Native OData App Development

Use SAP® Mobile Platform OData SDK to create OData (Open Data Protocol) applications for iOS and Android devices. The target audience is advanced developers who may be new to SAP Mobile Platform.

OData Framework Overview

The OData SDK provides an open and flexible framework for native OData application development for both online and offline applications. OData SDK components, each of which can be used independently, are implemented as static runtime libraries.

Use the OData SDK, which consists of a collection of runtime libraries and classes, to build native mobile applications. The OData SDK supports Android and iOS platforms, and is based on the native device SDKs of the platforms. There is a separate implementation for each platform. Native applications that are installed on the devices allow the client application to leverage the support provided by the platform, including:

- Adapting to each device's form factor (for example, automatic layout)
- Exploiting different input methods (for example, touch screen, keyboard or trackball)
- Caching data in native device data stores for better performance
- Tightly integrating with the features of the device

Figure 1: Main Components of the OData SDK

Logon Manager

The Mobile Application Framework (MAF) Logon Manager component manages common logon-related tasks, such as registering and deleting users, updating configuration, locking and unlocking applications, changing application passcodes, and securely handling passwords. It is based on reusable controls, and includes a default skinnable UI. MAF Logon Manager supports user onboarding, and its components include **MAFLogonUING** and **MAFLogonManagerNG**.

Client Hub

The Client Hub, which is integrated with Logon Manager, simplifies user onboarding and configuration to enable easier and faster strategic enterprise-wide deployments. The Client Hub simplifies end-user password management for mobile applications, and improves the user experience. The Client Hub:

- Manages the single sign-on (SSO) vault on the device.
- Enables co-signed business applications with the same security configuration to securely share credentials on the device.
- Supports multiple security configurations per device.

Core Services

The Core Services layer enables consumption of SAP Mobile Platform REST services with pure HTTP or HTTPS, (which is, by default, in on-premise connectivity). It provides simplified APIs for registration, exchanging settings between client and server, end-to-end tracing, and native push notifications. Functionalities supported by Core Services include:

- Client connection initialization
- User on-boarding or registration
- Application connection setting exchange
- Customization resource bundle
- Security configurations - Basic authentication, SSO certificate authentication, anonymous access, network edge (SiteMinder authentication - always asynchronous), non-network edge, single SSL and mutual SSL authentication
- Native notification support for iOS and Android platforms
- CAPTCHA support for both synchronous and asynchronous requests. Asynchronous request is recommended for on-boarding using CAPTCHA in a productive scenario.
- Non network edge authentication support for iOS and Android platforms. In Network edge (siteminder) scenario, reverse proxy is configured. User needs to get authenticated, and moves for authentication to server, and then to backend.

Request

The Request library provides the interfaces for handling both online and offline OData requests, and processes data transfer from the server to devices, and devices to the server. It supports offline capabilities, where OData requests (POST, PUT, DELETE) are persisted if there is no network connectivity, and invoked when a network becomes available. You can use the online and offline capabilities for applications that have direct connectivity with Gateway, and for applications that register the users on SAP Mobile Platform Server. Functionalities supported by Request include:

- Synchronous and asynchronous request handling
- OData request batch processing
- Delta token support
- Offline request queueing
- XSRF support

Parser

The Parser library parses OData feeds, service document and metadata and converts them to native objects, saving application developer from having to work with low-level details of OData semantics. The Parser library helps the application developers to generate OData feeds from native objects. Functionalities supported by Parser include:

- Parsing OData XML or JSON structures to native OData objects
- Validating OData XML or JSON during parsing by checking the existence of mandatory fields and structures
- Providing easy access to all OData fields and structures via the objects resulting from the parsing
- Building OData XML or JSON structures from native OData objects

Note: SAP recommends that, for better performance, you use JSON parser as your parser component.

Cache Management and Persistence

The runtime cache stores and accesses OData-related objects in memory, and also stores data on device for easy access. The cache enables mobile applications to access the locally stored data even in offline mode. Functionalities supported by these components include:

- Storing or accessing OData objects (both metadata and application data)
- Searching for OData entries using their searchable fields
- Support for encrypted persistence store

Logger

The Logger component implements logging and error handling to enable supportability from client to back-end. Functionalities supported by Logger include:

- Common exception and error handling
- Event logging

Connectivity

The connectivity layer handles all connectivity-related tasks, hides the complexity of the communication at the transport level, and provides easy-to-use APIs. Productive enterprise applications must use SAP Mobile Platform for connectivity. Functionalities supported by Connectivity include:

- Synchronous and asynchronous HTTP request handling
- Supported authentication methods include:
 - X509 certification
 - SSO token/cookie
 - Basic authentication (user/password)
- Timeout handling
- Compressed payload handling
- Request types as supported by OData Protocol
- Connection pools for optimal performance

DataVault

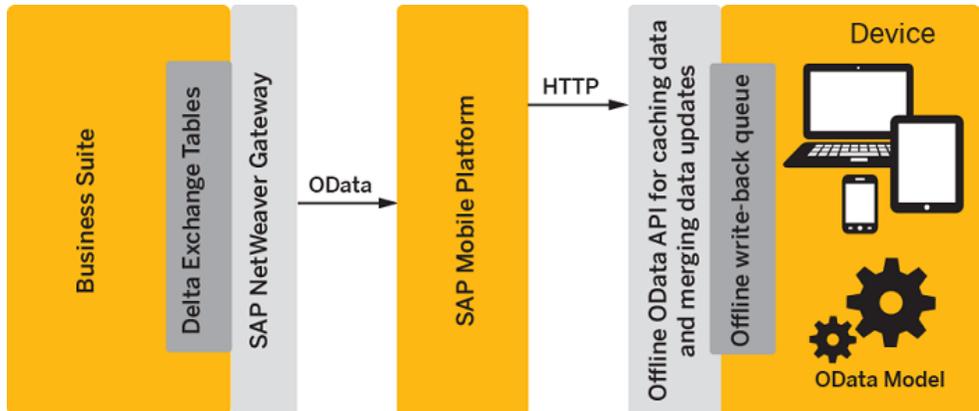

The DataVault component provides encrypted storage of certificates, database encryption keys, passwords, and other sensitive items. Functionalities supported by DataVault include:

- Create a vault
- Set a vault's properties
- Store objects in a vault
- Retrieve objects from a vault
- Change the password used to access a vault
- Control access to a vault that is shared by multiple iOS applications.

Offline OData Support

SAP Mobile Platform device users can access and modify enterprise data when disconnected from their corporate network. The device users can easily retrieve and modify the data when a connection is re-established. The OData offline APIs are used to seamlessly cache data and merge the delta updates.

Offline OData Overview

Offline OData provides the following features:

- No state in middle tier – allows for scalability to large number of users.
- Request-response based – a simple programming model helps in predicting the load on the backend.
- OData is the programming model – helps in unifying disparate back-ends.
- OData delta supported – a standard way for representing back end changes and exposing them to clients.
- Client libraries provide a secure document cache – useful for data protection.

OData Cache

The OData Cache is used to store service documents, metadata documents, and entities.

Delta Query Support

Delta Queries return a list of entities that have changed since you last queried the collection. So whatever has been created, updated and deleted since your last visit, these changes can then be merged into your local result set. SAP NetWeaver Gateway SP07 supports Delta Queries. Delta Queries work with the Cache object.

Setting Up the Native OData Development Environment

To build Android or iOS applications, you must first set up your development environment, which includes installing the SMP SDK.

Android Environment Requirements

Complete the prerequisites for setting up the development environment.

Prerequisites:

- Download the Java Standard Edition (6 Update 24 and above versions) Development Kit (JDK) from <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.
- Download the Android Developer Tool (ADT) Bundle from <http://developer.android.com/sdk/index.html>. With the single download of the ADT Bundle, you can get all the essential Android SDK components and Eclipse IDE installed. For more information on supported Google Android development environment in SAP Mobile Platform 3.0, see <http://service.sap.com/pam>.

iOS Environment Requirements

Complete the prerequisites for developing a device application for the iOS platform, and set up the development environment.

Prerequisites

- Verify that SAP Mobile Platform Server 3.0 is installed, and that you can access it from your Mac.
- To access the data from the backend, set up a Gateway OData service.
- Configure the Gateway URL in the SAP Mobile Platform Server using the Management Cockpit.

Downloading the Xcode IDE

Download and install Xcode from the Apple Developers Web site.

1. Go to <http://developer.apple.com/downloads/>.

Note: You must be a paying member of the iOS Developer Program. Free members cannot download the supported version.

2. Log in using your Apple Developer credentials.
3. (Optional) To narrow the search scope, unselect all Categories except Developer Tools.
4. Download the appropriate Xcode and SDK combination.

Note: See supported Apple iOS requirements at <http://service.sap.com/pam>

Configuring the Application in the Management Cockpit

Configure the application settings in the Management Cockpit. These settings enable you to monitor and manage your applications.

Prerequisites

- Make sure SAP Mobile Platform Server is installed.
- Make sure the server is started.
- Launch the Management Cockpit.

Task

Defining Applications

Create a new native, hybrid, or Agentry application definition, which enables you to use Management Cockpit to manage the application.

1. In Management Cockpit, select **Applications**, and click **New**.
2. In the New Application window, enter:

Field	Value
ID	<p>Unique identifier for the application, in reverse domain notation. This is the application or bundled identifier that the application developer assigns or generates during application development. The administrator uses the Application ID to register the application to SAP Mobile Platform Server, and the client application code uses the Application ID while sending requests to the server. Reverse domain notation means reversing a registered domain name; for example, reverse domain notation for the object <code>MyApp . sap . com</code> is <code>com . sap . MyApp</code>.</p> <p>The application identifier:</p> <ul style="list-style-type: none"> • Must be unique. • Must start with an alphabetic character. • Can contain only alphanumeric characters, underscores (<code>_</code>), and periods (<code>.</code>). • Cannot include spaces. • Can be up to 64 characters long. <hr/> <p>Note: The keywords that are not allowed to be entered as application identifiers include: <code>Admin</code>, <code>AdminData</code>, <code>Push</code>, <code>smp_cloud</code>, <code>resource</code>, <code>test-resources</code>, <code>resources</code>, <code>Scheduler</code>, <code>odata</code>, <code>applications</code>, <code>Connections</code>, <code>public</code>. These keywords are case sensitive.</p> <hr/> <p>Formatting guidelines:</p> <ul style="list-style-type: none"> • SAP recommends that application IDs contain a minimum of two periods (<code>.</code>). For example, this ID is valid: <code>com . sap . mobile . appl</code>. • Application IDs cannot start with a period (<code>.</code>). For example, this ID is invalid: <code>.com . sap . mobile . appl</code>. • Application IDs cannot include two consecutive periods (<code>.</code>). For example, this ID is invalid: <code>com . . sap . mobile . appl</code>.
Name	<p>Application name. The name:</p> <ul style="list-style-type: none"> • Can contain only alphanumeric characters, spaces, underscores (<code>_</code>), and periods (<code>.</code>). • Can be up to 80 characters long.
Vendor	<p>(Optional) Vendor who developed the application. The vendor name:</p> <ul style="list-style-type: none"> • Can contain only alphanumeric characters, spaces, underscores (<code>_</code>), and periods (<code>.</code>). • Can be up to 255 characters long.

Field	Value
Type	Application type. <ul style="list-style-type: none"> • Native – native applications, including Android, BlackBerry, iOS, Windows Mobile 8, and Windows 8. • Hybrid – Kapsel container-based applications. • Agentry – metadata-driven application. You can configure only one Agentry application per SAP Mobile Platform Server; after that, Agentry no longer appears as an option.
Description	(Optional) Short description of the application. The description: <ul style="list-style-type: none"> • Can contain alphanumeric characters. • Can contain most special characters, except percent signs (%) and ampersands (&). • Can be up to 255 characters long.

3. Click **Save**. You see application-related tabs, such as Back End, Authentication, Push, and so forth. The tabs you see differ by application type. You are ready to configure the application, based on the application type.

Note: These tabs appear in Management Cockpit only after you define or select an application. The steps that follow assume you have selected the application, and are working through each of the relevant tabs for your selected application. The steps use a "navigational shorthand"—such as "select **Applications > Back End**—to indicate the tab where tasks are performed, relative to that selected application, rather than repeating the entire navigation instruction.

Defining Back-end Connections for Native and Hybrid Apps

Define back-end connections for the selected native or hybrid application. SAP Mobile Platform supports one primary endpoint per application ID. However, the administrator can create multiple secondary endpoints for other services used by the application; SAP Mobile Platform treats these additional endpoints as proxy connections.

1. From Management Cockpit, select the **Home** tab, and then **Configure Application**. Alternatively, select the **Applications** tab.
2. On the Applications tab, select one of the applications.

You see application-related tabs, such as Back End, Authentication, Push, and so forth. The tabs you see differ by application type. You are ready to configure the application, based on the application type.

Note: These tabs appear in Management Cockpit only after you define or select an application. The steps that follow assume you have selected the application, and are working through each of the relevant tabs for your selected application. The steps use a navigational shorthand—such as "select **Applications > Back End**"—to indicate the tab

where tasks are performed, relative to that selected application, rather than repeating the entire navigation instruction.

3. Enter values for the selected application:

Field	Value
Connection Name	<p>(Appears only when adding a connection under Back-End Connections.) Identifies the back-end connection by name. The connection name:</p> <ul style="list-style-type: none"> • Must be unique. • Must start with an alphabetic character. • Can contain only alphanumeric characters, underscores (_), and periods (.). • Cannot include spaces.
Endpoint	<p>The URL (back-end connection, or service document) the application uses to access business data on the back-end system or service. The service document URL is the document destination you assigned to the service in Gateway Management Cockpit. Include a trailing slash to avoid triggering a redirection of the URL, and losing important HTTP header details. This is especially important when configuring the application with security, such as SSOToken and Certificates, and when Rewrite URL is enabled. Typical format:</p> <pre>http://host:port/gateway/odata/namespace/Connection_or_ServiceName.../</pre> <p>Examples:</p> <pre>http://testapp:65908/help/abc/app1/opg/sdata/TEST-FLIGHT/</pre> <pre>http://srv3333.xyz.com:30003/sap/opu/odata/RMTSAMPLE/</pre>
Use System Proxy	<p>(Optional) Whether to use system proxy settings in the SAP Mobile Platform <code>props.ini</code> file to access the back-end system. This setting is typically disabled, because most back-end systems can be accessed on the intranet without a proxy. Enable this setting only in unusual cases, where proxy settings are needed to access a remote back-end system outside of the network. When enabled, this particular connection is routed via the settings in <code>props.ini</code> file.</p>
Rewrite URL	<p>(Optional) Whether to mask the back-end URL with the equivalent SAP Mobile Platform Server URL. Enable this setting to ensure the client makes all requests via SAP Mobile Platform Server, and directly to the back end. Rewriting the URL also ensures that client applications need not do any additional steps to make requests to the back end via SAP Mobile Platform Server. If enabled, the back-end URL is rewritten with the SAP Mobile Platform Server URL. By default, this property is enabled.</p>

Field	Value
Allow Anonymous Access	<p>(Optional) Whether to enable anonymous access, which means the user can access the application without entering a user name and password. However, the back-end system still requires login credentials for data access, whether it is a read-only user, or a back-end user with specific roles.</p> <ul style="list-style-type: none"> If enabled and the back end requires it, enter the login credential values used to access the back-end system: <ul style="list-style-type: none"> User name – supply the user name for the back-end system. Password – (required if you set a user name) supply the password for the back-end system. If disabled (the default value) or the back end does not require it, you need not provide these credentials. <hr/> <p>Note: If you use Allow Anonymous Access for a native OData application, do not also assign the No Authentication Challenge security profile to the application; anonymous OData requests are not sent, and Status code: 401 is reported.</p>
Maximum Connections	<p>The number of back-end connections that are available for connection pooling for this application. The larger the pool, the larger the number of possible parallel connections to this specific connection. The default and minimum is 500 connections. Factors to consider when resetting this property:</p> <ul style="list-style-type: none"> The expected number of concurrent users of the application. The load that is acceptable to the back-end system. The load that the underlying hardware and network can handle. <p>Increase the maximum number of connections only if SAP Mobile Platform Server hardware can support the additional parallel connections, and if the underlying hardware and network infrastructure can handle it.</p>
Certificate Alias	<p>If the back-end system has a mutual SSL authentication requirement, supply the certificate alias name given to the private key and technical user certificate that is used to access the back-end system. The alias is located in <code>smp_keystore</code>. Otherwise, leave the entry blank.</p>

4. (Optional) Under Back-end Connections, view additional connections, or add new connections.
 - a) Click **New**, to add additional back-end connections in the server.
 - b) Enter values for the new back-end connection, using the values shown above.
 - c) Click **Save**. The new back-end connection is added to the list.

You can maintain the list of server-level back-end connections (including all the connections in SAP Mobile Platform Server), and of application-specific back-end connections. Application-specific back-end connections are the secondary connections that are enabled for an application; by default, no secondary connections are enabled. You must explicitly enable additional back-end connections for an application. Users who are registered to an application can access only these back-end connections. If a user attempts

to access a back-end connection (request-response) that is not enabled for an application, it is not allowed and a 403, Forbidden error is thrown.

5. Select **Application-specific Connections** from the drop-down to show the back-end connections that are enabled for the application.

Select **Server-level Connections** from the drop-down to show all available connections for the server. Use the checkbox to enable additional connections for the application.

Note:

- You can authenticate multiple back ends using various authentication provider options in the back-end security profile.
 - If the back-end system issues a “302 Redirect” response, which means it is redirecting the request to a different URL, then you must also add the target URL to the list of application-specific connections.
-

Defining Application Authentication

Assign a security profile to the selected application. The security profile defines parameters that control how the server authenticates the user during onboarding, and request-response interactions with the back end.

Prerequisites

Configure security profiles for application authentication.

Task

Security profiles are made up of one or more authentication providers. These authentication providers can be shared across multiple security profiles, and can be modified in Management Cockpit. For more information on authentication providers, see *Authentication in SAP Mobile Platform*.

You can stack multiple providers to take advantage of features in the order you chose; the Control Flag must be set for each enabled security provider in the stack.

1. From Management Cockpit, select **Applications > Authentication**.
2. Click **Existing Profile**.

Note: You can also create a new profile.

3. Select a security profile name from the Name list.

The name appears under Security Profile Properties, and the providers that are associated with the security profile appear under Authentication Providers.

4. Under Security Profile Properties, enter values.

Field	Value
Name	A unique name for the application authentication profile.
Check Impersonation	(Optional) In token-based authentication, whether to allow authentication to succeed when the user name presented cannot be matched against any of the user names validated in the login modules. By default the property is enabled, which prevents the user authentication from succeeding in this scenario.

5. Under Authentication Providers, you can select a security profile URL to view its settings. To change its settings, you must modify it using **Settings > Security Profiles**.

OData Security Matrix

Use one of the supported security configurations to secure your applications.

The below table provides a brief configuration procedure for the supported security configuration in Native OData applications. For more information, refer *Administration in SAP Mobile Platform Server*.

Security Configuration	Implemented Using	Authentication Provider	Configuration Steps (in brief)
Basic authentication with HTTP	OData SDK, Client Hub	HTTP/HTTPS Authentication	Set the back end credentials. Note: For anonymous user, set the back end to allow anonymous connections.
Basic authentication with HTTPS	OData SDK, Client Hub	HTTP/HTTPS Authentication	<ol style="list-style-type: none"> Set the back end credentials. Note: For anonymous user, set the back end to allow anonymous connections. Connect with HTTPS port. For example, 8081. Make sure the server certificate is installed in the device truststore. <ul style="list-style-type: none"> For iOS, use the iPhone Configuration Utility. For Android, install the certificate from the SD card.

Security Configuration	Implemented Using	Authentication Provider	Configuration Steps (in brief)
Mutual authentication with HTTPS using a certificate	OData SDK, Afaria	X.509 User Certificate	<ol style="list-style-type: none"> 1. Connect with HTTPS port. For example, 8082. 2. Make sure the server certificate is installed in the device truststore. <ul style="list-style-type: none"> • For iOS, use the iPhone Configuration Utility. • For Android, install the certificate from the SD card. 3. Ensure the client certificate is available on the device.
SiteMinder (unprotected network edge)	OData SDK	HTTP/HTTPS Authentication	Connect with SiteMinder back end using HTTPS.
SiteMinder network edge (reverse proxy)	OData SDK	Populate JAAS Subject From Client, HTTP/HTTPS Authentication	<ol style="list-style-type: none"> 1. Create a security profile using Populate JAAS Subject From Client authentication provider. 2. Create a security profile using HTTP/HTTPS Authentication authentication provider.
SSO2 token (HTTP and HTTPS)	OData SDK	HTTP/HTTPS Authentication	<ol style="list-style-type: none"> 1. Create a new security profile and indicate the SSO cookie name in the security profile. 2. Make sure the server certificate is installed in the device truststore. <ul style="list-style-type: none"> • For iOS, use the iPhone Configuration Utility. • For Android, install the certificate from the SD card.
Basic authentication with LDAP back end	OData SDK	Directory Service (LDAP/AD)	Create security profile.

Configuring Push on SAP Mobile Platform Server

You must explicitly register the application connection using the Management Cockpit.

1. Start the Management Cockpit.

2. Select **Applications**, and click **New**.
3. In the **New Application** window, enter values.

Field	Value
ID	Unique identifier for the application, in reverse domain notation. This is the application or bundled identifier that the application developer assigns or generates during application development. The administrator uses the Application ID to register the application to SAP Mobile Platform Server, and the client application code uses the Application ID while sending requests to the server.
Name	Application name.
Vendor	(Optional) Vendor who developed the application.
Version	Application version. Currently, only version 1.0 is supported.
Type	Application type. <ul style="list-style-type: none"> • Native – native iOS and Android applications. • Hybrid – container-based applications, such as Kapsel. • Agency – metadata-driven applications, such as Agency. Application configuration options differ depending on your selection.
Description	(Optional) Short description of the application.

4. Click the **Backend** tab and configure the endpoint information.
5. Click the **Push** tab to configure the push settings.
For Android GCM, see *Android Push Notifications*.
For Apple APNS, see *Apple Push Notifications*
6. In the settings for your device, enable the app to receive push notifications.

Android Push Notifications

Configure Android push notifications for the selected application, to enable client applications to receive Google Cloud Messaging (GCM) notifications.

1. From Management Cockpit, select **Applications > Push**.
2. Under Android, enter the access key for API key. This is the access key you obtained for your Google API project (<http://developer.android.com/google/gcm/gs.html>).
3. Enter a value for Sender ID. This is the project identifier.
4. (Optional) Configure push notifications for each device type supported.

Apple Push Notifications

Configure Apple push notifications for the selected application, to enable client applications to receive APNS notifications.

1. From Management Cockpit, select **Applications > Push**.

2. Under Apple, select **APNS endpoint**. "None" is the default endpoint value for all the applications.
3. Select **Sandbox** to configure APNS in a development and testing environment, or **Production** to configure APNS in a production environment.
 - a) Click **Browse** to navigate to the certificate file.
 - b) Select the file, and click **Open**.
 - c) Enter a valid password.

Note: The default URL is for a production environment; for a development and testing environment, change the URL to gateway.sandbox.push.apple.com.

4. (Optional) Configure push notifications for each device type supported.

Android Apps

Develop, run, test, debug, and deploy Android apps.

Developing Android Applications

The OData SDK is used to develop a device application for the Android platform. An application consists of reusable building blocks, which a developer can use to start the application and perform functions needed for the application. The target audience is advanced developers who are familiar working with APIs, but who may be new to SAP Mobile Platform.

Prerequisites

Before using OData SDK for developing an Android application:

- Verify that SAP Mobile Platform 3.0 server is installed so you can access it from your Android device.
- Set up a gateway OData service to access the business data from the backend.
- Ensure that you configure the gateway on SAP Mobile Platform Server as a back end by using Management Cockpit.

Creating a Project and Importing the OData Libraries

Create a new Android project in the eclipse workspace. Add library resources to the project and set other application properties.

Creating an Android Project

1. Start the Eclipse workspace.
2. Select **File > New > Project**.
3. Select **Android > Android Application Project**, then **Next**.
4. In the Creates a new Android Application page of the New Android Application wizard, enter the appropriate values.

5. Click **Next**.
6. In the Configure Launcher Icon window, accept the default settings and click **Next**.
7. In the Create Activity window, select **Create Activity**, then select **BlankActivity**, and click **Next**.
8. In the New Blank Activity window, use the appropriate values and click **Finish**.

Setting Up the Android SDK Library in the Plug in

Set up the Android SDK in the ADT Plugin.

1. In the Eclipse environment, from the Window menu, select **Preferences**.
2. In the left navigation pane, select the **Android** node.
3. Click **Browse** to search for the location where you have stored the Android SDK.
4. Click **Apply** and **OK**.

Adding User Permissions in Android Manifest File

1. In the Eclipse project, open the Android manifest file.
2. Add the user permissions in the AndroidManifest.xml file.

To use the applications offline, `AndroidManifest.xml` should have permission for accessing network state along with registered broadcast receiver.

```

:
<! -- adding Permission to access network state -->
    <uses-permission
android:name="android.permission.INTERNET"></uses-permission>
    <! -- adding Permission to access network state -->
    <uses-permission
android:name="android.permission.ACCESS_NETWORK_STATE" ></uses-
permission>

```

(Optional) For Offline-Capability

```

<application
    .
    .
    .
    .
>
    <receiver
android:name="com.sap.mobile.lib.request.NetworkStateListener"
    android:label="NetworkStateListener">
        <intent-filter>
            <action
android:name="android.net.conn.CONNECTIVITY_CHANGE"/>
        </intent-filter>
    </receiver>
    <activity
    .
    .
    .
    </activity>
    .
    .

```

```
</application>
```

Importing Libraries to your Android Application Project

1. Download the OData SDK library files from `<SMP_HOME>\MobileSDK3\NativeSDK\ODataFramework\Android\` to a `<Parent directory>` in your host development system.

(Online capability), Download the following libraries:

- CoreServices
- Connectivity
- Common
- DataVaultLib
- gson
- Parser
- perflib
- Request
- Sap-e2etrace

(To use Applications offline) Download the following libraries along with the above mentioned libraries:

- Cache
- Persistence
- sqlcipher-android-2.1.1
- commons-codec-1.3
- guava-r09
- libs/armeabi (includes libdatabase_sqlcipher.so, libsqlcipher_android.so and libstlport_shared.so)
- icudt46l.zip file from assets folder

Note: Since the X86 SQL Cipher 2.1.1 libraries are not packaged with OData SDK, SAP recommends you download and use these libraries from: <https://s3.amazonaws.com/sqlcipher/SQLCipher%20for%20Android%202.1.1.zip>. Copy x86 folder into libs folder, to ensure offline cache works seamlessly on Intel Atom x86 emulator.

2. (Optional) If you did not use the project wizard to create your project, create a new folder, named `libs`, in your Eclipse/Android project.
3. Right-click the `libs` folder and choose **Import > General > File System**, then click **Next**.
4. Browse the file system to find the library's parent directory (where you have downloaded it).

Note: If you use `AfariaSLL.jar` to provision configuration data and certificates for your SAP Mobile Platform client application, ensure to remove `libcrypto.jar` and `libssl.jar`, as `AfariaSLL` internally has these two libraries.

5. (Optional) Click **OK**, then click the directory name (not the checkbox) in the left pane and select the relevant JAR in the right pane from `AndroidODataSDK-3.0.0-CIAT-SNAPSHOT-bin[1].zip\Android\libraries`. This step physically places the library into your project.
6. (Optional) Right-click your project, choose **Build Path > Configure Build Path**, click the **Libraries** tab, then click **Add JARs**.
7. (Optional) Navigate to the JAR in the `libs` directory and add it. (This step converts JAR for use on Android.)
This procedure includes a Dalvik-converted JAR in your Android project and makes Java definitions available to Eclipse in order to find the third-party classes when compiling your project's source code.
8. Add the files from `assets` folder into your application `assets` folder.
9. Build the application.

Initializing an Application

Initialize the application when it starts the first time and subsequently.

Creating and Initializing the Client Connection

Create and initialize the `ClientConnection` class, which is part of `Core Services` library. The `ClientConnection` class declares the programmatic interface for an object that manages connection settings required for registering the user and fetching application settings from the server. You must initialize a `ClientConnection` object and set connection properties for it before you can perform user registration or fetch any application settings from the server. Initialize the application using the following example code, which returns an instance of `ClientConnection` class.

A `ClientConnection` object is required to set the parameters required for the registration or request-response with SAP Mobile Platform.

```
public class ClientConnectionUtility{
    public static Logger logger;
    public static Preferences pref;
    public static ConnectivityParameters param;
    public static RequestManager reqManagerObject;
    public static ClientConnection clientConnection;

    public ClientConnectionUtility( Context context){
        logger = new Logger();
        pref = new Preferences(context, logger);
        param = new ConnectivityParameters();
        param.setUsername(<username>);
        param.setUserPassword(<password>);
        reqManagerObject = new RequestManager(logger, pref, param,
1);
```

```
        clientConnection = new ClientConnection(context,
        <application ID>, <domain>, <security configuration>,
        reqManagerObject);
        clientConnection.setConnectionProfile(<host:port>);

clientConnection.setApplicationConnectionID(<ApplicationConnectionI
D>); // (optional, it registers client with the server using this
application connection ID.
    }

    public static ClientConnection getClientConnection(){
        return clientConnection;
    }
}
```

Registering the User

Register the user to the SAP Mobile Platform by invoking `registerUser (boolean isSynchronous)` method of `UserManager` class. The boolean parameter `isSynchronous` specifies whether the registration is synchronous or asynchronous. If asynchronous, implement and register `SMPCClientListeners.ISMPUserRegistrationListener` to get a call back.

Note: The user name and password and other connectivity parameters should be set on `ConnectivityParameter` instance before calling `registerUser` method.

Alternately, register and implement

`HttpChannelListeners.IAuthenticationChallengeListner` to get a callback upon authentication challenge from the server.

For Asynchronous Registration

```
public class SampleApplication extends Activity implements
ISMPUserRegistrationListener
{
    UserManager um;
    public void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(<Your Layout>);
        um = new UserManager(clientConnection); //use the
clientConnection initialized in the previous topic
        um.setUserRegistrationListener(SampleApplication.this);
        um.registerUser(false);
    }

    @Override
    public void onAsyncRegistrationResult(State registrationState,
ClientConnection conn, int errCode, String errMsg) {
        if(registrationState == State.SUCCESS)
        {
            Log.i("RegistrationState Success", conn.getApplicationID());
            try
            {
                Log.i("RegistrationState Success", "APPCID" +
um.getApplicationConnectionId());
            }
            catch (Exception e)
            {
                Log.e("RegistrationState Success", e.getMessage());
            }
        }
    }
}
```

```

    } catch (SMPEException e)
    {
        e.printStackTrace();
    }
}
if(registrationState == State.FAILURE)
{
    Log.i("Registration State Failure",errCode+errMsg);
}
}
}

```

For Synchronous Registration

```

public class SampleApplication extends Activity
{
    public void onCreate(Bundle savedInstanceState)
    {
        try
        {
            UserManager userManager = new
UserManager(clientConnection); //use the clientConnection
initialized in the previous section
            userManager.registerUser(true);
            String appCID = userManager.getApplicationConnectionId();
        }
        catch (SMPEException e){
            e.printStackTrace();
        }
    }
}

```

Handling Encryption Key

(Applicable to applications in offline mode) In offline mode, the application data can be encrypted and securely stored using EncryptionManager class. Hence, you must use getEncryptionKey and SetEncryptionKey APIs to generate and set the encryption key. The application must set the encryption key each time, it comes to foreground or is started.

Example to illustrate the usage of encryption key by the application:

```

String cipherKey = null;
/*fetch the cipherKey from Secure store like dataVault or android
applications shared Preference.*/
if(<CipherKey is found in SecureStore>)

/*Should be set every time application is loaded*/
    EncryptionKeyManager.setEncryptionKey(cipherKey,getContext());
/*Store the cipherKey in Secure store like dataVault or android
applications shared Preference.*/
else(<Cipher Key is not yet generated>)
    cipherKey= EncryptionKeyManager.getEncryptionKey(getContext());

```

Enabling Single and Mutual SSL Authentication

In a single SSL connection, the client must trust the server certificate. You can set this up in one of these ways:

- Install the CA certificate on the device trustStore that application uses while connecting to the HTTPS URL.
- If the application does not provide the certificate, implement the `ISSSLChallengeListener`. The application receives a callback to the `isServerTrusted` method. When the application receives the server certificate, it can choose to trust the certificate or not. Based on that, it returns the Boolean value as true or false.
- Bundle the CA certificate in the application and invoke the `setServerCertificate` method to provide the certificate. SAP recommends using one of the other methods, as this one is available only for backward compatibility with Android versions earlier than 4.0.

In mutual SSL connection, the server must trust the client certificate. The application must implement `IMutualSSLChallengeListener`, and invoke the `getClientCertificate` callback to request the client certificate. The client returns an X.509 certificate, and a private key, which together form an `HttpClientCertInfo` object.

Implement listeners for SSL callbacks.

```
public class LaunchActivity extends Activity implements
ISSSLChallengeListener, IMutualSSLChallengeListener {

    RequestManager srm;
    ILogger logger;
    IConnectivityParameters params;
    IPreferences prefer;
    String url="<Gateway URL>";

    public void mreg(View v){
        ClientConnection clientConnection;
        UserManager userManager;
        logger=new Logger();
        prefer=new Preferences(this, logger);
        params=new ConnectivityParameters();
        params.setLanguage("en");
        params.setUsername(<username>);
        params.setUserPassword(<password>);

        Context c = getApplicationContext();
        try{ InputStream certStream =
c.getResources().openRawResource(<certificate>);
CertificateFactory cf = CertificateFactory.getInstance("X509");
Certificate cer= cf.generateCertificate(certStream);

        param.setServerCertificate(cer); //to place certificate in
```

```

the devices less than 4.0

        Log.i("tag", "In Set Server certificate API");

        }catch(Exception e){
            Log.i("tag", "set certificate from file failed" +
e.getMessage());
            e.printStackTrace();
        }
        srm=new RequestManager(logger,prefer,params,1);
        /**
 * The set methods which should be called to register the
listeners to the request manager
 *
 */
        srm.setSSLChallengeListener(this);
        srm.setMutualSSLChallengeListener(this);
        ClientConnection.initInstance(getApplicationContext(),
"<application>", "<domain>", "<security configuration>", <request
manager>);
        try {
            j=ClientConnection.getInstance();
            j.setConnectionProfile("<connection url>");
            UserManager.registerUser(true);
        }
        catch (SMPEException e) {
            // TODO Auto-generated catch block
            e.printStackTrace();
        }

    }
}

```

Send X.509 certificate and private key to the client as an `HttpClientCertInfo` object.

```

public HttpClientCertInfo getClientCertificate()
{
    InputStream inStream;
    String cert="<p12 certificate location>";
    Context context=this(getApplicationContext());
    try {

        inStream = context.getResources().openRawResource(cert);

        /*following code loads the key store, and retrieves
        The alias under which it is loaded. */

        KeyStore ks = KeyStore.getInstance("PKCS12");
        ks.load(inStream, "mobile".toCharArray());
        Enumeration aliases=ks.aliases();
        String keyname=(String)aliases.nextElement();

        /* using the alias stored in the variable "keyname"
        We get the Private Key and the X509 Certificate
        Which we use to return HttpClientCertInfo object.*/
    }
}

```

```
        PrivateKey
pk= (PrivateKey) ks.getKey(keyname, "mobile".toCharArray());
        X509Certificate xcer=(X509Certificate)
        (ks.getCertificate(keyname));

        return new HttpClientCertInfo(xcer,pk);}

        catch(Exception e){
            return null;
        }

    }
    /*
    * This is the callback which is invoked if
    * 1) SSL is enabled,
    * 2) The correct certificate is not installed on the device, in
    which case it is required of the application to verify the server
    certificate.
    */

@Override
    public boolean isServerTrusted(X509Certificate[]
paramArrayOfX509Certificate) {
        // TODO Auto-generated method stub

        return true;
    }
}
```

Setting the Password Policy Using DataVault

(Optional) Use the `DVPasswordPolicy` (as defined in `com.sybase.persistence.DataVault`) which holds the information of the Password Policy.

