored in cache.

***Syntax***

```
public static final String SDM_CACHE_CAPACITY
```

***SDM\_CACHE\_MAX\_SEARCH\_RESULTS variable***

Preference for the maximum entries that can be returned as a result of a search.

***Syntax***

```
public static final String SDM_CACHE_MAX_SEARCH_RESULTS
```

***SDM\_CACHE\_PARSER\_SEARCH\_ATTRIBUTE variable***

Preference for the name of the XML attribute that should be used to decide if a property is searchable.

***Syntax***

```
public static final String SDM_CACHE_PARSER_SEARCH_ATTRIBUTE
```

***SDM\_CACHE\_SEARCH\_ATTRIBUTE\_XMLNS variable***

Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.

***Syntax***

```
public static final String SDM_CACHE_SEARCH_ATTRIBUTE_XMLNS
```

***SDM\_CONNECTIVITY\_CONNTIMEOUT variable***

Preference for connection time out.

***Syntax***

```
public static final String SDM_CONNECTIVITY_CONNTIMEOUT
```

### *SDM\_CONNECTIVITY\_HANDLER\_CLASS\_NAME variable*

Preference for full name (including package) of the class that should be initialized as connectivity handler.

#### *Syntax*

```
public static final String  
SDM_CONNECTIVITY_HANDLER_CLASS_NAME
```

### *SDM\_CONNECTIVITY\_HTTP\_PORT variable*

Preference for default HTTP port.

#### *Syntax*

```
public static final String SDM_CONNECTIVITY_HTTP_PORT
```

### *SDM\_CONNECTIVITY\_HTTPS\_PORT variable*

Preference for default HTTPS port.

#### *Syntax*

```
public static final String SDM_CONNECTIVITY_HTTPS_PORT
```

### *SDM\_CONNECTIVITY\_PROXY\_HOST variable*

Preference for proxy host if there is a proxy should be used.

#### *Syntax*

```
public static final String SDM_CONNECTIVITY_PROXY_HOST
```

### *SDM\_CONNECTIVITY\_PROXY\_PORT variable*

Preference for proxy port if there is a proxy should be used.

#### *Syntax*

```
public static final String SDM_CONNECTIVITY_PROXY_PORT
```

### *SDM\_CONNECTIVITY\_SCONNTIMEOUT variable*

Preference for socket connection time out.

#### *Syntax*

```
public static final String SDM_CONNECTIVITY_SCONNTIMEOUT
```

### *SDM\_LOG\_LEVEL variable*

Preference for the current log severity.

#### *Syntax*

```
public static final String SDM_LOG_LEVEL
```

***SDM\_PARSER\_FOLDER\_PATH variable***

Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.

***Syntax***

```
public static final String SDM_PARSER_FOLDER_PATH
```

***SDM\_PERSISTENCE\_BYTE\_BUFFER\_SIZE variable***

Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.

***Syntax***

```
public static final String SDM_PERSISTENCE_BYTE_BUFFER_SIZE
```

***SDM\_PERSISTENCE\_CIPHER\_TRANSFORMATION variable***

Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.

***Syntax***

```
public static final String
SDM_PERSISTENCE_CIPHER_TRANSFORMATION
```

***SDM\_PERSISTENCE\_FOLDER\_PATH variable***

Preference for the default folder where data should be persisted.

***Syntax***

```
public static final String SDM_PERSISTENCE_FOLDER_PATH
```

***SDM\_PERSISTENCE\_SECUREMODE variable***

Preference for indicator if persisted data should be encrypted.

***Syntax***

```
public static final String SDM_PERSISTENCE_SECUREMODE
```

***ISDMRequest interface***

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IRequest Interface for requests.

***Syntax***

```
public interface ISDMRequest
```

***Derived classes***

- *SDMBaseRequest* on page 1378

- *SDMPushRequest* on page 1987

### Members

All members of *ISDMRequest*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 1361	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 1361	etag "if-none-match"
public static final int	<i>ETAG_IF_RANGE</i> on page 1362	etag "if-range"
public static final int	<i>PRIORITY_HIGH</i> on page 1362	High priority.
public static final int	<i>PRIORITY_NORMAL</i> on page 1362	Normal priority.
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 1362	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 1362	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 1362	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 1363	HTTP PUT method.

### Methods

Modifier and Type	Method	Description
public byte[]	<i>getData()</i> on page 1356	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 1356	If the request method is POST, this method is called from the network library.
public Object	<i>getE2eRequest()</i> on page 1357	Get the <i>iRequest</i> object from the <i>ISDMRequest</i> .
public Map< String, String >	<i>getHeaders()</i> on page 1357	Returns the request headers set.

Modifier and Type	Method	Description
public ISDMNetListener	<i>getListener()</i> on page 1357	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public String	<i>getPassport()</i> on page 1357	
public int	<i>getPriority()</i> on page 1357	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 1358	Returns the request method.
public String	<i>getRequestUrl()</i> on page 1358	Returns the URL where the request must be done.
public String	<i>getTransId()</i> on page 1358	
public boolean	<i>isStreamEnabled()</i> on page 1358	
public void	<i>setData(byte[])</i> on page 1358	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 1359	Set the request data stream in case of POST request.
public void	<i>setE2eRequest(Object)</i> on page 1359	Set the iRequest object into the ISDMRequest.
public void	<i>setHeaders(Map&lt;String, String&gt;)</i> on page 1359	Set the request headers.
public void	<i>setListener(final ISDMNetListener)</i> on page 1359	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPassport(String)</i> on page 1360	
public void	<i>setPriority(final int)</i> on page 1360	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 1360	Sets the request method.

Modifier and Type	Method	Description
public void	<i>setRequestUrl(final String)</i> on page 1360	Sets the URL for the request.
public void	<i>setStreamEnabled(boolean)</i> on page 1361	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public void	<i>setTransId(String)</i> on page 1361	
public boolean	<i>useCookies()</i> on page 1361	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

**Usage**

All request objects must implement this interface. The network layer uses this interface to interact with the request objects

***getData()* method**

If the request method is POST, this method is called from the network library.

**Syntax**

```
public byte[] getData ()
```

**Returns**

the content data.

**Usage**

This method must return with the content to be sent to the server.

***getDataStream()* method**

If the request method is POST, this method is called from the network library.

**Syntax**

```
public InputStream getDataStream ()
```

**Returns**

the content data stream.

**Usage**

This method must return with the content stream to be sent to the server.

***getE2eRequest() method***

Get the iRequest object from the ISDMRequest.

***Syntax***

```
public Object getE2eRequest ()
```

***Usage***

Used for E2E tracing.

***getHeaders() method***

Returns the request headers set.

***Syntax***

```
public Map< String, String > getHeaders ()
```

***Returns***

the request headers

***getListener() method***

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

***Syntax***

```
public ISDMNetListener getListener ()
```

***Returns***

the listener or null.

***Usage***

Method will return null if there is no registered listener.

***getPassport() method******Syntax***

```
public String getPassport ()
```

***getPriority() method***

Returns the priority of the request.

***Syntax***

```
public int getPriority ()
```

*Returns*  
the priority.

*getRequestMethod() method*  
Returns the request method.

*Syntax*  
`public int getRequestMethod ()`

*Returns*  
the request method, with a value of `ISDMRequest.REQUEST_METHOD_*` constants.

*getRequestUrl() method*  
Returns the URL where the request must be done.

*Syntax*  
`public String getRequestUrl ()`

*Returns*  
the URL.

*getTransId() method*

*Syntax*  
`public String getTransId ()`

*isStreamEnabled() method*

*Syntax*  
`public boolean isStreamEnabled ()`

*setData(byte[]) method*  
Set the request data in case of POST request.

*Syntax*  
`public void setData (byte[] data )`

*Parameters*

- **data** – the request data to set

*setDataStream(InputStream) method*

Set the request data stream in case of POST request.

*Syntax*

```
public void setDataStream ( InputStream iStream )
```

*Parameters*

- **data** – the request data stream to set

*setE2eRequest(Object) method*

Set the iRequest object into the ISDMRequest.

*Syntax*

```
public void setE2eRequest ( Object iRequest )
```

*Parameters*

- **iRequest** –

*setHeaders(Map< String, String >) method*

Set the request headers.

*Syntax*

```
public void setHeaders ( Map< String, String > headers )
```

*Parameters*

- **headers** – the request headers to set

*setListener(final ISDMNetListener) method*

Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

*Syntax*

```
public void setListener ( final ISDMNetListener aListener )
```

*Parameters*

- **aListener** – the listener to set.

*Usage*

By default, the SDMBaseRequest object included in the connectivity layer will contain no registered listeners.

Setting this object is not mandatory. However, it can be used to handle incidental errors.

*setPassport(String) method*

*Syntax*

```
public void setPassport ( String passport )
```

*setPriority(final int) method*

Sets the priority of the request.

*Syntax*

```
public void setPriority ( final int aPriority )
```

*Parameters*

- **aPriority** – the priority of the request to set.

*Usage*

Allowed values: ISDMRequest.PRIORITY\_HIGH and ISDMRequest.PRIORITY\_NORMAL. In case of a different value, the default ISDMRequest.PRIORITY\_NORMAL will be used by the network. If the network layer finds an ISDMRequest with ISDMRequest.PRIORITY\_HIGH priority in the queue, that request will be executed first. If there are more than one IRequests with ISDMRequest.PRIORITY\_HIGH priority, the network layer will choose an execution order. If the priority is not one of the predefined values, the priority will be set by default to ISDMRequest.PRIORITY\_NORMAL

*setRequestMethod(final int) method*

Sets the request method.

*Syntax*

```
public void setRequestMethod ( final int aRequestMethod )
```

*Parameters*

- **aRequestMethod** – one of the ISDMRequest.REQUEST\_METHOD\_\* constants.

*setRequestUrl(final String) method*

Sets the URL for the request.

*Syntax*

```
public void setRequestUrl ( final String aUrl )
```

*Parameters*

- **aUrl** – the URL to set.

*setStreamEnabled(boolean) method*

Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.

*Syntax*

```
public void setStreamEnabled ( boolean streamEnabled )
```

*Parameters*

- **streamEnabled** –

*setTransId(String) method**Syntax*

```
public void setTransId ( String transId )
```

*useCookies() method*

This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

*Syntax*

```
public boolean useCookies ( )
```

*Returns*

the use of cookies in the network library.