(Applicable to On-Premise only) To make the password policy editable in the SAP Mobile Platform Server, set the application connection property "CapabilitiesPasswordPolicy" to true in the client application. To set the password policy, use the following example code:

```
AppSettings appSettings = new AppSettings(clientConnection); //use
the clientConnection object initialized in the "Creating and
Initializing the Client Connection" section.
DVPasswordPolicy passwordPolicy = appSettings.getPasswordPolicy();
```

(Optional) Initializing an Application Using Logon Manager

To initialize an application using Logon manager, see *MAF Logon Task Flow* on page 1781.

Invoking a Request

Send an asynchronous data request to the backend through the SAP Mobile Platform Server. With the offline capability, Request library requests are queued in a persistent database, if there is no network connectivity, and invoked when the network becomes available. You can use the Request library to develop applications that have direct connectivity to Gateway or to register users on Management Cockpit.

Creating a Request

The package structure for the Request library is `com.sap.mobile.lib.request`.

Note: Once the listener is set on the RequestManager class, all POST, PUT, DELETE (except GET) responses are received only on this listener. For GET requests, the listener can be set on corresponding request object itself.

1. To enable offline capability, set the response listeners using the following code, before invoking the request:

```

/* Setting the listener */
public class SampleActivity extends Activity implements
INetListener {
@Override
public void onError(IRequest arg0, IResponse arg1,
IRequestStateElement arg2) {}

@Override
public void onSuccess(IRequest arg0, IResponse arg1) {}
}
.
.
// setting the listener to current class
RequestManager reqMan = new RequestManager(logger, pref, param,
1);
reqMan.setListener(listener);

```

- Set the listener only once per application.
 - For all GET requests, the listener is always set on the request object.
 - If offline capability is disabled, then for POST, PUT, and DELETE requests also, the listener is set on corresponding request.
2. For all GET requests the listener is always set on request object. If offline capability is not enabled, then for POST, PUT, and DELETE requests also, listener is set on corresponding request.

Proceed with the following code to set response listener on request object:

```

public class SampleActivity extends Activity implements
INetListener {
@Override
public void onError(IRequest arg0, IResponse arg1,
IRequestStateElement arg2) {}

```

```
@Override
public void onSuccess(IRequest arg0, IResponse arg1) {}
.
.

getrequest.setListener(this);
}
```

3. Proceed with the following code to create the request asynchronously:

```
/*Enable XCSRF handling for OData requests*/
param.enableXsrf(true);
BaseRequest getEntry = new BaseRequest();
/*Initialize the Requesting class with the endpoint URL after
successful registration and set the headers */
Map<String, String> headers = new HashMap<String, String>();
headers.put("Content-Type", "application/atom+xml");
getrequest.setHeaders(headers);
getrequest.setRequestUrl("<URL>");
getEntry.setRequestMethod(<Request-Method>);
/*Set user name */
param.setUsername(<UserName>);
/*Set password */
param.setUserPassword(<Password>);
/*Set the listener to receive the response */
getrequest.setListener(this);
```

Creating a Batch Request

Batch processing allows you to send multiple requests in a single batch request to the Gateway. The batch request is a multipart POST request that contains one or more changesets comprising of other POST, PUT, or DELETE requests. The batch request can also contain GET-based retrieval requests. The Gateway processes the batch request, and the responses to the various requests that make up the batch request are combined into a single response and sent back to the user as a single response.

1. Initialize the batch request:

```
public BatchRequest batch;
batch = new BatchRequest(<Service doc URL>/$batch);
```

2. Add a retrieve request to the batch request:

```
public BaseRequest get1 = new BaseRequest();
get1.setRequestMethod(BaseRequest.REQUEST_METHOD_GET);
get1.setRequestUrl("<collection name>");
batch.addRetrieveRequestToBatch(get1);
```

3. Add request to a changeset:

```
public BaseRequest post1 = new BaseRequest();
post1.setRequestMethod(BaseRequest.REQUEST_METHOD_POST);
Map<String, String> headers1 = new HashMap<String, String>();
headers1.put("Content-Type", "application/atom+xml");
post1.setHeaders(headers1);
post1.setRequestUrl("TravelagencyCollection");
```

```
//For single request
IODataEntry entry = new ODataEntry(metaDataDocument);
entry.setCollectionId(<collectionId>);
```

```

    Iterator<IODataProperty> entryPropIter =
entry.getPropertiesData().iterator();
    IODataProperty entryProp;
    entry.putPropertyValue("agencynum", "agency001");
    entry.putPropertyValue("NAME", "travelagency001");
    String postBody = parser.buildODataEntryRequestBody(entry,
collectionId, metaDataDocument, 1);

    post1.setData(postBody.getBytes());
    batch = new BatchRequest(<Service doc URL>);
    batch.addRequestToChangeset(post1);

```

Note:

- The POST URL should be relative to the batch URL.
- Change sets are update requests. For the change set to be successfully processed, first do a GET operation on the URL to fetch the XSRF token. Then, after handling of XSRF token is done by the SDK implicitly.

Making a Request

Initialize the RequestManager and make a request.

```

//To initialise the Request manager
import com.sap.mobile.lib.request.Logger;
import com.sap.mobile.lib.request.Preferences;
import com.sap.mobile.lib.request.RequestManager;
import com.sap.mobile.lib.request.ConnectivityParameters;

....

Logger logger = null;
Preferences pref = null;
ConnectivityParameters param = null;
RequestManager requestManager= null;

logger = new Logger();
//
pref = new Preferences(this.getApplicationContext(), logger);
try {
pref.setBooleanPreference(IPreferences.PERSISTENCE_SECUREMODE,
false);
pref.setIntPreference(IPreferences.CONNECTIVITY_HTTPS_PORT, 443);
pref.setIntPreference(IPreferences.CONNECTIVITY_CONNTIMEOUT, 7000);
pref.setIntPreference(IPreferences.CONNECTIVITY_SCONNTIMEOUT,
7000);

} catch (PreferencesException e) {
logger.e("preferences", e.getMessage(), e);
e.printStackTrace();
}

param = new ConnectivityParameters();
param.setUsername("username");
param.setUserPassword("password");

```

```
param.enableXsrf(true);
requestManager = new RequestManager(logger, pref, param, 1);
//To make a request
requestManager.makeRequest(getrequest);
```

Parsing the Data

Parse the response from the backend to the device.

Retrieving the Response from Backend

Based on the data request sent to the backend, retrieve the data as a response to the device.

```
public void onSuccess(IRequest mRequest, IResponse mResponse) {
    /* Parses the service document */
    IODataServiceDocument serviceDocument =
parser.parseODataServiceDocument(EntityUtils.toString(mResponse.getEntity()));
    /*parses response meta data*/
    IODataSchema metaDataDocument =
parser.parseODataSchema(EntityUtils.toString(mResponse.getEntity()),
serviceDocument);

    /*Parses a feed or an entry and returns List of IODataEntry.*
    List<IODataEntry> Entries=
parser.parseODataEntries(EntityUtils.toString(mResponse.getEntity()),
collectionID, metaDataDocument);
    /*Parses a feed or an entry and returns IOdataFeed.*
    IODataFeed Odatafeed =
parser.parseODataFeed(EntityUtils.toString(mResponse.getEntity()),
collectionID, schema);
}
```

Accessing Properties of IODataEntry or IODataFeed

This section explains how to access properties of IODataEntry or IODataFeed.

```
List<IODataEntry> Entries = Odatafeed.getEntries();
for(IODataEntry entry:Entries)
{
    entry.getValues("content", "properties", "Name");
}
```

Features of JSON Parser

This section lists unique features of JSON parser.

Caching the Data

(Optional, offline mode only) Caching is an important part of getting an application to work in offline mode. Use the Cache API to cache and persist data, when the mobile device is out of the network range and process the data later when the device within the range of the network.

Note:

- Due to limitation on the emulator, you cannot determine the network connection state. For more information on other limitations, see **Emulator Limitations** in *Using the Emulator* at the Android Developer web site.
- The delete tombstones for delta query support is not available on OData JSON format.

The Cache API is divided into two parts, one that stores a copy of the entries that you receive from the server called as "server copy" and the other is locally modified entries called as "local copy". You can also use this procedure for online scenarios.

Prerequisites

Use the `Caching` interface, which is implemented by the `Cache` class, to create an object to work with.

Initialize the Cache

To initialize all the elements required for a cache to work, use the `initializeCache` method:

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

Cache can be used in persistable mode (database) and non-persistable mode (memory). By default, cache is persistable.

If you do not want to persist cache to the database, use the following API:

```
cache.setIsPersistable(false);
```

Merge to Cache

To incrementally update the cache for server entries with the latest state of server objects, use the `mergeEntries` method. Every online HTTP GET operation on a URL should be followed by a `MergeEntries` method to enable the server cache to be in-sync with the backend service. It is important to instantiate a server cache using the `MergeEntries` method for all operations to work after a successful online GET request for a URL at the initial stage. It is recommended to optimize GET operation with Delta support to avoid redundancies.

```
try{
    ILogger logger = new Logger();
    Parser parser = new Parser(pref, logger);
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    IODataFeed feed = parser.parseODataFeed(entriesdoc, collectionID,
    schema);
    cache.MergeEntries(feed, EntryURL);parameters.
}
```

```
catch (CacheException e) {
    Log.e("", e.getMessage());
}
```

Note: There is no overhead with the cache capabilities, when the parsed content is delivered for presentation, even before merging on to the cache, and when the merging operation is invoked on another thread. So, there is no wait time until the cache is being written.

Read Entry from Cache

You can read entries from the cache method either locally, or from the server.

- **Server entry** – All server entries are stored against a URL key, which is the end-point that returns all the entries you want to cache. Use the `readEntriesServer` method to read server entries.
- **Local entry** – Read the locally created, deleted, or modified entries based on the entity type (collection to which entry belongs to) and entry ID. Use the `readEntriesLocal` method to read local entries. Entity type and entry ID are optional parameters, but at least one parameter must be given. Passing null to entry ID retrieves all the entries for a specified entity type. Passing null to entry type and passing entry Id will retrieve specific entry from cache.

The `IODataEntry` class of the parser has two member properties. The `getIsLocal()` property checks if the particular entry is local, and `getCacheState()` checks if the local entry is created, updated, or deleted on the client. The cache states are represented by the `cacheState{Updated, Deleted, Inserted}` enum.

You need to combine the server and local entries to display the latest version of data on your application.

```
/*Read entry from server.*/
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    List<IODataEntry> entries = cache.ReadEntriesServer(urlKey); //
    return all entries respective to the parameter.
}
catch(CacheException e){
    Log.e("",e.getMessage());
}

/*Read entry from local*/
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    List<IODataEntry> entries =
    cache.ReadEntriesLocal(CollectionID,EntryID); // return all entries
    respective to either of the parameters.
}
catch(CacheException e){
```

```

    Log.e("", e.getMessage());
}

```

Managing Locally Modified Entries in Cache

- **Add Entry to Cache** – Use the `addEntry()` method to create a new entry in the local cache. With `Request` library, perform an HTTP POST request on the backend to create an entry in backend. After POST is successful, perform an HTTP GET request to fetch the latest server state optimized with delta, and merge the result with server cache on the device. The `addEntry()` method adds an entry into the local cache. Since the entry ID is generated by the back end in most of the cases, creating a local entry generates a temporary entry ID with which you can manage the cache entry.

```

try{
    //Invoke the HTTP POST request
    ODataEntry entry = new ODataEntry();
    entry.putPropertyValue("<property_name>",
"<property_value>");
    String postbody = Parser.buildODataEntryRequestBody(entry,
"<collection_ID>", schema, IParser.FORMAT_XML);

    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    String generated_id =cache.addEntry(entry);
    //Invoke the HTTP POST request
    BaseRequest post = new BaseRequest();

    post.setRequestMethod(BaseRequest.REQUEST_METHOD_POST);
    post.setData(postbody.getBytes());
    reqMan.makeRequest(post);
}
catch(CacheException e){
    Log.e("", e.getMessage());
}

```

- **Update Entry to Cache** – When you make changes that is stored locally on your device in offline mode, it must be cached and persisted locally to be updated in the backend when connectivity returns. This ensures the OData entries are cached to build an application that works with seamless offline-online experience. Use the `updateEntry` method to create a local copy of the updated entry in cache. With connectivity, perform an update on the back end using an HTTP PUT request. After the updates is successful, perform a HTTP GET request to fetch the latest server state optimized with delta, and merge the result with server cache on the device. The `updateEntry` method does not generate any temporary ID, as the entry is already associated with the ID generated by the back end.

```

try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.initializeCache();
        cache.updateEntry(entry);
}
catch(CacheException e){

```

```
Log.e("", e.getMessage());
}
```

- **Delete Entry from Cache** – Use the `deleteEntry` method to delete a new entry with its ID in the local cache. With connectivity, perform a HTTP DELETE request on the backend to delete the entry in back end. Post a successful delete on the backend, perform a HTTP GET request to fetch the latest server state optimized with delta, and merge the result with server cache on the device. The SDK reads the entry from the server cache, based on the entry ID, and updates the entry in the local cache by marking it as a local copy to be deleted. The `deleteEntry` method does not generate any temporary ID, as the entry is already associated with the ID generated by the back end.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.initializeCache();
    cache.deleteEntry(EntryID);
}
catch(CacheException e){
    Log.e("", e.getMessage());
}
```

- **Co-relating Requests with Local Cache Entries** – Each of the operations like add, update, and delete local cache entries are associated with entry IDs that are unique. These operations are also associated with requests. For example: Add corresponds to a POST request. To co-relate which request corresponds to which cached entry, there is a provision provided in the Request object interface to tag each of these requests with their respective entry IDs.

In case of request to a single endpoint, each request is associated with single cache entry ID.

- **Clearing Specific Data from the Local Cache** – To clear locally created entries when all the cache instances are updated with the server version of the entry on which modifications were made, use the `clearLocalEntryForEntryId` method.

Note: Since the local cache is specific to the entry ID, the changes made to an entry from one of the cache instances (for example, URL1 + top 10) should be reflected on all cache instances in which the entry is present (for example URL1 + top 20). Do not delete the local entry until you have refreshed all caches that are relevant for this entry.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.initializeCache();
    cache.clearLocalEntry(<EntryID>);
}
catch(CacheException e){
    Log.e("", e.getMessage());
}
```

Store Document in Cache

To cache the service and metadata document (schema) for a particular service URL, use the `storeDocument` method. You can also define your own enum type and store the data for that enum type. The service document must be stored only after the metadata document is parsed.

```
//Service document
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
cache.initializeCache();
    cache.storeDocument(serviceDocumentObject,
DocumentType.ServiceDocument, serviceDocUrl);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}

//MetaData Document
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    cache.storeDocument(serviceDocumentObject,
DocumentType.MetaDocument, serviceDocUrl);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

Read Document from Cache

To read the service and metadata documents from cache, use the `readDocumentForUrlKey` method. This method returns the stored document in the cache. The application should pass the document type and the URL for which the document is relevant.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.initializeCache();
    IODataServiceDocument serviceDocumentObject =
(IODataServiceDocument )cache.readDocument(DocumentType.ServiceDocu
ment, serviceDocUrl);
    IODataSchema metadata =
(IODataSchema) cache.readDocument(DocumentType.MetaDocument,
serviceDocUrl);
}
catch(CacheException e){
    Log.e("",e.getMessage());
}
```

Clearing the Cache

Use the `clearCache` method to clear the cache and persistence of all the entries based on URL key. This method also deletes the delta token of any document stored against this URL.

Hence it is recommended that you use this method only when the application does not support delta queries.

```
try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
cache.initializeCache();
    cache.clearCache (URLKey);

}
catch (CacheException e){
    Log.e("",e.getMessage());
}
```

Using Delta Link

The delta link retrieves the delta changes to a particular URL, since the last time URL was called.

Note: You must pass the complete request URL as urlKey. For example, `cache().mergeEntries(list, aRequest.getRequestUrl())`.

The default option in cache is to get the delta link if OData entry supports delta link. In this case, once `mergeEntries` API of cache is called to save server entries into cache, the next GET the application fires, will internally be fired for delta link for the OData entry. So only delta changes will be available as the response and the application developer can call `mergeEntries` to merge the entries in the cache.

The application developer can disable default delta link handling by calling the following API:

```
requestObject.disableDeltaHandling(true);
```

Changing Settings at Runtime

(Optional) Update application settings (client and the SAP Mobile Platform Server) using OData SDK.

Download Customization Resource Bundles

(Optional) Download customization resource bundles as defined in SAP Mobile Platform Server using the following example code:

```
//use the clientConnection object initialized in the "Initializing An
Application -> Creating and Initializing the Client Connection"
section.
AppSettings appSettings = new AppSettings(clientConnection);
byte[] customizationResourceBundle =
appSettings.getCustomizationResourceBundle("<resourcebundlename>:<v
ersion>");
```

Retrieve Push Endpoint

(Optional) Retrieve the push endpoint URL to register for push notification using the following example code:

```
String PushEndPoint = appSettings.getPushEndPoint();
```

Enabling GCM Push Notifications

(Optional) Subscribe to get GCM (Google Cloud Messaging) push notifications.

To enable GCM push notification for an Android application:

1. Enable the GCM service in Google, see Android developer Web site at: <http://developer.android.com/google/gcm/gs.html#gcm-service>.
2. Configure Management Cockpit for server-side configuration to receive GCM push notification.
3. Obtain the sender ID, configured in the Management Cockpit from the client application.

```
//use the clientConnection object initialized in the "Initializing
An Application -> Creating and Initializing the Client Connection"
section.
```

```
AppSettings appSettings = new AppSettings(clientConnection);
String senderID = (String)
appSettings.getConfigProperty("d:AndroidGcmSenderId");
```

4. Use the sender ID to register with the GCM server and obtain the registration ID. For more information on how to build GCM enabled application, see <http://developer.android.com/google/gcm/client.html>.
5. Send the registration ID obtained from the GCM server to the SAP Mobile Platform Server.

```
HashMap<String, String> registrationSetting = new HashMap<String,
String>();
```

```
registrationSetting.put("d:AndroidGcmRegistrationId",
registrationId); //registrationId obtained from the previous
step.
```

```
appSettings.setConfigProperty(registrationSetting);
```

Next

Configuration is complete and now the client application can obtain the push notifications.

Obtain the SAP Mobile Platform push end-point by using the `AppSettings.getPushEndPoint()`. This endpoint can be used to subscribe for push notifications from the back end.

API Reference

Use the API reference as the primary reference for all API listings and error code information.

SAP Mobile Platform 3.0 OData SDK for Android

Use the OData SDK API reference as the primary source for API usage and error code information.

Refer to the OData SDK API reference for each available package.

cache package

Cache class

Consists of the methods related to Cache.

Package

```
com.sap.mobile.lib.cache
```

Syntax

```
public class Cache implements ICache
```

Implemented interfaces

- *ICache* on page 56

Members

All members of Cache, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>Cache(Context, ILogger)</i> on page 38	

Methods

Modifier and Type	Method	Description
public String	<i>addEntry(IODataEntry)</i> on page 38	A new cache entry will be added into the local Cache using this particular method.
protected void	<i>addtoDelta(String, String)</i> on page 39	
protected void	<i>addtoLocal(IODataEntry, String)</i> on page 39	
protected void	<i>addtoServer(ODataEntryServer, String, boolean)</i> on page 40	

Modifier and Type	Method	Description
public void	<i>clearCache(String)</i> on page 40	This API will clear entries for the URLKey passed from all the cache except the Local cache.
public void	<i>clearLocalEntry(String)</i> on page 40	This API will clear entry from Local Cache.
public void	<i>deleteEntry(String)</i> on page 41	This API will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.
protected void	<i>deleteFromServercache(String)</i> on page 41	
protected Object	<i>deserialize(byte[])</i> on page 42	
public String	<i>getDeltaLink(String)</i> on page 42	This should return the delta token/delta link for the URL key passed.
public void	<i>initializeCache()</i> on page 42	
public void	<i>mergeEntries(IODataFeed, String)</i> on page 42	Merge APIs are to be invoked after doing a HTTP GET after modification or a set of modifications.
public Object	<i>readDocument(int, String)</i> on page 43	This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.
protected List< IODataEntry >	<i>readEntriesFromServer(String, String)</i> on page 44	
public List< IODataEntry >	<i>readEntriesLocal(String, String)</i> on page 44	Gets the Entries from the Local cache based on the EntityType and the EntryID.

Modifier and Type	Method	Description
public List< IODataEntry >	<i>readEntries.Server(String)</i> on page 45	Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.
protected byte[]	<i>serialize(Object)</i> on page 45	
public void	<i>setCacheListener(ICacheUpdateListener)</i> on page 45	Sets the listener for any update on Server cache and call backs upon merging Cache.
public void	<i>setIsPersistable(boolean)</i> on page 46	This API sets the isPersistable property of the cache which is used to check if the cache is implicitly persistable.
public void	<i>storeDocument(Object, int, String)</i> on page 47	This API Caches the service document or the meta data document depending on the DocumentType and against specified URLKey.
public void	<i>updateEntry(IODataEntry)</i> on page 47	This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

Cache(Context, ILogger) constructor

Syntax

```
public Cache (
    Context context,
    ILogger logger
)
```

addEntry(IODataEntry) method

A new cache entry will be added into the local Cache using this particular method.

Syntax

```
public String addEntry (IODataEntry entry) throws CacheException
```

Parameters

- **Entry** – object which is built for a new HTTP POST.

Exceptions

- **CacheException class** –

Remarks

This method will be mostly called when the application is trying to create entries in the backend via a HTTP POST.

```

Try{
//Fire a HTTP POST
IODataEntry entry = buildPostEntry();
ILogger logger = new  Logger();
ICache cache =new Cache(getApplicationContext(),logger);
String generated_id =cache.addEntry(entry);
PerformPostrequest(entry)//Fire HTTP POST request
}
Catch(CacheException e){
}. public void onSuccess(I Request arg0, I Response aResponse) {

    ClearLocalEntry(generated_id)//on success of POST
request ,application developer clears this entry after all the Cache
instances related to this entry (filter/query all matching) are
updated from the server
}
}

```

*addtoDelta(String, String) method**Syntax*

```

protected void addToDelta (
    String urlKey,
    String deltaLink
) throws PersistenceException

```

*addtoLocal(IODataEntry, String) method**Syntax*

```

protected void addToLocal (
    IODataEntry entry,
    String Id
) throws PersistenceException

```

addtoServer(ODataEntryServer, String, boolean) method

Syntax

```
protected void addToServer (
    ODataEntryServer odataEntryServer,
    String urlKey,
    boolean isUpdate
) throws PersistenceException
```

clearCache(String) method

This API will clear entries for the URLKey passed from all the cache except the Local cache.

Syntax

```
public void clearCache (String URLKey) throws CacheException
```

Parameters

- **URLKey** – : will clear cache for the URL key specified.

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.clearCache (URLKey);
}
Catch (CacheException e){
}
```

clearLocalEntry(String) method

This API will clear entry from Local Cache.

Syntax

```
public void clearLocalEntry (String entryID) throws CacheException
```

Parameters

- **EntryID** – from server Cache will be marked as "Deleted" and will be added in Local Cache

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.ClearLocalEntry(EntryID);
}
Catch(CacheException e){
}
```

deleteEntry(String) method

This API is will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.

Syntax

```
public void deleteEntry (String entryID) throws CacheException
```

Parameters

- **EntryID** – from server Cache will marked as "Deleted' and will be added in Local Cache

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.deleteEntry(EntryID);
}
Catch(CacheException e){
}
```

deleteFromServercache(String) method

Syntax

```
protected void deleteFromServercache (String Id) throws PersistenceException
```

deserialize(byte[]) method

Syntax

```
protected Object deserialize (byte[] rawData)
```

getDeltaLink(String) method

This should return the delta token/delta link for the URL key passed.

Syntax

```
public String getDeltaLink (String URLKey) throws CacheException
```

Parameters

- **URLKey** – : will return the delta token/delta link for the URL key.

Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
cache.getDeltaLink(URLKey);  
  
}  
Catch (CacheException e){  
  
}
```

initializeCache() method

Syntax

```
public void initializeCache ()
```

mergeEntries(IODataFeed, String) method

Merge APIS are to be invoked after doing a HTTP GET after modification or a set of modifications.

Syntax

```
public void mergeEntries (  
    IODataFeed Feed,  
    String URLKey  
) throws CacheException
```

Parameters

- **Entries** – list of entries which will be merged into server Cache.
- **URLKey** – : Cache returns cached entries for this urlKey.

Exceptions

- **CacheException class** –

Remarks

Merge all the entries provided into the Server cache for the respective urlkey.

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    IODataFeed feed = parser.parseODataFeed(responseEntity,
    collectionID, schema);
    cache.mergeEntries(feed, EntryURL);
}
Catch(CacheException e){
}
```

readDocument(int, String) method

This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.

Syntax

```
public Object readDocument (
    int documentType,
    String URLKey
) throws CacheException
```

Parameters

- **DocumentType** – : will return specified type of document
- **UrlKey** – : will fetch document for specified urlkey.

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
```

```
ICache cache =new Cache(getApplicationContext(),logger);
IODataServiceDocument serviceDocumentObject =
    (IODataServiceDocument)cache.ReadDocument(documentType.ServiceDocum
ent, serviceDocUrl);
IODataSchema metadata =
    (IODataSchema)cache.readDocument(documentType.MetaDocument,
serviceDocUrl);
}
Catch(CacheException e){
}
```

readEntriesFromServer(String, String) method

Syntax

```
protected List< IODataEntry > readEntriesFromServer (
    String urlkey,
    String EntryId
) throws PersistenceException, CacheException
```

readEntriesLocal(String, String) method

Gets the Entries from the Local cache based on the EntityType and the EntryID.

Syntax

```
public List< IODataEntry > readEntriesLocal (
    String entityType,
    String entryID
) throws CacheException
```

Parameters

- **EntityType** – is the type which represents collection in ODATA.
- **EntryId** – get entries based on this entry ID.

Exceptions

- **CacheException class** –

Remarks

The return type will be an array of Entries

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    List<I ODataEntry> entries =
    cache.readEntriesLocal("SomeCollection", "EntryID"); // return all
    entries respective to either of the parameters.
```

```

}
Catch (CacheException e) {
}

```

readEntriesServer(String) method

Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.

Syntax

```

public List< IODataEntry > readEntriesServer (String URLKey)
throws CacheException

```

Parameters

- **urlkey** – :Returns cached entries for this urlKey.

Exceptions

- **CacheException class** –

```

Try{
ILogger logger = new Logger();
ICache cache =new Cache (getApplicationContext(), logger);
List<IODataEntry> entries = cache.readEntriesServer (urlkey);
IODataEntry entry = entries.get(0);
String Name =entry.getPropertyValue("NAME");
}
Catch (CacheException e) {
}

```

serialize(Object) method

Syntax

```

protected byte[] serialize (Object obj) throws IOException

```

setCacheListener(ICacheUpdateListener) method

Sets the listener for any update on Server cache and call backs upon merging Cache.

Syntax

```

public void setCacheListener (ICacheUpdateListener
cacheUpdateListener)

```

Parameters

- **listener** – The listener to be set for call backs upon merge cache.

```
Class CacheupdateListener implements ICacheUpdateListener {
    public void OnCacheUpadte(String URLKEY, List<IODataEntry>
Entries) {
        Log.i("OnCacheUpdate", URLKEY);
    }
}
cacheupdateListener cacheUpdateListener = new
cacheupdateListener();
cache.setCacheListener(cacheUpdateListener);
```

setIsPersistable(boolean) method

This API sets the `isPersistable` property of the cache which is used to check if the cache is implicitly persistable.

Syntax

```
public void setIsPersistable (boolean value) throws
CacheException
```

Parameters

- **value** – this will persist cache in db or In-Memory, Default is in DB Store

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.setIsPersistable(true);
}
Catch(CacheException e){
}
```

storeDocument(Object, int, String) method

This API Caches the service document or the meta data document depending on the DocumentType and against specified URLKey.

Syntax

```
public void storeDocument (
    Object Document,
    int documentType,
    String URLKey
) throws CacheException
```

Parameters

- **document** – : will return the delta token/delta link for the URL key.
- **documentType** – specify the type of document to be cached.
- **urlKey** – Cache against this urlKey

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.storeDocument(serviceDocumentObject,
    documentType.ServiceDocument, serviceDocUrl);
}
Catch(CacheException e){
}
```

updateEntry(IODataEntry) method

This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

Syntax

```
public void updateEntry (IODataEntry entry) throws CacheException
```

Parameters

- **Entry** – will be marked as 'Updated' in Local cache.

Exceptions

- **CacheException class** –

```

Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.updateEntry(OdataEntries, URLKEY);
}
Catch(CacheException e){
}
    
```

CacheException class

This Class represents the exception thrown by the SMP REST library.

Package

com.sap.mobile.lib.cache

Syntax

```
public class CacheException
```

Members

All members of CacheException, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	ANY_INPUT_FIELD_NULL	Any of the input fields passed is null.
public static final int	APPLICATION_USER_ALREADY_REGISTERED	Attempt to register an application user which is already registered.
public static final int	APPLICATION_USER_NOT_REGISTERED	Attempt to delete the user which has not been registered.
public static final int	REGISTRATION_FAILED_UNKNOWN_ERROR	User registration timed out.

Modifier and Type	Variable	Description
public static final int	CacheGenericErrorCode	Asynchronous user registration listener not registered with UserManager.
public static final int	SUP_INTERNAL_PARSING_ERROR	SUP Internal Parsing Error.
public static final int	EMPTY_RESPONSE_FROM_SERVER	Empty response string received from server.
public static final int	SINGLETON_INITIALIZATION_FAILED	singleton Initialization failed
public static final int	UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS	Update Settings consists of one or more read only fields.
public static final int	APPLICATION_ID_NULL	Application is not initialized.
public static final int	JSON_PARSING_FAILED	Internal error, JSON parsing has failed.
public static final int	INVALID_MODULE_ID	Invalid module handle ID.
public static final int	CAPTCHA_LISTENER_NULL	Captcha listener is null.
public static final int	CLASS_INITIALIZATION_FAILED	Class initialization failed.
public static final int	E2E_NOT_STARTED	E2E Not started.
public static final int	BTX_UPLOAD_ERROR	E2E BTX upload error.
public static final int	HTTP_ERROR	HTTP error.
public static final int	PARSE_ERROR	Parse error.
public static final int	NETWORK_ERROR	Network error: Obtained when the URL is unreachable. Check AndroidManifest.xml if it has proper permissions.
public static final int	AUTHENTICATION_ERROR	Error while authenticating user.

Constructors

Modifier and Type	Constructor	Description
public	<i>CacheException(int)</i> on page 50	Constructs a SMPEException with specified error code.
public	<i>CacheException(int, String)</i> on page 50	Constructs a SMPEException with specified error code and error message.
public	<i>CacheException(String)</i> on page 51	Constructs a SMPEException with specified error message.

Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 51	Returns the error code of this SMPEException.
public String	<i>toString()</i> on page 51	Returns the complete error description of this SMPEException.

CacheException(int) constructor

Constructs a SMPEException with specified error code.

Syntax

```
public CacheException (int errorCode)
```

Parameters

- **errorCode** –

CacheException(int, String) constructor

Constructs a SMPEException with specified error code and error message.

Syntax

```
public CacheException (
    int errorCode,
    String message
)
```

Parameters

- **errorCode** –
- **message** – - error message

CacheException(String) constructor

Constructs a SMPEException with specified error message.

Syntax

```
public CacheException (String message)
```

Parameters

- **message** – - error message

getErrorCode() method

Returns the error code of this SMPEException.

Syntax

```
public int getErrorCode ()
```

toString() method

Returns the complete error description of this SMPEException.

Syntax

```
public String toString ()
```

ANY_INPUT_FIELD_NULL variable

Any of the input fields passed is null.

Syntax

```
public static final int ANY_INPUT_FIELD_NULL
```

APPLICATION_ID_NULL variable

Application is not initialized.

Syntax

```
public static final int APPLICATION_ID_NULL
```

APPLICATION_USER_ALREADY_REGISTERED variable

Attempt to register an application user which is already registered.

Syntax

```
public static final int APPLICATION_USER_ALREADY_REGISTERED
```

APPLICATION_USER_NOT_REGISTERED variable

Attempt to delete the user which has not been registered.

Syntax

```
public static final int APPLICATION_USER_NOT_REGISTERED
```

AUTHENTICATION_ERROR variable

Error while authenticating user.

Syntax

```
public static final int AUTHENTICATION_ERROR
```

BTX_UPLOAD_ERROR variable

E2E BTX upload error.

Syntax

```
public static final int BTX_UPLOAD_ERROR
```

CacheGenericErrorCode variable

Asynchronous user registration listener not registered with UserManager.

Syntax

```
public static final int CacheGenericErrorCode
```

CAPTCHA_LISTENER_NULL variable

Captcha listener is null.

Syntax

```
public static final int CAPTCHA_LISTENER_NULL
```

CLASS_INITIALIZATION_FAILED variable

Class initialization failed.

Syntax

```
public static final int CLASS_INITIALIZATION_FAILED
```

E2E_NOT_STARTED variable

E2E Not started.

Syntax

```
public static final int E2E_NOT_STARTED
```

EMPTY_RESPONSE_FROM_SERVER variable

Empty response string received from server.

Syntax

```
public static final int EMPTY_RESPONSE_FROM_SERVER
```

HTTP_ERROR variable

HTTP error.

Syntax

```
public static final int HTTP_ERROR
```

INVALID_MODULE_ID variable

Invalid module handle ID.

Syntax

```
public static final int INVALID_MODULE_ID
```

JSON_PARSING_FAILED variable

Internal error, JSON parsing has failed.

Syntax

```
public static final int JSON_PARSING_FAILED
```

NETWORK_ERROR variable

Network error: Obtained when the URL is unreachable.

Syntax

```
public static final int NETWORK_ERROR
```

Remarks

Check AndroidManifest.xml if it has proper permissions.

PARSE_ERROR variable

Parse error.

Syntax

```
public static final int PARSE_ERROR
```

REGISTRATION_FAILED_UNKNOWN_ERROR variable

User registration timed out.

Syntax

```
public static final int REGISTRATION_FAILED_UNKNOWN_ERROR
```

SINGLETON_INITIALIZATION_FAILED variable

singleton Initialization failed

Syntax

```
public static final int SINGLETON_INITIALIZATION_FAILED
```

SUP_INTERNAL_PARSING_ERROR variable

SUP Internal Parsing Error.

Syntax

```
public static final int SUP_INTERNAL_PARSING_ERROR
```

UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS variable

Update Settings consists of one or more read only fields.

Syntax

```
public static final int  
UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS
```

CacheUpdateListener class

Consists of the list of Cache class listeners.

Package

```
com.sap.mobile.lib.cache
```

Syntax

```
public class CacheUpdateListener
```

Members

All members of CacheUpdateListener, including inherited members. **Nested interfaces**

Modifier and Type	Interface	Description
publicinterface	<i>ICacheUpdateListener</i> on page 55	Interface to get the any updates on Server Cache.

CacheUpdateListener.ICacheUpdateListener interface

Interface to get the any updates on Server Cache.

Package

```
com.sap.mobile.lib.cache.CacheUpdateListener
```

Syntax

```
public interface ICacheUpdateListener
```

Members

All members of ICacheUpdateListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>OnCacheUpdate(String, List< IODataEntry >)</i> on page 55	Call back method upon update on Server cache after Merge Cache.

OnCacheUpdate(String, List< IODataEntry >) method

Call back method upon update on Server cache after Merge Cache.

Syntax

```
public void OnCacheUpdate (
    String URLKEY,
    List< IODataEntry > Entries
)
```

Parameters

- **URLKEY** – Call back for the respective URLKey on which the merge was initiated.
- **Entries** – This returns null,(Required for future references)

```
Class CacheupdateListener implements ICacheUpdateListener {
    public void OnCacheUpadte(String URLKEY, List<IODataEntry>
Entries) {
        Log.i("OnCacheUpdate", URLKEY);
    }
}
cacheupdateListener cacheUpdateListener = new
cacheupdateListener();
cache.setCacheListener(cacheUpdateListener);
```

ICache interface

Interface implemented by Cache class containing related methods.

Package

```
com.sap.mobile.lib.cache
```

Syntax

```
public interface ICache
```

Derived classes

- *Cache* on page 36

Members

All members of ICache, including inherited members. **Nested classes**

Modifier and Type	Class	Description
public class	<i>DocumentType</i> on page 58	Document Format type for caching.

Methods

Modifier and Type	Method	Description
public String	<i>addEntry(IODataEntry)</i> on page 58	A new cache entry will be added into the local Cache using this particular method.
public void	<i>clearCache(String)</i> on page 59	This API will clear entries for the URLkey passed from all the cache except the Local cache.
public void	<i>clearLocalEntry(String)</i> on page 59	This API will clear entry from Local Cache.
public void	<i>deleteEntry(String)</i> on page 60	This API will delete cache entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.
public String	<i>getDeltaLink(String)</i> on page 61	This should return the delta token/delta link for the URL key passed.

Modifier and Type	Method	Description
public void	<i>initializeCache()</i> on page 61	
public void	<i>mergeEntries(IODataFeed, String)</i> on page 61	Merge APIs are to be invoked after doing a HTTP GET after modification or a set of modifications.
public Object	<i>readDocument(int, String)</i> on page 62	This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.
public List< IODataEntry >	<i>readEntriesLocal(String, String)</i> on page 63	Gets the Entries from the Local cache based on the EntityType and the EntryID.
public List< IODataEntry >	<i>readEntriesServer(String)</i> on page 63	Returns an array of ODataEntry Objects stored for the given URL key in the server Cache. The return type will be an array of Entries.
public void	<i>setCacheListener(ICacheUpdateListener)</i> on page 64	Sets the listener for any update on Server cache and call backs upon merging Cache.
public void	<i>setIsPersistable(boolean)</i> on page 65	This API sets the isPersistable property of the cache which is used to check if the cache is implicitly persistable.
public void	<i>storeDocument(Object, int, String)</i> on page 65	This API Caches the service document or the meta data document depending on the DocumentType and against specified URLKey.
public void	<i>updateEntry(IODataEntry)</i> on page 66	This API will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

ICache.DocumentType class
Document Format type for caching.

Package

```
com.sap.mobile.lib.cache.ICache
```

Syntax

```
public class DocumentType
```

Members

All members of DocumentType, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	ServiceDocument	
public static final int	MetaDocument	

MetaDocument variable

Syntax

```
public static final int MetaDocument
```

ServiceDocument variable

Syntax

```
public static final int ServiceDocument
```

addEntry(IODataEntry) method

A new cache entry will be added into the local Cache using this particular method.

Syntax

```
public String addEntry (IODataEntry entry) throws CacheException
```

Parameters

- **Entry** – object which is built for a new HTTP POST.

Exceptions

- **CacheException** class –

Remarks

This method will be mostly called when the application is trying to create entries in the backend via a HTTP POST.

```

Try{
//Fire a HTTP POST
IODataEntry entry = buildPostEntry();
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
String generated_id =cache.addEntry(entry);
PerformPostrequest(entry)//Fire HTTP POST request
}
Catch(CacheException e){
}. public void onSuccess(I Request arg0, I Response aResponse) {

ClearLocalEntry(generated_id)//on success of POST
request ,application developer clears this entry after all the Cache
instances related to this entry (filter/query all matching) are
updated from the server
}
}

```

clearCache(String) method

This API will clear entries for the URLKey passed from all the cache except the Local cache.

Syntax

```
public void clearCache (String URLKey) throws CacheException
```

Parameters

- **URLKey** – : will clear cache for the URL key specified.

Exceptions

- **CacheException class** –

```

Try{

ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
cache.clearCache(URLKey);

}
Catch(CacheException e){
}
}

```

clearLocalEntry(String) method

This API will clear entry from Local Cache.

Syntax

```
public void clearLocalEntry (String entryID) throws CacheException
```

Parameters

- **EntryID** – from server Cache will marked as 'Deleted' and will be added in Local Cache

Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
cache.ClearLocalEntry(EntryID);  
  
}  
Catch(CacheException e){  
}
```

deleteEntry(String) method

This API is will cache Entry associated with HTTP DELETE which deletes the existing resource of a collection this entry will be marked as 'Deleted' in Local Cache.

Syntax

```
public void deleteEntry (String entryID) throws CacheException
```

Parameters

- **EntryID** – from server Cache will marked as 'Deleted' and will be added in Local Cache

Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(), logger);  
cache.deleteEntry(EntryID);  
  
}  
Catch(CacheException e){  
}
```

getDeltaLink(String) method

This should return the delta token/delta link for the URL key passed.

Syntax

```
public String getDeltaLink (String URLKey) throws CacheException
```

Parameters

- **URLKey** – : will return the delta token/delta link for the URL key.

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    cache.getDeltaLink(URLKey);
}
Catch(CacheException e){
}
```

*initializeCache() method**Syntax*

```
public void initializeCache ()
```

mergeEntries(IODataFeed, String) method

Merge APIS are to be invoked after doing a HTTP GET after modification or a set of modifications.

Syntax

```
public void mergeEntries (
    IODataFeed Feed,
    String URLKey
) throws CacheException
```

Parameters

- **Entries** – list of entries which will be merged into server Cache.
- **URLKey** – : Cache returns cached entries for this urlKey.

Exceptions

- **CacheException class** –

Remarks

Merge all the entries provided into the Server cache for the respective urlkey.

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    IODataFeed feed = parser.parseODataFeed(responseEntity,
collectionID, schema);
    cache.mergeEntries(feed, EntryURL);
}
Catch(CacheException e){
}
```

readDocument(int, String) method

This API returns the service document or the meta data document depending on the DocumentType and for the specified URLKey.

Syntax

```
public Object readDocument (
    int documentType,
    String URLKey
) throws CacheException
```

Parameters

- **ICache.DocumentType class** – : will return specified type of document
- **UrlKey** – : will fetch document for specified urlkey.

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    IODataServiceDocument serviceDocumentObject =
    (IODataServiceDocument) cache.ReadDocument (documentType.ServiceDocum
ent, serviceDocUrl);
    IODataSchema metadata =
    (IODataSchema) cache.readDocument (documentType.MetaDocument,
```

```

serviceDocUrl);
}
Catch(CacheException e){
}

```

readEntriesLocal(String, String) method

Gets the Entries from the Local cache based on the EntityType and the EntryID.

Syntax

```

public List< IODataEntry > readEntriesLocal (
    String entityType,
    String entryID
) throws CacheException

```

Parameters

- **EntityType** – is the type which represents collection in ODATA.
- **EntryId** – get entries based on this entry ID.

Exceptions

- **CacheException class** –

Remarks

The return type will be an array of Entries

```

Try{
ILogger logger = new Logger();
ICache cache =new Cache(getApplicationContext(),logger);
List<IODataEntry> entries =
cache.readEntriesLocal("SomeCollection", "EntryID"); // return all
entries respective to either of the parameters.
}
Catch(CacheException e){
}

```

readEntriesServer(String) method

Returns an array of ODataEntry Objects stored for the given URL key in the server Cache The return type will be an array of Entries.

Syntax

```

public List< IODataEntry > readEntriesServer (String URLKey)
throws CacheException

```

Parameters

- **urlkey** – :Returns cached entries for this urlKey.

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(),logger);
    List<IODataEntry> entries = cache.readEntriesServer(urlkey);
    IODataEntry entry = entries.get(0);
    String Name =entry.getPropertyValue("NAME");
}
Catch(CacheException e){
}
```

setCacheListener(ICacheUpdateListener) method

Sets the listener for any update on Server cache and call backs upon merging Cache.

Syntax

```
public void setCacheListener (ICacheUpdateListener
cacheUpdateListener)
```

Parameters

- **listener** – The listener to be set for call backs upon merge cache.

```
Class CacheupdateListener implements ICacheUpdateListener {
    public void OnCacheUpadte(String URLKEY, List<IODataEntry>
Entries) {
        Log.i("OnCacheUpdate", URLKEY);
    }
}
    cacheupdateListener cacheUpdateListener = new
cacheupdateListener();
cache.setCacheListener(cacheUpdateListener);
```

setIsPersistable(boolean) method

This API sets the `isPersistable` property of the cache which is used to check if the cache is implicitly persistable.

Syntax

```
public void setIsPersistable (boolean value) throws
CacheException
```

Parameters

- **value** – this will persist cache in db or In-Memory, Default is in DB Store

Exceptions

- **CacheException class** –

```
Try{
    ILogger logger = new Logger();
    ICache cache =new Cache(getApplicationContext(), logger);
    cache.setIsPersistable(true);
}
Catch (CacheException e){
}
```

storeDocument(Object, int, String) method

This API Caches the service document or the meta data document depending on the `DocumentType` and against specified `URLKey`.

Syntax

```
public void storeDocument (
    Object Document,
    int documentType,
    String URLKey
) throws CacheException
```

Parameters

- **document** – : will return the delta token/delta link for the URL key.
- **documentType** – specify the type of document to be cached.
- **urlKey** – Cache against this urlKey

Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
cache.storeDocument(serviceDocumentObject,  
documentType.ServiceDocument, serviceDocUrl);  
  
}  
Catch(CacheException e){  
}
```

updateEntry(IODataEntry) method

This API is will cache Entry associated with HTTP PUT which modifies the existing resource of a collection this entry will be marked as 'Updated' in Local Cache.

Syntax

```
public void updateEntry (IODataEntry entry) throws CacheException
```

Parameters

- **Entry** – will be marked as 'Updated' in Local cache.

Exceptions

- **CacheException class** –

```
Try{  
  
ILogger logger = new Logger();  
ICache cache =new Cache(getApplicationContext(),logger);  
cache.updateEntry(OdataEntries, URLKEY);  
  
}  
Catch(CacheException e){  
}
```

configuration package

Preferences class

Consists of the methods used to set the HTTP Parameters used for connection with the backend.

Package

```
com.sap.mobile.lib.configuration
```

Syntax

```
public class Preferences implements IPreferences, Constants
```

Implemented interfaces

- *IPreferences* on page 85
- *Constants* on page 79

Members

All members of Preferences, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static final String	PREFERENCES	
public static String	DEFAULT_PERSISTENCE_STRING_SUBFOLDER_NAME	Default subfolder for Persistence.
public static String	DEFAULT_PARSER_STRING_SUBFOLDER_NAME	Default subfolder for Parser.
protected Hashtable< String, Set< IPreferenceChangeListener >>	preferenceChangeListeners	Listeners for Preference changes.
protected Hashtable< String, Object >	defaultPreferences	Store for default Preferences.
protected ILogger	logger	
protected int	logLevel	

Constructors

Modifier and Type	Constructor	Description
public	<i>Preferences</i> (Context, ILogger) on page 69	

Methods

Modifier and Type	Method	Description
protected void	<i>addDefaultPreferences()</i> on page 69	Can be used to add application specific default preferences.
protected Object	<i>confirmPreference(String)</i> on page 70	Validates changed preference if it can be changed.
public boolean	<i>containsPreference(String)</i> on page 70	Checks the existence of the given preference.
public Map< String,?>	<i>getAllPreferences()</i> on page 70	
public Boolean	<i>getBooleanPreference(String)</i> on page 70	Returns the value of the given preference or null if there is no preference with the given key.
public Context	<i>getContext()</i> on page 71	Returns the context.
public Float	<i>getFloatPreference(String)</i> on page 71	Returns the value of the given preference or null if there is no preference with the given key.
public Integer	<i>getIntPreference(String)</i> on page 71	Returns the value of the given preference or null if there is no preference with the given key.
public Long	<i>getLongPreference(String)</i> on page 72	Returns the value of the given preference or null if there is no preference with the given key.
public String	<i>getStringPreference(String)</i> on page 72	Returns the value of the given preference or null if there is no preference with the given key.
public void	<i>onSharedPreference-Changed(SharedPreferences, final String)</i> on page 73	
public synchronized void	<i>registerPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 73	You can register a class implementing the IPreferenceChangeListener interface for the change of a preference with the given key.
public void	<i>removePreference(String)</i> on page 73	Removes the preferences with the given key.

Modifier and Type	Method	Description
public void	<i>resetPreference(String)</i> on page 74	Resets the preference's value to its default value or to null if there is no default value for the given preference.
public void	<i>setBooleanPreference(String, boolean)</i> on page 74	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setFloatPreference(String, float)</i> on page 74	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setIntPreference(String, int)</i> on page 75	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setLongPreference(String, long)</i> on page 75	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setStringPreference(String, String)</i> on page 75	Sets and validates and persists the value of the preferences with the given type.
public synchronized void	<i>unRegisterPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 76	You can unregister a change listener.

Preferences(Context, ILogger) constructor

Syntax

```
public Preferences (
    Context context,
    ILogger logger
)
```

addDefaultPreferences() method

Can be used to add application specific default preferences.

Syntax

```
protected void addDefaultPreferences ()
```

confirmPreference(String) method

Validates changed preference if it can be changed.

Syntax

```
protected Object confirmPreference (String key)
```

Parameters

- **key** – The key of the preferences

Returns

The changed value

containsPreference(String) method

Checks the existence of the given preference.

Syntax

```
public boolean containsPreference (String key)
```

Parameters

- **key** – The key of the preference

Returns

true if Preference contains the given key or false otherwise

getAllPreferences() method

Syntax

```
public Map< String, ?> getAllPreferences () throws  
PreferencesException
```

getBooleanPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Boolean getBooleanPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the boolean type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getContext() method

Returns the context.

Syntax

```
public Context getContext ()
```

getFloatPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Float getFloatPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the float type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getIntPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Integer getIntPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the integer type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getLongPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Long getLongPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the long type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getStringPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public String getStringPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the String type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

*onSharedPreferenceChanged(SharedPreferences, final String) method**Syntax*

```
public void onSharedPreferenceChanged (
    SharedPreferences sharedPreferences,
    final String key
)
```

registerPreferenceChangeListener(String, IPreferenceChangeListener) method

You can register a class implementing the IPreferenceChangeListener interface for the change of a preference with the given key.

Syntax

```
public synchronized void registerPreferenceChangeListener (
    String key,
    IPreferenceChangeListener changeListener
)
```

Parameters

- **key** – key of the preference
- **changeListener** – listener object to be registered

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

If any of the arguments are null, an IllegalArgumentException is thrown.

removePreference(String) method

Removes the preferences with the given key.

Syntax

```
public void removePreference (String key) throws
    PreferencesException
```

Parameters

- **key** – The key of the preference

Exceptions

- **PreferencesException class** – If the preference does not exist or it cannot be removed (e.g. a preference)

Remarks

Also notifies the listeners with null value.

resetPreference(String) method

Resets the preference's value to it's default value or to null if there is no default value for the given preference.

Syntax

```
public void resetPreference (String key)
```

Parameters

- **key** – The key of the preference

setBooleanPreference(String, boolean) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setBooleanPreference (
    String key,
    boolean value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setFloatPreference(String, float) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setFloatPreference (
    String key,
    float value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setIntPreference(String, int) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setIntPreference (
    String key,
    int value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setLongPreference(String, long) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setLongPreference (
    String key,
    long value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setStringPreference(String, String) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setStringPreference (
    String key,
```

```
String value  
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

unRegisterPreferenceChangeListener(String, IPreferenceChangeListener) method

You can unregister a change listener.

Syntax

```
public synchronized void unRegisterPreferenceChangeListener (  
    String key,  
    IPreferenceChangeListener changeListener  
)
```

Parameters

- **key** – key of the preference
- **changeListener** – listener object to be unregistered

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

If any of the arguments are null, an `IllegalArgumentException` is thrown.

DEFAULT_PARSER_STRING_SUBFOLDER_NAME variable

Default subfolder for Parser.

Syntax

```
public static String DEFAULT_PARSER_STRING_SUBFOLDER_NAME
```

DEFAULT_PERSISTENCE_STRING_SUBFOLDER_NAME variable

Default subfolder for Persistence.

Syntax

```
public static String DEFAULT_PERSISTENCE_STRING_SUBFOLDER_NAME
```

defaultPreferences variable

Store for default Preferences.

Syntax

```
protected Hashtable< String, Object > defaultPreferences
```

*logger variable**Syntax*

```
protected ILogger logger
```

*logLevel variable**Syntax*

```
protected int logLevel
```

preferenceChangeListeners variable

Listeners for Preference changes.

Syntax

```
protected Hashtable< String, Set< IPreferenceChangeListener > > preferenceChangeListeners
```

*PREFERENCES variable**Syntax*

```
protected static final String PREFERENCES
```

PreferencesException class

PreferencesException is used in Request Library.

Package

```
com.sap.mobile.lib.configuration
```

Syntax

```
public class PreferencesException
```

Members

All members of PreferencesException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>PreferencesException()</i> on page 78	
public	<i>PreferencesException(int, String)</i> on page 78	
public	<i>PreferencesException(int, String, Throwable)</i> on page 78	
public	<i>PreferencesException(String)</i> on page 79	
public	<i>PreferencesException(String, Throwable)</i> on page 79	
public	<i>PreferencesException(Throwable)</i> on page 79	

Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 79	

PreferencesException() constructor**Syntax**

```
public PreferencesException ()
```

PreferencesException(int, String) constructor**Syntax**

```
public PreferencesException (
    int iErrorCode,
    String detailMessage
)
```

PreferencesException(int, String, Throwable) constructor**Syntax**

```
public PreferencesException (
    int iErrorCode,
    String detailMessage,
    Throwable throwable
)
```

*PreferencesException(String) constructor**Syntax*

```
public PreferencesException (String detailMessage)
```

*PreferencesException(String, Throwable) constructor**Syntax*

```
public PreferencesException (
    String detailMessage,
    Throwable throwable
)
```

*PreferencesException(Throwable) constructor**Syntax*

```
public PreferencesException (Throwable throwable)
```

*getErrorCode() method**Syntax*

```
public int getErrorCode ()
```

Constants interface

Consists of Request constants.

Package

```
com.sap.mobile.lib.configuration
```

Syntax

```
public interface Constants
```

Derived classes

- *Preferences* on page 67

Members

All members of Constants, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	SHARED_PREFERENCES	Shared preferences.

Modifier and Type	Variable	Description
public static final int	DEFAULT_CONNECTION_TIMEOUT	Default connection timeout.
public static final int	DEFAULT_SOCKET_CONNECTION_TIMEOUT	Default socket connection timeout.
public static final int	DEFAULT_HTTP_PORT	Default HTTP port.
public static final int	DEFAULT_HTTPS_PORT	Default HTTPS port.
public static final String	DEFAULT_SAP_APPLICATIONID_HEADER_VALUE	Default application ID.
public static final String	DEFAULT_PROXY_HOST	Default proxy host.
public static final int	DEFAULT_PROXY_PORT	Default proxy port.
public static final String	HTTP_HANDLER_CLASS	Socket Connection handler class.
public static final String	IMO_HANDLER_CLASS	IMO Connection handler class.
public static final String	DEFAULT_HANDLER_CLASS_NAME	Default handler class.
public static final boolean	DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE	Default security mode.
public static final int	DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE	Default buffer size.
public static final int	MIN_PERSISTENCE_BYTE_BUFFER_SIZE	Minimum buffer size.
public static final int	MAX_PERSISTENCE_BYTE_BUFFER_SIZE	Maximum buffer size.
public static final String	DEFAULT_CIPHER_TRANSFORMATION	Default cipher transformation.
public static final int	DEFAULT_STORE_CAPACITY	Default cache capacity.

Modifier and Type	Variable	Description
public static final int	MAXIMUM_STORE_CAPACITY	Maximum cache capacity.
public static final int	DEFAULT_SEARCH_LIMIT	Default for maximum search results retrieved from cache.
public static final int	DEFAULT_LOG_LEVEL	Default log level.
public static final boolean	DEFAULT_SAPPASSPORT_ENABLED	SAP Passport enablement default setting.
public static final boolean	DEFAULT_BUSINESS_TRANSACTION_ENABLED	SAP Business Transaction XML enablement default setting.

DEFAULT_BUSINESS_TRANSACTION_ENABLED variable
SAP Business Transaction XML enablement default setting.

Syntax

```
public static final boolean DEFAULT_BUSINESS_TRANSACTION_ENABLED
```

DEFAULT_CIPHER_TRANSFORMATION variable
Default cipher transformation.

Syntax

```
public static final String DEFAULT_CIPHER_TRANSFORMATION
```

DEFAULT_CONNECTION_TIMEOUT variable
Default connection timeout.

Syntax

```
public static final int DEFAULT_CONNECTION_TIMEOUT
```

DEFAULT_HANDLER_CLASS_NAME variable
Default handler class.

Syntax

```
public static final String DEFAULT_HANDLER_CLASS_NAME
```

DEFAULT_HTTP_PORT variable

Default HTTP port.

Syntax

```
public static final int DEFAULT_HTTP_PORT
```

DEFAULT_HTTPS_PORT variable

Default HTTPS port.

Syntax

```
public static final int DEFAULT_HTTPS_PORT
```

DEFAULT_LOG_LEVEL variable

Default log level.

Syntax

```
public static final int DEFAULT_LOG_LEVEL
```

DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE variable

Default security mode.

Syntax

```
public static final boolean  
DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE
```

DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE variable

Default buffer size.

Syntax

```
public static final int DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE
```

DEFAULT_PROXY_HOST variable

Default proxy host.

Syntax

```
public static final String DEFAULT_PROXY_HOST
```

DEFAULT_PROXY_PORT variable

Default proxy port.

Syntax

```
public static final int DEFAULT_PROXY_PORT
```

DEFAULT_SAP_APPLICATIONID_HEADER_VALUE variable

Default application ID.

Syntax

```
public static final String
DEFAULT_SAP_APPLICATIONID_HEADER_VALUE
```

DEFAULT_SAPPASSPORT_ENABLED variable

SAP Passport enablement default setting.

Syntax

```
public static final boolean DEFAULT_SAPPASSPORT_ENABLED
```

DEFAULT_SEARCH_LIMIT variable

Default for maximum search results retrieved from cache.

Syntax

```
public static final int DEFAULT_SEARCH_LIMIT
```

DEFAULT_SOCKET_CONNECTION_TIMEOUT variable

Default socket connection timeout.

Syntax

```
public static final int DEFAULT_SOCKET_CONNECTION_TIMEOUT
```

DEFAULT_STORE_CAPACITY variable

Default cache capacity.

Syntax

```
public static final int DEFAULT_STORE_CAPACITY
```

HTTP_HANDLER_CLASS variable

Socket Connection handler class.

Syntax

```
public static final String HTTP_HANDLER_CLASS
```

IMO_HANDLER_CLASS variable

IMO Connection handler class.

Syntax

```
public static final String IMO_HANDLER_CLASS
```

MAX_PERSISTENCE_BYTE_BUFFER_SIZE variable

Maximum buffer size.

Syntax

```
public static final int MAX_PERSISTENCE_BYTE_BUFFER_SIZE
```

MAXIMUM_STORE_CAPACITY variable

Maximum cache capacity.

Syntax

```
public static final int MAXIMUM_STORE_CAPACITY
```

MIN_PERSISTENCE_BYTE_BUFFER_SIZE variable

Minimum buffer size.

Syntax

```
public static final int MIN_PERSISTENCE_BYTE_BUFFER_SIZE
```

SHARED_PREFERENCES variable

Shared preferences.

Syntax

```
public static final String SHARED_PREFERENCES
```

IPreferenceChangeListener interface

Interface for classes that are to listen changes of preferences.

Package

```
com.sap.mobile.lib.configuration
```

Syntax

```
public interface IPreferenceChangeListener
```

Derived classes

- *RequestManager* on page 633

Members

All members of `IPreferenceChangeListener`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onPreferenceChanged</i> (String, Object) on page 85	Callback method for preference change event.

onPreferenceChanged(String, Object) method

Callback method for preference change event.

Syntax

```
public void onPreferenceChanged (
    String key,
    Object value
)
```

Parameters

- **key** – key of the preference
- **value** – value of the preference

```
public class Activity implements IPreferenceChangeListener{ ....@override public void
onPreferenceChanged(String key, Object value) { Logger.d(TAG,"Got preference change
notification: " + key + " to value " + value + ""); } ...}
```

IPreferences interface

Main interface for Configuration.

Package

```
com.sap.mobile.lib.configuration
```

Syntax

```
public interface IPreferences
```

Derived classes

- *Preferences* on page 67

Members

All members of IPreferences, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	CONNECTIVITY_CONNTIMEOUT	Preference for connection time out.
public static final String	CONNECTIVITY_SCONNECTIONTIMEOUT	Preference for socket connection time out.

Modifier and Type	Variable	Description
public static final String	CONNECTIVITY_HTTP_PORT	Preference for default HTTP port.
public static final String	CONNECTIVITY_HTTPS_PORT	Preference for default HTTPS port.
public static final String	SAP_APPLICATION_ID_HEADER_VALUE	Preference for application ID (used in request headers)
public static final String	CONNECTIVITY_PROXY_HOST	Preference for proxy host if there is a proxy should be used.
public static final String	CONNECTIVITY_PROXY_PORT	Preference for proxy port if there is a proxy should be used.
public static final String	CONNECTIVITY_HANDLER_CLASS_NAME	Preference for full name (including package) of the class that should be initialized as connectivity handler.
public static final String	PARSER_FOLDER_PATH	Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.
public static final String	PERSISTENCE_FOLDER_PATH	Preference for the default folder where data should be persisted.
public static final String	PERSISTENCE_SECURE_MODE	Preference for indicator if persisted data should be encrypted.
public static final String	PERSISTENCE_BYTE_BUFFER_SIZE	Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.
public static final String	PERSISTENCE_CIPHER_TRANSFORMATION	Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.

Modifier and Type	Variable	Description
public static final String	CACHE_CAPACITY	Preference for the maximum number of documents can be stored in cache.
public static final String	CACHE_MAX_SEARCH_RESULTS	Preference for the maximum entries that can be returned as a result of a search.
public static final String	CACHE_SEARCH_ATTRIBUTE_XMLNS	Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.
public static final String	CACHE_PARSER_SEARCH_ATTRIBUTE	Preference for the name of the XML attribute that should be used to decide if a property is searchable.
public static final String	LOG_LEVEL	Preference for the current log severity.
public static final String	SAPPASSPORT_ENABLED	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	BUSINESSTRANSACTION_ENABLED	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	BYPASS_PROXY	Preference for the indicator to decide which URLs need the proxy bypassed.

Methods

Modifier and Type	Method	Description
public boolean	<i>containsPreference(String)</i> on page 89	Checks the existence of the given preference.
public Map< String, ?>	<i>getAllPreferences()</i> on page 89	
public Boolean	<i>getBooleanPreference(String)</i> on page 89	Returns the value of the given preference or null if there is no preference with the given key.

Modifier and Type	Method	Description
public Context	<i>getContext()</i> on page 90	Returns the context.
public Float	<i>getFloatPreference(String)</i> on page 90	Returns the value of the given preference or null if there is no preference with the given key.
public Integer	<i>getIntPreference(String)</i> on page 90	Returns the value of the given preference or null if there is no preference with the given key.
public Long	<i>getLongPreference(String)</i> on page 91	Returns the value of the given preference or null if there is no preference with the given key.
public String	<i>getStringPreference(String)</i> on page 91	Returns the value of the given preference or null if there is no preference with the given key.
public void	<i>registerPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 92	You can register a class implementing the <code>IPreferenceChangeListener</code> interface for the change of a preference with the given key.
public void	<i>removePreference(String)</i> on page 92	Removes the preferences with the given key.
public void	<i>resetPreference(String)</i> on page 93	Resets the preference's value to its default value or to null if there is no default value for the given preference.
public void	<i>setBooleanPreference(String, boolean)</i> on page 93	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setFloatPreference(String, float)</i> on page 93	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setIntPreference(String, int)</i> on page 94	Sets and validates and persists the value of the preferences with the given type.

Modifier and Type	Method	Description
public void	<i>setLongPreference(String, long)</i> on page 94	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setStringPreference(String, String)</i> on page 94	Sets and validates and persists the value of the preferences with the given type.
public void	<i>unRegisterPreferenceChangeListener(String, IPreferenceChangeListener)</i> on page 95	You can unregister a change listener.

containsPreference(String) method

Checks the existence of the given preference.

Syntax

```
public boolean containsPreference (String key)
```

Parameters

- **key** – The key of the preference

Returns

true if Preference contains the given key or false otherwise

getAllPreferences() method***Syntax***

```
public Map< String, ?> getAllPreferences () throws  
PreferencesException
```

getBooleanPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Boolean getBooleanPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the boolean type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getContext() method

Returns the context.

Syntax

```
public Context getContext ()
```

getFloatPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Float getFloatPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the float type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getIntPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Integer getIntPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the integer type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getLongPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Long getLongPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the long type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

getStringPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public String getStringPreference (String key) throws  
PreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the String type preference with the given key

Exceptions

- **PreferencesException class** – if preference exists with the given key but with value of different type

registerPreferenceChangeListener(String, IPreferenceChangeListener) method

You can register a class implementing the `IPreferenceChangeListener` interface for the change of a preference with the given key.

Syntax

```
public void registerPreferenceChangeListener (
    String key,
    IPreferenceChangeListener changeListener
)
```

Parameters

- **key** – key of the preference
- **changeListener** – listener object to be registered

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

If any of the arguments are null, an `IllegalArgumentException` is thrown.

removePreference(String) method

Removes the preferences with the given key.

Syntax

```
public void removePreference (String key) throws
    PreferencesException
```

Parameters

- **key** – The key of the preference

Exceptions

- **PreferencesException class** – If the preference does not exist or it cannot be removed (e.g. a preference)

Remarks

Also notifies the listeners with null value.

resetPreference(String) method

Resets the preference's value to it's default value or to null if there is no default value for the given preference.

Syntax

```
public void resetPreference (String key)
```

Parameters

- **key** – The key of the preference

setBooleanPreference(String, boolean) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setBooleanPreference (
    String key,
    boolean value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setFloatPreference(String, float) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setFloatPreference (
    String key,
    float value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setIntPreference(String, int) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setIntPreference (
    String key,
    int value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setLongPreference(String, long) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setLongPreference (
    String key,
    long value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

setStringPreference(String, String) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setStringPreference (
    String key,
```

```
String value
) throws PreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **PreferencesException class** – if the new value of the preference is invalid for any reasons

unRegisterPreferenceChangeListener(String, IPreferenceChangeListener) method

You can unregister a change listener.

Syntax

```
public void unRegisterPreferenceChangeListener (
    String key,
    IPreferenceChangeListener changeListener
)
```

Parameters

- **key** – key of the preference
- **changeListener** – listener object to be unregistered

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

If any of the arguments are null, an IllegalArgumentException is thrown.

BUSINESSTRANSACTION_ENABLED variable

Preference for the indicator to decide if SAP passport should be enabled or not.

Syntax

```
public static final String BUSINESSTRANSACTION_ENABLED
```

BYPASS_PROXY variable

Preference for the indicator to decide which URLs need the proxy bypassed.

Syntax

```
public static final String BYPASS_PROXY
```

CACHE_CAPACITY variable

Preference for the maximum number of documents can be stored in cache.

Syntax

```
public static final String CACHE_CAPACITY
```

CACHE_MAX_SEARCH_RESULTS variable

Preference for the maximum entries that can be returned as a result of a search.

Syntax

```
public static final String CACHE_MAX_SEARCH_RESULTS
```

CACHE_PARSER_SEARCH_ATTRIBUTE variable

Preference for the name of the XML attribute that should be used to decide if a property is searchable.

Syntax

```
public static final String CACHE_PARSER_SEARCH_ATTRIBUTE
```

CACHE_SEARCH_ATTRIBUTE_XMLNS variable

Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.

Syntax

```
public static final String CACHE_SEARCH_ATTRIBUTE_XMLNS
```

CONNECTIVITY_CONNTIMEOUT variable

Preference for connection time out.

Syntax

```
public static final String CONNECTIVITY_CONNTIMEOUT
```

CONNECTIVITY_HANDLER_CLASS_NAME variable

Preference for full name (including package) of the class that should be initialized as connectivity handler.

Syntax

```
public static final String CONNECTIVITY_HANDLER_CLASS_NAME
```

CONNECTIVITY_HTTP_PORT variable

Preference for default HTTP port.

Syntax

```
public static final String CONNECTIVITY_HTTP_PORT
```

CONNECTIVITY_HTTPS_PORT variable

Preference for default HTTPS port.

Syntax

```
public static final String CONNECTIVITY_HTTPS_PORT
```

CONNECTIVITY_PROXY_HOST variable

Preference for proxy host if there is a proxy should be used.

Syntax

```
public static final String CONNECTIVITY_PROXY_HOST
```

CONNECTIVITY_PROXY_PORT variable

Preference for proxy port if there is a proxy should be used.

Syntax

```
public static final String CONNECTIVITY_PROXY_PORT
```

CONNECTIVITY_SCONNTIMEOUT variable

Preference for socket connection time out.

Syntax

```
public static final String CONNECTIVITY_SCONNTIMEOUT
```

LOG_LEVEL variable

Preference for the current log severity.

Syntax

```
public static final String LOG_LEVEL
```

PARSER_FOLDER_PATH variable

Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.

Syntax

```
public static final String PARSER_FOLDER_PATH
```

PERSISTENCE_BYTE_BUFFER_SIZE variable

Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.

Syntax

```
public static final String PERSISTENCE_BYTE_BUFFER_SIZE
```

PERSISTENCE_CIPHER_TRANSFORMATION variable

Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.

Syntax

```
public static final String PERSISTENCE_CIPHER_TRANSFORMATION
```

PERSISTENCE_FOLDER_PATH variable

Preference for the default folder where data should be persisted.