*Usage*

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the `SDMBaseRequest` implementation.

*ETAG\_IF\_MATCH variable*

```
etag "if-match"
```

*Syntax*

```
public static final int ETAG_IF_MATCH
```

*ETAG\_IF\_NONE\_MATCH variable*

```
etag "if-none-match"
```

*Syntax*

```
public static final int ETAG_IF_NONE_MATCH
```

### *ETAG\_IF\_RANGE variable*

etag "if-range"

#### *Syntax*

```
public static final int ETAG_IF_RANGE
```

### *PRIORITY\_HIGH variable*

High priority.

#### *Syntax*

```
public static final int PRIORITY_HIGH
```

#### *Usage*

Requests with high priority will be executed first. If there are more than one IRequests with ISDMRequest.PRIORITY\_HIGH priority, the network layer will choose an execution order.

### *PRIORITY\_NORMAL variable*

Normal priority.

#### *Syntax*

```
public static final int PRIORITY_NORMAL
```

#### *Usage*

This is the default priority.

### *REQUEST\_METHOD\_DELETE variable*

HTTP DELETE method.

#### *Syntax*

```
public static final int REQUEST_METHOD_DELETE
```

### *REQUEST\_METHOD\_GET variable*

HTTP GET method.

#### *Syntax*

```
public static final int REQUEST_METHOD_GET
```

### *REQUEST\_METHOD\_POST variable*

HTTP POST method.

#### *Syntax*

```
public static final int REQUEST_METHOD_POST
```

*REQUEST\_METHOD\_PUT* variable

HTTP PUT method.

*Syntax*

```
public static final int REQUEST_METHOD_PUT
```

*ISDMRequestManager* interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IRequestManager

*Syntax*

```
public interface ISDMRequestManager
```

*Derived classes*

- *SDMRequestManager* on page 1994

*Members*

All members of ISDMRequestManager, including inherited members. **Methods**

Modifier and Type	Method	Description
public Vector< ISDMRequest >	<i>getAllRequests()</i> on page 1364	Returns all requests from the connectivity component which are in the queue.
public ISDMConnectivityParameters	<i>getConnectivityParameters()</i> on page 1364	Returns the ConnectivityParameters object containing the settings used by the library.
public int	<i>getQueueSize()</i> on page 1364	Returns the number of requests from the connectivity component which are in the queue.
public Object	<i>getRequest()</i> on page 1365	Returns an ISDMRequest from the queue(s)
public boolean	<i>hasRequests()</i> on page 1365	Returns a boolean indicating the queue has requests or doesn't.
public void	<i>makeRequest(final ISDMRequest)</i> on page 1365	Put a request object into the SDMRequestManager.
public void	<i>makeRequest(final ISDMBundleRequest)</i> on page 1365	

Modifier and Type	Method	Description
public void	<i>sendOnSuccess</i> (final ISDMNetListener, final ISDMRequest, final ISDMResponse) on page 1365	Used to notify the ISDMNetListener implementation about successful request, without blocking ISDMConnectivity threads and reducing the concurrency on the application.
public void	<i>setMainHandlerClassName</i> (final String) on page 1366	Sets the class name of the ISDMConnectionHandler implementation.
public void	<i>terminate</i> () on page 1366	Terminates all the requests in the queue.

***getAllRequests()* method**

Returns all requests from the connectivity component which are in the queue.

***Syntax***

```
public Vector< ISDMRequest > getAllRequests ()
```

***Returns***

all the requests currently in the queue.

***getConnectivityParameters()* method**

Returns the ConnectivityParameters object containing the settings used by the library.

***Syntax***

```
public ISDMConnectivityParameters getConnectivityParameters  
()
```

***getQueueSize()* method**

Returns the number of requests from the connectivity component which are in the queue.

***Syntax***

```
public int getQueueSize ()
```

***Returns***

the number of requests currently in the queue.

*getRequest() method*

Returns an ISDMRequest from the queue(s)

*Syntax*

```
public Object getRequest ()
```

*Returns*

an ISDMRequest implementation

*hasRequests() method*

Returns a boolean indicating the queue has requests or doesn't.

*Syntax*

```
public boolean hasRequests ()
```

*Returns*

whether the queue has requests or it doesn't

*makeRequest(final ISDMRequest) method*

Put a request object into the SDMRequestManager.

*Syntax*

```
public void makeRequest ( final ISDMRequest aRequest )
```

*Parameters*

- **aRequest** – the request.

*makeRequest(final ISDMBundleRequest) method**Syntax*

```
public void makeRequest ( final ISDMBundleRequest  
aBundleRequest )
```

*sendOnSuccess(final ISDMNetListener, final ISDMRequest, final ISDMResponse) method*

Used to notify the ISDMNetListener implementation about successful request, without blocking ISDMConnectivity threads and reducing the concurrency on the application.

*Syntax*

```
public void sendOnSuccess ( final ISDMNetListener listener , final  
ISDMRequest request , final ISDMResponse response )
```

*Parameters*

- **listener** – ISDMNetListener instance
- **request** – ISDMRequest instance
- **response** – HttpResponse instance

*setMainHandlerClassName(final String) method*

Sets the class name of the ISDMConnectionHandler implementation.

*Syntax*

```
public void setMainHandlerClassName ( final String classname )
```

*Parameters*

- **classname** – the name as String

*Usage*

Default class: com.sap.mobile.lib.sdmconnectivity.SocketConnectionHandler

*terminate() method*

Terminates all the requests in the queue.

*Syntax*

```
public void terminate ()
```

*ISDMRequestStateElement interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IRequestStateElement

*Syntax*

```
public abstract interface ISDMRequestStateElement
```

*Derived classes*

- *SDMRequestStateElement* on page 2006

*Members*

All members of ISDMRequestStateElement, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	<i>AUTHENTICATION_ERROR</i> on page 1369	Authentication error.
public static final int	<i>CLIENT_ERROR</i> on page 1369	Client error.

Modifier and Type	Variable	Description
public static final int	<i>HTTP_ERROR</i> on page 1370	Server response status > 302.
public static final int	<i>NETWORK_ERROR</i> on page 1370	There was a network error during a read/write to/from stream.
public static final int	<i>NO_ERROR</i> on page 1370	
public static final int	<i>PARSE_ERROR</i> on page 1370	Problem with parsing the response xml.
public static final int	<i>REQUEST_ERROR</i> on page 1370	Problem with parsing the request.

### Methods

Modifier and Type	Method	Description
public abstract int	<i>getErrorCode()</i> on page 1367	Returns the error code.
public abstract Exception	<i>getException()</i> on page 1368	Returns the Exception if it was set.
public abstract HttpResponseMessage	<i>getHttpResponse()</i> on page 1368	Returns the HttpResponseMessage.
public abstract int	<i>getHttpStatusCode()</i> on page 1368	Returns the HTTP status if it was set.
public abstract void	<i>setErrorCode(final int)</i> on page 1368	Sets the error code.
public abstract void	<i>setException(final Exception)</i> on page 1369	Sets the Exception.
public abstract void	<i>setHttpResponse(HttpResponse)</i> on page 1369	Sets the HttpResponseMessage.
public abstract void	<i>setHttpStatusCode(final int)</i> on page 1369	Sets the HTTP status.

#### *getErrorCode()* method

Returns the error code.

#### Syntax

```
public abstract int getErrorCode ()
```

#### Usage

The error code can be the following:

- HTTP\_ERROR
- PARSE\_ERROR
- NETWORK\_ERROR
- AUTHENTICATION\_ERROR

### *getException() method*

Returns the Exception if it was set.

### *Syntax*

```
public abstract Exception getException ()
```

### *Returns*

the Exception stored in SDMRequestStateElement.

### *Usage*

If not, the returned value will be null.

### *getHttpResponse() method*

Returns the HttpResponse.

### *Syntax*

```
public abstract HttpResponse getHttpResponse ()
```

### *Returns*

The HttpResponse

### *getHttpStatusCode() method*

Returns the HTTP status if it was set.

### *Syntax*

```
public abstract int getHttpStatusCode ()
```

### *Returns*

the HTTP status code, if available.

### *Usage*

If there was no http status set, the value is -1.

### *setErrorCode(final int) method*

Sets the error code.

### *Syntax*

```
public abstract void setErrorCode ( final int code )
```

*Parameters*

- **code** –

*setException(final Exception) method*

Sets the Exception.

*Syntax*

```
public abstract void setException ( final Exception aException )
```

*Parameters*

- **aException** – the Exception to set.

*setHttpResponse(HttpResponse) method*

Sets the HttpResponse.

*Syntax*

```
public abstract void setHttpResponse ( HttpResponse aResponse )
```

*Parameters*

- **aResponse** – The HttpResponse

*setHttpStatusCode(final int) method*

Sets the HTTP status.

*Syntax*

```
public abstract void setHttpStatusCode ( final int httpStatus )
```

*Parameters*

- **httpStatus** – to set

*AUTHENTICATION\_ERROR variable*

Authentication error.

*Syntax*

```
public static final int AUTHENTICATION_ERROR
```

*CLIENT\_ERROR variable*

Client error.

*Syntax*

```
public static final int CLIENT_ERROR
```

### *HTTP\_ERROR variable*

Server response status > 302.

#### *Syntax*

```
public static final int HTTP_ERROR
```

### *NETWORK\_ERROR variable*

There was a network error during a read/write to/from stream.

#### *Syntax*

```
public static final int NETWORK_ERROR
```

### *NO\_ERROR variable*

#### *Syntax*

```
public static final int NO_ERROR
```

### *PARSE\_ERROR variable*

Problem with parsing the response xml.

#### *Syntax*

```
public static final int PARSE_ERROR
```

### *REQUEST\_ERROR variable*

Problem with parsing the request.

#### *Syntax*

```
public static final int REQUEST_ERROR
```

### *ISDMResponse interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IResponse

#### *Syntax*

```
public interface ISDMResponse extends HttpResponseMessage
```

#### *Derived classes*

- *SDMResponseImpl* on page 2012

#### *Members*

All members of ISDMResponse, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>getCookie()</i> on page 1371	
public String	<i>getCorelationId()</i> on page 1371	
public int	<i>getCurrentOffset()</i> on page 1371	
public int	<i>getDataStream(byte[], int)</i> on page 1371	Used to obtain the data in stream.
public int	<i>getDataStream(byte[], int, int, String)</i> on page 1372	
public Map< String, String >	<i>getHeadersMap()</i> on page 1372	
public boolean	<i>isDataAvailable()</i> on page 1372	To check whether the response object is available or it needs to be streamed in chunks.
public void	<i>setCorelationId(String)</i> on page 1372	

***getCookie() method******Syntax***

```
public String getCookie ()
```

***getCorelationId() method******Syntax***

```
public String getCorelationId ()
```

***getCurrentOffset() method******Syntax***

```
public int getCurrentOffset ()
```

***getDataStream(byte[], int) method***

Used to obtain the data in stream.

***Syntax***

```
public int getDataStream (byte[] chunk , int chunkSize )
```

## Parameters

- **chunk** –
- **offset** –

## Usage

Returns the chunk of data of size 'chunkSize' from the given offset.

## *getDataStream(byte[], int, int, String) method*

### Syntax

```
public int getDataStream (byte[] chunk , int chunkSize , int offset ,  
String cookie )
```

## *getHeadersMap() method*

### Syntax

```
public Map< String, String > getHeadersMap ()
```

## *isDataAvailable() method*

To check whether the response object is available or it needs to be streamed in chunks.

### Syntax

```
public boolean isDataAvailable ()
```

## *setCorelationId(String) method*

### Syntax

```
public void setCorelationId (String coRelationId )
```

## *JSONParser class*

Deprecated. since 3.0, Use JSONParser

### Syntax

```
public class JSONParser
```

## Members

All members of JSONParser, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static String	<i>JSON_TAG_D</i> on page 1375	

Modifier and Type	Variable	Description
protected static String	<i>JSON_TAG_DEFERRED</i> on page 1375	
protected static String	<i>JSON_TAG_DELTA</i> on page 1375	
protected static String	<i>JSON_TAG_METADATA</i> on page 1375	
protected static String	<i>JSON_TAG_RESULTS</i> on page 1375	
protected static String	<i>JSON_TAG_TYPE</i> on page 1376	
protected static String	<i>JSON_TAG_URI</i> on page 1376	

### Constructors

Modifier and Type	Constructor	Description
public	<i>JSONParser()</i> on page 1374	

### Methods

Modifier and Type	Method	Description
protected List< ISDMODa- taEntry >	<i>parseComplexEntry(String, String, ISDMODataSchema, String)</i> on page 1374	
protected List< ISDMODa- taEntry >	<i>parseFunctionImportComplex- Type(String, String, ISDMO- DataSchema, String)</i> on page 1374	
protected List< ISDMODa- taEntry >	<i>parseODataEntries(String, String, ISDMODataSchema)</i> on page 1374	
protected List< ISDMODa- taEntry >	<i>parseODataEntry(String, String, ISDMODataSchema)</i> on page 1375	
protected ISDMODataService- Document	<i>parseODataServiceDocu- ment(String)</i> on page 1375	

Modifier and Type	Method	Description
protected void	<i>populateODataEntry(SDMO-DataEntry, JsonObject)</i> on page 1375	

*JSONParser() constructor**Syntax*

```
public JSONParser ()
```

*parseComplexEntry(String, String, ISDMODataSchema, String) method**Syntax*

```
protected List< ISDMODataEntry > parseComplexEntry (String
complexEntryXml , String functionImport , ISDMODataSchema schema ,
String returnType )
```

*parseFunctionImportComplexType(String, String, ISDMODataSchema, String) method**Syntax*

```
protected List< ISDMODataEntry >
parseFunctionImportComplexType (String entryJson , String
functionImport , ISDMODataSchema schema , String returnType )
```

*parseODataEntries(String, String, ISDMODataSchema) method**Syntax*

```
protected List< ISDMODataEntry > parseODataEntries (String
entriesJson , String collectionId , ISDMODataSchema schema ) throws
SDMParseException
```

*Parameters*

- **entriesJson** –
- **collectionId** –
- **schema** –

*Exceptions*

- **ParserException** –

*parseODataEntry(String, String, ISDMODataSchema) method***Syntax**

```
protected List< ISDMODataEntry > parseODataEntry ( String
entryJson , String collectionId , ISDMODataSchema schema )
```

*parseODataServiceDocument(String) method***Syntax**

```
protected ISDMODataServiceDocument parseODataServiceDocument
( String serviceDocumentXML )
```

*populateODataEntry(SDMODataEntry, JsonObject) method***Syntax**

```
protected void populateODataEntry ( SDMODataEntry oDataEntry ,
JsonObject properties )
```

*JSON\_TAG\_D variable***Syntax**

```
protected static String JSON_TAG_D
```

*JSON\_TAG\_DEFERRED variable***Syntax**

```
protected static String JSON_TAG_DEFERRED
```

*JSON\_TAG\_DELTA variable***Syntax**

```
protected static String JSON_TAG_DELTA
```

*JSON\_TAG\_METADATA variable***Syntax**

```
protected static String JSON_TAG_METADATA
```

*JSON\_TAG\_RESULTS variable***Syntax**

```
protected static String JSON_TAG_RESULTS
```

*JSON\_TAG\_TYPE* variable*Syntax*

```
protected static String JSON_TAG_TYPE
```

*JSON\_TAG\_URI* variable*Syntax*

```
protected static String JSON_TAG_URI
```

*RouteManager* class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.RouteManager

*Syntax*

```
public class RouteManager
```

*Members*

All members of RouteManager, including inherited members. **Variables**

Modifier and Type	Variable	Description
static HashMap< String, SUP-Route >	<i>routeManager</i> on page 1377	

**Methods**

Modifier and Type	Method	Description
public static void	<i>addHeaders(HttpUriRequest, DefaultHttpClient)</i> on page 1376	
public static SUPRoute	<i>getRoute(String)</i> on page 1376	

*addHeaders(HttpUriRequest, DefaultHttpClient)* method*Syntax*

```
public static void addHeaders (HttpUriRequest request ,
DefaultHttpClient httpClient )
```

*getRoute(String)* method*Syntax*

```
public static SUPRoute getRoute (String URL )
```

*routeManager* variable**Syntax**

```
static HashMap< String, SUPRoute > routeManager
```

**SAPSSLSocketFactory** class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.SAPSSLSocketFactory

**Syntax**

```
public class SAPSSLSocketFactory extends SSLSocketFactory
```

**Members**

All members of SAPSSLSocketFactory, including inherited members. **Variables**

Modifier and Type	Variable	Description
SSLContext	<i>sslContext</i> on page 1378	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>SAPSSLSocketFactory(KeyStore, TrustManager[])</i> on page 1377	

**Methods**

Modifier and Type	Method	Description
public Socket	<i>createSocket(Socket, String, int, boolean)</i> on page 1378	
public Socket	<i>createSocket()</i> on page 1378	

**SAPSSLSocketFactory(KeyStore, TrustManager[])** constructor**Syntax**

```
public SAPSSLSocketFactory ( KeyStore truststore , TrustManager[]
trustManagers ) throws NoSuchAlgorithmException,
KeyManagementException, KeyStoreException,
UnrecoverableKeyException
```

*createSocket(Socket, String, int, boolean) method*

**Syntax**

```
public Socket createSocket ( Socket socket , String host , int port ,
boolean autoClose ) throws IOException, UnknownHostException
```

*createSocket() method*

**Syntax**

```
public Socket createSocket () throws IOException
```

*sslContext variable*

**Syntax**

```
SSLContext sslContext
```

*SDMBaseRequest class*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.BaseRequest

**Syntax**

```
public class SDMBaseRequest extends ISDMRequest
```

**Members**

All members of SDMBaseRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected HashMap< String, String >	<i>eTagMap</i> on page 1386	
protected static String	<i>HostURL</i> on page 1386	
protected static boolean	<i>isStreamEnabled</i> on page 1386	
protected byte[]	<i>mData</i> on page 1386	
protected Map< String, String >	<i>mHeaders</i> on page 1386	
protected ISDMNetListener	<i>mListener</i> on page 1387	
protected int	<i>mPriority</i> on page 1387	
protected int	<i>mRequestMethod</i> on page 1387	
protected String	<i>mUrl</i> on page 1387	

Modifier and Type	Variable	Description
protected static ArrayList<String >	<i>setCookie</i> on page 1387	
protected static String	<i>xsrftoken</i> on page 1387	

## Methods

Modifier and Type	Method	Description
public byte[]	<i>getData()</i> on page 1381	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 1382	If the request method is POST, this method is called from the network library.
public Request	<i>getE2eRequest()</i> on page 1382	Get the iRequest object from the ISDMRequest.
public Map<String, String >	<i>getHeaders()</i> on page 1382	Returns the request headers set.
public ISDMNetListener	<i>getListener()</i> on page 1382	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public String	<i>getPassport()</i> on page 1383	
public int	<i>getPriority()</i> on page 1383	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 1383	Returns the request method.
public String	<i>getRequestUrl()</i> on page 1383	Returns the URL where the request must be done.
public String	<i>getTransId()</i> on page 1383	
public boolean	<i>isStreamEnabled()</i> on page 1383	
public void	<i>setData(byte[])</i> on page 1384	Set the request data in case of POST request.

Modifier and Type	Method	Description
public void	<i>setDataStream(InputStream)</i> on page 1384	Set the request data stream in case of POST request.
public void	<i>setE2eRequest(Object)</i> on page 1384	Set the iRequest object into the ISDMRequest.
public void	<i>setETag(String, int)</i> on page 1384	
public void	<i>setHeaders(Map&lt;String, String&gt;)</i> on page 1384	Set the request headers.
public void	<i>setListener(ISDMNetListener)</i> on page 1385	
public void	<i>setPassport(String)</i> on page 1385	
public void	<i>setPriority(int)</i> on page 1385	
public void	<i>setRequestMethod(int)</i> on page 1385	
public void	<i>setRequestUrl(String)</i> on page 1385	
public void	<i>setStreamEnabled(boolean)</i> on page 1385	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public void	<i>setTransId(String)</i> on page 1385	
public boolean	<i>useCookies()</i> on page 1386	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

#### Inherited members from ISDMRequest

Modifier and Type	Member	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 1361	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 1361	etag "if-none-match"

Modifier and Type	Member	Description
public static final int	<i>ETAG_IF_RANGE</i> on page 1362	etag "if-range"
public static final int	<i>PRIORITY_HIGH</i> on page 1362	High priority.
public static final int	<i>PRIORITY_NORMAL</i> on page 1362	Normal priority.
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 1362	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 1362	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 1362	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 1363	HTTP PUT method.
public void	<i>setListener(final ISDMNetListener)</i> on page 1359	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(final int)</i> on page 1360	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 1360	Sets the request method.
public void	<i>setRequestUrl(final String)</i> on page 1360	Sets the URL for the request.