Syntax

```
public static final String PERSISTENCE_FOLDER_PATH
```

PERSISTENCE_SECUREMODE variable

Preference for indicator if persisted data should be encrypted.

Syntax

```
public static final String PERSISTENCE_SECUREMODE
```

SAP_APPLICATIONID_HEADER_VALUE variable

Preference for application ID (used in request headers)

Syntax

```
public static final String SAP_APPLICATIONID_HEADER_VALUE
```

SAPPASSPORT_ENABLED variable

Preference for the indicator to decide if SAP passport should be enabled or not.

Syntax

```
public static final String SAPPASSPORT_ENABLED
```

parser package

ODataAssociation class

Consists of APIs related to OData association.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataAssociation extends ParserDocument implements
IODataAssociation
```

Implemented interfaces

- *IODataAssociation* on page 368

Derived classes

- *ODataAssociationSet* on page 106

Members

All members of ODataAssociation, including inherited members. **Nested classes**

Modifier and Type	Class	Description
publicclass	<i>ODataAssociationEnd</i> on page 103	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataAssociation()</i> on page 105	
protected	<i>ODataAssociation(int[], String[])</i> on page 105	
public	<i>ODataAssociation(ParserDocument)</i> on page 105	
protected	<i>ODataAssociation(String)</i> on page 105	

Methods

Modifier and Type	Method	Description
public IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 106	Returns the value of the appropriate Association End OData element with the given role.
public List< IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 106	Returns list of the appropriate OData elements.
public String	<i>getName()</i> on page 106	Returns the value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route. Documents will be paired to elements in order. Elements with greater or equals index than size of new elements will be untouched. Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataAssociation.ODataAssociationEnd class

Package

```
com.sap.mobile.lib.parser.ODataAssociation
```

Syntax

```
public class ODataAssociationEnd extends ParserDocument
implements IODataAssociationEnd
```

Implemented interfaces

- *IODataAssociationEnd* on page 373

Members

All members of *ODataAssociationEnd*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataAssociationEnd()</i> on page 104	
protected	<i>ODataAssociationEnd(int[], String[])</i> on page 104	
public	<i>ODataAssociationEnd(ParserDocument)</i> on page 104	

Methods

Modifier and Type	Method	Description
public String	<i>getCollectionId()</i> on page 104	
public String	<i>getEntitySet()</i> on page 105	
public String	<i>getMultiplicity()</i> on page 105	
public String	<i>getRole()</i> on page 105	
public String	<i>getType()</i> on page 105	

ODataAssociationEnd() constructor

Syntax

```
public ODataAssociationEnd ()
```

ODataAssociationEnd(int[], String[]) constructor

Syntax

```
protected ODataAssociationEnd (
    int[] routes,
    String[] values
)
```

ODataAssociationEnd(ParserDocument) constructor

Syntax

```
public ODataAssociationEnd (ParserDocument document)
```

getCollectionId() method

Syntax

```
public String getCollectionId ()
```

*getEntitySet() method**Syntax*

```
public String getEntitySet ()
```

*getMultiplicity() method**Syntax*

```
public String getMultiplicity ()
```

*getRole() method**Syntax*

```
public String getRole ()
```

*getType() method**Syntax*

```
public String getType ()
```

*ODataAssociation() constructor**Syntax*

```
public ODataAssociation ()
```

*ODataAssociation(int[], String[]) constructor**Syntax*

```
protected ODataAssociation (
    int[] routes,
    String[] values
)
```

*ODataAssociation(ParserDocument) constructor**Syntax*

```
public ODataAssociation (ParserDocument document)
```

*ODataAssociation(String) constructor**Syntax*

```
protected ODataAssociation (String elementAssociationset)
```

getAssociationEnd(String) method

Returns the value of the appropriate Association End OData element with the given role.

Syntax

```
public IODataAssociationEnd getAssociationEnd (String role)
```

Parameters

- **role** – The expected value of the appropriate OData attribute

Returns

the value of the appropriate Association End OData element

getAssociationEnds() method

Returns list of the appropriate OData elements.

Syntax

```
public List< IODataAssociationEnd > getAssociationEnds ()
```

Returns

list of the appropriate OData elements

getName() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getName ()
```

Returns

the value of the appropriate OData attribute

ODataAssociationSet class

Consists of APIs related to OData Association set.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataAssociationSet extends ODataAssociation  
implements IODataAssociationSet
```

Base class

- *ODataAssociation* on page 99

Implemented interfaces

- *IODataAssociationSet* on page 377

Members

All members of *ODataAssociationSet*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataAssociationSet()</i> on page 115	
protected	<i>ODataAssociationSet(int[], String[])</i> on page 115	
public	<i>ODataAssociationSet(Parser-Document)</i> on page 115	

Methods

Modifier and Type	Method	Description
public String	<i>getAssociation()</i> on page 115	Returns the value of appropriate OData element.

Inherited members from *ODataAssociation*

Modifier and Type	Member	Description
public IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 106	Returns the value of the appropriate Association End OData element with the given role.
public List< IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 106	Returns list of the appropriate OData elements.
public String	<i>getName()</i> on page 106	Returns the value of the appropriate OData attribute.
public	<i>ODataAssociation()</i> on page 105	
protected	<i>ODataAssociation(int[], String[])</i> on page 105	

Modifier and Type	Member	Description
public	<i>ODataAssociation(ParserDocument)</i> on page 105	
protected	<i>ODataAssociation(String)</i> on page 105	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

Inherited members from IODataAssociation

Modifier and Type	Member	Description
public abstract IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 375	Returns the value of the appropriate Association End OData element with the given role.
public abstract List<IODataAssociationEnd>	<i>getAssociationEnds()</i> on page 376	Returns list of the appropriate OData elements.
public abstract String	<i>getName()</i> on page 376	Returns the value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParseDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParseDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataAssociationSet() constructor

Syntax

```
public ODataAssociationSet ()
```

ODataAssociationSet(int[], String[]) constructor

Syntax

```
protected ODataAssociationSet (
    int[] routes,
    String[] values
)
```

ODataAssociationSet(ParserDocument) constructor

Syntax

```
public ODataAssociationSet (ParserDocument document)
```

getAssociation() method

Returns the value of appropriate OData element.

Syntax

```
public String getAssociation ()
```

Returns

the value of appropriate OData element

ODataCollection class

Consists of APIs related to OData Collection.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataCollection extends ParserDocument implements
IODataCollection
```

Implemented interfaces

- *IODataCollection* on page 381

Members

All members of *ODataCollection*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	
protected String	collectionName	
protected boolean	isJson	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataCollection()</i> on page 121	
protected	<i>ODataCollection(int[], String[])</i> on page 121	
public	<i>ODataCollection(ParserDocument)</i> on page 121	
public	<i>ODataCollection(String)</i> on page 121	

Methods

Modifier and Type	Method	Description
public int	<i>getDisplayOrder()</i> on page 122	Returns the value of the appropriate OData extension attribute.
public String	<i>getHref()</i> on page 122	Returns the value of the 'href' OData attribute.
public List< IODataIcon >	<i>getIcons()</i> on page 122	Returns list of the appropriate OData elements.
public String	<i>getId()</i> on page 122	Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)

Modifier and Type	Method	Description
public List< IODataLink >	<i>getLinks()</i> on page 122	Returns the value of the appropriate OData elements.
public String	<i>getMemberTitle()</i> on page 123	Returns the value of the appropriate OData element.
public IODataLink	<i>getSearchLink()</i> on page 123	Returns OData Link object that should be used for retrieving Open Search Description XML.
public String	<i>getSemantics()</i> on page 123	Returns the value of the appropriate OData attribute.
public IODataLink	<i>getSubscriptionLink()</i> on page 123	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getTitle()</i> on page 124	Returns the value of the appropriate OData element.
public String	<i>getUrl()</i> on page 124	Returns OData Link object that should be used for self related operations.
public boolean	<i>isCreatable()</i> on page 124	Returns the value of the appropriate OData attribute.
public boolean	<i>isDeletable()</i> on page 124	Returns the value of the appropriate OData attribute.
public boolean	<i>isFilterable()</i> on page 124	Returns the value of the appropriate OData attribute.
public boolean	<i>isSearchable()</i> on page 125	Returns the value of the appropriate OData attribute.
public boolean	<i>isUpdatable()</i> on page 125	Returns the value of the appropriate OData attribute.
public void	<i>read(BufferedReader)</i> on page 125	
protected void	<i>setBaseUrl(String)</i> on page 125	

Modifier and Type	Method	Description
public void	<i>setEntitySet(IODataEntitySet)</i> on page 126	Sets the data held by the appropriate element of the OData Schema.
public void	<i>write(BufferedWriter)</i> on page 126	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given routes. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataCollection() constructor

Syntax

```
public ODataCollection ()
```

ODataCollection(int[], String[]) constructor

Syntax

```
protected ODataCollection (
    int[] routes,
    String[] values
)
```

ODataCollection(ParserDocument) constructor

Syntax

```
public ODataCollection (ParserDocument document)
```

ODataCollection(String) constructor

Syntax

```
public ODataCollection (String string)
```

getDisplayOrder() method

Returns the value of the appropriate OData extension attribute.

Syntax

```
public int getDisplayOrder ()
```

Returns

The value of the appropriate OData extension attribute

getHref() method

Returns the value of the 'href' OData attribute.

Syntax

```
public String getHref ()
```

Returns

The value of the 'href' OData attribute

getIcons() method

Returns list of the appropriate OData elements.

Syntax

```
public List< IODataIcon > getIcons ()
```

Returns

list of the appropriate OData elements

getId() method

Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)

Syntax

```
public String getId ()
```

Returns

The value of the 'href' OData attribute

getLinks() method

Returns the value of the appropriate OData elements.

Syntax

```
public List< IODataLink > getLinks ()
```

Returns

The value of the appropriate OData elements

getMemberTitle() method

Returns the value of the appropriate OData element.

Syntax

```
public String getMemberTitle ()
```

Returns

The value of the appropriate OData element

getSearchLink() method

Returns OData Link object that should be used for retrieving Open Search Description XML.

Syntax

```
public IODataLink getSearchLink ()
```

Returns

OData Link for search

getSemantics() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate OData attribute

getSubscriptionLink() method

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public IODataLink getSubscriptionLink ()
```

Returns

OData Link for subscribe

getTitle() method

Returns the value of the appropriate OData element.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate OData element

getUrl() method

Returns OData Link object that should be used for self related operations.

Syntax

```
public String getUrl ()
```

Returns

OData Link for self Returns the full URL of the collectionThe full URL of the collection

isCreatable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public boolean isCreatable ()
```

Returns

The value of the appropriate OData attribute

isDeletable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public boolean isDeletable ()
```

Returns

The value of the appropriate OData attribute

isFilterable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public boolean isFilterable ()
```

Returns

The value of the appropriate OData attribute

isSearchable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public boolean isSearchable ()
```

Returns

The value of the appropriate OData attribute

isUpdatable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public boolean isUpdatable ()
```

Returns

The value of the appropriate OData attribute

read(BufferedReader) method**Syntax**

```
public void read (BufferedReader reader) throws  
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method**Syntax**

```
protected void setBaseUrl (String baseUrl)
```

setEntitySet(IODataEntitySet) method

Sets the data held by the appropriate element of the OData Schema.

Syntax

```
public void setEntitySet (IODataEntitySet entitySet)
```

Parameters

- **entitySet** – The OData EntitySet to use the data from.

Remarks

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

collectionName variable

Syntax

```
protected String collectionName
```

isJson variable

Syntax

```
protected boolean isJson
```

***ODataComplexType* class**

Consists of APIs related to OData complex type.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataComplexType extends ParserDocument implements
IODataComplexType
```

Implemented interfaces

- *IODataComplexType* on page 393

Members

All members of *ODataComplexType*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataComplexType()</i> on page 131	
protected	<i>ODataComplexType(int[], String[])</i> on page 131	
public	<i>ODataComplexType(ParserDocument)</i> on page 131	

Methods

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 131	Returns the value of the appropriate OData element.
public List< IODataProperty >	<i>getProperties()</i> on page 131	Returns the list of the appropriate OData elements.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataComplexType() constructor

Syntax

```
public ODataComplexType ()
```

ODataComplexType(int[], String[]) constructor

Syntax

```
protected ODataComplexType (
    int[] routes,
    String[] values
)
```

ODataComplexType(ParserDocument) constructor

Syntax

```
public ODataComplexType (ParserDocument document)
```

getName() method

Returns the value of the appropriate OData element.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate OData element

getProperties() method

Returns the list of the appropriate OData elements.

Syntax

```
public List< IODataProperty > getProperties ()
```

Returns

The list of the appropriate OData elements

ODataEntitySet class

Consists of APIs related to OData Entity Set.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataEntitySet extends ParserDocument implements
IODataEntitySet
```

Implemented interfaces

- *IODataEntitySet* on page 398

Members

All members of ODataEntitySet, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataEntitySet()</i> on page 136	
protected	<i>ODataEntitySet(int[], String[])</i> on page 136	
public	<i>ODataEntitySet(ParserDocu- ment)</i> on page 136	

Methods

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 136	
public boolean	<i>isCreatable()</i> on page 136	
public boolean	<i>isDeletable()</i> on page 137	
public boolean	<i>isSearchable()</i> on page 137	
public boolean	<i>isSearchable(String)</i> on page 137	Returns the value of the given OData attribute.
public boolean	<i>isUpdatable()</i> on page 137	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataEntitySet() constructor*Syntax*

```
public ODataEntitySet ()
```

ODataEntitySet(int[], String[]) constructor*Syntax*

```
protected ODataEntitySet (
    int[] routes,
    String[] values
)
```

ODataEntitySet(ParserDocument) constructor*Syntax*

```
public ODataEntitySet (ParserDocument document)
```

getName() method*Syntax*

```
public String getName ()
```

Returns

The value of the appropriate OData attribute

isCreatable() method*Syntax*

```
public boolean isCreatable ()
```

Returns

The value of the appropriate OData attribute

*isDeletable() method**Syntax*

```
public boolean isDeletable ()
```

Returns

The value of the appropriate OData attribute

*isSearchable() method**Syntax*

```
public boolean isSearchable ()
```

Returns

The value of the appropriate OData attribute

isSearchable(String) method

Returns the value of the given OData attribute.

Syntax

```
public boolean isSearchable (String searchAttributeName)
```

Parameters

- **searchAttributeName** – The name of the OData attribute

Returns

The value of the given OData attribute

*isUpdatable() method**Syntax*

```
public boolean isUpdatable ()
```

Returns

The value of the appropriate OData attribute

ODataEntityType class

Consists of APIs related to OData EntityType.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataEntityType extends ParserDocument implements
IODataEntityType
```

Implemented interfaces

- *IODataEntityType* on page 405

Derived classes

- *ODataReturnEntityType* on page 260

Members

All members of *ODataEntityType*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataEntityType()</i> on page 143	
protected	<i>ODataEntityType(int[], String[])</i> on page 143	
public	<i>ODataEntityType(ParserDocument)</i> on page 143	

Methods

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 143	Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 144	Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 144	Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Modifier and Type	Method	Description
public List< String >	<i>getKeyPropertyNames()</i> on page 144	Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.
public String	<i>getName()</i> on page 144	Returns The value of the appropriate OData attribute.
public List< IODataNavigationProperty >	<i>getNavigationProperties()</i> on page 145	Returns The list of appropriate OData elements.
public IODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 145	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getProperties()</i> on page 145	Returns The list of appropriate OData elements.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 145	Returns The list of appropriate OData elements with given attribute value.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 146	Returns The list of appropriate OData elements with given attribute value.
public IODataProperty	<i>getProperty(String)</i> on page 146	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 146	Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.
protected IODataSchema	<i>getSchema()</i> on page 146	
public List< IODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 147	Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.
public boolean	<i>hasStream()</i> on page 147	Returns The value of the appropriate OData attribute.
protected void	<i>setSchema(IODataSchema)</i> on page 147	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataEntityType() constructor*Syntax*

```
public ODataEntityType ()
```

ODataEntityType(int[], String[]) constructor*Syntax*

```
protected ODataEntityType (
    int[] routes,
    String[] values
)
```

ODataEntityType(ParserDocument) constructor*Syntax*

```
public ODataEntityType (ParserDocument document)
```

getGPUseInSearchPropertiesData() method

Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

Syntax

```
public List< IODataProperty > getGPUseInSearchPropertiesData
()
```

Returns

The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value

getGPVisibleInDetailPropertiesData() method

Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

Syntax

```
public List< IODataProperty >  
getGPVisibleInDetailPropertiesData ()
```

Returns

The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value

getGPVisibleInListPropertiesData() method

Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Syntax

```
public List< IODataProperty > getGPVisibleInListPropertiesData  
( )
```

Returns

The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value

getKeyPropertyNames() method

Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.

Syntax

```
public List< String > getKeyPropertyNames ()
```

Returns

The list of the values of the 'PropertyRef' OData element

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate OData attribute

getNavigationProperties() method

Returns The list of appropriate OData elements.

Syntax

```
public List< IODataNavigationProperty >
getNavigationProperties ()
```

Returns

The list of appropriate OData elements

getNavigationProperty(String) method

Returns The appropriate OData element with the given name.

Syntax

```
public IODataNavigationProperty getNavigationProperty (String
name)
```

Returns

The appropriate OData element with the given name

getProperties() method

Returns The list of appropriate OData elements.

Syntax

```
public List< IODataProperty > getProperties ()
```

Returns

The list of appropriate OData elements

getPropertiesWithAttribute(String, String) method

Returns The list of appropriate OData elements with given attribute value.

Syntax

```
public List< IODataProperty > getPropertiesWithAttribute (
    String attributeName,
    String attributeValue
)
```

Returns

The list of appropriate OData elements with given attribute value

getPropertiesWithAttribute(String, String, boolean) method

Returns The list of appropriate OData elements with given attribute value.

Syntax

```
public List< IODataProperty > getPropertiesWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Returns

The list of appropriate OData elements with given attribute value

getProperty(String) method

Returns The appropriate OData element with the given name.

Syntax

```
public IODataProperty getProperty (String propertyName)
```

Returns

The appropriate OData element with the given name

getSAPSearchablePropertiesData() method

Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.

Syntax

```
public List< IODataProperty > getSAPSearchablePropertiesData
()
```

Returns

The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value

getSchema() method

Syntax

```
protected IODataSchema getSchema ()
```

Returns

the schema

getSearchablePropertiesData(String) method

Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.

Syntax

```
public List< IODataProperty > getSearchablePropertiesData
(String searchAttributeName)
```

Returns

The list of appropriate OData elements with 'true' attribute value of the given attribute

hasStream() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean hasStream ()
```

Returns

The value of the appropriate OData attribute

*setSchema(IODataSchema) method**Syntax*

```
protected void setSchema (IODataSchema schema)
```

Parameters

- **schema** – the schema to set

ODataEntry class

Consists of APIs related to OData Entry.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataEntry extends ParserDocument implements
IODataEntry
```

Implemented interfaces

- *IODataEntry* on page 415

Derived classes

- *ODataReturnTypeEntry* on page 241
- *ODataSubscriptionEntry* on page 289

Members

All members of *ODataEntry*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected transient JsonObject	jsonObject	JSON related variables
protected transient IOData-Schema	schema	
protected String	collectionId	
protected cacheState	Cachestate	
protected boolean	isLocalEntry	
protected Long	cache_timestamp	
protected static transient static final String	FILTER	
protected static transient static final String	FILTER_EQ	
protected static transient static final String	FILTER_AND	
protected static transient static final int	TRUE	
protected static transient static final int	FALSE	
protected static transient static final int	NOT_TESTED	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataEntry()</i> on page 158	
public	<i>ODataEntry(boolean)</i> on page 158	

Modifier and Type	Constructor	Description
protected	<i>ODataEntry(int[], String[])</i> on page 158	
public	<i>ODataEntry(IODataSchema)</i> on page 158	
public	<i>ODataEntry(JsonObject)</i> on page 158	Json Related
public	<i>ODataEntry(ParserDocument)</i> on page 158	
public	<i>ODataEntry(ParserDocument, IODataSchema)</i> on page 158	

Methods

Modifier and Type	Method	Description
protected void	<i>addPropertyValues(IODataProperty, Map<String, String>, String)</i> on page 159	
public ODataEntry	<i>clone()</i> on page 159	Creates a copy of this object.
protected void	<i>fillPropertyData(IODataProperty, String...)</i> on page 159	
protected void	<i>fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...)</i> on page 159	
public List< IODataLink >	<i>getActionLinks()</i> on page 159	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 160	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCacheState()</i> on page 160	
public Long	<i>getCacheTimestamp()</i> on page 160	

Modifier and Type	Method	Description
public String	<i>getCollectionId()</i> on page 160	Returns the Id of the OCata Collection that this Entry belongs to.
public String	<i>getContentType()</i> on page 160	Returns the content type of the entry.
public String	<i>getEtag()</i> on page 161	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 161	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 161	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 161	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 162	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public List< IODataIcon >	<i>getIcons()</i> on page 162	Returns the list of the appropriate OData elements.

Modifier and Type	Method	Description
public String	<i>getId()</i> on page 162	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 162	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 162	Returns the values of the properties that are marked as key properties in the OData Schema document.
public Date	<i>getLastUpdated()</i> on page 163	Returns The parsed value of the 'updated' OData Element.
public List< IODataLink >	<i>getLinks()</i> on page 163	Returns the list of the appropriate OData elements.
public String	<i>getMediaSrc()</i> on page 163	Returns the media source if the entry has a media content.
public List< IODataProperty >	<i>getPropertiesData()</i> on page 163	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 164	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 164	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public IParserDocument	<i>getPropertiesDocument()</i> on page 164	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

Modifier and Type	Method	Description
public String	<i>getPropertyValue(String...)</i> on page 165	Returns the value of the appropriate property.
public List< String >	<i>getPropertyValues(List< String[]>)</i> on page 165	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 166	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< IODataLink >	<i>getRelatedDataLinks()</i> on page 166	Returns OData Link objects that represents links to Related Data.
public List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 166	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public IODataSchema	<i>getSchema()</i> on page 166	Returns the appropriate OData Schema object.
public IODataLink	<i>getSelfLink()</i> on page 167	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public IODataLink	<i>getSubscriptionLink()</i> on page 167	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 167	Returns The value of the appropriate OData element.
public String	<i>getTitle()</i> on page 167	Returns The value of the appropriate OData element.
protected void	<i>materialize()</i> on page 167	

Modifier and Type	Method	Description
protected void	<i>parseCollectionId()</i> on page 168	
protected long	<i>parseEdmTime(String)</i> on page 168	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 168	Puts the new property element as a sub-element of the 'complex properties' OData element.
public void	<i>putContentType(String)</i> on page 168	Puts the content type for a new entry object.
public void	<i>putDocument(IParserDocument, String...)</i> on page 169	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 169	Sets id of this OData Entry document (value of appropriate OData Id element)
public void	<i>putMediaSrc(String)</i> on page 169	Puts the media source for a new entry object.
public void	<i>putPropertyValue(String, String)</i> on page 169	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 170	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>read(BufferedReader)</i> on page 170	
protected String	<i>resolveTargetCollection(IODataLink)</i> on page 171	
public void	<i>setAuthorName(String)</i> on page 171	Sets the value of the 'name' OData element of the 'author' OData element.

Modifier and Type	Method	Description
public void	<i>setCacheState(cacheState)</i> on page 171	
public void	<i>setCacheTimestamp(Long)</i> on page 171	
public void	<i>setCollectionId(String)</i> on page 171	Maintains the Id of the OCata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 171	
public void	<i>setSchema(IODataSchema)</i> on page 172	Maintains the reference to the appropriate OData Schema object.
public void	<i>setSummary(String)</i> on page 172	Sets the value of the appropriate OData element.
public void	<i>setTitle(String)</i> on page 172	Sets the value of the appropriate OData element.
public void	<i>write(BufferedWriter)</i> on page 172	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataEntry() constructor

Syntax

```
public ODataEntry ()
```

ODataEntry(boolean) constructor

Syntax

```
public ODataEntry (boolean isComplex)
```

ODataEntry(int[], String[]) constructor

Syntax

```
protected ODataEntry (  
    int[] routes,  
    String[] values  
)
```

ODataEntry(IODataSchema) constructor

Syntax

```
public ODataEntry (IODataSchema schema)
```

ODataEntry(JsonObject) constructor

Json Related

Syntax

```
public ODataEntry (JsonObject entry)
```

ODataEntry(ParserDocument) constructor

Syntax

```
public ODataEntry (ParserDocument document)
```

ODataEntry(ParserDocument, IODataSchema) constructor

Syntax

```
public ODataEntry (  
    ParserDocument document,  
    IODataSchema schema  
)
```

*addPropertyValues(IODataProperty, Map< String, String >, String) method***Syntax**

```
protected void addPropertyValues (
    IODataProperty property,
    Map< String, String > values,
    String pathString
)
```

clone() method

Creates a copy of this object.

Syntax

```
public ODataEntry clone () throws CloneNotSupportedException
```

Returns

The new copy of this object

*fillPropertyData(IODataProperty, String...) method***Syntax**

```
protected void fillPropertyData (
    IODataProperty property,
    String... path
)
```

*fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...) method***Syntax**

```
protected void fillPropertyDataWithAttribute (
    IODataProperty property,
    String attributeName,
    String attributeValue,
    boolean addByefault,
    String... path
)
```

getActionLinks() method

Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')

Syntax

```
public List< IODataLink > getActionLinks ()
```

Returns

List of OData Action Link documents

getAuthorName() method

Returns The value of the 'name' OData element of the 'author' OData element.

Syntax

```
public String getAuthorName ()
```

Returns

The value of the 'name' OData element of the 'author' OData element

getCachestate() method

Syntax

```
public cacheState getCachestate ()
```

getCacheTimestamp() method

Syntax

```
public Long getCacheTimestamp ()
```

getCollectionId() method

Returns the Id of the OCata Collection that this Entry belongs to.

Syntax

```
public String getCollectionId ()
```

Returns

The Id of the OCata Collection that this Entry belongs to

getContentType() method

Returns the content type of the entry.

Syntax

```
public String getContentType ()
```

Returns

Content Type of the entry

getEtag() method

Returns the Id of the OData Collection that this Entry belongs to.

Syntax

```
public String getEtag ()
```

Returns

The Id of the OData Collection that this Entry belongs to

getFilterUrl() method

Returns the full execution URL hat can be used for filtering collection search for this single entry.

Syntax

```
public String getFilterUrl ()
```

Returns

The full filter URL

getGPUseInSearchPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.

Syntax

```
public List< IODataProperty > getGPUseInSearchPropertiesData  
( )
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInDetailPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.

Syntax

```
public List< IODataProperty >  
getGPVisibleInDetailPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInListPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.

Syntax

```
public List< IODataProperty > getGPVisibleInListPropertiesData  
( )
```

Returns

The meta-informations and values of the appropriate properties

getIcons() method

Returns the list of the appropriate OData elements.

Syntax

```
public List< IODataIcon > getIcons ( )
```

Returns

The list of the appropriate OData elements

getId() method

Returns The Id of this OData Entry (value of appropriate OData Id element)

Syntax

```
public String getId ( )
```

Returns

The Id of this OData Entry

getIsLocal() method

Syntax

```
public boolean getIsLocal ( )
```

getKeyPropertyValues() method

Returns the values of the properties that are marked as key properties in the OData Schema document.

Syntax

```
public Map< String, String > getKeyPropertyValues ( )
```

Returns

The name-value pairs of the key properties

getLastUpdated() method

Returns The parsed value of the 'updated' OData Element.

Syntax

```
public Date getLastUpdated ()
```

Returns

The parsed value of the value of the 'updated' OData element or null is parsing failed

getLinks() method

Returns the list of the appropriate OData elements.

Syntax

```
public List< IODataLink > getLinks ()
```

Returns

The list of the appropriate OData elements

getMediaSrc() method

Returns the media source if the entry has a media content.

Syntax

```
public String getMediaSrc ()
```

Returns

Media source link of the entry

getPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.

Syntax

```
public List< IODataProperty > getPropertiesData ()
```

Returns

The meta-informations and values of the contained properties

getPropertiesDataWithAttribute(String, String) method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Syntax

```
public List< IODataProperty > getPropertiesDataWithAttribute (  
    String attributeName,  
    String attributeValue  
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

Returns

The meta-informations and values of the appropriate properties

getPropertiesDataWithAttribute(String, String, boolean) method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Syntax

```
public List< IODataProperty > getPropertiesDataWithAttribute (  
    String attributeName,  
    String attributeValue,  
    boolean addByDefault  
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

Returns

The meta-informations and values of the appropriate properties

getPropertiesDocument() method

Returns the representer document of OData 'properties' (Metadata name-space) document
This method is created for performance reasons mostly to use in search methods.

Syntax

```
public IParserDocument getPropertiesDocument ()
```

Returns

The ParseDocument representation of OData 'properties' (Metadata name-space) document

getPropertyValue(String...) method

Returns the value of the appropriate property.

Syntax

```
public String getPropertyValue (String... propertyPath)
```

Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

Returns

The value of the property

Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous.

Remarks

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

getPropertyValues(List< String[]>) method

Return list of property values for the given property paths.

Syntax

```
public List< String > getPropertyValues (List< String[]>  
propertyPathes)
```

Parameters

- **propertyPathes** – Name of the property or path including the name of the enclosing Complex Types

Returns

The list of the values of the properties

getPropertyValues() method

Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

Syntax

```
public Map< String, String > getPropertyValues ()
```

Returns

The name/path and value pairs of the contained properties

Remarks

The name of the properties will contain their current name-space prefixes.

getRelatedDataLinks() method

Returns OData Link objects that represents links to Related Data.

Syntax

```
public List< IODataLink > getRelatedDataLinks ()
```

Returns

List of OData Related Link documents

getSAPSearchablePropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.

Syntax

```
public List< IODataProperty > getSAPSearchablePropertiesData  
( )
```

Returns

The meta-informations and values of the appropriate properties

getSchema() method

Returns the appropriate OData Schema object.

Syntax

```
public IODataSchema getSchema ()
```

Returns

The appropriate OData Schema object.

getSelfLink() method

Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

Syntax

```
public IODataLink getSelfLink ()
```

Returns

OData self Link

getSubscriptionLink() method

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public IODataLink getSubscriptionLink ()
```

Returns

OData Link for subscribe

getSummary() method

Returns The value of the appropriate OData element.

Syntax

```
public String getSummary ()
```

Returns

The value of the appropriate OData element

getTitle() method

Returns The value of the appropriate OData element.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate OData element

materialize() method***Syntax***

```
protected void materialize ()
```

parseCollectionId() method

Syntax

```
protected void parseCollectionId ()
```

parseEdmTime(String) method

Syntax

```
protected long parseEdmTime (String value)
```

putComplexPropertyValue(String, String...) method

Puts the new property element as a sub-element of the 'complex properties' OData element.

Syntax

```
public void putComplexPropertyValue (  
    String propertyValue,  
    String... propertyName  
)
```

Parameters

- **propertyName** – The route of the property with or without name-space until the complex type.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putContentType(String) method

Puts the content type for a new entry object.

Syntax

```
public void putContentType (String contentType)
```

Parameters

- **contentType** – - Content Type of the entry

putDocument(IParserDocument, String...) method

Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.

Syntax

```
public void putDocument (
    IParserDocument document,
    String... route
) throws IllegalArgumentException
```

Parameters

- **document** – The new document
- **route** – The route to the parent element of the new document

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

putId(String) method

Sets id of this OData Entry document (value of appropriate OData Id element)

Syntax

```
public void putId (String id)
```

Parameters

- **id** – The new id.

putMediaSrc(String) method

Puts the media source for a new entry object.

Syntax

```
public void putMediaSrc (String mediaSrc)
```

Parameters

- **mediaSrc** – - Media source of the entry

putPropertyValue(String, String) method

Puts the new property element as a sub-element of the 'properties' OData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
```

```
String propertyValue
)
```

Parameters

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putPropertyValue(String, String, boolean) method

Puts the new property element as a sub-element of the 'properties' OData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
    String propertyValue,
    boolean useDefaultPrefix
)
```

Parameters

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

*resolveTargetCollection(IODataLink) method**Syntax*

```
protected String resolveTargetCollection (IODataLink link)
```

setAuthorName(String) method

Sets the value of the 'name' OData element of the 'author' OData element.

Syntax

```
public void setAuthorName (String authorName)
```

Parameters

- **authorName** – The new value of the element

*setCachestate(cacheState) method**Syntax*

```
public void setCachestate (cacheState cachestate)
```

*setCacheTimestamp(Long) method**Syntax*

```
public void setCacheTimestamp (Long timestamp)
```

setCollectionId(String) method

Maintains the Id of the OCata Collection that this Entry belongs to.

Syntax

```
public void setCollectionId (String collectionId)
```

Parameters

- **collectionId** – The Id of the OCata Collection that this Entry belongs to

*setIsLocal(boolean) method**Syntax*

```
public void setIsLocal (boolean isLocal)
```

setSchema(IODataSchema) method

Maintains the reference to the appropriate OData Schema object.

Syntax

```
public void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The appropriate OData Schema object.

setSummary(String) method

Sets the value of the appropriate OData element.

Syntax

```
public void setSummary (String summary)
```

Parameters

- **summary** – The new value of the element

setTitle(String) method

Sets the value of the appropriate OData element.

Syntax

```
public void setTitle (String title)
```

Parameters

- **title** – The new value of the element

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

*cache_timestamp variable**Syntax*

```
protected Long cache_timestamp
```

*Cachestate variable**Syntax*

```
protected cacheState Cachestate
```

*collectionId variable**Syntax*

```
protected String collectionId
```

*FALSE variable**Syntax*

```
protected static transient static final int FALSE
```

*FILTER variable**Syntax*

```
protected static transient static final String FILTER
```

*FILTER_AND variable**Syntax*

```
protected static transient static final String FILTER_AND
```

*FILTER_EQ variable**Syntax*

```
protected static transient static final String FILTER_EQ
```

*isLocalEntry variable**Syntax*

```
protected boolean isLocalEntry
```

JsonObject variable

JSON related variables

Syntax

```
protected transient JsonObject jsonObject
```

NOT_TESTED variable

Syntax

```
protected static transient static final int NOT_TESTED
```

schema variable

Syntax

```
protected transient IODataSchema schema
```

TRUE variable

Syntax

```
protected static transient static final int TRUE
```

ODataError class

Consists of APIs related to OData Error.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataError extends ParserDocument implements IODataError
```

Implemented interfaces

- *IODataError* on page 440

Members

All members of ODataError, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataError()</i> on page 179	
protected	<i>ODataError(int[], String[])</i> on page 179	

Modifier and Type	Constructor	Description
public	<i>ODataError(JsonObject)</i> on page 179	
public	<i>ODataError(ParserDocument)</i> on page 179	

Methods

Modifier and Type	Method	Description
public String	<i>getErrorCode()</i> on page 179	Returns The value of the 'code' OData element.
public String	<i>getLang()</i> on page 179	Returns The value of the appropriate OData attribute of the 'message' element.
public String	<i>getMessage()</i> on page 180	Return the localized error message.
protected void	<i>setCode(String)</i> on page 180	
protected void	<i>setLang(String)</i> on page 180	
protected void	<i>setMessage(String)</i> on page 180	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

*OnError() constructor**Syntax*

```
public OnError ()
```

*OnError(int[], String[]) constructor**Syntax*

```
protected OnError (
    int[] routes,
    String[] values
)
```

*OnError(JsonObject) constructor**Syntax*

```
public OnError (JsonObject error)
```

*OnError(ParserDocument) constructor**Syntax*

```
public OnError (ParserDocument document)
```

getErrorCode() method

Returns The value of the 'code' OData element.