***getData()* method**

If the request method is POST, this method is called from the network library.

***Syntax***

```
public byte[] getData ()
```

***Returns***

the content data.

***Usage***

This method must return with the content to be sent to the server.

### *getDataStream() method*

If the request method is POST, this method is called from the network library.

#### *Syntax*

```
public InputStream getDataStream ()
```

#### *Returns*

the content data stream.

#### *Usage*

This method must return with the content stream to be sent to the server.

### *getE2eRequest() method*

Get the iRequest object from the ISDMRequest.

#### *Syntax*

```
public Request getE2eRequest ()
```

#### *Usage*

Used for E2E tracing.

### *getHeaders() method*

Returns the request headers set.

#### *Syntax*

```
public Map< String, String > getHeaders ()
```

#### *Returns*

the request headers

### *getListener() method*

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

#### *Syntax*

```
public ISDMNetListener getListener ()
```

#### *Returns*

the listener or null.

#### *Usage*

Method will return null if there is no registered listener.

*getPassport() method***Syntax**

```
public String getPassport ()
```

*getPriority() method*

Returns the priority of the request.

**Syntax**

```
public int getPriority ()
```

**Returns**

the priority.

*getRequestMethod() method*

Returns the request method.

**Syntax**

```
public int getRequestMethod ()
```

**Returns**

the request method, with a value of ISDMRequest.REQUEST\_METHOD\_\* constants.

*getRequestUrl() method*

Returns the URL where the request must be done.

**Syntax**

```
public String getRequestUrl ()
```

**Returns**

the URL.

*getTransId() method***Syntax**

```
public String getTransId ()
```

*isStreamEnabled() method***Syntax**

```
public boolean isStreamEnabled ()
```

### *setData(byte[]) method*

Set the request data in case of POST request.

#### *Syntax*

```
public void setData (byte[] data)
```

#### *Parameters*

- **data** – the request data to set

### *setDataStream(InputStream) method*

Set the request data stream in case of POST request.

#### *Syntax*

```
public void setDataStream (InputStream iStream)
```

#### *Parameters*

- **data** – the request data stream to set

### *setE2eRequest(Object) method*

Set the iRequest object into the ISDMRequest.

#### *Syntax*

```
public void setE2eRequest (Object iRequest)
```

#### *Parameters*

- **iRequest** –

### *setETag(String, int) method*

#### *Syntax*

```
public void setETag (String tag , int i) throws  
IllegalArgumentException
```

### *setHeaders(Map< String, String >) method*

Set the request headers.

#### *Syntax*

```
public void setHeaders (Map< String, String > headers)
```

*Parameters*

- **headers** – the request headers to set

*setListener(ISDMNetListener) method**Syntax*

```
public void setListener ( ISDMNetListener listener )
```

*setPassport(String) method**Syntax*

```
public void setPassport ( String passport )
```

*setPriority(int) method**Syntax*

```
public void setPriority ( int value )
```

*setRequestMethod(int) method**Syntax*

```
public void setRequestMethod ( int requestMethod )
```

*setRequestUrl(String) method**Syntax*

```
public void setRequestUrl ( String aUrl )
```

*setStreamEnabled(boolean) method*

Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.

*Syntax*

```
public void setStreamEnabled ( boolean streamEnabled )
```

*Parameters*

- **streamEnabled** –

*setTransId(String) method**Syntax*

```
public void setTransId ( String transId )
```

### *useCookies() method*

This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

#### *Syntax*

```
public boolean useCookies ()
```

#### *Returns*

the use of cookies in the network library.

#### *Usage*

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the `SDMBaseRequest` implementation.

### *eTagMap variable*

#### *Syntax*

```
protected HashMap< String, String > eTagMap
```

### *HostURL variable*

#### *Syntax*

```
protected static String HostURL
```

### *isStreamEnabled variable*

#### *Syntax*

```
protected static boolean isStreamEnabled
```

### *mData variable*

#### *Syntax*

```
protected byte[] mData
```

### *mHeaders variable*

#### *Syntax*

```
protected Map< String, String > mHeaders
```

*mListener variable**Syntax*

```
protected ISDMNetListener mListener
```

*mPriority variable**Syntax*

```
protected int mPriority
```

*mRequestMethod variable**Syntax*

```
protected int mRequestMethod
```

*mUrl variable**Syntax*

```
protected String mUrl
```

*setCookie variable**Syntax*

```
protected static ArrayList< String > setCookie
```

*xsrftoken variable**Syntax*

```
protected static String xsrftoken
```

*SDMBundleRequest class*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.BundleRequest

*Syntax*

```
public class SDMBundleRequest extends ISDMBundleRequest
```

*Members*

All members of SDMBundleRequest, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMBundleRequest()</i> on page 1388	

**Methods**

Modifier and Type	Method	Description
public void	<i>addRequest</i> (final <i>ISDMRequest</i> ) on page 1388	
public void	<i>clearRequests</i> () on page 1388	Cleans out the request storage.
public <i>ISDMRequest</i> []	<i>getRequests</i> () on page 1388	Returns all requests from the storage.
public void	<i>removeRequest</i> (final <i>ISDMRequest</i> ) on page 1389	

**Inherited members from *ISDMBundleRequest***

Modifier and Type	Member	Description
public void	<i>addRequest</i> ( <i>ISDMRequest</i> ) on page 1049	Adds a request to the storage.
public void	<i>removeRequest</i> ( <i>ISDMRequest</i> ) on page 1049	Removes the specific request from the storage.

*SDMBundleRequest*() constructor*Syntax*

```
public SDMBundleRequest ()
```

*addRequest*(final *ISDMRequest*) method*Syntax*

```
public void addRequest ( final ISDMRequest request )
```

*clearRequests*() method

Cleans out the request storage.

*Syntax*

```
public void clearRequests ()
```

*getRequests*() method

Returns all requests from the storage.

*Syntax*

```
public ISDMRequest[] getRequests ()
```

**Returns**

the array of requests

***removeRequest(final ISDMRequest) method*****Syntax**

```
public void removeRequest ( final ISDMRequest request )
```

***SDMCache class***

Deprecated. since 3.0, Use Cache The SDMCache component is responsible for storing and accessing OData related objects in the memory of the device.

**Syntax**

```
public class SDMCache extends ISDMCache,
ISDMPreferenceChangeListener, ISDMEntrySearch
```

**Members**

All members of SDMCache, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	<i>ALL_ENTRY_SEARCH_TERM</i> on page 1399	
protected int	<i>cacheCapacity</i> on page 1400	
protected HashMap< String, Map< String, ISDMParserDocument > >	<i>collectionStore</i> on page 1400	
protected static final String	<i>ENTRY_KEY_ODATASchema</i> on page 1400	
protected static final String	<i>ENTRY_KEY_ODATASERVICEDOCUMENT</i> on page 1400	
protected static final String	<i>ENTRY_TYPE_ODATAENTRY</i> on page 1400	

Modifier and Type	Variable	Description
protected static final String	<i>ENTRY_TYPE_ODATASBASEDOCUMENT</i> on page 1400	Search property tag to be used In the default cache search algorithm, this tag will be checked to identify the fields which are included in the search.
protected ISDMEntrySearch	<i>entrySearch</i> on page 1400	
protected ISDMLogger	<i>logger</i> on page 1401	Logger object.
protected int	<i>maxSearchResult</i> on page 1401	
protected String	<i>mLogTag</i> on page 1401	
protected long	<i>mPerformanceTime</i> on page 1401	
protected long	<i>mTimerStart</i> on page 1401	
protected static final String	<i>NON_SAPDATA_DOCUMENTS_HASHMAP_KEY</i> on page 1401	
protected ISDMPreferences	<i>preferences</i> on page 1401	
protected ISDMODataSchema	<i>schema</i> on page 1401	
protected int	<i>searchAlgohythm</i> on page 1402	
protected String	<i>searchField</i> on page 1402	
protected ISDMODataService-Document	<i>serviceDocument</i> on page 1402	

### Constructors

Modifier and Type	Constructor	Description
public	<i>SDMCache(ISDMPreferences, ISDMLogger)</i> on page 1394	
public	<i>SDMCache(ISDMPreferences, ISDMLogger, ISDMODataServiceDocument, ISDMODataSchema)</i> on page 1394	

### Methods

Modifier and Type	Method	Description
protected void	<i>addSearchableProperty-Path(ISDMODDataProperty, String, List&lt;String[]&gt;, String...)</i> on page 1395	
public void	<i>clear()</i> on page 1395	
protected Map< String, ISDM-ParserDocument >	<i>createStore()</i> on page 1395	
protected boolean	<i>fullTermContainSearch(String, ISDMODDataEntry, List&lt;String[]&gt;)</i> on page 1395	
protected boolean	<i>fullTermPrefixSearch(String, ISDMODDataEntry, List&lt;String[]&gt;)</i> on page 1395	
public ISDMEntrySearch	<i>getEntrySearch()</i> on page 1395	
public ISDMParserDocument	<i>getSDMODDataDocument(String)</i> on page 1395	
public List< ISDMODDataEntry >	<i>getSDMODDataEntries(String)</i> on page 1396	
public ISDMODDataEntry	<i>getSDMODDataEntry(String)</i> on page 1396	
public ISDMODDataSchema	<i>getSDMODDataSchema()</i> on page 1396	
public ISDMODDataServiceDocument	<i>getSDMODDataServiceDocument()</i> on page 1396	
public int	<i>getSearchAlgorithm()</i> on page 1396	
public List< ISDMParserDocument >	<i>getStoredDocuments()</i> on page 1396	
public void	<i>onPreferenceChanged(String, Object)</i> on page 1396	
public void	<i>read(BufferedReader)</i> on page 1396	

Modifier and Type	Method	Description
protected boolean	<i>regexSearch(String, ISDMODataEntry)</i> on page 1397	
public boolean	<i>removeSDMODataDocument(String)</i> on page 1397	
public boolean	<i>removeSDMODataEntries(String)</i> on page 1397	
public void	<i>removeStoredDocuments()</i> on page 1397	
public boolean	<i>searchInEntry(String, String, List&lt;String&gt;, ISDMODataEntry, List&lt;String[]&gt;, int)</i> on page 1397	Verifies whether the entry should be found during searching for the incoming search term.
public List< ISDMODataEntry >	<i>searchSDMODataEntries(String, String)</i> on page 1398	
public List< ISDMODataEntry >	<i>searchSDMODataEntries(String, String, int)</i> on page 1398	
public void	<i>setEntrySearch(ISDMEntrySearch)</i> on page 1398	
public void	<i>setSDMODataDocument(String, ISDMParserDocument)</i> on page 1398	
public void	<i>setSDMODataEntries(List&lt; ISDMODataEntry &gt;)</i> on page 1398	
public void	<i>setSDMODataEntry(ISDMODataEntry)</i> on page 1398	
public void	<i>setSDMODataSchema(ISDMODataSchema)</i> on page 1398	
public void	<i>setSDMODataServiceDocument(ISDMODataServiceDocument)</i> on page 1399	

Modifier and Type	Method	Description
public void	<i>setSearchAlgorithm(int)</i> on page 1399	
protected boolean	<i>tokenizedContainAllSearch(List&lt;String&gt;, ISDMODataEntry, List&lt;String[]&gt;)</i> on page 1399	
protected boolean	<i>tokenizedContainSearch(List&lt;String&gt;, ISDMODataEntry, List&lt;String[]&gt;)</i> on page 1399	
protected boolean	<i>tokenizedPrefixSearch(List&lt;String&gt;, ISDMODataEntry, List&lt;String[]&gt;)</i> on page 1399	
public void	<i>write(BufferedWriter)</i> on page 1399	

#### Inherited members from ISDMCache

Modifier and Type	Member	Description
public static final int	<i>DEFAULT_SEARCH</i> on page 1059	Constant ID of default algorithm:
public static final int	<i>FULLTERM_CONTAIN_SEARCH</i> on page 1060	Constant ID of Full Term Contain-search algorithm: Searching for the full search-term as a part of searchable values.
public static final int	<i>FULLTERM_PREFIX_SEARCH</i> on page 1060	Constant ID of Full Term Prefix-search algorithm: Searching for the full search-term as a prefix of searchable values.
public static final int	<i>REGEX_SEARCH</i> on page 1060	Constant ID of regex search algorithm.
public static final int	<i>TOKENIZED_CONTAIN_ALL_SEARCH</i> on page 1060	Constant ID of All Token Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.

Modifier and Type	Member	Description
public static final int	<i>TOKENIZED_CONTAIN_SEARCH</i> on page 1060	Constant ID of Tokenized Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.
public static final int	<i>TOKENIZED_PREFIX_SEARCH</i> on page 1061	Constant ID of Tokenized Prefix-search algorithm: Searching for all the tokens of the search-term as a prefix of searchable values.

**Inherited members from ISDMPersistable**

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1332	
public void	<i>write(BufferedWriter)</i> on page 1332	

*Usage*

Technical Details: For capacity management, SDMCache uses an LRU (least recently used) like algorithm that ensures that the most recently used entries are not removed first because of reaching the maximum capacity. SDMCache currently supports only the tokenized prefix search as stated above. As a future improvement SDMCache is also going to support custom search logic. SDMCache is an implementer of the android.os.Parcelable interface provided by Android SDK. SDMCache depends on SAPData specific interfaces of SDMParser but does not depend on the real implementation of SDMParser.

*SDMCache(ISDMPreferences, ISDMLogger) constructor**Syntax*

```
public SDMCache ( ISDMPreferences preferences , ISDMLogger logger )
```

*SDMCache(ISDMPreferences, ISDMLogger, ISDMODataServiceDocument, ISDMODataSchema) constructor**Syntax*

```
public SDMCache ( ISDMPreferences preferences , ISDMLogger logger , ISDMODataServiceDocument serviceDocument , ISDMODataSchema schema )
```

*addSearchablePropertyPath(ISDMODataProperty, String, List< String[]>, String...)*  
method

**Syntax**

```
protected void addSearchablePropertyPath ( ISDMODataProperty
property , String searchField , List< String[]> searchablePropertyPathes ,
String... path )
```

*clear()* method

**Syntax**

```
public void clear ()
```

*createStore()* method

**Syntax**

```
protected Map< String, ISDMParserDocument > createStore ()
```

*fullTermContainSearch(String, ISDMODataEntry, List< String[]>)* method

**Syntax**

```
protected boolean fullTermContainSearch ( String searchTerm ,
ISDMODataEntry entry , List< String[]> searchablePropertyPathes )
```

*fullTermPrefixSearch(String, ISDMODataEntry, List< String[]>)* method

**Syntax**

```
protected boolean fullTermPrefixSearch ( String searchTerm ,
ISDMODataEntry entry , List< String[]> searchablePropertyPathes )
```

*getEntrySearch()* method

**Syntax**

```
public ISDMEntrySearch getEntrySearch ()
```

*getSDMODataDocument(String)* method

**Syntax**

```
public ISDMParserDocument getSDMODataDocument ( String key )
```

*getSDMODataEntries(String) method*

*Syntax*

```
public List< ISDMODataEntry > getSDMODataEntries ( String  
collectionId )
```

*getSDMODataEntry(String) method*

*Syntax*

```
public ISDMODataEntry getSDMODataEntry ( String key )
```

*getSDMODataSchema() method*

*Syntax*

```
public ISDMODataSchema getSDMODataSchema ()
```

*getSDMODataServiceDocument() method*

*Syntax*

```
public ISDMODataServiceDocument getSDMODataServiceDocument  
( )
```

*getSearchAlgorithm() method*

*Syntax*

```
public int getSearchAlgorithm ()
```

*getStoredDocuments() method*

*Syntax*

```
public List< ISDMParserDocument > getStoredDocuments ()
```

*onPreferenceChanged(String, Object) method*

*Syntax*

```
public void onPreferenceChanged ( String key , Object value )
```

*read(BufferedReader) method*

*Syntax*

```
public void read ( BufferedReader reader ) throws  
SDMPersistenceException
```

*regexSearch(String, ISDMODataEntry) method***Syntax**

```
protected boolean regexSearch ( String searchTerm ,
ISDMODataEntry entry )
```

*removeSDMODataDocument(String) method***Syntax**

```
public boolean removeSDMODataDocument ( String key )
```

*removeSDMODataEntries(String) method***Syntax**

```
public boolean removeSDMODataEntries ( String collectionId )
```

*removeStoredDocuments() method***Syntax**

```
public void removeStoredDocuments ()
```

*searchInEntry(String, String, List< String >, ISDMODataEntry, List< String[]>, int) method*

Verifies whether the entry should be found during searching for the incoming search term.

**Syntax**

```
public boolean searchInEntry ( String searchTerm , String
collectionId , List< String > searchTokens , ISDMODataEntry entry , List<
String[]> searchablePropertyPathes , int searchAlgorhythm )
```

**Parameters**

- **searchTerm** – The full search-term that the search initiated with,
- **collectionId** – The id of the searched collection
- **searchTokens** – The tokens of splitted lower-case search-term.
- **entry** – The entry that should be checked.
- **searchablePropertyPathes** – The properties of the entry that's values should be used during search.
- **searchAlgorhythm** – The constant ID of the search algorithm.

**Returns**

True if the entry 'matches' with the given search-term, and false otherwise.

*searchSDMODataEntries(String, String) method*

**Syntax**

```
public List< ISDMODataEntry > searchSDMODataEntries ( String  
searchTerm , String collectionId )
```

*searchSDMODataEntries(String, String, int) method*

**Syntax**

```
public List< ISDMODataEntry > searchSDMODataEntries ( String  
searchTerm , String collectionId , int searchAlgorithm )
```

*setEntrySearch(ISDMEntrySearch) method*

**Syntax**

```
public void setEntrySearch ( ISDMEntrySearch entrySearch )
```

*setSDMODataDocument(String, ISDMParserDocument) method*

**Syntax**

```
public void setSDMODataDocument ( String key ,  
ISDMParserDocument document )
```

*setSDMODataEntries(List< ISDMODataEntry >) method*

**Syntax**

```
public void setSDMODataEntries ( List< ISDMODataEntry >  
entries )
```

*setSDMODataEntry(ISDMODataEntry) method*

**Syntax**

```
public void setSDMODataEntry ( ISDMODataEntry entry )
```

**Exceptions**

- **IllegalAccessException** –

*setSDMODataSchema(ISDMODataSchema) method*

**Syntax**

```
public void setSDMODataSchema ( ISDMODataSchema schema )
```

*setSDMODataServiceDocument(ISDMODataServiceDocument) method*

**Syntax**

```
public void setSDMODataServiceDocument
( ISDMODataServiceDocument serviceDocument )
```

*setSearchAlgorithm(int) method*

**Syntax**

```
public void setSearchAlgorithm ( int searchAlgorhythm )
```

*tokenizedContainAllSearch(List< String >, ISDMODataEntry, List< String[]>) method*

**Syntax**

```
protected boolean tokenizedContainAllSearch ( List< String >
searchTermTokens , ISDMODataEntry entry , List< String[]>
searchablePropertyPathes )
```

*tokenizedContainSearch(List< String >, ISDMODataEntry, List< String[]>) method*

**Syntax**

```
protected boolean tokenizedContainSearch ( List< String >
searchTermTokens , ISDMODataEntry entry , List< String[]>
searchablePropertyPathes )
```

*tokenizedPrefixSearch(List< String >, ISDMODataEntry, List< String[]>) method*

**Syntax**

```
protected boolean tokenizedPrefixSearch ( List< String >
searchTermTokens , ISDMODataEntry entry , List< String[]>
searchablePropertyPathes )
```

*write(BufferedWriter) method*

**Syntax**

```
public void write ( BufferedWriter writer ) throws
SDMPersistenceException
```

*ALL\_ENTRY\_SEARCH\_TERM variable*

**Syntax**

```
public static final String ALL_ENTRY_SEARCH_TERM
```

### *cacheCapacity variable*

#### *Syntax*

```
protected int cacheCapacity
```

### *collectionStore variable*

#### *Syntax*

```
protected HashMap< String, Map< String, ISDMParserDocument >  
> collectionStore
```

### *ENTRY\_KEY\_ODATASHEMA variable*

#### *Syntax*

```
protected static final String ENTRY_KEY_ODATASHEMA
```

### *ENTRY\_KEY\_ODATASERVICEDOCUMENT variable*

#### *Syntax*

```
protected static final String ENTRY_KEY_ODATASERVICEDOCUMENT
```

### *ENTRY\_TYPE\_ODATAENTRY variable*

#### *Syntax*

```
protected static final String ENTRY_TYPE_ODATAENTRY
```

### *ENTRY\_TYPE\_ODATASBASEDOCUMENT variable*

Search property tag to be used In the default cache search algorithm, this tag will be checked to identify the fields which are included in the search.