Syntax

```
public String getErrorCode ()
```

Returns

The value of the 'code' OData element

getLang() method

Returns The value of the appropriate OData attribute of the 'message' element.

Syntax

```
public String getLang ()
```

Returns

The value of the appropriate OData attribute of the 'message' element

getMessage() method

Return the localized error message.

Syntax

```
public String getMessage ()
```

Returns

The value of the 'message' OData element

setCode(String) method

Syntax

```
protected void setCode (String code)
```

setLang(String) method

Syntax

```
protected void setLang (String lang)
```

setMessage(String) method

Syntax

```
protected void setMessage (String message)
```

ODataFeed class

Consists of APIs related to OData Feed.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataFeed implements IODataFeed
```

Implemented interfaces

- *IODataFeed* on page 445

Members

All members of ODataFeed, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>getAuthor()</i> on page 181	Returns the name of the Author of the OData Feed.
public List< String >	<i>getDeletedEntries()</i> on page 181	Returns the list of links of the Deleted Entries.
public IODataLink	<i>getDeltaLink()</i> on page 182	Returns the latest delta link token.
public List< IODataEntry >	<i>getEntries()</i> on page 182	Returns the entries in the feed that have been updated/ entire list of entries in the collection.
public String	<i>getId()</i> on page 182	Returns the id of the OData Feed.
public String	<i>getLastUpdated()</i> on page 182	Returns the date/time of last update on the OData Feed.
public List< IODataLink >	<i>getLinks()</i> on page 182	
protected IODataSchema	<i>getSchema()</i> on page 183	
public String	<i>getTitle()</i> on page 183	Returns the Title of the OData Feed.
protected void	<i>setDeltaLink(IODataLink)</i> on page 183	
protected void	<i>setSchema(IODataSchema)</i> on page 183	

getAuthor() method

Returns the name of the Author of the OData Feed.

Syntax

```
public String getAuthor ()
```

Returns

String Author Name

getDeletedEntries() method

Returns the list of links of the Deleted Entries.

Syntax

```
public List< String > getDeletedEntries ()
```

Returns

List<ISDMODataLink> - List of links of the deleted entries

getDeltaLink() method

Returns the latest delta link token.

Syntax

```
public IODataLink getDeltaLink ()
```

getEntries() method

Returns the entries in the feed that have been updated/ entire list of entries in the collection.

Syntax

```
public List< IODataEntry > getEntries ()
```

Returns

List<ISDMODataEntry> - List of ODataEntries

getId() method

Returns the id of the OData Feed.

Syntax

```
public String getId ()
```

Returns

String Id

getLastUpdated() method

Returns the date/time of last update on the OData Feed.

Syntax

```
public String getLastUpdated ()
```

Returns

String Date-time

getLinks() method

Syntax

```
public List< IODataLink > getLinks ()
```

*getSchema() method**Syntax*

```
protected IODataSchema getSchema ()
```

Returns

the schema

getTitle() method

Returns the Title of the OData Feed.

Syntax

```
public String getTitle ()
```

Returns

String Title

*setDeltaLink(IODataLink) method**Syntax*

```
protected void setDeltaLink (IODataLink deltaLink2)
```

Parameters

- **deltaLink2** – the deltaLink to set

*setSchema(IODataSchema) method**Syntax*

```
protected void setSchema (IODataSchema schema)
```

Parameters

- **schema** – the schema to set

ODataFunctionImport class

Consists of APIs related to OData FunctionImport.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataFunctionImport extends ParserDocument
implements IODataFunctionImport
```

Implemented interfaces

- *IODataFunctionImport* on page 448

Members

All members of *IODataFunctionImport*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>IODataFunctionImport()</i> on page 189	
protected	<i>IODataFunctionImport(int[], String[])</i> on page 189	
public	<i>IODataFunctionImport(Parser-Document)</i> on page 189	

Methods

Modifier and Type	Method	Description
public String	<i>getActionFor()</i> on page 189	Returns The value of the appropriate OData attribute.
public String	<i>getCollectionId()</i> on page 189	Returns The value of the 'EntitySet' OData attribute.
public String	<i>getEntitySet()</i> on page 189	Returns The value of the 'EntitySet' OData attribute.
public String	<i>getExecutionUrl(Map< String, String >)</i> on page 190	Calculate the full execution URL for executing this Function Import according to the passed parameters.
public String	<i>getHTTPMethod()</i> on page 190	Returns The value of the appropriate OData attribute.
public List< String >	<i>getInputParameterNames()</i> on page 190	Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 190	Returns The value of the appropriate OData attribute.
public List< String >	<i>getOutputParameterNames()</i> on page 191	Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.
public List< IODataParameter >	<i>getParameters()</i> on page 191	Returns The list of the appropriate OData element.
public String	<i>getReturnType()</i> on page 191	Returns The value of the appropriate OData attribute.
public RETURNTYPE_ENUM	<i>getReturnTypeEnum()</i> on page 191	Returns The return type of this Function Import OData document.
public void	<i>read(BufferedReader)</i> on page 191	
public void	<i>setBaseUrl(String)</i> on page 192	
public void	<i>write(BufferedWriter)</i> on page 192	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataFunctionImport() constructor*Syntax*

```
public ODataFunctionImport ()
```

ODataFunctionImport(int[], String[]) constructor*Syntax*

```
protected ODataFunctionImport (
    int[] routes,
    String[] values
)
```

ODataFunctionImport(ParserDocument) constructor*Syntax*

```
public ODataFunctionImport (ParserDocument document)
```

getActionFor() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getActionFor ()
```

Returns

The value of the appropriate OData attribute

getCollectionId() method

Returns The value of the 'EntitySet' OData attribute.

Syntax

```
public String getCollectionId ()
```

Returns

The value of the 'EntitySet' OData attribute

getEntitySet() method

Returns The value of the 'EntitySet' OData attribute.

Syntax

```
public String getEntitySet ()
```

Returns

The value of the 'EntitySet' OData attribute

getExecutionUrl(Map< String, String >) method

Calculate the full execution URL for executing this Function Import according to the passed parameters.

Syntax

```
public String getExecutionUrl (Map< String, String > parameters)
```

Returns

The full execution URL

getHTTPMethod() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getHTTPMethod ()
```

Returns

The value of the appropriate OData attribute

getInputParameterNames() method

Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.

Syntax

```
public List< String > getInputParameterNames ()
```

Returns

The list of the appropriate OData element with 'In' or 'InOut' attribute value

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate OData attribute

getOutputParameterNames() method

Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.

Syntax

```
public List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate OData element with 'Out' or 'InOut' attribute value

getParameters() method

Returns The list of the appropriate OData element.

Syntax

```
public List< IODataParameter > getParameters ()
```

Returns

The list of the appropriate OData element

getReturnType() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getReturnType ()
```

Returns

The value of the appropriate OData attribute

getReturnTypeEnum() method

Returns The return type of this Function Import OData document.

Syntax

```
public RETURNTYPE_ENUM getReturnTypeEnum ()
```

Returns

The return type of this Function Import OData document

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws  
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
public void setBaseUrl (String baseUrl)
```

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

ODataIcon class

Consists of APIs related to OData Icon.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataIcon extends ParserDocument implements  
IODataIcon
```

Implemented interfaces

- *IODataIcon* on page 457

Members

All members of `ODataIcon`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	<code>baseUrl</code>	

Constructors

Modifier and Type	Constructor	Description
public	<code>ODataIcon()</code> on page 197	
protected	<code>ODataIcon(int[], String[])</code> on page 197	
public	<code>ODataIcon(ParserDocument)</code> on page 197	

Methods

Modifier and Type	Method	Description
public int	<code>getHeight()</code> on page 197	Returns The value of the appropriate OData attribute.
public String	<code>getUrl()</code> on page 197	Returns The value of the appropriate OData attribute.
public int	<code>getWidth()</code> on page 198	Returns The value of the appropriate OData attribute.
public void	<code>read(BufferedReader)</code> on page 198	
protected void	<code>setBaseUrl(String)</code> on page 198	
public void	<code>write(BufferedWriter)</code> on page 198	

Inherited members from `IParserDocument`

Modifier and Type	Member	Description
public abstract <code>IParserDocument</code>	<code>clone()</code> on page 574	Creates a copy of this object.

Modifier and Type	Member	Description
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataIcon() constructor*Syntax*

```
public ODataIcon ()
```

ODataIcon(int[], String[]) constructor*Syntax*

```
protected ODataIcon (
    int[] routes,
    String[] values
)
```

ODataIcon(ParserDocument) constructor*Syntax*

```
public ODataIcon (ParserDocument document)
```

getHeight() method

Returns The value of the appropriate OData attribute.

Syntax

```
public int getHeight ()
```

Returns

The value of the appropriate OData attribute

getUrl() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getUrl ()
```

Returns

The value of the appropriate OData attribute

getWidth() method

Returns The value of the appropriate OData attribute.

Syntax

```
public int getWidth ()
```

Returns

The value of the appropriate OData attribute

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

baseUrl variable**Syntax**

```
protected String baseUrl
```

ODataLink class

Consists of APIs related to OData link.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataLink extends ParserDocument implements
IODataLink
```

Implemented interfaces

- *IODataLink* on page 463

Members

All members of ODataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	targetCollectionId	
protected String	baseUrl	
protected IODataSchema	schema	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataLink()</i> on page 204	
protected	<i>ODataLink(int[], String[])</i> on page 204	
public	<i>ODataLink(ParserDocument)</i> on page 204	

Methods

Modifier and Type	Method	Description
public String	<i>getHref()</i> on page 205	Returns the value of the appropriate OData attribute.
public List< IODataEntry >	<i>getInlineEntries()</i> on page 205	Returns the list of OData Entries contained by the appropriate OData 'inline' element.
public List< String >	<i>getInputParameterNames()</i> on page 205	Returns the list of the appropriate OData Parameter elements that should be used as input parameter.
public List< String >	<i>getOutputParameterNames()</i> on page 205	Returns the list of the appropriate OData Parameter elements that should be used as output parameter.
public List< IODataParameter >	<i>getParameters()</i> on page 206	Returns the list of the appropriate OData Parameter elements.
public String	<i>getRel()</i> on page 206	Returns the value of the appropriate OData attribute.
public IODataSchema	<i>getSchema()</i> on page 206	Returns the Schema that is to be used for 'Inline entries'.
public String	<i>getSemantics()</i> on page 206	Returns The value of the appropriate OData extension (vCard) attribute.
public String	<i>getTargetCollectionId()</i> on page 206	Returns the Id of the collection that this link points to (if any)
public String	<i>getTitle()</i> on page 207	Returns the value of the appropriate OData attribute.
public String	<i>getUrl()</i> on page 207	Returns the full URL for this OData Link object without parameters.
public String	<i>getUrlWithParameters(Map< String, String >)</i> on page 207	Returns the full URL for this OData Link object extended with the given parameter names and values.
public void	<i>read(BufferedReader)</i> on page 207	

Modifier and Type	Method	Description
protected void	<i>setBaseUrl(String)</i> on page 208	
public void	<i>setSchema(IODataSchema)</i> on page 208	Sets the Schema that is to be used for 'Inline entries'.
public void	<i>setTargetCollectionId(String)</i> on page 208	Maintains the Id of the collection that this link points to (if any)
public void	<i>write(BufferedWriter)</i> on page 208	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.

public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataLink() constructor

Syntax

```
public ODataLink ()
```

ODataLink(int[], String[]) constructor

Syntax

```
protected ODataLink (
    int[] routes,
    String[] values
)
```

ODataLink(ParserDocument) constructor

Syntax

```
public ODataLink (ParserDocument document)
```

getHref() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getHref ()
```

Returns

The value of the appropriate OData attribute

getInlineEntries() method

Returns the list of OData Entries contained by the appropriate OData 'inline' element.

Syntax

```
public List< IODataEntry > getInlineEntries ()
```

Returns

The List of 'inline' OData Entries

getInputParameterNames() method

Returns the list of the appropriate OData Parameter elements that should be used as input parameter.

Syntax

```
public List< String > getInputParameterNames ()
```

Returns

The list of the appropriate OData Parameter elements that should be used as input parameter

getOutputParameterNames() method

Returns the list of the appropriate OData Parameter elements that should be used as output parameter.

Syntax

```
public List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate OData Parameter elements that should be used as output parameter

getParameters() method

Returns the list of the appropriate OData Parameter elements.

Syntax

```
public List< IODataParameter > getParameters ()
```

Returns

The list of the appropriate OData Parameter elements

getRel() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getRel ()
```

Returns

The value of the appropriate OData attribute

getSchema() method

Returns the Schema that is to be used for 'Inline entries'.

Syntax

```
public IODataSchema getSchema ()
```

Returns

The relevant schema

getSemantics() method

Returns The value of the appropriate OData extension (vCard) attribute.

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate OData extension (vCard) attribute

getTargetCollectionId() method

Returns the Id of the collection that this link points to (if any)

Syntax

```
public String getTargetCollectionId ()
```

Returns

The Id of the collection that this link points to

getTitle() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate OData attribute

getUrl() method

Returns the full URL for this OData Link object without parameters.

Syntax

```
public String getUrl ()
```

Returns

The full URL of this link without parameters

getUrlWithParameters(Map< String, String >) method

Returns the full URL for this OData Link object extended with the given parameter names and values.

Syntax

```
public String getUrlWithParameters (Map< String, String >
parameters)
```

Returns

The full URL of this link with parameters

read(BufferedReader) method**Syntax**

```
public void read (BufferedReader reader) throws
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

setSchema(IODataSchema) method

Sets the Schema that is to be used for 'Inline entries'.

Syntax

```
public void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The relevant schema

setTargetCollectionId(String) method

Maintains the Id of the collection that this link points to (if any)

Syntax

```
public void setTargetCollectionId (String targetCollectionId)
```

Parameters

- **targetCollectionId** – The Id of the collection that this link points to

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

schema variable

Syntax

```
protected IODataSchema schema
```

targetCollectionId variable

Syntax

```
protected String targetCollectionId
```

***ODataNavigationProperty* class**

Consists of APIs related to OData EntityType.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataNavigationProperty extends ParserDocument
implements IODataNavigationProperty
```

Implemented interfaces

- *IODataNavigationProperty* on page 474

Members

All members of ODataNavigationProperty, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataNavigationProperty()</i> on page 213	
protected	<i>ODataNavigationProperty(int[], String[])</i> on page 213	
public	<i>ODataNavigationProperty(ParserDocument)</i> on page 213	

Methods

Modifier and Type	Method	Description
public String	<i>getFromRole()</i> on page 214	Returns The value of the appropriate OData attribute.
public String	<i>getName()</i> on page 214	Returns The value of the appropriate OData attribute.
public String	<i>getRelationship()</i> on page 214	Returns The value of the appropriate OData attribute.
public String	<i>getToRole()</i> on page 214	Returns The value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route. Documents will be paired to elements in order. Elements with greater or equals index than size of new elements will be untouched. Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataNavigationProperty() constructor

Syntax

```
public ODataNavigationProperty ()
```

ODataNavigationProperty(int[], String[]) constructor

Syntax

```
protected ODataNavigationProperty (
    int[] routes,
    String[] values
)
```

ODataNavigationProperty(ParserDocument) constructor

Syntax

```
public ODataNavigationProperty (ParserDocument document)
```

getFromRole() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getFromRole ()
```

Returns

The value of the appropriate OData attribute

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate OData attribute

getRelationship() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getRelationship ()
```

Returns

The value of the appropriate OData attribute

getToRole() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getToRole ()
```

Returns

The value of the appropriate OData attribute

ODataOpenSearchDescription class

Consists of APIs related to OData OpenSearchDescription.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataOpenSearchDescription extends ParserDocument
implements IODataOpenSearchDescription
```

Implemented interfaces

- *IODataOpenSearchDescription* on page 480

Members

All members of *ODataOpenSearchDescription*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataOpenSearchDescription()</i> on page 219	
protected	<i>ODataOpenSearchDescription(int[], String[])</i> on page 219	
public	<i>ODataOpenSearchDescription(ParserDocument)</i> on page 219	

Methods

Modifier and Type	Method	Description
public String	<i>getDescription()</i> on page 220	Returns The value of the appropriate OData element.
public String	<i>getShortName()</i> on page 220	Returns The value of the appropriate OData element.
public List< IODataURL >	<i>getUrls()</i> on page 220	Returns The list of the appropriate OData element.
public void	<i>read(BufferedReader)</i> on page 220	
protected void	<i>setBaseUrl(String)</i> on page 221	

Modifier and Type	Method	Description
public void	<i>write(BufferedWriter)</i> on page 221	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given routes. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataOpenSearchDescription() constructor

Syntax

```
public ODataOpenSearchDescription ()
```

ODataOpenSearchDescription(int[], String[]) constructor

Syntax

```
protected ODataOpenSearchDescription (
    int[] routes,
    String[] values
)
```

ODataOpenSearchDescription(ParserDocument) constructor

Syntax

```
public ODataOpenSearchDescription (ParserDocument document)
```

getDescription() method

Returns The value of the appropriate OData element.

Syntax

```
public String getDescription ()
```

Returns

The value of the appropriate OData element

getShortName() method

Returns The value of the appropriate OData element.

Syntax

```
public String getShortName ()
```

Returns

The value of the appropriate OData element

getUrls() method

Returns The list of the appropriate OData element.

Syntax

```
public List< IODataURL > getUrls ()
```

Returns

The list of the appropriate OData element

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

*setBaseUrl(String) method**Syntax*

```
protected void setBaseUrl (String baseUrl)
```

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

*baseUrl variable**Syntax*

```
protected String baseUrl
```

ODataParameter class

Consists of APIs related to OData Parameter.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataParameter extends ParserDocument implements  
IODataParameter
```

Implemented interfaces

- *IODataParameter* on page 486

Members

All members of ODataParameter, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataParameter()</i> on page 225	
protected	<i>ODataParameter(int[], String[])</i> on page 226	
public	<i>ODataParameter(ParserDocument)</i> on page 226	

Methods

Modifier and Type	Method	Description
public String	<i>getMode()</i> on page 226	Returns The value of the appropriate OData attribute.
public String	<i>getName()</i> on page 226	Returns The value of the appropriate OData attribute.
public String	<i>getType()</i> on page 226	Returns The value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataParameter() constructor

Syntax

```
public ODataParameter ()
```

ODataParameter(int[], String[]) constructor

Syntax

```
protected ODataParameter (  
    int[] routes,  
    String[] values  
)
```

ODataParameter(ParserDocument) constructor

Syntax

```
public ODataParameter (ParserDocument document)
```

getMode() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getMode ()
```

Returns

The value of the appropriate OData attribute

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate OData attribute

getType() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getType ()
```

Returns

The value of the appropriate OData attribute

ODataProperty class

Consists of APIs related to OData Property.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataProperty extends ParserDocument implements
IODataProperty
```

Implemented interfaces

- *IODataProperty* on page 492

Members

All members of ODataProperty, including inherited members. **Nested classes**

Modifier and Type	Class	Description
publicclass	<i>DetailDisplayOrderCompara- tor</i> on page 233	
publicclass	<i>ListDisplayOrderComparator</i> on page 233	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataProperty()</i> on page 234	
protected	<i>ODataProperty(int[], String[])</i> on page 234	
public	<i>ODataProperty(ParserDocu- ment)</i> on page 234	

Methods

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getChildPropertiesData()</i> on page 234	Returns all the child properties added to this document with putChildProperty method.

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 235	Returns list of appropriate contained Property OData elements with the given attribute value.
public List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 235	Returns list of appropriate contained Property OData elements with the given attribute value.
public IODataProperty	<i>getChildPropertyData(String)</i> on page 235	Return a single child property added with putChildProperty method.
public String	<i>getCollation()</i> on page 236	Returns the value of the appropriate OData attribute.
public String	<i>getDefaultValue()</i> on page 236	Returns the value of the appropriate OData attribute.
public int	<i>getDetailDisplayOrder()</i> on page 236	In current version it return the same value as getListDisplayOrder.
public String	<i>getLabel()</i> on page 236	Returns The value of the appropriate OData attribute.
public int	<i>getListDisplayOrder()</i> on page 237	In current version it returns the same value as getDetailDisplayOrder.
public int	<i>getMaxLength()</i> on page 237	Returns the value of the appropriate OData attribute with default value = 0;.
public String	<i>getName()</i> on page 237	Returns The value of the appropriate OData attribute.
public String	<i>getPrecision()</i> on page 237	Returns the value of the appropriate OData attribute.
public String	<i>getScale()</i> on page 237	Returns the value of the appropriate OData attribute.
public String	<i>getSemantics()</i> on page 238	Returns the value of the appropriate OData attribute with default value = 0;.

Modifier and Type	Method	Description
public String	<i>getType()</i> on page 238	Returns The value of the appropriate OData attribute.
public String	<i>getValue()</i> on page 238	Returns the value of the property if there is a single property instance that is represented by this object and value is set with <i>setValue</i> method.
public boolean	<i>hasFixedLength()</i> on page 238	Returns The value of the appropriate OData attribute.
public boolean	<i>isComplex()</i> on page 239	Returns if the property has complex type and has child properties.
public boolean	<i>isCreatable()</i> on page 239	Returns The value of the appropriate OData attribute.
public boolean	<i>isDeletable()</i> on page 239	Returns The value of the appropriate OData attribute.
public boolean	<i>isFilterable()</i> on page 239	Returns The value of the appropriate OData attribute.
public boolean	<i>isNullable()</i> on page 240	Returns The value of the appropriate OData attribute.
public boolean	<i>isSearchable()</i> on page 240	Returns The value of the appropriate OData attribute.
public boolean	<i>isUnicode()</i> on page 240	Returns the value of the appropriate OData attribute.
public boolean	<i>isUpdatable()</i> on page 240	Returns The value of the appropriate OData attribute.
public void	<i>putChildPropertyData(IODataProperty)</i> on page 240	Put new child property to this property document.
public void	<i>setValue(String)</i> on page 241	Sets the value of the property, represented by this object.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataProperty.DetailDisplayOrderComparator class*Package*

```
com.sap.mobile.lib.parser.ODataProperty
```

Syntax

```
public class DetailDisplayOrderComparator
```

Members

All members of DetailDisplayOrderComparator, including inherited members. **Methods**

Syntax

```
public class ListDisplayOrderComparator
```

Members

All members of ListDisplayOrderComparator, including inherited members. **Methods**

Modifier and Type	Method	Description
public int	<i>compare(IODataProperty, IO-DataProperty)</i> on page 234	

compare(IODataProperty, IODataProperty) method

Syntax

```
public int compare (
    IODataProperty arg0,
    IODataProperty arg1
)
```

ODataProperty() constructor

Syntax

```
public ODataProperty ()
```

ODataProperty(int[], String[]) constructor

Syntax

```
protected ODataProperty (
    int[] routes,
    String[] values
)
```

ODataProperty(ParserDocument) constructor

Syntax

```
public ODataProperty (ParserDocument document)
```

getChildPropertiesData() method

Returns all the child properties added to this document with putChildProperty method.

Syntax

```
public List< IODataProperty > getChildPropertiesData ()
```

Returns

List of child properties.

getChildPropertiesDataWithAttribute(String, String) method

Returns list of appropriate contained Property OData elements with the given attribute value.

Syntax

```
public List< IODataProperty >
getChildPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

Returns

list of appropriate contained Property OData elements with the given attribute value

getChildPropertiesDataWithAttribute(String, String, boolean) method

Returns list of appropriate contained Property OData elements with the given attribute value.

Syntax

```
public List< IODataProperty >
getChildPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

Returns

list of appropriate contained Property OData elements with the given attribute value

getChildPropertyData(String) method

Return a single child property added with putChildProperty method.

Syntax

```
public IODataProperty getChildPropertyData (String propertyName)
```

Parameters

- **propertyName** – The name of the child property that should be returned.

Returns

The found child property or null if there is no child property with the given name.

getCollation() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getCollation ()
```

Returns

The value of the appropriate OData attribute

getDefaultValue() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getDefaultValue ()
```

Returns

The value of the appropriate OData attribute

getDetailDisplayOrder() method

In current version it return the same value as getListDisplayOrder.

Syntax

```
public int getDetailDisplayOrder ()
```

Returns

The value of 'display-order' attribute with default value = 0;

getLabel() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getLabel ()
```

Returns

The value of the appropriate OData attribute

getListDisplayOrder() method

In current version it returns the same value as `getDetailDisplayOrder`.

Syntax

```
public int getListDisplayOrder ()
```

Returns

The value of 'display-order' attribute with `defaultValue = 0`;

getMaxLength() method

Returns the value of the appropriate OData attribute with `defaultValue = 0`;

Syntax

```
public int getMaxLength ()
```

Returns

The value of the appropriate OData attribute with `defaultValue = 0`;

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate OData attribute

getPrecision() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getPrecision ()
```

Returns

The value of the appropriate OData attribute

getScale() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getScale ()
```

Returns

The value of the appropriate OData attribute

getSemantics() method

Returns the value of the appropriate OData attribute with default value = 0;

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate OData attribute with default value = 0;

getType() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getType ()
```

Returns

The value of the appropriate OData attribute

getValue() method

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

Syntax

```
public String getValue ()
```

Returns

the value of the property instance represented by this object.

Remarks

Otherwise it returns null.

Typically this object contains value only if this object was returned by an OData Entry.

hasFixedLength() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean hasFixedLength ()
```

Returns

The value of the appropriate OData attribute

isComplex() method

Returns if the property has complex type and has child properties.

Syntax

```
public boolean isComplex ()
```

Returns

true if the property has complex type and has child properties.

isCreatable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean isCreatable ()
```

Returns

The value of the appropriate OData attribute

isDeletable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean isDeletable ()
```

Returns

The value of the appropriate OData attribute

isFilterable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean isFilterable ()
```

Returns

The value of the appropriate OData attribute

isNullable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean isNullable ()
```

Returns

The value of the appropriate OData attribute

isSearchable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean isSearchable ()
```

Returns

The value of the appropriate OData attribute

isUnicode() method

Returns the value of the appropriate OData attribute.

Syntax

```
public boolean isUnicode ()
```

Returns

The value of the appropriate OData attribute

isUpdatable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public boolean isUpdatable ()
```

Returns

The value of the appropriate OData attribute

putChildPropertyData(IODataProperty) method

Put new child property to this property document.

Syntax

```
public void putChildPropertyData (IODataProperty property)
```

Parameters

- **property** – The child property

setValue(String) method

Sets the value of the property, represented by this object.

Syntax

```
public void setValue (String value)
```

Parameters

- **value** – The value of the property instance represented by this object.

Remarks

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an OData Entry object.

ODataReturnTypeEntry class

Consists of APIs related to OData ReturnTypeEntry.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataReturnTypeEntry extends ODataEntry implements IODataEntry
```

Base class

- *ODataEntry* on page 147

Implemented interfaces

- *IODataEntry* on page 415

Members

All members of ODataReturnTypeEntry, including inherited members. **Nested classes**

Modifier and Type	Class	Description
protectedclass	<i>ODataReturnSchema</i> on page 254	

Variables

Modifier and Type	Variable	Description
protected static final String	<code>_RETURN_TYPE_COLLECTION</code>	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataReturnEntryEntry(boolea)</i> on page 268	
public	<i>ODataReturnEntryEntry(ParserDocument, IODataFunctionImport, IODataSchema, boolea)</i> on page 268	

Methods

Modifier and Type	Method	Description
public void	<i>putPropertyValue(String, String)</i> on page 268	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>putPropertyValue(String, String, boolea)</i> on page 269	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>read(BufferedReader)</i> on page 269	
public void	<i>setCollectionId(String)</i> on page 269	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setSchema(IODataSchema)</i> on page 270	Maintains the reference to the appropriate OData Schema object.
public void	<i>write(BufferedWriter)</i> on page 270	

Inherited members from ODataEntry

Modifier and Type	Member	Description
protected void	<i>addPropertyValues(IODataProperty, Map<String, String>, String)</i> on page 159	
public ODataEntry	<i>clone()</i> on page 159	Creates a copy of this object.
protected void	<i>fillPropertyData(IODataProperty, String...)</i> on page 159	
protected void	<i>fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...)</i> on page 159	
public List< IODataLink >	<i>getActionLinks()</i> on page 159	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 160	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 160	
public Long	<i>getCacheTimestamp()</i> on page 160	
public String	<i>getCollectionId()</i> on page 160	Returns the Id of the OCata Collection that this Entry belongs to.
public String	<i>getContentType()</i> on page 160	Returns the content type of the entry.
public String	<i>getEtag()</i> on page 161	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 161	Returns the full execution URL hat can be used for filtering collection search for this single entry.

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 161	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 161	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 162	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public List< IODataIcon >	<i>getIcons()</i> on page 162	Returns the list of the appropriate OData elements.
public String	<i>getId()</i> on page 162	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 162	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 162	Returns the values of the properties that are marked as key properties in the OData Schema document.
public Date	<i>getLastUpdated()</i> on page 163	Returns The parsed value of the 'updated' OData Element.
public List< IODataLink >	<i>getLinks()</i> on page 163	Returns the list of the appropriate OData elements.
public String	<i>getMediaSrc()</i> on page 163	Returns the media source if the entry has a media content.

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getPropertiesData()</i> on page 163	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 164	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 164	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public IParserDocument	<i>getPropertiesDocument()</i> on page 164	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public String	<i>getPropertyValue(String...)</i> on page 165	Returns the value of the appropriate property.
public List< String >	<i>getPropertyValues(List<String[]>)</i> on page 165	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 166	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< IODataLink >	<i>getRelatedDataLinks()</i> on page 166	Returns OData Link objects that represents links to Related Data.

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 166	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public IODataSchema	<i>getSchema()</i> on page 166	Returns the appropriate OData Schema object.
public IODataLink	<i>getSelfLink()</i> on page 167	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public IODataLink	<i>getSubscriptionLink()</i> on page 167	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 167	Returns The value of the appropriate OData element.
public String	<i>getTitle()</i> on page 167	Returns The value of the appropriate OData element.
protected void	<i>materialize()</i> on page 167	
public	<i>ODataEntry()</i> on page 158	
public	<i>ODataEntry(boolean)</i> on page 158	
protected	<i>ODataEntry(int[], String[])</i> on page 158	
public	<i>ODataEntry(IODataSchema)</i> on page 158	
public	<i>ODataEntry(ParserDocument)</i> on page 158	
public	<i>ODataEntry(ParserDocument, IODataSchema)</i> on page 158	

Modifier and Type	Member	Description
public	<i>ODataEntry(JsonObject)</i> on page 158	Json Related
protected void	<i>parseCollectionId()</i> on page 168	
protected long	<i>parseEdmTime(String)</i> on page 168	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 168	Puts the new property element as a sub-element of the 'complex properties' OData element.
public void	<i>putContentType(String)</i> on page 168	Puts the content type for a new entry object.
public void	<i>putDocument(IParserDocument, String...)</i> on page 169	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 169	Sets id of this OData Entry document (value of appropriate OData Id element)
public void	<i>putMediaSrc(String)</i> on page 169	Puts the media source for a new entry object.
protected String	<i>resolveTargetCollection(IODataLink)</i> on page 171	
public void	<i>setAuthorName(String)</i> on page 171	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cacheState)</i> on page 171	
public void	<i>setCacheTimestamp(Long)</i> on page 171	
public void	<i>setIsLocal(boolean)</i> on page 171	

Modifier and Type	Member	Description
public void	<i>setSummary(String)</i> on page 172	Sets the value of the appropriate OData element.
public void	<i>setTitle(String)</i> on page 172	Sets the value of the appropriate OData element.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataReturnTypeInfo.ODataReturnSchema class

Package

```
com.sap.mobile.lib.parser.ODataReturnTypeInfo
```

Syntax

```
protected class ODataReturnSchema extends ODataSchema implements ILocalSchema
```

Base class

- *ODataSchema* on page 270

Implemented interfaces

- *ILocalSchema* on page 368

Members

All members of *ODataReturnSchema*, including inherited members. **Nested classes**

Modifier and Type	Class	Description
protectedclass	<i>ODataReturnEntityType</i> on page 260	

Variables

Modifier and Type	Variable	Description
protected List< IODataProperty >	referenceProperties	
protected ODataComplexType	complexType	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataReturnSchema()</i> on page 266	
public	<i>ODataReturnSchema(List< IODataProperty >)</i> on page 267	
public	<i>ODataReturnSchema(List< IODataProperty >, ODataComplexType)</i> on page 267	

Methods

Modifier and Type	Method	Description
public void	<i>addProperty(IODataProperty)</i> on page 267	
public ODataComplexType	<i>getComplexType(String)</i> on page 267	

Modifier and Type	Method	Description
public ODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 267	
public void	<i>read(BufferedReader)</i> on page 267	
public void	<i>write(BufferedWriter)</i> on page 267	

Inherited members from ODataSchema

Modifier and Type	Member	Description
public ODataAssociation	<i>getAssociation(String)</i> on page 276	Returns the appropriate OData Association element with the given relationship attribute.
public List< IODataAssociation >	<i>getAssociations()</i> on page 276	Returns the list of the appropriate OData elements.
public ODataAssociationSet	<i>getAssociationSet(String)</i> on page 277	Returns the appropriate AssociationSet with for given association.
public List< IODataAssociationSet >	<i>getAssociationSets()</i> on page 277	Returns the list of the appropriate OData elements.
public List< IODataComplexType >	<i>getComplexTypes()</i> on page 277	Returns The list of the appropriate OData element.
public ODataEntitySet	<i>getEntitySet(String)</i> on page 278	Returns The appropriate OData EntitySet.
public ODataEntityType	<i>getEntityType(String)</i> on page 278	Returns The 'EntityType' OData element associated with the reference argument.
public List< IODataFunctionImport >	<i>getFunctionImports()</i> on page 279	Returns The list of the 'FunctionImport' OData element.
public List< IODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 279	Returns List of FunctionImports valid for the appropriate collection.
public IODataServiceDocument	<i>getServiceDocument()</i> on page 279	Returns the appropriate OData Service Document.