#### *Syntax*

```
protected static final String ENTRY_TYPE_ODATASBASEDOCUMENT
```

#### *Usage*

If configured to be an empty string, all fields are included.

### *entrySearch variable*

#### *Syntax*

```
protected ISDMEntrySearch entrySearch
```

*logger variable*

Logger object.

*Syntax*

```
protected ISDMLogger logger
```

*maxSearchResult variable**Syntax*

```
protected int maxSearchResult
```

*mLogTag variable**Syntax*

```
protected String mLogTag
```

*mPerformanceTime variable**Syntax*

```
protected long mPerformanceTime
```

*mTimerStart variable**Syntax*

```
protected long mTimerStart
```

*NON\_SAPDATA\_DOCUMENTS\_HASHMAP\_KEY variable**Syntax*

```
protected static final String  
NON_SAPDATA_DOCUMENTS_HASHMAP_KEY
```

*preferences variable**Syntax*

```
protected ISDMPreferences preferences
```

*schema variable**Syntax*

```
protected ISDMODataSchema schema
```

*searchAlgorithm variable***Syntax**

```
protected int searchAlgorithm
```

*searchField variable***Syntax**

```
protected String searchField
```

*serviceDocument variable***Syntax**

```
protected ISDMODataServiceDocument serviceDocument
```

*SDMConnectivityException class*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.ConnectivityException  
SDMconnectivityException is used in SDMConnectivity.

**Syntax**

```
public class SDMConnectivityException extends Exception
```

**Members**

All members of SDMConnectivityException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMConnectivityException()</i> on page 1402	Constructs a new SDMconnectivityException.
public	<i>SDMConnectivityException(String)</i> on page 1403	Constructs a new SDMconnectivityException.
public	<i>SDMConnectivityException(Throwable)</i> on page 1403	Constructs a new SDMconnectivityException.
public	<i>SDMConnectivityException(String, Throwable)</i> on page 1403	Constructs a new SDMconnectivityException.

*SDMConnectivityException() constructor*

Constructs a new SDMconnectivityException.

**Syntax**

```
public SDMConnectivityException ()
```

*SDMConnectivityException(String) constructor*

Constructs a new SDMconnectivityException.

*Syntax*

```
public SDMConnectivityException ( String detailMessage )
```

*Parameters*

- **detailMessage** – the message to set.

*SDMConnectivityException(Throwable) constructor*

Constructs a new SDMconnectivityException.

*Syntax*

```
public SDMConnectivityException ( Throwable throwable )
```

*Parameters*

- **throwable** – the Throwable to set.

*SDMConnectivityException(String, Throwable) constructor*

Constructs a new SDMconnectivityException.

*Syntax*

```
public SDMConnectivityException ( String detailMessage , Throwable throwable )
```

*Parameters*

- **detailMessage** – the message to set.
- **throwable** – the Throwable to set.

*SDMConnectivityParameters class*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.ConnectivityParameters

*Syntax*

```
public class SDMConnectivityParameters extends  
ISDMConnectivityParameters
```

*Members*

All members of SDMConnectivityParameters, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static Boolean	<i>autoredirectenabled</i> on page 1407	
public static Boolean	<i>isXsrfEnabled</i> on page 1408	

### Methods

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 1405	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 1405	
public String	<i>getLanguage()</i> on page 1405	Returns the language setting.
public final TrustManager[]	<i>getTrustManagers()</i> on page 1405	Returns an array filled with TrustManager instances.
public String	<i>getUserName()</i> on page 1406	Returns the username.
public String	<i>getUserPassword()</i> on page 1406	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 1406	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 1406	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 1406	Sets the base URL for requests.
public void	<i>setLanguage(final String)</i> on page 1407	
public void	<i>setServerCertificate(Certificate[])</i> on page 1407	
public void	<i>setServerCertificate(Certificate)</i> on page 1407	
public void	<i>setUserName(String)</i> on page 1407	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 1407	Sets the password.

### Inherited members from ISDMConnectivityParameters

Modifier and Type	Member	Description
public void	<i>setLanguage(String)</i> on page 1069	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 1069	Sets the server certificate.
public void	<i>setServerCertificate(final Certificate)</i> on page 1070	Sets a single server certificate.

***enableXsrf(Boolean) method***

Sets the XSRFEnabled flag.

***Syntax***

```
public void enableXsrf ( Boolean isXsrfEnabled )
```

***Parameters***

- **isXsrfEnabled** – the boolean to set.

***getBaseUrl() method******Syntax***

```
public String getBaseUrl ()
```

***Returns***

the base URL for the requests.

***getLanguage() method***

Returns the language setting.

***Syntax***

```
public String getLanguage ()
```

***Returns***

the language setting

***getTrustManagers() method***

Returns an array filled with TrustManager instances.

***Syntax***

```
public final TrustManager[] getTrustManagers ()
```

### *Returns*

the array.

### *getUserName() method*

Returns the username.

### *Syntax*

```
public String getUserName ()
```

### *Returns*

the user name.

### *getUserPassword() method*

Returns the password.

### *Syntax*

```
public String getUserPassword ()
```

### *Returns*

the password.

### *isAutoRedirectEnabled() method*

Returns whether auto redirect is enabled.

### *Syntax*

```
public boolean isAutoRedirectEnabled ()
```

### *setAutoRedirectEnabled(boolean) method*

Enables or disables auto redirect.

### *Syntax*

```
public void setAutoRedirectEnabled ( boolean paramboolean )
```

### *Parameters*

- **paramboolean** – the boolean to set

### *setBaseUrl(String) method*

Sets the base URL for requests.

### *Syntax*

```
public void setBaseUrl ( String baseUrl )
```

*Parameters*

- **baseUrl** –

*setLanguage(final String) method**Syntax*

```
public void setLanguage ( final String language )
```

*setServerCertificate(Certificate[]) method**Syntax*

```
public void setServerCertificate ( Certificate[] certificate ) throws  
KeyStoreException
```

*setServerCertificate(Certificate) method**Syntax*

```
public void setServerCertificate ( Certificate arg0 )
```

*setUserName(String) method*

Sets the username which must be used during authentication.

*Syntax*

```
public void setUserName ( String aUserName )
```

*Parameters*

- **aUserName** – the user name to set.

*setUserPassword(String) method*

Sets the password.

*Syntax*

```
public void setUserPassword ( String aPassword )
```

*Parameters*

- **aPassword** – the password to set.

*autoredirectenabled variable**Syntax*

```
public static Boolean autoredirectenabled
```

*isXcsrfEnabled* variable*Syntax*

```
public static Boolean isXcsrfEnabled
```

*SDMConstants* interface

Deprecated. since 3.0, Use com.sap.mobile.lib.configuration.Constants

*Syntax*

```
public interface SDMConstants
```

*Derived classes*

- *SDMPreferences* on page 1971

*Members*

All members of SDMConstants, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final boolean	<i>DEFAULT_BUSINESS_TRANSACTION_ENABLED</i> on page 1410	SAP Business Transaction XML enablement default setting.
public static final String	<i>DEFAULT_CIPHER_TRANSFORMATION</i> on page 1410	Default cipher transformation.
public static final int	<i>DEFAULT_CONNECTION_TIMEOUT</i> on page 1410	Default connection timeout.
public static final String	<i>DEFAULT_HANDLER_CLASS_NAME</i> on page 1410	Default handler class.
public static final int	<i>DEFAULT_HTTP_PORT</i> on page 1410	Default HTTP port.
public static final int	<i>DEFAULT_HTTPS_PORT</i> on page 1410	Default HTTPS port.
public static final int	<i>DEFAULT_LOG_LEVEL</i> on page 1410	Default log level.
public static final boolean	<i>DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE</i> on page 1411	Default security mode.

Modifier and Type	Variable	Description
public static final int	<i>DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 1411	Default buffer size.
public static final String	<i>DEFAULT_PROXY_HOST</i> on page 1411	Default proxy host.
public static final int	<i>DEFAULT_PROXY_PORT</i> on page 1411	Default proxy port.
public static final String	<i>DEFAULT_SAP_APPLICATIONID_HEADER_VALUE</i> on page 1411	Default application ID.
public static final boolean	<i>DEFAULT_SAPPASSPORT_ENABLED</i> on page 1411	SAP Passport enablement default setting.
public static final int	<i>DEFAULT_SEARCH_LIMIT</i> on page 1411	Default for maximum search results retrieved from cache.
public static final int	<i>DEFAULT_SOCKET_CONNECTION_TIMEOUT</i> on page 1412	Default socket connection timeout.
public static final int	<i>DEFAULT_STORE_CAPACITY</i> on page 1412	Default cache capacity.
public static final int	<i>MAX_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 1412	Maximum buffer size.
public static final int	<i>MAXIMUM_STORE_CAPACITY</i> on page 1412	Maximum cache capacity.
public static final int	<i>MIN_PERSISTENCE_BYTE_BUFFER_SIZE</i> on page 1412	Minimum buffer size.
public static final String	<i>SDM_HTTP_HANDLER_CLASS</i> on page 1412	Socket Connection handler class.
public static final String	<i>SDM_IMO_HANDLER_CLASS</i> on page 1412	IMO Connection handler class.
public static final String	<i>SDM_SHARED_PREFERENCES</i> on page 1413	Shared preferences.

***DEFAULT\_BUSINESSTRANSACTION\_ENABLED*** variable

SAP Business Transaction XML enablement default setting.

***Syntax***

```
public static final boolean  
DEFAULT_BUSINESSTRANSACTION_ENABLED
```

***DEFAULT\_CIPHER\_TRANSFORMATION*** variable

Default cipher transformation.

***Syntax***

```
public static final String DEFAULT_CIPHER_TRANSFORMATION
```

***DEFAULT\_CONNECTION\_TIMEOUT*** variable

Default connection timeout.

***Syntax***

```
public static final int DEFAULT_CONNECTION_TIMEOUT
```

***DEFAULT\_HANDLER\_CLASS\_NAME*** variable

Default handler class.

***Syntax***

```
public static final String DEFAULT_HANDLER_CLASS_NAME
```

***DEFAULT\_HTTP\_PORT*** variable

Default HTTP port.

***Syntax***

```
public static final int DEFAULT_HTTP_PORT
```

***DEFAULT\_HTTPS\_PORT*** variable

Default HTTPS port.

***Syntax***

```
public static final int DEFAULT_HTTPS_PORT
```

***DEFAULT\_LOG\_LEVEL*** variable

Default log level.

***Syntax***

```
public static final int DEFAULT_LOG_LEVEL
```

***DEFAULT\_PERSISTENCE\_BOOLEAN\_SECUREMODE*** variable

Default security mode.

***Syntax***

```
public static final boolean
DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE
```

***DEFAULT\_PERSISTENCE\_BYTE\_BUFFER\_SIZE*** variable

Default buffer size.

***Syntax***

```
public static final int DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE
```

***DEFAULT\_PROXY\_HOST*** variable

Default proxy host.

***Syntax***

```
public static final String DEFAULT_PROXY_HOST
```

***DEFAULT\_PROXY\_PORT*** variable

Default proxy port.

***Syntax***

```
public static final int DEFAULT_PROXY_PORT
```

***DEFAULT\_SAP\_APPLICATIONID\_HEADER\_VALUE*** variable

Default application ID.

***Syntax***

```
public static final String
DEFAULT_SAP_APPLICATIONID_HEADER_VALUE
```

***DEFAULT\_SAPPASSPORT\_ENABLED*** variable

SAP Passport enablement default setting.

***Syntax***

```
public static final boolean DEFAULT_SAPPASSPORT_ENABLED
```

***DEFAULT\_SEARCH\_LIMIT*** variable

Default for maximum search results retrieved from cache.

***Syntax***

```
public static final int DEFAULT_SEARCH_LIMIT
```

***DEFAULT\_SOCKET\_CONNECTION\_TIMEOUT variable***

Default socket connection timeout.

***Syntax***

```
public static final int DEFAULT_SOCKET_CONNECTION_TIMEOUT
```

***DEFAULT\_STORE\_CAPACITY variable***

Default cache capacity.

***Syntax***

```
public static final int DEFAULT_STORE_CAPACITY
```

***MAX\_PERSISTENCE\_BYTE\_BUFFER\_SIZE variable***

Maximum buffer size.

***Syntax***

```
public static final int MAX_PERSISTENCE_BYTE_BUFFER_SIZE
```

***MAXIMUM\_STORE\_CAPACITY variable***

Maximum cache capacity.

***Syntax***

```
public static final int MAXIMUM_STORE_CAPACITY
```

***MIN\_PERSISTENCE\_BYTE\_BUFFER\_SIZE variable***

Minimum buffer size.

***Syntax***

```
public static final int MIN_PERSISTENCE_BYTE_BUFFER_SIZE
```

***SDM\_HTTP\_HANDLER\_CLASS variable***

Socket Connection handler class.

***Syntax***

```
public static final String SDM_HTTP_HANDLER_CLASS
```

***SDM\_IMO\_HANDLER\_CLASS variable***

IMO Connection handler class.

***Syntax***

```
public static final String SDM_IMO_HANDLER_CLASS
```

*SDM\_SHARED\_PREFERENCES* variable

Shared preferences.

*Syntax*

```
public static final String SDM_SHARED_PREFERENCES
```

*SDMEncryptDecrypt* class*Syntax*

```
class SDMEncryptDecrypt
```

*Members*

All members of *SDMEncryptDecrypt*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected final int	<i>DECRYPT</i> on page 1414	
protected final int	<i>ENCRYPT</i> on page 1415	
protected Cipher	<i>mCipher</i> on page 1415	
protected ISDMLogger	<i>mLogger</i> on page 1415	
protected String	<i>mLogTag</i> on page 1415	
protected SecretKey	<i>mSecretKey</i> on page 1415	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMEncryptDecrypt(SecretKey, String, ISDMLogger)</i> on page 1414	Deprecated.

**Methods**

Modifier and Type	Method	Description
public InputStream	<i>decryptStream(InputStream)</i> on page 1414	Deprecated.
public OutputStream	<i>encryptStream(OutputStream)</i> on page 1414	Deprecated.
protected void	<i>initCipher(int)</i> on page 1414	

*SDMEncryptDecrypt(SecretKey, String, ISDMLogger) constructor [deprecated]*  
Deprecated.

**Syntax**

```
public SDMEncryptDecrypt ( SecretKey key , String cipherType ,  
ISDMLogger logger ) throws NoSuchAlgorithmException,  
NoSuchPaddingException, InvalidKeyException
```

**Usage**

Deprecated

*decryptStream(InputStream) method [deprecated]*

Deprecated.

**Syntax**

```
public InputStream decryptStream ( InputStream stream ) throws  
InvalidKeyException
```

**Usage**

Deprecated

*encryptStream(OutputStream) method [deprecated]*

Deprecated.

**Syntax**

```
public OutputStream encryptStream ( OutputStream stream ) throws  
InvalidKeyException
```

**Usage**

Deprecated

*initCipher(int) method*

**Syntax**

```
protected void initCipher ( int mode ) throws InvalidKeyException
```

*DECRYPT variable*

**Syntax**

```
protected final int DECRYPT
```

*ENCRYPT variable**Syntax*

```
protected final int ENCRYPT
```

*mCipher variable**Syntax*

```
protected Cipher mCipher
```

*mLogger variable**Syntax*

```
protected ISDMLogger mLogger
```

*mLogTag variable**Syntax*

```
protected String mLogTag
```

*mSecretKey variable**Syntax*

```
protected SecretKey mSecretKey
```

*SDMHttpChannelListeners class*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpChannelListeners

*Syntax*

```
public class SDMHttpChannelListeners
```

*SDMHttpChannelListeners.AuthenticationSchema class*

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.HttpChannelListeners.AuthenticationSchema

*Syntax*

```
public class AuthenticationSchema
```

*Members*

All members of AuthenticationSchema, including inherited members. **Variables**

Modifier and Type	Variable	Description
public String	<i>realm</i> on page 1416	
public String	<i>schemaName</i> on page 1416	

**Methods**

Modifier and Type	Method	Description
public String	<i>getRealm()</i> on page 1416	
public String	<i>getSchemeName()</i> on page 1416	
public void	<i>processChallenge(ICredential, ISDMRequest)</i> on page 1416	

*getRealm() method***Syntax**

```
public String getRealm ()
```

*getSchemeName() method***Syntax**

```
public String getSchemeName ()
```

*processChallenge(ICredential, ISDMRequest) method***Syntax**

```
public void processChallenge ( ICredential credentials ,  
ISDMRequest request )
```

*realm variable***Syntax**

```
public String realm
```

*schemaName variable***Syntax**

```
public String schemaName
```

*SDMHttpChannelListeners.BasicCredetials class*

Deprecated. since 3.0, Use

`com.sap.mobile.lib.request.HttpChannelListeners.BasicCredetials`

**Syntax**

```
public class BasicCredetials extends ICredential
```

**Members**

All members of `BasicCredetials`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static String	<i>passwd</i> on page 1417	
public static String	<i>uName</i> on page 1418	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>BasicCredetials(String, String)</i> on page 1417	

**Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 1417	

*BasicCredetials(String, String) constructor***Syntax**

```
public BasicCredetials ( String username , String pwd )
```

*getAuthHeader() method***Syntax**

```
public Map< String, Object > getAuthHeader ()
```

*passwd variable***Syntax**

```
public static String passwd
```

*uName variable***Syntax**

```
public static String uName
```

***SDMHttpChannelListeners.CookieCredetials class***

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpChannelListeners.ICredential

**Syntax**

```
public class CookieCredetials extends ICredential
```

**Members**

All members of CookieCredetials, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static Cookie	<i>cookieValue</i> on page 1418	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>CookieCredetials(Cookie)</i> on page 1418	

**Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 1418	

***CookieCredetials(Cookie) constructor*****Syntax**

```
public CookieCredetials ( Cookie cookie )
```

***getAuthHeader() method*****Syntax**

```
public Map< String, Object > getAuthHeader ()
```

***cookieValue variable*****Syntax**

```
protected static Cookie cookieValue
```

*SDMHttpChannelListeners.IAuthenticationChallengeListner interface*

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.HttpChannelListeners.IAuthenticationChallengeListner

*Syntax*

```
public interface IAuthenticationChallengeListner
```

*Derived classes*

- *AuthenticationChallengeListener* on page 2003

*Members*

All members of IAuthenticationChallengeListner, including inherited members. **Methods**

Modifier and Type	Method	Description
public ICredential	<i>OnAuthenticationFailed(Authenticationschema, HttpResponse)</i> on page 1419	

*OnAuthenticationFailed(Authenticationschema, HttpResponse) method**Syntax*

```
public ICredential OnAuthenticationFailed
( Authenticationschema authScheme , HttpResponse response )
```

*SDMHttpChannelListeners.ICredential interface*

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpChannelListeners.ICredential

*Syntax*

```
public interface ICredential
```

*Derived classes*

- *BasicCredetials* on page 1417
- *CookieCredetials* on page 1418

*Members*

All members of ICredential, including inherited members. **Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 1420	

*getAuthHeader() method**Syntax*

```
public Map< String, Object > getAuthHeader ()
```

*SDMHttpChannelListeners.IMutualSSLChallengeListener interface*

Deprecated. since 3.0, Use

```
com.sap.mobile.lib.request.HttpChannelListeners.IMutualSSLChallengeListener
```

*Syntax*

```
public interface IMutualSSLChallengeListener
```

*Members*

All members of IMutualSSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public HttpClientCertInfo	<i>getClientCertificate()</i> on page 1420	

*getClientCertificate() method**Syntax*

```
public HttpClientCertInfo getClientCertificate ()
```

*SDMHttpChannelListeners.ISSLChallengeListener interface*

Deprecated. since 3.0, Use

```
com.sap.mobile.lib.request.HttpChannelListeners.ISSLChallengeListener
```

*Syntax*

```
public interface ISSLChallengeListener
```

*Members*

All members of ISSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>isServerTrusted(X509Certificate[])</i> on page 1421	

*isServerTrusted(X509Certificate[]) method***Syntax**

```
public boolean isServerTrusted ( X509Certificate[]
    paramArrayOfX509Certificate )
```

**SDMLogger class**

Deprecated. since 3.0, Use com.sap.mobile.lib.supportability.Logger ISDMLogger implementation.