Modifier and Type	Member	Description
public String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 279	Resolves the target collection Id of the given OData Navigation Property element.
public	<i>ODataSchema()</i> on page 276	
protected	<i>ODataSchema(int[], String[])</i> on page 276	
public	<i>ODataSchema(ParserDocument)</i> on page 276	
public void	<i>setServiceDocument(IOData-ServiceDocument)</i> on page 280	Maintains reference to the appropriate OData Service Document.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataReturnTypeInfo.ODataReturnSchema.ODataReturnEntityType class

Package

```
com.sap.mobile.lib.parser.ODataReturnTypeInfo.ODataReturnSchema
```

Syntax

```
protected class ODataReturnEntityType extends ODataEntityType
```

Base class

- *ODataEntityType* on page 137

Members

All members of *ODataReturnEntityType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected List< IODataProperty >	referenceProperties	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataReturnEntityType</i> (List< IODataProperty >) on page 266	

Methods

Modifier and Type	Method	Description
public List< IODataProperty >	<i>getProperties()</i> on page 266	

Inherited members from ODataEntityType

Modifier and Type	Member	Description
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 143	Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 144	Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 144	Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Modifier and Type	Member	Description
public List< String >	<i>getKeyPropertyNames()</i> on page 144	Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.
public String	<i>getName()</i> on page 144	Returns The value of the appropriate OData attribute.
public List< IODataNavigationProperty >	<i>getNavigationProperties()</i> on page 145	Returns The list of appropriate OData elements.
public IODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 145	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 145	Returns The list of appropriate OData elements with given attribute value.
public List< IODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 146	Returns The list of appropriate OData elements with given attribute value.
public IODataProperty	<i>getProperty(String)</i> on page 146	Returns The appropriate OData element with the given name.
public List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 146	Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.
protected IODataSchema	<i>getSchema()</i> on page 146	
public List< IODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 147	Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.
public boolean	<i>hasStream()</i> on page 147	Returns The value of the appropriate OData attribute.
public	<i>ODataEntityType()</i> on page 143	
protected	<i>ODataEntityType(int[], String[])</i> on page 143	

Modifier and Type	Member	Description
public	<i>ODataEntityType(ParserDocument)</i> on page 143	
protected void	<i>setSchema(IODataSchema)</i> on page 147	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

*ODataReturnEntityType(List< IODataProperty >) constructor**Syntax*

```
public ODataReturnEntityType (List< IODataProperty >
referenceProperties)
```

*getProperties() method**Syntax*

```
public List< IODataProperty > getProperties ()
```

*referenceProperties variable**Syntax*

```
protected List< IODataProperty > referenceProperties
```

*ODataReturnSchema() constructor**Syntax*

```
public ODataReturnSchema ()
```

*ODataReturnSchema(List< IODataProperty >) constructor**Syntax*

```
public ODataReturnSchema (List< IODataProperty > referenceProperties)
```

*ODataReturnSchema(List< IODataProperty >, ODataComplexType) constructor**Syntax*

```
public ODataReturnSchema (
    List< IODataProperty > referenceProperties,
    ODataComplexType complexType
)
```

*addProperty(IODataProperty) method**Syntax*

```
public void addProperty (IODataProperty property)
```

*getComplexType(String) method**Syntax*

```
public ODataComplexType getComplexType (String complexTypeReference)
```

*getEntityTypeForCollection(String) method**Syntax*

```
public ODataEntityType getEntityTypeForCollection (String
collectionId)
```

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

complexType variable

Syntax

```
protected ODataComplexType complexType
```

referenceProperties variable

Syntax

```
protected List< IODataProperty > referenceProperties
```

ODataReturnTypeEntry(boolean) constructor

Syntax

```
public ODataReturnTypeEntry (boolean isComplex)
```

ODataReturnTypeEntry(ParserDocument, IODataFunctionImport, IODataSchema, boolean) constructor

Syntax

```
public ODataReturnTypeEntry (
    ParserDocument document,
    IODataFunctionImport functionImport,
    IODataSchema schema,
    boolean isComplex
)
```

putPropertyValue(String, String) method

Puts the new property element as a sub-element of the 'properties' OData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
    String propertyValue
)
```

Parameters

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putPropertyValue(String, String, boolean) method

Puts the new property element as a sub-element of the 'properties' OData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
    String propertyValue,
    boolean useDefaultPrefix
)
```

Parameters

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-space.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setCollectionId(String) method

Maintains the Id of the OCata Collection that this Entry belongs to.

Syntax

```
public void setCollectionId (String collectionId)
```

Parameters

- **collectionId** – The Id of the OData Collection that this Entry belongs to

setSchema(IODataSchema) method

Maintains the reference to the appropriate OData Schema object.

Syntax

```
public void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The appropriate OData Schema object.

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

__RETURN_TYPE_COLLECTION variable

Syntax

```
protected static final String __RETURN_TYPE_COLLECTION
```

ODataSchema class

Consists of APIs related to OData Schema.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataSchema extends ParserDocument implements  
IODataSchema
```

Implemented interfaces

- *IODataSchema* on page 509

Derived classes

- *ODataReturnSchema* on page 254

Members

All members of *ODataSchema*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected <i>IODataServiceDocument</i>	<i>serviceDocument</i>	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataSchema()</i> on page 276	
protected	<i>ODataSchema(int[], String[])</i> on page 276	
public	<i>ODataSchema(ParserDocument)</i> on page 276	

Methods

Modifier and Type	Method	Description
public <i>ODataAssociation</i>	<i>getAssociation(String)</i> on page 276	Returns the appropriate OData Association element with the given relationship attribute.
public List< <i>IODataAssociation</i> >	<i>getAssociations()</i> on page 276	Returns the list of the appropriate OData elements.
public <i>ODataAssociationSet</i>	<i>getAssociationSet(String)</i> on page 277	Returns the appropriate AssociationSet with for given association.
public List< <i>IODataAssociationSet</i> >	<i>getAssociationSets()</i> on page 277	Returns the list of the appropriate OData elements.

Modifier and Type	Method	Description
public ODataComplexType	<i>getComplexType(String)</i> on page 277	Returns The 'ComplexType' OData element associated with the reference.
public List< IODataComplexType >	<i>getComplexTypes()</i> on page 277	Returns The list of the appropriate OData element.
public ODataEntitySet	<i>getEntitySet(String)</i> on page 278	Returns The appropriate OData EntitySet.
public ODataEntityType	<i>getEntityType(String)</i> on page 278	Returns The 'EntityType' OData element associated with the reference argument.
public ODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 278	Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.
public List< IODataFunctionImport >	<i>getFunctionImports()</i> on page 279	Returns The list of the 'FunctionImport' OData element.
public List< IODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 279	Returns List of FunctionImports valid for the appropriate collection.
public IODataServiceDocument	<i>getServiceDocument()</i> on page 279	Returns the appropriate OData Service Document.
public String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 279	Resolves the target collection Id of the given OData Navigation Property element.
public void	<i>setServiceDocument(IODataServiceDocument)</i> on page 280	Maintains reference to the appropriate OData Service Document.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataSchema() constructor*Syntax*

```
public ODataSchema ()
```

ODataSchema(int[], String[]) constructor*Syntax*

```
protected ODataSchema (
    int[] routes,
    String[] values
)
```

ODataSchema(ParserDocument) constructor*Syntax*

```
public ODataSchema (ParserDocument document)
```

getAssociation(String) method

Returns the appropriate OData Association element with the given relationship attribute.

Syntax

```
public ODataAssociation getAssociation (String relationship)
```

getAssociations() method

Returns the list of the appropriate OData elements.

Syntax

```
public List< IODataAssociation > getAssociations ()
```

Returns

List of the appropriate OData elements

getAssociationSet(String) method

Returns the appropriate AssociationSet with for given association.

Syntax

```
public ODataAssociationSet getAssociationSet (String association)
```

Parameters

- **association** – The association of the AssociationSet

Returns

The appropriate AssociationSet with for given association

getAssociationSets() method

Returns the list of the appropriate OData elements.

Syntax

```
public List< IODataAssociationSet > getAssociationSets ()
```

Returns

List of the appropriate OData elements

getComplexType(String) method

Returns The 'ComplexType' OData element associated with the reference.

Syntax

```
public ODataComplexType getComplexType (String complexTypeReference)
```

Parameters

- **complexTypeReference** – Reference to the appropriate Complex Type (example: 'namespace.complextypename')

Returns

The 'ComplexType' OData element associated with the reference

getComplexTypes() method

Returns The list of the appropriate OData element.

Syntax

```
public List< IODataComplexType > getComplexTypes ()
```

Returns

The list of the appropriate OData element

getEntitySet(String) method

Returns The appropriate OData EntitySet.

Syntax

```
public ODataEntitySet getEntitySet (String collectionId)
```

Parameters

- **collectionId** – The href of the collection to find the OData EntitySet for

Returns

The appropriate OData EntitySet

getEntityType(String) method

Returns The 'EntityType' OData element associated with the reference argument.

Syntax

```
public ODataEntityType getEntityType (String entityTypeReference)
```

Parameters

- **entityTypeReference** – Reference to the appropriate Entity Type (example: 'namespace.entitytypename')

Returns

The 'EntityType' OData element associated with the reference argument

getEntityTypeForCollection(String) method

Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.

Syntax

```
public ODataEntityType getEntityTypeForCollection (String collectionId)
```

Parameters

- **collectionId** – The Id to be compared with the name of 'EntitySet' elements

Returns

The matching EntityType

getFunctionImports() method

Returns The list of the 'FunctionImport' OData element.

Syntax

```
public List< IODataFunctionImport > getFunctionImports ()
```

Returns

The list of the 'FunctionImport' OData element

getFunctionImportsForCollection(String) method

Returns List of FunctionImports valid for the appropriate collection.

Syntax

```
public List< IODataFunctionImport >
getFunctionImportsForCollection (String collectionId)
```

Parameters

- **collectionId** – The href of the appropriate collection.

Returns

List of FunctionImports valid for the appropriate collection.

getServiceDocument() method

Returns the appropriate OData Service Document.

Syntax

```
public IODataServiceDocument getServiceDocument ()
```

Returns

The appropriate OData Service Document

getTargetCollectionIdForNavigationProperty(String, String) method

Resolves the target collection Id of the given OData Navigation Property element.

Syntax

```
public String getTargetCollectionIdForNavigationProperty (
    String sourceCollectionId,
    String navigationPropertyName
)
```

Parameters

- **sourceCollectionId** – The source Id of the source collection that is linked with the target collection
- **navigationPropertyName** – The name of the Navigation Property

Returns

The Id of the target collection

setServiceDocument(IODataServiceDocument) method

Maintains reference to the appropriate OData Service Document.

Syntax

```
public void setServiceDocument (IODataServiceDocument  
serviceDocument)
```

Parameters

- **serviceDocument** – The appropriate OData Service Document

serviceDocument variable

Syntax

```
protected IODataServiceDocument serviceDocument
```

IODataServiceDocument class

Consists of APIs related to OData Service Document.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class IODataServiceDocument extends ParserDocument  
implements IODataServiceDocument
```

Implemented interfaces

- *IODataServiceDocument* on page 521

Members

All members of IODataServiceDocument, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected IODataSchema	schema	
protected boolean	isJson	
protected Map< String, IODataOpenSearchDescription >	openSearchDescriptions	
protected JsonObject	gwServiceDocument	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataServiceDocument()</i> on page 285	
protected	<i>ODataServiceDocument(int[], String[])</i> on page 286	
public	<i>ODataServiceDocument(JsonObject)</i> on page 286	
public	<i>ODataServiceDocument(ParserDocument)</i> on page 286	

Methods

Modifier and Type	Method	Description
public List< IODataCollection >	<i>getAllCollections()</i> on page 286	Returns the list of all 'collection' OData element contained by the 'workspace' elements.
public String	<i>getBaseUrl()</i> on page 286	Returns The value of the 'base' OData attribute.
public String	<i>getEtag()</i> on page 286	Returns The value of the 'etag' OData attribute.
public String	<i>getLanguage()</i> on page 287	Returns the value of the 'lang' OData attribute.
public IODataOpenSearchDescription	<i>getOpenSearchDescription(String)</i> on page 287	Returns the appropriate OpenSearch Description Document for the given collection.
public IODataSchema	<i>getSchema()</i> on page 287	Returns the appropriate OData Schema document.

Modifier and Type	Method	Description
public String	<i>getSchemaUrl()</i> on page 287	Returns The full URL that can be used for retrieving the OData Schema document.
public List< IODataWorkspace >	<i>getWorkspaces()</i> on page 288	Returns the list of appropriate OData elements.
public void	<i>read(BufferedReader)</i> on page 288	
public void	<i>setOpenSearchDescription(String, IODataOpenSearchDescription)</i> on page 288	Maintains the appropriate OpenSearch Description Document for the given collection.
public void	<i>setSchema(IODataSchema)</i> on page 288	Maintains the appropriate OData Schema document.
public void	<i>write(BufferedWriter)</i> on page 289	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataServiceDocument() constructor

Syntax

```
public ODataServiceDocument ()
```

ODataServiceDocument(int[], String[]) constructor

Syntax

```
protected ODataServiceDocument (  
    int[] routes,  
    String[] values  
)
```

ODataServiceDocument(JsonObject) constructor

Syntax

```
public ODataServiceDocument (JsonObject document)
```

ODataServiceDocument(ParserDocument) constructor

Syntax

```
public ODataServiceDocument (ParserDocument document)
```

getAllCollections() method

Returns the list of all 'collection' OData element contained by the 'workspace' elements.

Syntax

```
public List< IODataCollection > getAllCollections ()
```

Returns

The list of all 'collection' OData element contained by the 'workspace' elements

getBaseUrl() method

Returns The value of the 'base' OData attribute.

Syntax

```
public String getBaseUrl ()
```

Returns

The value of the 'base' OData attribute

getEtag() method

Returns The value of the 'etag' OData attribute.

Syntax

```
public String getEtag ()
```

Returns

The value of the 'etag' OData attribute

getLanguage() method

Returns the value of the 'lang' OData attribute.

Syntax

```
public String getLanguage ()
```

Returns

The value of the 'lang' OData attribute

getOpenSearchDescription(String) method

Returns the appropriate OpenSearch Description Document for the given collection.

Syntax

```
public IODataOpenSearchDescription getOpenSearchDescription  
(String collectionId)
```

Parameters

- **collectionId** – The Id of the collection

Returns

The appropriate OpenSearch Description Document

getSchema() method

Returns the appropriate OData Schema document.

Syntax

```
public IODataSchema getSchema ()
```

Returns

The appropriate OData Schema document

getSchemaUrl() method

Returns The full URL that can be used for retrieving the OData Schema document.

Syntax

```
public String getSchemaUrl ()
```

Returns

The full URL that can be used for retrieving the OData Schema document

getWorkspaces() method

Returns the list of appropriate OData elements.

Syntax

```
public List< IODataWorkspace > getWorkspaces ()
```

Returns

The list of appropriate OData elements

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setOpenSearchDescription(String, IODataOpenSearchDescription) method

Maintains the appropriate OpenSearch Description Document for the given collection.

Syntax

```
public void setOpenSearchDescription (  
    String collectionId,  
    IODataOpenSearchDescription openSearchDescription  
)
```

Parameters

- **collectionId** – The Id of the collection
- **openSearchDescription** – The appropriate OpenSearch Description Document

setSchema(IODataSchema) method

Maintains the appropriate OData Schema document.

Syntax

```
public void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The appropriate OData Schema document

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

*gwServiceDocument variable**Syntax*

```
protected JsonObject gwServiceDocument
```

*isJson variable**Syntax*

```
protected boolean isJson
```

*openSearchDescriptions variable**Syntax*

```
protected Map< String, IODataOpenSearchDescription >
openSearchDescriptions
```

*schema variable**Syntax*

```
protected IODataSchema schema
```

ODataSubscriptionEntry class

Consists of APIs related to OData SubscriptionEntry.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataSubscriptionEntry extends ODataEntry
implements IODataSubscriptionEntry
```

Base class

- *ODataEntry* on page 147

Implemented interfaces

- *IODataSubscriptionEntry* on page 529

Members

All members of *ODataSubscriptionEntry*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ODataSubscriptionEntry()</i> on page 308	
protected	<i>ODataSubscriptionEntry(int[], String[])</i> on page 308	
public	<i>ODataSubscriptionEntry(ParserDocument)</i> on page 308	
public	<i>ODataSubscriptionEntry(String, String)</i> on page 308	
public	<i>ODataSubscriptionEntry(String, String, String, String, String, String)</i> on page 308	

Methods

Modifier and Type	Method	Description
public String	<i>getCollection()</i> on page 309	Returns The value of the appropriate entry property.
public String	<i>getDeliveryAddress()</i> on page 309	Returns The value of the appropriate entry property.
public String	<i>getFilter()</i> on page 309	Returns The value of the appropriate entry property.

Modifier and Type	Method	Description
public String	<i>getSelect()</i> on page 309	Returns The value of the appropriate entry property.
public void	<i>setCollection(String)</i> on page 309	Sets the value of the appropriate entry property.
public void	<i>setDeliveryAddress(String)</i> on page 310	Sets the value of the appropriate entry property.
public void	<i>setFilter(String)</i> on page 310	Sets the value of the appropriate entry property.
public void	<i>setSelect(String)</i> on page 310	Sets the value of the appropriate entry property.

Inherited members from ODataEntry

Modifier and Type	Member	Description
protected void	<i>addPropertyValues(IODataProperty, Map< String, String >, String)</i> on page 159	
public ODataEntry	<i>clone()</i> on page 159	Creates a copy of this object.
protected void	<i>fillPropertyData(IODataProperty, String...)</i> on page 159	
protected void	<i>fillPropertyDataWithAttribute(IODataProperty, String, String, boolean, String...)</i> on page 159	
public List< IODataLink >	<i>getActionLinks()</i> on page 159	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 160	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCacheState()</i> on page 160	
public Long	<i>getCacheTimestamp()</i> on page 160	

Modifier and Type	Member	Description
public String	<i>getCollectionId()</i> on page 160	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getContentType()</i> on page 160	Returns the content type of the entry.
public String	<i>getEtag()</i> on page 161	Returns the Id of the OData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 161	Returns the full execution URL that can be used for filtering collection search for this single entry.
public List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 161	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 161	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 162	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public List< IODataIcon >	<i>getIcons()</i> on page 162	Returns the list of the appropriate OData elements.

Modifier and Type	Member	Description
public String	<i>getId()</i> on page 162	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 162	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 162	Returns the values of the properties that are marked as key properties in the OData Schema document.
public Date	<i>getLastUpdated()</i> on page 163	Returns The parsed value of the 'updated' OData Element.
public List< IODataLink >	<i>getLinks()</i> on page 163	Returns the list of the appropriate OData elements.
public String	<i>getMediaSrc()</i> on page 163	Returns the media source if the entry has a media content.
public List< IODataProperty >	<i>getPropertiesData()</i> on page 163	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 164	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 164	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public IParserDocument	<i>getPropertiesDocument()</i> on page 164	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

Modifier and Type	Member	Description
public String	<i>getPropertyValue(String...)</i> on page 165	Returns the value of the appropriate property.
public List< String >	<i>getPropertyValues(List< String[]>)</i> on page 165	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 166	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< IODataLink >	<i>getRelatedDataLinks()</i> on page 166	Returns OData Link objects that represents links to Related Data.
public List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 166	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public IODataSchema	<i>getSchema()</i> on page 166	Returns the appropriate OData Schema object.
public IODataLink	<i>getSelfLink()</i> on page 167	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public IODataLink	<i>getSubscriptionLink()</i> on page 167	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 167	Returns The value of the appropriate OData element.
public String	<i>getTitle()</i> on page 167	Returns The value of the appropriate OData element.
protected void	<i>materialize()</i> on page 167	
public	<i>ODataEntry()</i> on page 158	

Modifier and Type	Member	Description
public	<i>ODataEntry(boolean)</i> on page 158	
protected	<i>ODataEntry(int[], String[])</i> on page 158	
public	<i>ODataEntry(IONDataSchema)</i> on page 158	
public	<i>ODataEntry(ParserDocument)</i> on page 158	
public	<i>ODataEntry(ParserDocument, IONDataSchema)</i> on page 158	
public	<i>ODataEntry(JsonObject)</i> on page 158	Json Related
protected void	<i>parseCollectionId()</i> on page 168	
protected long	<i>parseEdmTime(String)</i> on page 168	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 168	Puts the new property element as a sub-element of the 'complex properties' OData element.
public void	<i>putContentType(String)</i> on page 168	Puts the content type for a new entry object.
public void	<i>putDocument(IParserDocument, String...)</i> on page 169	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 169	Sets id of this OData Entry document (value of appropriate OData Id element)
public void	<i>putMediaSrc(String)</i> on page 169	Puts the media source for a new entry object.

Modifier and Type	Member	Description
public void	<i>putPropertyValue(String, String)</i> on page 169	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 170	Puts the new property element as a sub-element of the 'properties' OData element.
public void	<i>read(BufferedReader)</i> on page 170	
protected String	<i>resolveTargetCollection(IODataLink)</i> on page 171	
public void	<i>setAuthorName(String)</i> on page 171	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCacheState(cacheState)</i> on page 171	
public void	<i>setCacheTimestamp(Long)</i> on page 171	
public void	<i>setCollectionId(String)</i> on page 171	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 171	
public void	<i>setSchema(IODataSchema)</i> on page 172	Maintains the reference to the appropriate OData Schema object.
public void	<i>setSummary(String)</i> on page 172	Sets the value of the appropriate OData element.
public void	<i>setTitle(String)</i> on page 172	Sets the value of the appropriate OData element.
public void	<i>write(BufferedWriter)</i> on page 172	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

Inherited members from IODataEntry

Modifier and Type	Member	Description
public abstract List< IOData-Link >	<i>getActionLinks()</i> on page 425	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 425	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 426	
public Long	<i>getCacheTimestamp()</i> on page 426	
public abstract String	<i>getCollectionId()</i> on page 426	Returns the Id of the OCata Collection that this Entry belongs to.
public abstract String	<i>getContentType()</i> on page 426	Returns the content type of the entry.
public abstract String	<i>getEtag()</i> on page 426	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 427	Returns the full execution URL hat can be used for filtering collection search for this single entry.

Modifier and Type	Member	Description
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public abstract List< IODataIcon >	<i>getIcons()</i> on page 428	Returns the list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 428	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 428	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 428	Returns the values of the properties that are marked as key properties in the OData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 428	Returns The parsed value of the 'updated' OData Element.
public abstract List< IODataLink >	<i>getLinks()</i> on page 429	Returns the list of the appropriate OData elements.
public abstract String	<i>getMediaSrc()</i> on page 429	Returns the media source if the entry has a media content.

Modifier and Type	Member	Description
public abstract List< IODataProperty >	<i>getPropertiesData()</i> on page 429	Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 429	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 430	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract IParserDocument	<i>getPropertiesDocument()</i> on page 430	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 431	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 431	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 432	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List<String[]>)</i> on page 432	Return list of property values for the given property paths.

Modifier and Type	Member	Description
public abstract List< IOData-Link >	<i>getRelatedDataLinks()</i> on page 432	Returns OData Link objects that represents links to Related Data.
public abstract List< IODataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 433	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract IODataSchema	<i>getSchema()</i> on page 433	Returns the appropriate OData Schema object.
public abstract IODataLink	<i>getSelfLink()</i> on page 433	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 433	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 434	Returns The value of the appropriate OData element.
public abstract String	<i>getTitle()</i> on page 434	Returns The value of the appropriate OData element.
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 434	Puts the new property element as a sub-element of the 'complex properties' OData element.
public abstract void	<i>putContentType(String)</i> on page 434	Puts the content type for a new entry object.
public abstract void	<i>putId(String)</i> on page 435	Sets id of this OData Entry document (value of appropriate OData Id element)
public abstract void	<i>putMediaSrc(String)</i> on page 435	Puts the media source for a new entry object.

Modifier and Type	Member	Description
public abstract void	<i>putPropertyValue(String, String)</i> on page 435	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 436	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>setAuthorName(String)</i> on page 436	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCacheState(cache.State)</i> on page 436	
public void	<i>setCacheTimestamp(Long)</i> on page 436	
public abstract void	<i>setCollectionId(String)</i> on page 437	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 437	
public abstract void	<i>setSchema(IODataSchema)</i> on page 437	Maintains the reference to the appropriate OData Schema object.
public abstract void	<i>setSummary(String)</i> on page 437	Sets the value of the appropriate OData element.
public abstract void	<i>setTitle(String)</i> on page 437	Sets the value of the appropriate OData element.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataSubscriptionEntry() constructor*Syntax*

```
public ODataSubscriptionEntry ()
```

ODataSubscriptionEntry(int[], String[]) constructor*Syntax*

```
protected ODataSubscriptionEntry (
    int[] routes,
    String[] values
)
```

ODataSubscriptionEntry(ParserDocument) constructor*Syntax*

```
public ODataSubscriptionEntry (ParserDocument document)
```

ODataSubscriptionEntry(String, String) constructor*Syntax*

```
public ODataSubscriptionEntry (
    String deliveryAddress,
    String collection
)
```

ODataSubscriptionEntry(String, String, String, String, String, String) constructor*Syntax*

```
public ODataSubscriptionEntry (
    String deliveryAddress,
    String collection,
    String filter,
    String select,
    String title,
    String author
)
```

getCollection() method

Returns The value of the appropriate entry property.

Syntax

```
public String getCollection ()
```

Returns

The value of the appropriate entry property

getDeliveryAddress() method

Returns The value of the appropriate entry property.

Syntax

```
public String getDeliveryAddress ()
```

Returns

The value of the appropriate entry property

getFilter() method

Returns The value of the appropriate entry property.

Syntax

```
public String getFilter ()
```

Returns

The value of the appropriate entry property

getSelect() method

Returns The value of the appropriate entry property.

Syntax

```
public String getSelect ()
```

Returns

The value of the appropriate entry property

setCollection(String) method

Sets the value of the appropriate entry property.

Syntax

```
public void setCollection (String collection)
```

Parameters

- **collection** – The new value of the appropriate entry property

setDeliveryAddress(String) method

Sets the value of the appropriate entry property.

Syntax

```
public void setDeliveryAddress (String deliveryAddress)
```

Parameters

- **deliveryAddress** –

setFilter(String) method

Sets the value of the appropriate entry property.

Syntax

```
public void setFilter (String filterString)
```

Parameters

- **filterString** – The new value of the appropriate entry property

setSelect(String) method

Sets the value of the appropriate entry property.

Syntax

```
public void setSelect (String selectString)
```

Parameters

- **selectString** – The new value of the appropriate entry property

ODataURL class

Consists of APIs related to OData URL.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataURL extends ParserDocument implements  
IODataURL
```

Implemented interfaces

- *IODataURL* on page 541

Members

All members of *IODataURL*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>IODataURL()</i> on page 315	
protected	<i>IODataURL(int[], String[])</i> on page 316	
public	<i>IODataURL(ParserDocument)</i> on page 316	

Methods

Modifier and Type	Method	Description
public List< String >	<i>getMandatoryTemplateParameters()</i> on page 316	Returns the list of mandatory template parameter names.
protected List< String >	<i>getMandatoryTemplateParameters(String)</i> on page 316	
public List< String >	<i>getOptionalTemplateParameters()</i> on page 316	Returns the list of optional template parameter names.
protected List< String >	<i>getOptionalTemplateParameters(String)</i> on page 316	
public String	<i>getTemplate()</i> on page 317	Returns the value of the appropriate OData attribute.
public List< String >	<i>getTemplateParameters()</i> on page 317	Returns the list of all template parameter names.
public String	<i>getType()</i> on page 317	Returns the value of the appropriate OData attribute.

Modifier and Type	Method	Description
public String	<i>getUrl()</i> on page 317	Returns the full URL of this OData attribute without parameters.
public String	<i>getUrlFromTemplate(Map<String, String >)</i> on page 318	Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.
public void	<i>read(BufferedReader)</i> on page 318	
protected void	<i>setBaseUrl(String)</i> on page 318	
public void	<i>write(BufferedWriter)</i> on page 318	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataURL() constructor

Syntax

```
public ODataURL ()
```

ODataURL(int[], String[]) constructor

Syntax

```
protected ODataURL (  
    int[] routes,  
    String[] values  
)
```

ODataURL(ParserDocument) constructor

Syntax

```
public ODataURL (ParserDocument document)
```

getMandatoryTemplateParameters() method

Returns the list of mandatory template parameter names.

Syntax

```
public List< String > getMandatoryTemplateParameters ()
```

Returns

the list of mandatory template parameter names

getMandatoryTemplateParameters(String) method

Syntax

```
protected List< String > getMandatoryTemplateParameters  
(String template)
```

getOptionalTemplateParameters() method

Returns the list of optional template parameter names.

Syntax

```
public List< String > getOptionalTemplateParameters ()
```

Returns

the list of optional template parameter names

getOptionalTemplateParameters(String) method

Syntax

```
protected List< String > getOptionalTemplateParameters (String  
template)
```

getTemplate() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getTemplate ()
```

Returns

The value of the appropriate OData attribute

getTemplateParameters() method

Returns the list of all template parameter names.

Syntax

```
public List< String > getTemplateParameters ()
```

Returns

the list of all template parameter names

getType() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getType ()
```

Returns

The value of the appropriate OData attribute

getUrl() method

Returns the full URL of this OData attribute without parameters.

Syntax

```
public String getUrl ()
```

Returns

The full URL this OData attribute without parameters

getUrlFromTemplate(Map< String, String >) method

Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.

Syntax

```
public String getUrlFromTemplate (Map< String, String >
parameters)
```

Returns

The full URL this OData attribute with parameters names and values

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

baseUrl variable**Syntax**

```
protected String baseUrl
```

ODataWorkspace class

Consists of APIs related to OData Workspace.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ODataWorkspace extends ParserDocument implements
IODataWorkspace
```

Implemented interfaces

- *IODataWorkspace* on page 547

Members

All members of ODataWorkspace, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>ODataWorkspace()</i> on page 323	
protected	<i>ODataWorkspace(int[], String[])</i> on page 323	
public	<i>ODataWorkspace(ParserDocument)</i> on page 323	

Methods

Modifier and Type	Method	Description
public List< IODataCollection >	<i>getCollections()</i> on page 324	Returns The list of of 'collection' OData element.

Modifier and Type	Method	Description
public String	<i>getSemantics()</i> on page 324	Returns the value of the appropriate OData attribute.
public String	<i>getTitle()</i> on page 324	Returns the value of the appropriate OData element.
protected void	<i>setBaseUrl(String)</i> on page 324	

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route. Documents will be paired to elements in order. Elements with greater or equals index than size of new elements will be untouched. Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

ODataWorkspace() constructor

Syntax

```
public ODataWorkspace ()
```

ODataWorkspace(int[], String[]) constructor

Syntax

```
protected ODataWorkspace (
    int[] routes,
    String[] values
)
```

ODataWorkspace(ParserDocument) constructor

Syntax

```
public ODataWorkspace (ParserDocument document)
```

getCollections() method

Returns The list of of 'collection' OData element.

Syntax

```
public List< IODataCollection > getCollections ()
```

Returns

The list of of 'collection' OData element.

getSemantics() method

Returns the value of the appropriate OData attribute.

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate OData attribute

getTitle() method

Returns the value of the appropriate OData element.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate OData element

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

baseUrl variable

Syntax

```
protected String baseUrl
```

Parser class

Class which contains APIs for parsing service document, metadata document, function imports, entries, feeds etc.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class Parser implements IParser
```

Implemented interfaces

- *IParser* on page 553

Members

All members of Parser, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected SAXParser	parser	
protected File	defaultFolder	
protected int	logLevel	
protected ILogger	logger	
protected IPreferences	preferences	
protected static final String	NAMEMAP_FILENAME	

Constructors

Modifier and Type	Constructor	Description
public	<i>Parser(IPreferences, ILogger)</i> on page 328	

Methods

Modifier and Type	Method	Description
public String	<i>buildODataDocument(IParser-Document)</i> on page 328	Builds a valid OData Entry XML Post body from the entry argument.

Modifier and Type	Method	Description
public String	<i>buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int)</i> on page 328	Builds a valid OData Entry JSON Post body from the entry argument.
public void	<i>enableParserPerformanceLog(boolean, Context)</i> on page 329	This method is to be called if performance data point are to be enabled for Parser.
public IParserDocument	<i>parse(InputStream)</i> on page 329	Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.
public IParserDocument	<i>parse(String)</i> on page 330	Parses the Source and converts it to a Java Object containing all the information that were contained by the source.
public List< IODataEntry >	<i>parseFunctionImportResult(String, IODataFunctionImport, IODataSchema)</i> on page 330	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..
public List< IODataEntry >	<i>parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema)</i> on page 331	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..
public List< IODataEntry >	<i>parseODataEntries(String, String, IODataSchema)</i> on page 332	Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

Modifier and Type	Method	Description
public List< IODataEntry >	<i>parseODataEntries(InputStream, String, IODataSchema)</i> on page 332	Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.
public IODataError	<i>parseODataError(String)</i> on page 333	Parses the OData Error.
public IODataError	<i>parseODataError(InputStream)</i> on page 333	Parses the OData Error from stream.
public IODataFeed	<i>parseODataFeed(String, String, IODataSchema)</i> on page 334	Parse OData Feed, support for Delta Query.
public IODataFeed	<i>parseODataFeed(InputStream, String, IODataSchema)</i> on page 334	Parse OData Feed from stream, support for Delta Query.
public IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(String, String, IODataServiceDocument)</i> on page 334	Parses the OData Open Search Description.
public IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument)</i> on page 335	Parses the OData Open Search Description from stream.
public IODataSchema	<i>parseODataSchema(String, IODataServiceDocument)</i> on page 335	Parses the OData Schema.
public IODataSchema	<i>parseODataSchema(InputStream, IODataServiceDocument)</i> on page 336	Parses the OData Schema from stream.
public IODataServiceDocument	<i>parseODataServiceDocument(String)</i> on page 336	Parses the OData Service Document.
public IODataServiceDocument	<i>parseODataServiceDocument(InputStream)</i> on page 337	Parses the OData Service Document from stream.
protected synchronized void	<i>readNameMap()</i> on page 337	
protected void	<i>writeNameMap(int)</i> on page 337	

Parser(IPreferences, ILogger) constructor

Syntax

```
public Parser (  
    IPreferences preferences,  
    ILogger logger  
) throws ParseException
```

buildODataDocument(IParserDocument) method

Builds a valid OData Entry XML Post body from the entry argument.

Syntax

```
public String buildODataDocument (IParserDocument document)  
throws ParseException
```

Parameters

- **entry** – The ODataEntry object to build the from
- **document** – The ParserDocument object to build the from

Returns

The built documentThe built document

Exceptions

- **ParseException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds and representation of the document argument
- **ParseException class** – If building document has failed
- **IllegalArgumentException** – If the argument is null

buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int) method

Builds a valid OData Entry JSON Post body from the entry argument.

Syntax

```
public String buildODataEntryRequestBody (  
    IODataEntry entry,  
    String collectionId,  
    IODataSchema schema,  
    int formatType  
) throws ParseException
```

Parameters

- **entry** – The ODataEntry object to build the from
- **collectionID** –
- **entry** – The ODataEntry object to build the from
- **collectionID** – Collection t which the entry would be posted
- **schema** – Schema of the service
- **formatType** – Format of the post body to be built 1 - Atom/XML 2 - JSON

Returns

The built document
The built document

Exceptions

- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds a valid OData Entry XML or JSON Post body from the entry argument
- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null

enableParserPerformanceLog(boolean, Context) method

This method is to be called if performance data point are to be enabled for Parser.

Syntax

```
public void enableParserPerformanceLog (
    boolean perflog,
    Context applicationContext
)
```

Parameters

- **perflog** –
- **applicationContext** –

parse(InputStream) method

Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.

Syntax

```
public IParserDocument parse (InputStream stream) throws
ParserException
```

Parameters

- **stream** – A stream that holds a syntactically valid document

Returns

The Object representation of the parsed document

Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

parse(String) method

Parses the Source and converts it to a Java Object containing all the information that were contained by the source.

Syntax

```
public IParserDocument parse (String document) throws  
ParserException
```

Parameters

- **A** – syntactically valid document

Returns

The Object representation of the parsed document

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseFunctionImportResult(String, IODataFunctionImport, IODataSchema) method

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.