**Syntax**

```
public class SDMLogger extends ISDMLogger, ISDMPersistable
```

**Members**

All members of SDMLogger, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static int	<i>e2eStep</i> on page 1442	
public static int	<i>passportTraceLevel</i> on page 1442	

**Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMLogger()</i> on page 1426	Constructs a new SDMLogger, an ISDMLogger implementation.

**Methods**

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 1426	Implementer should override this method!
public void	<i>cleanUp(final int)</i> on page 1426	Deletes all entries weaker than the threshold priority.
public void	<i>d(final String, final String)</i> on page 1426	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 1426	Sends a DEBUG log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>d</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1427	Sends a DEBUG log message.
public void	<i>d</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1427	Sends a DEBUG log message and logs the exception.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> ) on page 1428	Sends an ERROR log message.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1428	Sends an ERROR log message and logs the exception.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1428	Sends an ERROR log message.
public void	<i>e</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1429	Sends an ERROR log message and logs the exception.
public Enumeration< LogEntry >	<i>getLogElements</i> () on page 1429	
public Vector< LogEntry >	<i>getLogElements</i> ( <i>final int</i> ) on page 1429	Get the log elements above (and including) the threshold.
public Vector< LogEntry >	<i>getLogElementsByCorrelationId</i> ( <i>final String</i> ) on page 1430	
public Vector< LogEntry >	<i>getLogElementsByPID</i> ( <i>final long</i> ) on page 1430	
public Vector< LogEntry >	<i>getLogElementsByTag</i> ( <i>final String</i> ) on page 1430	
public Vector< LogEntry >	<i>getLogElementsByTimeStamp</i> ( <i>final long</i> , <i>final long</i> ) on page 1430	
public final int	<i>getLogLevel</i> () on page 1430	Returns the log level.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> ) on page 1430	Sends an INFO log message.
public void	<i>i</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1431	Sends a INFO log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>i(final String, final String, final String)</i> on page 1431	Sends an INFO log message.
public void	<i>i(final String, final String, final Throwable, final String)</i> on page 1431	Sends a INFO log message and logs the exception.
public void	<i>log(final int, final String, final String, final Throwable, String)</i> on page 1432	Logs a log message.
public void	<i>logFullLocation(boolean)</i> on page 1432	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation()</i> on page 1432	To get the setting which controls log output should contain full location (class and method name) or not.
public boolean	<i>logsToAndroid()</i> on page 1433	To get the setting which controls log output to Android log.
public void	<i>logToAndroid(final boolean)</i> on page 1433	Setting to control log output to Android log.
public void	<i>p(final String, final String)</i> on page 1433	Sends a PERFORMANCE log message.
public void	<i>p(final String, final String, final String)</i> on page 1433	Sends a PERFORMANCE log message.
public void	<i>read(BufferedReader)</i> on page 1434	
public void	<i>setHeaderData(final String, final String, final String, final String, final String, final String, final String, final String)</i> on page 1434	Sets the log header fields.
public void	<i>setLogLevel(final int)</i> on page 1435	Set the log level.
public void	<i>terminate()</i> on page 1435	Clears collected log data.
public synchronized String	<i>toString()</i> on page 1435	Get log data.

Modifier and Type	Method	Description
public void	<i>v</i> ( <i>final String</i> , <i>final String</i> ) on page 1435	Sends a VERBOSE log message.
public void	<i>v</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1436	Sends a VERBOSE log message and logs the exception.
public void	<i>v</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1436	Sends a VERBOSE log message.
public void	<i>v</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1436	Sends a VERBOSE log message and logs the exception.
public void	<i>w</i> ( <i>final String</i> , <i>final Throwable</i> ) on page 1437	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1437	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String</i> , <i>final String</i> ) on page 1437	Sends a WARN log message.
public void	<i>w</i> ( <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1438	Sends a WARN log message and logs the exception.
public void	<i>w</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1438	Sends a WARN log message.
public void	<i>w</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1438	Sends a WARN log message and logs the exception.
public void	<i>write</i> ( <i>BufferedWriter</i> ) on page 1439	
public void	<i>wtf</i> ( <i>final String</i> , <i>final Throwable</i> ) on page 1439	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> ) on page 1440	Use com.sap.mobile.lib.supportability.ILogger#w(String, String) What a Terrible Failure: Reports a condition that should never happen.

Modifier and Type	Method	Description
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> ) on page 1440	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1440	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> , <i>final String</i> ) on page 1441	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf</i> ( <i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i> ) on page 1441	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.

#### Inherited members from ISDMLLogger

Modifier and Type	Member	Description
public static final int	<i>ASSERT</i> on page 1089	Log level ASSERT.
public static final int	<i>DEBUG</i> on page 1089	Log level DEBUG.
public static final int	<i>ERROR</i> on page 1089	Log level ERROR.
public static final int	<i>FATAL</i> on page 1089	Log level FATAL.
public static final int	<i>INFO</i> on page 1089	Log level INFO.
public static final int	<i>PERFORMANCE</i> on page 1089	Log level PERFORMANCE.
public static final int	<i>VERBOSE</i> on page 1090	Log level VERBOSE.
public static final int	<i>WARN</i> on page 1090	Log level WARN.

### *SDMLogger() constructor*

Constructs a new SDMLogger, an ISDMLogger implementation.

#### *Syntax*

```
public SDMLogger ()
```

### *canLog() method*

Implementer should override this method!

#### *Syntax*

```
public boolean canLog ()
```

### *Returns*

State of ability to log.

### *cleanUp(final int) method*

Deletes all entries weaker than the threshold priority.

#### *Syntax*

```
public void cleanUp ( final int threshold )
```

### *d(final String, final String) method*

Sends a DEBUG log message.

#### *Syntax*

```
public void d ( final String tag , final String msg )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,String)`

### *d(final String, final String, final Throwable) method*

Sends a DEBUG log message and logs the exception.

#### *Syntax*

```
public void d ( final String tag , final String msg , final  
Throwable tr )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### Usage

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,Throwable,String)`

### *d(final String, final String, final String) method*

Sends a DEBUG log message.

### Syntax

```
public void d (final String tag , final String msg , final String
location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *d(final String, final String, final Throwable, final String) method*

Sends a DEBUG log message and logs the exception.

### Syntax

```
public void d (final String tag , final String msg , final
Throwable tr , final String location )
```

### Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *e(final String, final String) method*

Sends an ERROR log message.

#### *Syntax*

```
public void e ( final String tag , final String msg )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,String)`

### *e(final String, final String, final Throwable) method*

Sends an ERROR log message and logs the exception.

#### *Syntax*

```
public void e ( final String tag , final String msg , final  
Throwable tr )
```

#### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

#### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,Throwable,String)`

### *e(final String, final String, final String) method*

Sends an ERROR log message.

#### *Syntax*

```
public void e ( final String tag , final String msg , final String  
location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

*e(final String, final String, final Throwable, final String) method*

Sends an ERROR log message and logs the exception.

*Syntax*

```
public void e ( final String tag , final String msg , final
Throwable tr , final String location )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*getLogElements() method**Syntax*

```
public Enumeration< LogEntry > getLogElements ()
```

*getLogElements(final int) method*

Get the log elements above (and including) the threshold.

*Syntax*

```
public Vector< LogEntry > getLogElements ( final int threshold )
```

*Parameters*

- **threshold** – the desired level (inclusively)

*Returns*

log elements as Vector

*getLogElementsByCorrelationId(final String) method*

*Syntax*

```
public Vector< LogEntry > getLogElementsByCorrelationId  
( final String correlationId )
```

*getLogElementsByPID(final long) method*

*Syntax*

```
public Vector< LogEntry > getLogElementsByPID ( final long  
PID )
```

*getLogElementsByTag(final String) method*

*Syntax*

```
public Vector< LogEntry > getLogElementsByTag ( final String  
aTag )
```

*getLogElementsByTimeStamp(final long, final long) method*

*Syntax*

```
public Vector< LogEntry > getLogElementsByTimeStamp ( final  
long start , final long end )
```

*getLogLevel() method*

Returns the log level.

*Syntax*

```
public final int getLogLevel ()
```

*Returns*

the log level.

*i(final String, final String) method*

Sends an INFO log message.

*Syntax*

```
public void i ( final String tag , final String msg )
```

*Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,String)`

### *i(final String, final String, final Throwable) method*

Sends a INFO log message and logs the exception.

### *Syntax*

```
public void i ( final String tag , final String msg , final
Throwable tr )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

### *Usage*

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,Throwable,String)`

### *i(final String, final String, final String) method*

Sends an INFO log message.

### *Syntax*

```
public void i ( final String tag , final String msg , final String
location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

### *i(final String, final String, final Throwable, final String) method*

Sends a INFO log message and logs the exception.

### *Syntax*

```
public void i ( final String tag , final String msg , final
Throwable tr , final String location )
```

### *Parameters*

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *log(final int, final String, final String, final Throwable, String) method*

Logs a log message.

### *Syntax*

```
public void log ( final int level , final String tag , final String msg , final Throwable tr , String location )
```

### *Parameters*

- **level** – the log level
- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

### *logFullLocation(boolean) method*

Setting to control log full location (class-path and method name).

### *Syntax*

```
public void logFullLocation ( boolean logFullLocation )
```

### *Parameters*

- **logFullLocation** – log i or do not log it.

### *logsFullLocation() method*