Syntax

```
public List< IODataEntry > parseFunctionImportResult (  
    String document,  
    IODataFunctionImport functionImport,  
    IODataSchema schema  
) throws ParserException, IllegalArgumentException
```

Parameters

- **document** – The Function Import result document
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

Returns

List of OData Entry containing the result values

Exceptions

- **ParserException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema) method

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..

Syntax

```
public List< IODataEntry > parseFunctionImportResult (
    InputStream stream,
    IODataFunctionImport functionImport,
    IODataSchema schema
) throws ParserException, IllegalArgumentException
```

Parameters

- **stream** – The function Import result stream
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

Returns

List of OData Entry containing the result values

Exceptions

- **ParserException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

parseODataEntries(String, String, IODataSchema) method

Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

Syntax

```
public List< IODataEntry > parseODataEntries (
    String entries,
    String collectionId,
    IODataSchema schema
) throws ParseException, IllegalArgumentException
```

Parameters

- **entries** – The source of either a single OData Entry or OData Feed of several OData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

Returns

The list of the OData Entries contained by the source

Exceptions

- **ParseException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataEntries(InputStream, String, IODataSchema) method

Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.

Syntax

```
public List< IODataEntry > parseODataEntries (
    InputStream stream,
    String collectionId,
    IODataSchema schema
) throws ParseException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds the source of either a single OData Entry or OData Feed of several OData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

Returns

The list of the OData Entries contained by the source

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataError(String) method

Parses the OData Error.

Syntax

```
public IODataError parseODataError (String error) throws
ParserException
```

Parameters

- **error** – The OData Error

Returns

The OData Error document

Exceptions

- **ParserException class** – If the If the document source is invalid source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataError(InputStream) method

Parses the OData Error from stream.

Syntax

```
public IODataError parseODataError (InputStream stream) throws
ParserException
```

Parameters

- **stream** – The OData Error as stream

Returns

The OData Error document

Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataFeed(String, String, IODataSchema) method

Parse OData Feed, support for Delta Query.

Syntax

```
public IODataFeed parseODataFeed (  
    String feed,  
    String collectionId,  
    IODataSchema schema  
) throws ParseException
```

Parameters

- **feed** –
- **collectionId** –
- **schema** –

Exceptions

- **SDMParseException** –

parseODataFeed(InputStream, String, IODataSchema) method

Parse OData Feed from stream, support for Delta Query.

Syntax

```
public IODataFeed parseODataFeed (  
    InputStream stream,  
    String collectionId,  
    IODataSchema schema  
) throws ParseException
```

Parameters

- **stream** –
- **collectionId** –
- **schema** –

Exceptions

- **ParseException class** –

parseODataOpenSearchDescription(String, String, IODataServiceDocument) method

Parses the OData Open Search Description.

Syntax

```
public IODataOpenSearchDescription  
parseODataOpenSearchDescription (  

```

```
String openSearchDescription,
String collectionId,
IODataServiceDocument serviceDocument
) throws ParseException, IllegalArgumentException
```

Parameters

- **openSearchDescription** – The OData Open Search Description

Returns

OData Open Search Description document

Exceptions

- **ParseException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument) method

Parses the OData Open Search Description from stream.

Syntax

```
public IODataOpenSearchDescription
parseODataOpenSearchDescription (
    InputStream stream,
    String collectionId,
    IODataServiceDocument serviceDocument
) throws ParseException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds the OData Open Search Description .

Returns

OData Open Search Description document

Exceptions

- **ParseException class** – If the stream source is invalid.
- **IllegalArgumentException** – If the argument is null.

parseODataSchema(String, IODataServiceDocument) method

Parses the OData Schema.

Syntax

```
public IODataSchema parseODataSchema (
    String schema,
```

```
IODataServiceDocument serviceDocument  
) throws ParseException, IllegalArgumentException
```

Parameters

- **schema** – The OData Schema
- **serviceDocument** – The appropriate OData Service Document object

Returns

The OData Schema document

Exceptions

- **ParseException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataSchema(InputStream, IODataServiceDocument) method

Parses the OData Schema from stream.

Syntax

```
public IODataSchema parseODataSchema (  
    InputStream stream,  
    IODataServiceDocument serviceDocument  
) throws ParseException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds OData Schema
- **serviceDocument** – The appropriate OData Service Document object

Returns

The OData Schema document

Exceptions

- **ParseException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataServiceDocument(String) method

Parses the OData Service Document.

Syntax

```
public IODataServiceDocument parseODataServiceDocument  
(String serviceDocument) throws ParseException,  
IllegalArgumentException
```

Parameters

- **serviceDocument** – The OData Service Document

Returns

The OData Service Document

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataServiceDocument(InputStream) method

Parses the OData Service Document from stream.

Syntax

```
public IODataServiceDocument parseODataServiceDocument
(InputStream stream) throws ParserException,
IllegalArgumentException
```

Parameters

- **stream** – The stream that holds OData Service Document

Returns

The OData Service Document

Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

*readNameMap() method**Syntax*

```
protected synchronized void readNameMap () throws IOException
```

*writeNameMap(int) method**Syntax*

```
protected void writeNameMap (int starpos) throws IOException
```

defaultFolder variable

Syntax

```
protected File defaultFolder
```

logger variable

Syntax

```
protected ILogger logger
```

logLevel variable

Syntax

```
protected int logLevel
```

NAMEMAP_FILENAME variable

Syntax

```
protected static final String NAMEMAP_FILENAME
```

parser variable

Syntax

```
protected SAXParser parser
```

preferences variable

Syntax

```
protected IPreferences preferences
```

ParserException class

Main exception throwable by Parser or Odata documents.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class ParserException
```

Members

All members of ParserException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ParserException()</i> on page 339	Constructor.
public	<i>ParserException(int, String)</i> on page 339	
public	<i>ParserException(int, String, Throwable)</i> on page 339	
public	<i>ParserException(String)</i> on page 340	Constructor.
public	<i>ParserException(String, Throwable)</i> on page 340	Constructor.
public	<i>ParserException(Throwable)</i> on page 340	Constructor.

Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 340	

ParserException() constructor
 Constructor.

Syntax

```
public ParserException ()
```

ParserException(int, String) constructor

Syntax

```
public ParserException (
    int iErrorCode,
    String detailMessage
)
```

ParserException(int, String, Throwable) constructor

Syntax

```
public ParserException (
    int iErrorCode,
    String detailMessage,
    Throwable throwable
)
```

ParserException(String) constructor

Constructor.

Syntax

```
public ParserException (String detailMessage)
```

Parameters

- **detailMessage** – Error message

ParserException(String, Throwable) constructor

Constructor.

Syntax

```
public ParserException (
    String detailMessage,
    Throwable throwable
)
```

Parameters

- **detailMessage** – Error message
- **throwable** – Route exception

ParserException(Throwable) constructor

Constructor.

Syntax

```
public ParserException (Throwable throwable)
```

Parameters

- **throwable** – Route exception

getErrorCode() method

Syntax

```
public int getErrorCode ()
```

Semantics class

Constant class with possible values of 'semantics' (SAP name-space) OData attribute collected from vCard 2.1 specification.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public class Semantics
```

Members

All members of Semantics, including inherited members. **Variables**

```
com.sap.mobile.lib.parser
```

Syntax

```
public interface Constants
```

Members

All members of Constants, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	SHARED_PREFERENCES	Shared preferences.
public static final int	DEFAULT_CONNECTION_TIMEOUT	Default connection timeout.
public static final int	DEFAULT_SOCKET_CONNECTION_TIMEOUT	Default socket connection timeout.
public static final int	DEFAULT_HTTP_PORT	Default HTTP port.
public static final int	DEFAULT_HTTPS_PORT	Default HTTPS port.
public static final String	DEFAULT_SAP_APPLICATIONID_HEADER_VALUE	Default application ID.
public static final String	DEFAULT_PROXY_HOST	Default proxy host.
public static final int	DEFAULT_PROXY_PORT	Default proxy port.
public static final String	HTTP_HANDLER_CLASS	Socket Connection handler class.
public static final String	IMO_HANDLER_CLASS	IMO Connection handler class.

Modifier and Type	Variable	Description
public static final String	DEFAULT_HANDLER_CLASS_NAME	Default handler class.
public static final boolean	DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE	Default security mode.
public static final int	DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE	Default buffer size.
public static final int	MIN_PERSISTENCE_BYTE_BUFFER_SIZE	Minimum buffer size.
public static final int	MAX_PERSISTENCE_BYTE_BUFFER_SIZE	Maximum buffer size.
public static final String	DEFAULT_CIPHER_TRANSFORMATION	Default cipher transformation.
public static final int	DEFAULT_STORE_CAPACITY	Default cache capacity.
public static final int	MAXIMUM_STORE_CAPACITY	Maximum cache capacity.
public static final int	DEFAULT_SEARCH_LIMIT	Default for maximum search results retrieved from cache.
public static final int	DEFAULT_LOG_LEVEL	Default log level.
public static final boolean	DEFAULT_SAPPASSPORT_ENABLED	SAP Passport enablement default setting.
public static final boolean	DEFAULT_BUSINESSTRANSACTION_ENABLED	SAP Business Transaction XML enablement default setting.

DEFAULT_BUSINESSTRANSACTION_ENABLED variable
SAP Business Transaction XML enablement default setting.

Syntax

```
public static final boolean DEFAULT_BUSINESSTRANSACTION_ENABLED
```

DEFAULT_CIPHER_TRANSFORMATION variable

Default cipher transformation.

Syntax

```
public static final String DEFAULT_CIPHER_TRANSFORMATION
```

DEFAULT_CONNECTION_TIMEOUT variable

Default connection timeout.

Syntax

```
public static final int DEFAULT_CONNECTION_TIMEOUT
```

DEFAULT_HANDLER_CLASS_NAME variable

Default handler class.

Syntax

```
public static final String DEFAULT_HANDLER_CLASS_NAME
```

DEFAULT_HTTP_PORT variable

Default HTTP port.

Syntax

```
public static final int DEFAULT_HTTP_PORT
```

DEFAULT_HTTPS_PORT variable

Default HTTPS port.

Syntax

```
public static final int DEFAULT_HTTPS_PORT
```

DEFAULT_LOG_LEVEL variable

Default log level.

Syntax

```
public static final int DEFAULT_LOG_LEVEL
```

DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE variable

Default security mode.

Syntax

```
public static final boolean  
DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE
```

DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE variable

Default buffer size.

Syntax

```
public static final int DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE
```

DEFAULT_PROXY_HOST variable

Default proxy host.

Syntax

```
public static final String DEFAULT_PROXY_HOST
```

DEFAULT_PROXY_PORT variable

Default proxy port.

Syntax

```
public static final int DEFAULT_PROXY_PORT
```

DEFAULT_SAP_APPLICATIONID_HEADER_VALUE variable

Default application ID.

Syntax

```
public static final String  
DEFAULT_SAP_APPLICATIONID_HEADER_VALUE
```

DEFAULT_SAPPASSPORT_ENABLED variable

SAP Passport enablement default setting.

Syntax

```
public static final boolean DEFAULT_SAPPASSPORT_ENABLED
```

DEFAULT_SEARCH_LIMIT variable

Default for maximum search results retrieved from cache.

Syntax

```
public static final int DEFAULT_SEARCH_LIMIT
```

DEFAULT_SOCKET_CONNECTION_TIMEOUT variable

Default socket connection timeout.

Syntax

```
public static final int DEFAULT_SOCKET_CONNECTION_TIMEOUT
```

DEFAULT_STORE_CAPACITY variable

Default cache capacity.

Syntax

```
public static final int DEFAULT_STORE_CAPACITY
```

HTTP_HANDLER_CLASS variable

Socket Connection handler class.

Syntax

```
public static final String HTTP_HANDLER_CLASS
```

IMO_HANDLER_CLASS variable

IMO Connection handler class.

Syntax

```
public static final String IMO_HANDLER_CLASS
```

MAX_PERSISTENCE_BYTE_BUFFER_SIZE variable

Maximum buffer size.

Syntax

```
public static final int MAX_PERSISTENCE_BYTE_BUFFER_SIZE
```

MAXIMUM_STORE_CAPACITY variable

Maximum cache capacity.

Syntax

```
public static final int MAXIMUM_STORE_CAPACITY
```

MIN_PERSISTENCE_BYTE_BUFFER_SIZE variable

Minimum buffer size.

Syntax

```
public static final int MIN_PERSISTENCE_BYTE_BUFFER_SIZE
```

SHARED_PREFERENCES variable

Shared preferences.

Syntax

```
public static final String SHARED_PREFERENCES
```

ILocalSchema interface

Interface to define the given schema is used for a locally created document.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public interface ILocalSchema
```

Derived classes

- *ODataReturnSchema* on page 254

IODataAssociation interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataAssociation extends  
IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataAssociation* on page 99

Derived interfaces

- *IODataAssociationSet* on page 377

Members

All members of IODataAssociation, including inherited members. **Nested interfaces**

Modifier and Type	Interface	Description
public abstractinterface	<i>IODataAssociationEnd</i> on page 373	Represents the appropriate OData element.

Variables

Modifier and Type	Variable	Description
public static final String	ELEMENT_ASSOCIATION	Name of the appropriate OData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_ASSOCIATION	Name of the appropriate OData attribute.
public static final String	ELEMENT_ASSOCIATION- END	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract IODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 375	Returns the value of the appropriate Association End OData element with the given role.
public abstract List<IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 376	Returns list of the appropriate OData elements.
public abstract String	<i>getName()</i> on page 376	Returns the value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

IODataAssociation.IODataAssociationEnd interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser.IODataAssociation
```

Syntax

```
public abstract interface IODataAssociationEnd
```

Derived classes

- *ODataAssociationEnd* on page 103

Members

All members of IODataAssociationEnd, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_ROLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_ENTITYSET	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_MULTIPLICITY	Name of the appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getCollectionId()</i> on page 374	Returns the value of the appropriate EntitySet OData attribute.
public abstract String	<i>getEntitySet()</i> on page 374	Returns the value of the appropriate OData attribute.
public abstract String	<i>getMultiplicity()</i> on page 374	Returns the value of the appropriate OData attribute.
public abstract String	<i>getRole()</i> on page 374	Returns the value of the appropriate OData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getType()</i> on page 375	Returns the value of the appropriate OData attribute.

getCollectionId() method

Returns the value of the appropriate EntitySet OData attribute.

Syntax

```
public abstract String getCollectionId ()
```

Returns

the value of the appropriate EntitySet OData attribute

getEntitySet() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getEntitySet ()
```

Returns

the value of the appropriate OData attribute

getMultiplicity() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getMultiplicity ()
```

Returns

the value of the appropriate OData attribute

getRole() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getRole ()
```

Returns

the value of the appropriate OData attribute

getType() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getType ()
```

Returns

the value of the appropriate OData attribute

ATTRIBUTE_ENTITYSET variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYSET
```

ATTRIBUTE_MULTIPLICITY variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_MULTIPLICITY
```

ATTRIBUTE_ROLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ROLE
```

ATTRIBUTE_TYPE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

getAssociationEnd(String) method

Returns the value of the appropriate Association End OData element with the given role.

Syntax

```
public abstract IODataAssociationEnd getAssociationEnd  
(String role)
```

Parameters

- **role** – The expected value of the appropriate OData attribute

Returns

the value of the appropriate Association End OData element

getAssociationEnds() method

Returns list of the appropriate OData elements.

Syntax

```
public abstract List< IODataAssociationEnd >  
getAssociationEnds ()
```

Returns

list of the appropriate OData elements

getName() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getName ()
```

Returns

the value of the appropriate OData attribute

ATTRIBUTE_ASSOCIATION variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ASSOCIATION
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ELEMENT_ASSOCIATION variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ASSOCIATION
```

ELEMENT_ASSOCIATIONEND variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ASSOCIATIONEND
```

IODataAssociationSet interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataAssociationSet extends
IODataAssociation
```

Implemented interfaces

- *IODataAssociation* on page 368

Derived classes

- *ODataAssociationSet* on page 106

Members

All members of *IODataAssociationSet*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ASSOCIATION-SET	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getAssociation()</i> on page 381	Returns the value of appropriate OData element.

Inherited members from *IODataAssociation*

Modifier and Type	Member	Description
public abstract <i>IODataAssociationEnd</i>	<i>getAssociationEnd(String)</i> on page 375	Returns the value of the appropriate Association End OData element with the given role.

Modifier and Type	Member	Description
public abstract List<IODataAssociationEnd >	<i>getAssociationEnds()</i> on page 376	Returns list of the appropriate OData elements.
public abstract String	<i>getName()</i> on page 376	Returns the value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getAssociation() method

Returns the value of appropriate OData element.

Syntax

```
public abstract String getAssociation ()
```

Returns

the value of appropriate OData element

ELEMENT_ASSOCIATIONSET variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ASSOCIATIONSET
```

IODataCollection interface

Represents the 'Collection' element of the OData Service Document.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataCollection extends
  IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataCollection* on page 115

Members

All members of IODataCollection, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_COLLECTION	Name of the appropriate OData element.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate OData attribute.
public static final String	ELEMENT_TITLE	Name of the appropriate OData element.
public static final String	ELEMENT_MEMBERTITLE	Name of the appropriate OData element.
public static final String	ATTRIBUTE_HREF	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_CREATABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_UPDATABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_DELETABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_SEARCHABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_FILTERABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_DISPLAYORDER	Name of the appropriate OData extension attribute.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_VALUE_REL_SEARCH	Possible value of the appropriate OData attribute.
public static final String	ELEMENT_LINK	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract int	<i>getDisplayOrder()</i> on page 387	Returns the value of the appropriate OData extension attribute.
public abstract String	<i>getHref()</i> on page 388	Returns the value of the 'href' OData attribute.
public abstract List< IODataIcon >	<i>getIcons()</i> on page 388	Returns list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 388	Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)
public abstract List< IODataLink >	<i>getLinks()</i> on page 388	Returns the value of the appropriate OData elements.
public abstract String	<i>getMemberTitle()</i> on page 388	Returns the value of the appropriate OData element.
public abstract IODataLink	<i>getSearchLink()</i> on page 389	Returns OData Link object that should be used for retrieving Open Search Description XML.
public abstract String	<i>getSemantics()</i> on page 389	Returns the value of the appropriate OData attribute.
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 389	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getTitle()</i> on page 389	Returns the value of the appropriate OData element.

Modifier and Type	Method	Description
public abstract String	<i>getUrl()</i> on page 390	Returns OData Link object that should be used for self related operations.
public abstract boolean	<i>isCreatable()</i> on page 390	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isDeletable()</i> on page 390	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isFilterable()</i> on page 390	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isSearchable()</i> on page 390	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 391	Returns the value of the appropriate OData attribute.
public abstract void	<i>setEntitySet(IODataEntitySet)</i> on page 391	Sets the data held by the appropriate element of the OData Schema.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getDisplayOrder() method

Returns the value of the appropriate OData extension attribute.

Syntax

```
public abstract int getDisplayOrder ()
```

Returns

The value of the appropriate OData extension attribute

getHref() method

Returns the value of the 'href' OData attribute.

Syntax

```
public abstract String getHref ()
```

Returns

The value of the 'href' OData attribute

getIcons() method

Returns list of the appropriate OData elements.

Syntax

```
public abstract List< IODataIcon > getIcons ()
```

Returns

list of the appropriate OData elements

getId() method

Returns the value of the 'href' OData attribute as a relative href (matchable with appropriate entitySet)

Syntax

```
public abstract String getId ()
```

Returns

The value of the 'href' OData attribute

getLinks() method

Returns the value of the appropriate OData elements.

Syntax

```
public abstract List< IODataLink > getLinks ()
```

Returns

The value of the appropriate OData elements

getMemberTitle() method

Returns the value of the appropriate OData element.

Syntax

```
public abstract String getMemberTitle ()
```

Returns

The value of the appropriate OData element

getSearchLink() method

Returns OData Link object that should be used for retrieving Open Search Description XML.

Syntax

```
public abstract IODataLink getSearchLink ()
```

Returns

OData Link for search

getSemantics() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate OData attribute

getSubscriptionLink() method

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public abstract IODataLink getSubscriptionLink ()
```

Returns

OData Link for subscribe

getTitle() method

Returns the value of the appropriate OData element.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate OData element

getUrl() method

Returns OData Link object that should be used for self related operations.

Syntax

```
public abstract String getUrl ()
```

Returns

OData Link for self Returns the full URL of the collectionThe full URL of the collection

isCreatable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract boolean isCreatable ()
```

Returns

The value of the appropriate OData attribute

isDeletable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract boolean isDeletable ()
```

Returns

The value of the appropriate OData attribute

isFilterable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract boolean isFilterable ()
```

Returns

The value of the appropriate OData attribute

isSearchable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract boolean isSearchable ()
```

Returns

The value of the appropriate OData attribute

isUpdatable() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract boolean isUpdatable ()
```

Returns

The value of the appropriate OData attribute

setEntitySet(IODataEntitySet) method

Sets the data held by the appropriate element of the OData Schema.

Syntax

```
public abstract void setEntitySet (IODataEntitySet entitySet)
```

Parameters

- **entitySet** – The OData EntitySet to use the data from.

Remarks

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

ATTRIBUTE_CREATABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_CREATABLE
```

ATTRIBUTE_DELETABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_DELETABLE
```

ATTRIBUTE_DISPLAYORDER variable

Name of the appropriate OData extension attribute.

Syntax

```
public static final String ATTRIBUTE_DISPLAYORDER
```

ATTRIBUTE_FILTERABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_FILTERABLE
```

ATTRIBUTE_HREF variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_HREF
```

ATTRIBUTE_SEARCHABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEARCHABLE
```

ATTRIBUTE_SEMANTICS variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_UPDATABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_UPDATABLE
```

ATTRIBUTE_VALUE_REL_SEARCH variable

Possible value of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_VALUE_REL_SEARCH
```

ELEMENT_COLLECTION variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_COLLECTION
```

ELEMENT_LINK variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_LINK
```

ELEMENT_MEMBERTITLE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_MEMBERTITLE
```

ELEMENT_TITLE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_TITLE
```

IODataComplexType interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataComplexType extends
  IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataComplexType* on page 127

Members

All members of *IODataComplexType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_COMPLEXTYPE	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ELEMENT_PROPERTY	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 397	Returns the value of the appropriate OData element.
public abstract List< IODataProperty >	<i>getProperties()</i> on page 398	Returns the list of the appropriate OData elements.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getName() method

Returns the value of the appropriate OData element.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate OData element

getProperties() method

Returns the list of the appropriate OData elements.

Syntax

```
public abstract List< IODataProperty > getProperties ()
```

Returns

The list of the appropriate OData elements

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ELEMENT_COMPLEXTYPE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_COMPLEXTYPE
```

ELEMENT_PROPERTY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PROPERTY
```

IODataEntitySet interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataEntitySet extends  
IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataEntitySet* on page 132

Members

All members of *IODataEntitySet*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ENTITYSET	Name of the appropriate OData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_CREATABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_UPDATABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_DELETABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_SEARCHABLE	Name of the appropriate OData attribute.

public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

*getName() method**Syntax*

```
public abstract String getName ()
```

Returns

The value of the appropriate OData attribute

*isCreatable() method**Syntax*

```
public abstract boolean isCreatable ()
```

Returns

The value of the appropriate OData attribute

*isDeletable() method**Syntax*

```
public abstract boolean isDeletable ()
```

Returns

The value of the appropriate OData attribute

*isSearchable() method**Syntax*

```
public abstract boolean isSearchable ()
```

Returns

The value of the appropriate OData attribute

isSearchable(String) method

Returns the value of the given OData attribute.

Syntax

```
public abstract boolean isSearchable (String searchAttributeName)
```

Parameters

- **searchAttributeName** – The name of the OData attribute

Returns

The value of the given OData attribute

isUpdatable() method

Syntax

```
public abstract boolean isUpdatable ()
```

Returns

The value of the appropriate OData attribute

ATTRIBUTE_CREATABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_CREATABLE
```

ATTRIBUTE_DELETABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_DELETABLE
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_SEARCHABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEARCHABLE
```

ATTRIBUTE_UPDATABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_UPDATABLE
```

ELEMENT_ENTITYSET variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ENTITYSET
```

IODataEntityType interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataEntityType extends
  IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataEntityType* on page 137

Members

All members of *IODataEntityType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ENTITYTYPE	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_HASSTREAM	Name of the appropriate OData attribute.
public static final String	ELEMENT_KEY	Name of the appropriate OData element.
public static final String	ELEMENT_PROPERTYREF	Name of the appropriate OData element.
public static final String	ELEMENT_PROPERTY	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 411	Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 411	Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 411	Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.
public abstract List< String >	<i>getKeyPropertyNames()</i> on page 411	Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.
public abstract String	<i>getName()</i> on page 412	Returns The value of the appropriate OData attribute.
public abstract List< IODataNavigationProperty >	<i>getNavigationProperties()</i> on page 412	Returns The list of appropriate OData elements.
public abstract IODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 412	Returns The appropriate OData element with the given name.

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getProperties()</i> on page 412	Returns The list of appropriate OData elements.
public abstract List< IODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 413	Returns The list of appropriate OData elements with given attribute value.
public abstract List< IODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 413	Returns The list of appropriate OData elements with given attribute value.
public abstract IODataProperty	<i>getProperty(String)</i> on page 413	Returns The appropriate OData element with the given name.
public abstract List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 413	Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.
public abstract List< IODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 414	Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.
public abstract boolean	<i>hasStream()</i> on page 414	Returns The value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getGPUseInSearchPropertiesData() method

Returns The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getGPUseInSearchPropertiesData ()
```

Returns

The list of appropriate OData elements with 'true' use-in-search (Generic Player names-pace) attribute value

getGPVisibleInDetailPropertiesData() method

Returns The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getGPVisibleInDetailPropertiesData ()
```

Returns

The list of appropriate OData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value

getGPVisibleInListPropertiesData() method

Returns The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getGPVisibleInListPropertiesData ()
```

Returns

The list of appropriate OData elements with 'true' visible-in-list (Generic Player names-pace) attribute value

getKeyPropertyNames() method

Returns the list of the values of the 'PropertyRef' OData element contained by the 'Key' OData element.

Syntax

```
public abstract List< String > getKeyPropertyNames ()
```

Returns

The list of the values of the 'PropertyRef' OData element

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate OData attribute

getNavigationProperties() method

Returns The list of appropriate OData elements.

Syntax

```
public abstract List< IODataNavigationProperty >  
getNavigationProperties ()
```

Returns

The list of appropriate OData elements

getNavigationProperty(String) method

Returns The appropriate OData element with the given name.

Syntax

```
public abstract IODataNavigationProperty getNavigationProperty  
(String name)
```

Returns

The appropriate OData element with the given name

getProperties() method

Returns The list of appropriate OData elements.

Syntax

```
public abstract List< IODataProperty > getProperties ()
```

Returns

The list of appropriate OData elements

getPropertiesWithAttribute(String, String) method

Returns The list of appropriate OData elements with given attribute value.

Syntax

```
public abstract List< IODataProperty >
getPropertiesWithAttribute (
    String attributeName,
    String attributeValue
)
```

Returns

The list of appropriate OData elements with given attribute value

getPropertiesWithAttribute(String, String, boolean) method

Returns The list of appropriate OData elements with given attribute value.

Syntax

```
public abstract List< IODataProperty >
getPropertiesWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Returns

The list of appropriate OData elements with given attribute value

getProperty(String) method

Returns The appropriate OData element with the given name.

Syntax

```
public abstract IODataProperty getProperty (String propertyName)
```

Returns

The appropriate OData element with the given name

getSAPSearchablePropertiesData() method

Returns The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getSAPSearchablePropertiesData ()
```

Returns

The list of appropriate OData elements with 'true' searchable (SAP names-pace) attribute value

getSearchablePropertiesData(String) method

Returns The list of appropriate OData elements with 'true' attribute value of the given attribute.

Syntax

```
public abstract List< IODataProperty >  
getSearchablePropertiesData (String searchAttributeName)
```

Returns

The list of appropriate OData elements with 'true' attribute value of the given attribute

hasStream() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean hasStream ()
```

Returns

The value of the appropriate OData attribute

ATTRIBUTE_HASSTREAM variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_HASSTREAM
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ELEMENT_ENTITYTYPE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ENTITYTYPE
```

ELEMENT_KEY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_KEY
```

ELEMENT_PROPERTY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PROPERTY
```

ELEMENT_PROPERTYREF variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PROPERTYREF
```

IODataEntry interface

Represents the 'entry' OData element with maintained reference to the appropriate OData Schema document.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataEntry extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataEntry* on page 147
- *ODataReturnTypeEntry* on page 241

Derived interfaces

- *IODataSubscriptionEntry* on page 529

Members

All members of IODataEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	PROPERTY_LEVEL_SEPARATOR	
public static final String	ELEMENT_ENTRY	Name of the appropriate OData element.
public static final String	ELEMENT_TITLE	Name of the appropriate OData element.
public static final String	ELEMENT_SUMMARY	Name of the appropriate OData element.
public static final String	ELEMENT_CATEGORY	Name of the appropriate OData element.
public static final String	ATTRIBUTE_TERM	Name of the appropriate OData attribute.
public static final String	ELEMENT_CONTENT	Name of the appropriate OData element.
public static final String	ELEMENT_PROPERTIES	Name of the appropriate OData element.
public static final String	ELEMENT_LINK	Name of the appropriate OData element.
public static final String	ELEMENT_UPDATED	Name of the appropriate OData element.
public static final String	ELEMENT_AUTHOR	Name of the appropriate OData element.
public static final String	ELEMENT_NAME	Name of the appropriate OData element.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_VALUE_SEMANTICS_ACTION	Value option for appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public abstract List< IOData-Link >	<i>getActionLinks()</i> on page 425	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 425	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 426	
public Long	<i>getCacheTimestamp()</i> on page 426	
public abstract String	<i>getCollectionId()</i> on page 426	Returns the Id of the OCata Collection that this Entry belongs to.
public abstract String	<i>getContentType()</i> on page 426	Returns the content type of the entry.
public abstract String	<i>getEtag()</i> on page 426	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 427	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player name-space) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public abstract List< IODataIcon >	<i>getIcons()</i> on page 428	Returns the list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 428	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 428	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 428	Returns the values of the properties that are marked as key properties in the OData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 428	Returns The parsed value of the 'updated' OData Element.
public abstract List< IODataLink >	<i>getLinks()</i> on page 429	Returns the list of the appropriate OData elements.
public abstract String	<i>getMediaSrc()</i> on page 429	Returns the media source if the entry has a media content.
public abstract List< IODataProperty >	<i>getPropertiesData()</i> on page 429	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 429	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 430	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract IParserDocument	<i>getPropertiesDocument()</i> on page 430	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 431	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 431	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 432	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List< String[]>)</i> on page 432	Return list of property values for the given property paths.
public abstract List< IODataLink >	<i>getRelatedDataLinks()</i> on page 432	Returns OData Link objects that represents links to Related Data.
public abstract List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 433	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract IODataSchema	<i>getSchema()</i> on page 433	Returns the appropriate OData Schema object.

Modifier and Type	Method	Description
public abstract IODataLink	<i>getSelfLink()</i> on page 433	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 433	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 434	Returns The value of the appropriate OData element.
public abstract String	<i>getTitle()</i> on page 434	Returns The value of the appropriate OData element.
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 434	Puts the new property element as a sub-element of the 'complex properties' OData element.
public abstract void	<i>putContentType(String)</i> on page 434	Puts the content type for a new entry object.
public abstract void	<i>putId(String)</i> on page 435	Sets id of this OData Entry document (value of appropriate OData Id element)
public abstract void	<i>putMediaSrc(String)</i> on page 435	Puts the media source for a new entry object.
public abstract void	<i>putPropertyValue(String, String)</i> on page 435	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 436	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>setAuthorName(String)</i> on page 436	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cache.State)</i> on page 436	
public void	<i>setCacheTimestamp(Long)</i> on page 436	

Modifier and Type	Method	Description
public abstract void	<i>setCollectionId(String)</i> on page 437	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 437	
public abstract void	<i>setSchema(IODataSchema)</i> on page 437	Maintains the reference to the appropriate OData Schema object.
public abstract void	<i>setSummary(String)</i> on page 437	Sets the value of the appropriate OData element.
public abstract void	<i>setTitle(String)</i> on page 437	Sets the value of the appropriate OData element.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

IODataEntry.cacheState enum

Members

All members of cacheState, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	Updated	

Modifier and Type	Variable	Description
public	Deleted	
public	Inserted	

*Deleted variable**Syntax*

```
public Deleted
```

*Inserted variable**Syntax*

```
public Inserted
```

*Updated variable**Syntax*

```
public Updated
```

getActionLinks() method

Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')

Syntax

```
public abstract List< IODataLink > getActionLinks ()
```

Returns

List of OData Action Link documents

getAuthorName() method

Returns The value of the 'name' OData element of the 'author' OData element.

Syntax

```
public abstract String getAuthorName ()
```

Returns

The value of the 'name' OData element of the 'author' OData element

getCacheState() method

Syntax

```
public cacheState getCacheState ()
```

getCacheTimestamp() method

Syntax

```
public Long getCacheTimestamp ()
```

getCollectionId() method

Returns the Id of the OData Collection that this Entry belongs to.

Syntax

```
public abstract String getCollectionId ()
```

Returns

The Id of the OData Collection that this Entry belongs to

getContentType() method

Returns the content type of the entry.

Syntax

```
public abstract String getContentType ()
```

Returns

Content Type of the entry

getEtag() method

Returns the Id of the OData Collection that this Entry belongs to.

Syntax

```
public abstract String getEtag ()
```

Returns

The Id of the OData Collection that this Entry belongs to

getFilterUrl() method

Returns the full execution URL that can be used for filtering collection search for this single entry.

Syntax

```
public abstract String getFilterUrl ()
```

Returns

The full filter URL

getGPUseInSearchPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getGPUseInSearchPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInDetailPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getGPVisibleInDetailPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInListPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.

Syntax

```
public abstract List< IODataProperty >
getGPVisibleInListPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getIcons() method

Returns the list of the appropriate OData elements.

Syntax

```
public abstract List< IODataIcon > getIcons ()
```

Returns

The list of the appropriate OData elements

getId() method

Returns The Id of this OData Entry (value of appropriate OData Id element)

Syntax

```
public abstract String getId ()
```

Returns

The Id of this OData Entry

getIsLocal() method

Syntax

```
public boolean getIsLocal ()
```

getKeyPropertyValues() method

Returns the values of the properties that are marked as key properties in the OData Schema document.

Syntax

```
public abstract Map< String, String > getKeyPropertyValues ()
```

Returns

The name-value pairs of the key properties

getLastUpdated() method

Returns The parsed value of the 'updated' OData Element.

Syntax

```
public abstract Date getLastUpdated ()
```

Returns

The parsed value of the value of the 'updated' OData element or null is parsing failed

getLinks() method

Returns the list of the appropriate OData elements.

Syntax

```
public abstract List< IODataLink > getLinks ()
```

Returns

The list of the appropriate OData elements

getMediaSrc() method

Returns the media source if the entry has a media content.

Syntax

```
public abstract String getMediaSrc ()
```

Returns

Media source link of the entry

getPropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this Odata Entry document.

Syntax

```
public abstract List< IODataProperty > getPropertiesData ()
```

Returns

The meta-informations and values of the contained properties

getPropertiesDataWithAttribute(String, String) method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Syntax

```
public abstract List< IODataProperty >
getPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

Returns

The meta-informations and values of the appropriate properties

getPropertiesDataWithAttribute(String, String, boolean) method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Syntax

```
public abstract List< IODataProperty >
getPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

Returns

The meta-informations and values of the appropriate properties

getPropertiesDocument() method

Returns the representer document of OData 'properties' (Metadata name-space) document
This method is created for performance reasons mostly to use in search methods.

Syntax

```
public abstract IParserDocument getPropertiesDocument ()
```

Returns

The ParseDocument representation of OData 'properties' (Metadata name-space) document

getPropertyValue(String...) method

Returns the value of the appropriate property.

Syntax

```
public abstract String getPropertyValue (String... propertyPath)
throws IllegalArgumentException
```

Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

Returns

The value of the property

Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous.

Remarks

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

getPropertyValueParsed(String...) method

Returns the value of the appropriate property parsed to it's real type.

Syntax

```
public abstract< T > T getPropertyValueParsed (String...
propertyPath) throws ClassCastException
```

Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

Returns

The value of the property

Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous
- **ClassCastException** – if the property value can not be parsed to the expected type

Remarks

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

getPropertyValues() method

Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

Syntax

```
public abstract Map< String, String > getPropertyValues ()
```

Returns

The name/path and value pairs of the contained properties

Remarks

The name of the properties will contain their current name-space prefixes.

getPropertyValues(List< String[]>) method

Return list of property values for the given property paths.

Syntax

```
public abstract List< String > getPropertyValues (List< String[]> propertyPathes)
```

Parameters

- **propertyPathes** – Name of the property or path including the name of the enclosing Complex Types

Returns

The list of the values of the properties

getRelatedDataLinks() method

Returns OData Link objects that represents links to Related Data.

Syntax

```
public abstract List< IODataLink > getRelatedDataLinks ()
```

Returns

List of OData Related Link documents

getSAPSearchablePropertiesData() method

Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.

Syntax

```
public abstract List< IODataProperty >
getSAPSearchablePropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getSchema() method

Returns the appropriate OData Schema object.

Syntax

```
public abstract IODataSchema getSchema ()
```

Returns

The appropriate OData Schema object.

getSelfLink() method

Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

Syntax

```
public abstract IODataLink getSelfLink ()
```

Returns

OData self Link

getSubscriptionLink() method

Returns OData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public abstract IODataLink getSubscriptionLink ()
```

Returns

OData Link for subscribe

getSummary() method

Returns The value of the appropriate OData element.

Syntax

```
public abstract String getSummary ()
```

Returns

The value of the appropriate OData element

getTitle() method

Returns The value of the appropriate OData element.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate OData element

putComplexPropertyValue(String, String...) method

Puts the new property element as a sub-element of the 'complex properties' OData element.

Syntax

```
public abstract void putComplexPropertyValue (
    String propertyValue,
    String... propertyName
)
```

Parameters

- **propertyName** – The route of the property with or without name-space until the complex type.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putContentType(String) method

Puts the content type for a new entry object.

Syntax

```
public abstract void putContentType (String contentType)
```

Parameters

- **contentType** – - Content Type of the entry

putId(String) method

Sets id of this OData Entry document (value of appropriate OData Id element)

Syntax

```
public abstract void putId (String id) throws
IllegalArgumentException
```

Parameters

- **id** – The new id.

putMediaSrc(String) method

Puts the media source for a new entry object.

Syntax

```
public abstract void putMediaSrc (String mediaSrc)
```

Parameters

- **mediaSrc** – - Media source of the entry

putPropertyValue(String, String) method

Puts the new property element as a sub-element of the 'properties' OData element.

Syntax

```
public abstract void putPropertyValue (
    String propertyName,
    String propertyValue
)
```

Parameters

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putPropertyValue(String, String, boolean) method

Puts the new property element as a sub-element of the 'properties' OData element.

Syntax

```
public abstract void putPropertyValue (  
    String propertyName,  
    String propertyValue,  
    boolean useDefaultPrefix  
)
```

Parameters

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-space.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

setAuthorName(String) method

Sets the value of the 'name' OData element of the 'author' OData element.

Syntax

```
public abstract void setAuthorName (String authorName)
```

Parameters

- **authorName** – The new value of the element

setCachestate(cacheState) method

Syntax

```
public void setCachestate (cacheState cachestate)
```

setCacheTimestamp(Long) method

Syntax

```
public void setCacheTimestamp (Long timestamp)
```

setCollectionId(String) method

Maintains the Id of the OData Collection that this Entry belongs to.

Syntax

```
public abstract void setCollectionId (String collectionId)
```

Parameters

- **collectionId** – The Id of the OData Collection that this Entry belongs to

*setIsLocal(boolean) method**Syntax*

```
public void setIsLocal (boolean isLocal)
```

setSchema(IODataSchema) method

Maintains the reference to the appropriate OData Schema object.

Syntax

```
public abstract void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The appropriate OData Schema object.

setSummary(String) method

Sets the value of the appropriate OData element.

Syntax

```
public abstract void setSummary (String summary)
```

Parameters

- **summary** – The new value of the element

setTitle(String) method

Sets the value of the appropriate OData element.

Syntax

```
public abstract void setTitle (String title)
```

Parameters

- **title** – The new value of the element

ATTRIBUTE_SEMANTICS variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_TERM variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TERM
```

ATTRIBUTE_VALUE_SEMANTICS_ACTION variable

Value option for appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_VALUE_SEMANTICS_ACTION
```

ELEMENT_AUTHOR variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_AUTHOR
```

ELEMENT_CATEGORY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_CATEGORY
```

ELEMENT_CONTENT variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_CONTENT
```

ELEMENT_ENTRY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ENTRY
```

ELEMENT_LINK variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_LINK
```

ELEMENT_NAME variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_NAME
```

ELEMENT_PROPERTIES variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PROPERTIES
```

ELEMENT_SUMMARY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_SUMMARY
```

ELEMENT_TITLE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_TITLE
```

ELEMENT_UPDATED variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_UPDATED
```

PROPERTY_LEVEL_SEPARATOR variable***Syntax***

```
public static final String PROPERTY_LEVEL_SEPARATOR
```

IODataError interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataError extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataError* on page 174

Members

All members of IODataError, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ERROR	Name of the appropriate OData element.
public static final String	ATTRIBUTE_LANGUAGE	Name of the appropriate OData attribute.
public static final String	ELEMENT_ERRORCODE	Name of the appropriate OData element.
public static final String	ELEMENT_MESSAGE	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getErrorCode()</i> on page 444	Returns The value of the 'code' OData element.
public abstract String	<i>getLang()</i> on page 444	Returns The value of the appropriate OData attribute of the 'message' element.
public abstract String	<i>getMessage()</i> on page 444	Return the localized error message.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

***getErrorCode()* method**

Returns The value of the 'code' OData element.

Syntax

```
public abstract String getErrorCode ()
```

Returns

The value of the 'code' OData element

***getLang()* method**

Returns The value of the appropriate OData attribute of the 'message' element.

Syntax

```
public abstract String getLang ()
```

Returns

The value of the appropriate OData attribute of the 'message' element

***getMessage()* method**

Return the localized error message.

Syntax

```
public abstract String getMessage ()
```

Returns

The value of the 'message' OData element

***ATTRIBUTE_LANGUAGE* variable**

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_LANGUAGE
```

***ELEMENT_ERROR* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ERROR
```

***ELEMENT_ERRORCODE* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ERRORCODE
```

***ELEMENT_MESSAGE* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_MESSAGE
```

***IODataFeed* interface**

Consists of APIs related to OData Feed.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public interface IODataFeed
```

Derived classes

- *IODataFeed* on page 180

Members

All members of IODataFeed, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>getAuthor()</i> on page 446	Returns the name of the Author of the OData Feed.
public List< String >	<i>getDeletedEntries()</i> on page 446	Returns the list of links of the Deleted Entries.
public IODataLink	<i>getDeltaLink()</i> on page 446	Returns the latest delta link token.

Modifier and Type	Method	Description
public List< IODataEntry >	<i>getEntries()</i> on page 447	Returns the entries in the feed that have been updated/ entire list of entries in the collection.
public String	<i>getId()</i> on page 447	Returns the id of the OData Feed.
public String	<i>getLastUpdated()</i> on page 447	Returns the date/time of last update on the OData Feed.
public List< IODataLink >	<i>getLinks()</i> on page 447	
public String	<i>getTitle()</i> on page 447	Returns the Title of the OData Feed.

getAuthor() method

Returns the name of the Author of the OData Feed.

Syntax

```
public String getAuthor ()
```

Returns

String Author Name

getDeletedEntries() method

Returns the list of links of the Deleted Entries.

Syntax

```
public List< String > getDeletedEntries ()
```

Returns

List<ISDMODataLink> - List of links of the deleted entries

getDeltaLink() method

Returns the latest delta link token.

Syntax

```
public IODataLink getDeltaLink ()
```

getEntries() method

Returns the entries in the feed that have been updated/ entire list of entries in the collection.

Syntax

```
public List< IODataEntry > getEntries ()
```

Returns

List<ISDMODataEntry> - List of ODataEntries

getId() method

Returns the id of the OData Feed.

Syntax

```
public String getId ()
```

Returns

String Id

getLastUpdated() method

Returns the date/time of last update on the OData Feed.

Syntax

```
public String getLastUpdated ()
```

Returns

String Date-time

*getLinks() method**Syntax*

```
public List< IODataLink > getLinks ()
```

getTitle() method

Returns the Title of the OData Feed.

Syntax

```
public String getTitle ()
```

Returns

String Title

IODataFunctionImport interface

Represents the 'FunctionImport' OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataFunctionImport extends
IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataFunctionImport* on page 183

Members

All members of IODataFunctionImport, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_FUNCTIONALIMPORT	Name of the appropriate OData element.
public static final String	ELEMENT_PARAMETER	Name of the appropriate OData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_ACTION_FOR	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_RETURNTYPE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_HTTPMETHOD	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_ENTITYSET	Name of the appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getActionFor()</i> on page 454	Returns The value of the appropriate OData attribute.
public abstract String	<i>getCollectionId()</i> on page 454	Returns The value of the 'EntitySet' OData attribute.
public abstract String	<i>getEntitySet()</i> on page 454	Returns The value of the 'EntitySet' OData attribute.
public abstract String	<i>getExecutionUrl(Map< String, String >)</i> on page 455	Calculate the full execution URL for executing this Function Import according to the passed paramteres.
public abstract String	<i>getHTTPMethod()</i> on page 455	Returns The value of the appropriate OData attribute.
public abstract List< String >	<i>getInputParameterNames()</i> on page 455	Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.
public abstract String	<i>getName()</i> on page 455	Returns The value of the appropriate OData attribute.
public abstract List< String >	<i>getOutputParameterNames()</i> on page 456	Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.
public abstract List< IOData-Parameter >	<i>getParameters()</i> on page 456	Returns The list of the appropriate OData element.
public abstract String	<i>getReturnType()</i> on page 456	Returns The value of the appropriate OData attribute.
public RETURNTYPE_ENUM	<i>getReturnTypeEnum()</i> on page 456	Returns The return type of this Function Import OData document.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

IODataFunctionImport.RETURNTYPE_ENUM enum

Possible return type of a SMDOData Function Import element.

Members

All members of RETURNTYPE_ENUM, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	RETURNTYPE_SIMPLE	
public	RETURNTYPE_COMPLEX	
public	RETURNTYPE_ENTRY	
public	RETURNTYPE_FEED	
public	RETURNTYPE_SIMPLE_COLLECTION	
public	RETURNTYPE_COMPLEX_COLLECTION	

RETURNTYPE_COMPLEX variable

Syntax

```
public RETURNTYPE_COMPLEX
```

RETURNTYPE_COMPLEX_COLLECTION variable

Syntax

```
public RETURNTYPE_COMPLEX_COLLECTION
```

RETURNTYPE_ENTRY variable

Syntax

```
public RETURNTYPE_ENTRY
```

RETURNTYPE_FEED variable

Syntax

```
public RETURNTYPE_FEED
```

RETURNTYPE_SIMPLE variable

Syntax

```
public RETURNTYPE_SIMPLE
```

RETURNTYPE_SIMPLE_COLLECTION variable

Syntax

```
public RETURNTYPE_SIMPLE_COLLECTION
```

getActionFor() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getActionFor ()
```

Returns

The value of the appropriate OData attribute

getCollectionId() method

Returns The value of the 'EntitySet' OData attribute.

Syntax

```
public abstract String getCollectionId ()
```

Returns

The value of the 'EntitySet' OData attribute

getEntitySet() method

Returns The value of the 'EntitySet' OData attribute.

Syntax

```
public abstract String getEntitySet ()
```

Returns

The value of the 'EntitySet' OData attribute

getExecutionUrl(Map< String, String >) method

Calculate the full execution URL for executing this Function Import according to the passed parameters.

Syntax

```
public abstract String getExecutionUrl (Map< String, String >
parameters)
```

Returns

The full execution URL

getHTTPMethod() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getHTTPMethod ()
```

Returns

The value of the appropriate OData attribute

getInputParameterNames() method

Returns The list of the appropriate OData element with 'In' or 'InOut' attribute value.

Syntax

```
public abstract List< String > getInputParameterNames ()
```

Returns

The list of the appropriate OData element with 'In' or 'InOut' attribute value

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate OData attribute

getOutputParameterNames() method

Returns The list of the appropriate OData element with 'Out' or 'InOut' attribute value.

Syntax

```
public abstract List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate OData element with 'Out' or 'InOut' attribute value

getParameters() method

Returns The list of the appropriate OData element.

Syntax

```
public abstract List< IODataParameter > getParameters ()
```

Returns

The list of the appropriate OData element

getReturnType() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getReturnType ()
```

Returns

The value of the appropriate OData attribute

getReturnTypeEnum() method

Returns The return type of this Function Import OData document.

Syntax

```
public RETURNTYPE_ENUM getReturnTypeEnum ()
```

Returns

The return type of this Function Import OData document

ATTRIBUTE_ACTION_FOR variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ACTION_FOR
```

ATTRIBUTE_ENTITYSET variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYSET
```

ATTRIBUTE_HTTPMETHOD variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_HTTPMETHOD
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_RETURNTYPE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_RETURNTYPE
```

ELEMENT_FUNCTIONALIMPORT variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

ELEMENT_PARAMETER variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PARAMETER
```

IODataIcon interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public interface IODataIcon extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *IODataIcon* on page 192

Members

All members of IODataIcon, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ICON	Name of the appropriate OData element.
public static final String	ATTRIBUTE_WIDTH	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_HEIGHT	Name of the appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public int	<i>getHeight()</i> on page 462	Returns The value of the appropriate OData attribute.
public String	<i>getUrl()</i> on page 462	Returns The value of the appropriate OData attribute.
public int	<i>getWidth()</i> on page 462	Returns The value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getHeight() method

Returns The value of the appropriate OData attribute.

Syntax

```
public int getHeight ()
```

Returns

The value of the appropriate OData attribute

getUrl() method

Returns The value of the appropriate OData attribute.

Syntax

```
public String getUrl ()
```

Returns

The value of the appropriate OData attribute

getWidth() method

Returns The value of the appropriate OData attribute.

Syntax

```
public int getWidth ()
```

Returns

The value of the appropriate OData attribute

ATTRIBUTE_HEIGHT variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_HEIGHT
```

ATTRIBUTE_WIDTH variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_WIDTH
```

ELEMENT_ICON variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ICON
```

IODataLink interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataLink extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataLink* on page 199

Members

All members of IODataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_LINK	Name of the appropriate OData element.
public static final String	ELEMENT_INLINE	Name of the appropriate OData element.
public static final String	ELEMENT_PARAMETER	Name of the appropriate OData element.
public static final String	ELEMENT_PARAMETER-SET	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_REL_VALUE_EDIT	Value option for the appropriate OData parameter.
public static final String	ATTRIBUTE_REL_VALUE_SELF	Value option for the appropriate OData parameter.
public static final String	ATTRIBUTE_HREF	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_REL	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_TITLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_VALUEPART_RELATED	String that should be part of every rel attribute of a Related Data Link.
public static final String	ATTRIBUTE_VALUEPART_DELTA	String that should be part of every rel attribute of a Delta.
public static final String	ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION	String that should be end of every rel attribute of a Subscription Link.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getHref()</i> on page 469	Returns the value of the appropriate OData attribute.
public abstract List<IODataEntry >	<i>getInlineEntries()</i> on page 469	Returns the list of OData Entries contained by the appropriate OData 'inline' element.
public abstract List< String >	<i>getInputParameterNames()</i> on page 469	Returns the list of the appropriate OData Parameter elements that should be used as input parameter.

Modifier and Type	Method	Description
public abstract List< String >	<i>getOutputParameterNames()</i> on page 469	Returns the list of the appropriate OData Parameter elements that should be used as output parameter.
public abstract List< IOData-Parameter >	<i>getParameters()</i> on page 470	Returns the list of the appropriate OData Parameter elements.
public abstract String	<i>getRel()</i> on page 470	Returns the value of the appropriate OData attribute.
public abstract IODataSchema	<i>getSchema()</i> on page 470	Returns the Schema that is to be used for 'Inline entries'.
public abstract String	<i>getSemantics()</i> on page 470	Returns The value of the appropriate OData extension (vCard) attribute.
public abstract String	<i>getTargetCollectionId()</i> on page 471	Returns the Id of the collection that this link points to (if any)
public abstract String	<i>getTitle()</i> on page 471	Returns the value of the appropriate OData attribute.
public abstract String	<i>getUrl()</i> on page 471	Returns the full URL for this OData Link object without parameters.
public abstract String	<i>getUrlWithParameters(Map<String, String >)</i> on page 471	Returns the full URL for this OData Link object extended with the given parameter names and values.
public abstract void	<i>setSchema(IODataSchema)</i> on page 472	Sets the Schema that is to be used for 'Inline entries'.
public abstract void	<i>setTargetCollectionId(String)</i> on page 472	Maintains the Id of the collection that this link points to (if any)

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.

Modifier and Type	Member	Description
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParseDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParseDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

***getHref()* method**

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getHref ()
```

Returns

The value of the appropriate OData attribute

***getInlineEntries()* method**

Returns the list of OData Entries contained by the appropriate OData 'inline' element.

Syntax

```
public abstract List< IODataEntry > getInlineEntries ()
```

Returns

The List of 'inline' OData Entries

***getInputParameterNames()* method**

Returns the list of the appropriate OData Parameter elements that should be used as input parameter.

Syntax

```
public abstract List< String > getInputParameterNames ()
```

Returns

The list of the appropriate OData Parameter elements that should be used as input parameter

***getOutputParameterNames()* method**

Returns the list of the appropriate OData Parameter elements that should be used as output parameter.

Syntax

```
public abstract List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate OData Parameter elements that should be used as output parameter

getParameters() method

Returns the list of the appropriate OData Parameter elements.

Syntax

```
public abstract List< IODataParameter > getParameters ()
```

Returns

The list of the appropriate OData Parameter elements

getRel() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getRel ()
```

Returns

The value of the appropriate OData attribute

getSchema() method

Returns the Schema that is to be used for 'Inline entries'.

Syntax

```
public abstract IODataSchema getSchema ()
```

Returns

The relevant schema

getSemantics() method

Returns The value of the appropriate OData extension (vCard) attribute.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate OData extension (vCard) attribute

getTargetCollectionId() method

Returns the Id of the collection that this link points to (if any)

Syntax

```
public abstract String getTargetCollectionId ()
```

Returns

The Id of the collection that this link points to

getTitle() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate OData attribute

getUrl() method

Returns the full URL for this OData Link object without parameters.

Syntax

```
public abstract String getUrl ()
```

Returns

The full URL of this link without parameters

getUrlWithParameters(Map< String, String >) method

Returns the full URL for this OData Link object extended with the given parameter names and values.

Syntax

```
public abstract String getUrlWithParameters (Map< String,  
String > parameters)
```

Returns

The full URL of this link with parameters

setSchema(IODataSchema) method

Sets the Schema that is to be used for 'Inline entries'.

Syntax

```
public abstract void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The relevant schema

setTargetCollectionId(String) method

Maintains the Id of the collection that this link points to (if any)

Syntax

```
public abstract void setTargetCollectionId (String targetCollectionId)
```

Parameters

- **targetCollectionId** – The Id of the collection that this link points to

ATTRIBUTE_HREF variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_HREF
```

ATTRIBUTE_REL variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_REL
```

ATTRIBUTE_REL_VALUE_EDIT variable

Value option for the appropriate OData parameter.

Syntax

```
public static final String ATTRIBUTE_REL_VALUE_EDIT
```

ATTRIBUTE_REL_VALUE_SELF variable

Value option for the appropriate OData parameter.

Syntax

```
public static final String ATTRIBUTE_REL_VALUE_SELF
```

ATTRIBUTE_SEMANTICS variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_TITLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TITLE
```

ATTRIBUTE_VALUEPART_DELTA variable

String that should be part of every rel attribute of a Delta.

Syntax

```
public static final String ATTRIBUTE_VALUEPART_DELTA
```

ATTRIBUTE_VALUEPART_RELATED variable

String that should be part of every rel attribute of a Related Data Link.

Syntax

```
public static final String ATTRIBUTE_VALUEPART_RELATED
```

ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION variable

String that should be end of every rel attribute of a Subscription Link.

Syntax

```
public static final String ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION
```

ELEMENT_INLINE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_INLINE
```

ELEMENT_LINK variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_LINK
```

ELEMENT_PARAMETER variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PARAMETER
```

ELEMENT_PARAMETERSET variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PARAMETERSET
```

IODataNavigationProperty interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataNavigationProperty extends  
IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *IODataNavigationProperty* on page 209

Members

All members of *IODataNavigationProperty*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_NAVIGATION-PROPERTY	Name of the appropriate OData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_RELATIONSHIP	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_FROMROLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_TOROLE	Name of the appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getFromRole()</i> on page 478	Returns The value of the appropriate OData attribute.
public abstract String	<i>getName()</i> on page 479	Returns The value of the appropriate OData attribute.
public abstract String	<i>getRelationship()</i> on page 479	Returns The value of the appropriate OData attribute.
public abstract String	<i>getToRole()</i> on page 479	Returns The value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getFromRole() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getFromRole ()
```

Returns

The value of the appropriate OData attribute

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate OData attribute

getRelationship() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getRelationship ()
```

Returns

The value of the appropriate OData attribute

getToRole() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getToRole ()
```

Returns

The value of the appropriate OData attribute

ATTRIBUTE_FROMROLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_FROMROLE
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_RELATIONSHIP variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_RELATIONSHIP
```

ATTRIBUTE_TOROLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TOROLE
```

ELEMENT_NAVIGATIONPROPERTY variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_NAVIGATIONPROPERTY
```

IODataOpenSearchDescription interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataOpenSearchDescription extends  
IParserDocument,
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *IODataOpenSearchDescription* on page 214

Members

All members of IODataOpenSearchDescription, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_OPENSEARCH- DESCRIPTION	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ELEMENT_SHORTNAME	Name of the appropriate OData element.
public static final String	ELEMENT_DESCRIPTION	Name of the appropriate OData element.
public static final String	ELEMENT_URL	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getDescription()</i> on page 484	Returns The value of the appropriate OData element.
public abstract String	<i>getShortName()</i> on page 485	Returns The value of the appropriate OData element.
public abstract List< IODataURL >	<i>getUrls()</i> on page 485	Returns The list of the appropriate OData element.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getDescription() method

Returns The value of the appropriate OData element.

Syntax

```
public abstract String getDescription ()
```

Returns

The value of the appropriate OData element

getShortName() method

Returns The value of the appropriate OData element.

Syntax

```
public abstract String getShortName ()
```

Returns

The value of the appropriate OData element

getUrls() method

Returns The list of the appropriate OData element.

Syntax

```
public abstract List< IODataURL > getUrls ()
```

Returns

The list of the appropriate OData element

ELEMENT_DESCRIPTION variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_DESCRIPTION
```

ELEMENT_OPENSEARCHDESCRIPTION variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_OPENSEARCHDESCRIPTION
```

ELEMENT_SHORTNAME variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_SHORTNAME
```

ELEMENT_URL variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_URL
```

IODataParameter interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataParameter extends
IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataParameter* on page 221

Members

All members of IODataParameter, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_PARAMETER	Name of the appropriate OData element.
public static final String	VALUE_MODE_IN	Value option for the 'Mode' OData attribute.
public static final String	VALUE_MODE_OUT	Value option for the 'Mode' OData attribute.
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_MODE	Name of the appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getMode()</i> on page 490	Returns The value of the appropriate OData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 490	Returns The value of the appropriate OData attribute.
public abstract String	<i>getType()</i> on page 491	Returns The value of the appropriate OData attribute.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getMode() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getMode ()
```

Returns

The value of the appropriate OData attribute

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate OData attribute

getType() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getType ()
```

Returns

The value of the appropriate OData attribute

ATTRIBUTE_MODE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_MODE
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_TYPE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

ELEMENT_PARAMETER variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PARAMETER
```

VALUE_MODE_IN variable

Value option for the 'Mode' OData attribute.

Syntax

```
public static final String VALUE_MODE_IN
```

VALUE_MODE_OUT variable

Value option for the 'Mode' OData attribute.

Syntax

```
public static final String VALUE_MODE_OUT
```

IODataProperty interface

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataProperty extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataProperty* on page 227

Members

All members of IODataProperty, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_PROPERTY	Name of the appropriate OData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_NULLABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_FIXED-LENGTH	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_LABEL	Name of the appropriate OData attribute.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_CREATABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_UPDATABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_DELETABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_SEARCHABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_FILTERABLE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_UNICODE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_DEFAULTVALUE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_PRECISION	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_SCALE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_COLLATION	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_MAXLENGTH	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_USEIN-SEARCH	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_VISIBLEIN-LIST	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_VISIBLEINDE-TAIL	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_LIST_DIS-PLAYORDER	Name of the display-order OData attribute.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_DETAIL_DISPLAYORDER	Name of the display-order OData attribute.

Methods

Modifier and Type	Method	Description
public abstract List< IODataProperty >	<i>getChildPropertiesData()</i> on page 499	Returns all the child properties added to this document with putChildProperty method.
public abstract List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 499	Returns list of appropriate contained Property OData elements with the given attribute value.
public abstract List< IODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 500	Returns list of appropriate contained Property OData elements with the given attribute value.
public abstract IODataProperty	<i>getChildPropertyData(String)</i> on page 500	Return a single child property added with putChildProperty method.
public abstract String	<i>getCollation()</i> on page 501	Returns the value of the appropriate OData attribute.
public abstract String	<i>getDefault Value()</i> on page 501	Returns the value of the appropriate OData attribute.
public abstract int	<i>getDetailDisplayOrder()</i> on page 501	In current version it return the same value as getListDisplayOrder.
public abstract String	<i>getLabel()</i> on page 501	Returns The value of the appropriate OData attribute.
public abstract int	<i>getListDisplayOrder()</i> on page 501	In current version it returns the same value as getDetailDisplayOrder.
public abstract int	<i>getMaxLength()</i> on page 502	Returns the value of the appropriate OData attribute with default Value = 0;.
public abstract String	<i>getName()</i> on page 502	Returns The value of the appropriate OData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getPrecision()</i> on page 502	Returns the value of the appropriate OData attribute.
public abstract String	<i>getScale()</i> on page 502	Returns the value of the appropriate OData attribute.
public abstract String	<i>getSemantics()</i> on page 503	Returns the value of the appropriate OData attribute with defaultValue = 0;.
public abstract String	<i>getType()</i> on page 503	Returns The value of the appropriate OData attribute.
public abstract String	<i>getValue()</i> on page 503	Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.
public abstract boolean	<i>hasFixedLength()</i> on page 503	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isComplex()</i> on page 504	Returns if the property has complex type and has child properties.
public abstract boolean	<i>isCreatable()</i> on page 504	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isDeletable()</i> on page 504	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isFilterable()</i> on page 504	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isNullable()</i> on page 504	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isSearchable()</i> on page 505	Returns The value of the appropriate OData attribute.
public abstract boolean	<i>isUnicode()</i> on page 505	Returns the value of the appropriate OData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 505	Returns The value of the appropriate OData attribute.

Modifier and Type	Method	Description
public abstract void	<i>putChildPropertyData(IODataProperty)</i> on page 505	Put new child property to this property document.
public abstract void	<i>setValue(String)</i> on page 506	Sets the value of the property, represented by this object.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

Usage

May contain additional data retrieved from several source documents

getChildPropertiesData() method

Returns all the child properties added to this document with `putChildProperty` method.

Syntax

```
public abstract List< IODataProperty > getChildPropertiesData
()
```

Returns

List of child properties.

getChildPropertiesDataWithAttribute(String, String) method

Returns list of appropriate contained Property OData elements with the given attribute value.

Syntax

```
public abstract List< IODataProperty >
getChildPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

Returns

list of appropriate contained Property OData elements with the given attribute value

getChildPropertiesDataWithAttribute(String, String, boolean) method

Returns list of appropriate contained Property OData elements with the given attribute value.

Syntax

```
public abstract List< IODataProperty >
getChildPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

Returns

list of appropriate contained Property OData elements with the given attribute value

getChildPropertyData(String) method

Return a single child property added with putChildProperty method.

Syntax

```
public abstract IODataProperty getChildPropertyData (String
propertyName)
```

Parameters

- **propertyName** – The name of the child property that should be returned.

Returns

The found child property or null if there is no child property with the given name.

getCollation() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getCollation ()
```

Returns

The value of the appropriate OData attribute

getDefaultValue() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getDefaultValue ()
```

Returns

The value of the appropriate OData attribute

getDetailDisplayOrder() method

In current version it return the same value as getListDisplayOrder.

Syntax

```
public abstract int getDetailDisplayOrder ()
```

Returns

The value of 'display-order' attribute with defaultValue = 0;

getLabel() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getLabel ()
```

Returns

The value of the appropriate OData attribute

getListDisplayOrder() method

In current version it returns the same value as getDetailDisplayOrder.

Syntax

```
public abstract int getListDisplayOrder ()
```

Returns

The value of 'display-order' attribute with defaultValue = 0;

getMaxLength() method

Returns the value of the appropriate OData attribute with defaultValue = 0;

Syntax

```
public abstract int getMaxLength ()
```

Returns

The value of the appropriate OData attribute with defaultValue = 0;

getName() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate OData attribute

getPrecision() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getPrecision ()
```

Returns

The value of the appropriate OData attribute

getScale() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getScale ()
```

Returns

The value of the appropriate OData attribute

getSemantics() method

Returns the value of the appropriate OData attribute with defaultValue = 0;

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate OData attribute with defaultValue = 0;

getType() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract String getType ()
```

Returns

The value of the appropriate OData attribute

getValue() method

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

Syntax

```
public abstract String getValue ()
```

Returns

the value of the property instance represented by this object.

Remarks

Otherwise it returns null.

Typically this object contains value only if this object was returned by an OData Entry.

hasFixedLength() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean hasFixedLength ()
```

Returns

The value of the appropriate OData attribute

isComplex() method

Returns if the property has complex type and has child properties.

Syntax

```
public abstract boolean isComplex ()
```

Returns

true if the property has complex type and has child properties.

isCreatable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean isCreatable ()
```

Returns

The value of the appropriate OData attribute

isDeletable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean isDeletable ()
```

Returns

The value of the appropriate OData attribute

isFilterable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean isFilterable ()
```

Returns

The value of the appropriate OData attribute

isNullable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean isNullable ()
```

Returns

The value of the appropriate OData attribute

isSearchable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean isSearchable ()
```

Returns

The value of the appropriate OData attribute

isUnicode() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract boolean isUnicode ()
```

Returns

The value of the appropriate OData attribute

isUpdatable() method

Returns The value of the appropriate OData attribute.

Syntax

```
public abstract boolean isUpdatable ()
```

Returns

The value of the appropriate OData attribute

putChildPropertyData(IODataProperty) method

Put new child property to this property document.

Syntax

```
public abstract void putChildPropertyData (IODataProperty
property)
```

Parameters

- **property** – The child property

setValue(String) method

Sets the value of the property, represented by this object.

Syntax

```
public abstract void setValue (String value)
```

Parameters

- **value** – The value of the property instance represented by this object.

Remarks

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an OData Entry object.

ATTRIBUTE_COLLATION variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_COLLATION
```

ATTRIBUTE_CREATABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_CREATABLE
```

ATTRIBUTE_DEFAULTVALUE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_DEFAULTVALUE
```

ATTRIBUTE_DELETABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_DELETABLE
```

ATTRIBUTE_DETAIL_DISPLAYORDER variable

Name of the display-order OData attribute.

Syntax

```
public static final String ATTRIBUTE_DETAIL_DISPLAYORDER
```

ATTRIBUTE_FILTERABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_FILTERABLE
```

ATTRIBUTE_FIXEDLENGTH variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_FIXEDLENGTH
```

ATTRIBUTE_LABEL variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_LABEL
```

ATTRIBUTE_LIST_DISPLAYORDER variable

Name of the display-order OData attribute.

Syntax

```
public static final String ATTRIBUTE_LIST_DISPLAYORDER
```

ATTRIBUTE_MAXLENGTH variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_MAXLENGTH
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_NULLABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NULLABLE
```

ATTRIBUTE_PRECISION variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_PRECISION
```

ATTRIBUTE_SCALE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SCALE
```

ATTRIBUTE_SEARCHABLE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEARCHABLE
```

ATTRIBUTE_SEMANTICS variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_TYPE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

ATTRIBUTE_UNICODE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_UNICODE
```

***ATTRIBUTE_UPDATABLE* variable**

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_UPDATABLE
```

***ATTRIBUTE_USEINSEARCH* variable**

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_USEINSEARCH
```

***ATTRIBUTE_VISIBLEINDETAIL* variable**

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_VISIBLEINDETAIL
```

***ATTRIBUTE_VISIBLEINLIST* variable**

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_VISIBLEINLIST
```

***ELEMENT_PROPERTY* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_PROPERTY
```

***IODataSchema* interface**

Represents the OData Service Document.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataSchema extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataSchema* on page 270

Members

All members of IODataSchema, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_NAME	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_ENTITYTYPE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_ENTITYSET	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_NAMESPACE	Name of the appropriate OData attribute.
public static final String	ELEMENT_EDMX	Name of the appropriate OData element.
public static final String	ELEMENT_DATASERVICES	Name of the appropriate OData element.
public static final String	ELEMENT_SCHEMA	Name of the appropriate OData element.
public static final String	ELEMENT_ENTITYCONTAINER	Name of the appropriate OData element.
public static final String	ELEMENT_ENTITYSET	Name of the appropriate OData element.
public static final String	ACTION_FOR	name of the appropriate Odata attribute
public static final String	ELEMENT_FUNCTIONALIMPORT	Name of the appropriate OData element.
public static final String	ELEMENT_COMPLEXTYPE	Name of the appropriate OData element.
public static final String	ELEMENT_ENTITYTYPE	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract IODataAssociation	<i>getAssociation(String)</i> on page 515	Returns the appropriate OData Association element with the given relationship attribute.
public abstract List< IODataAssociation >	<i>getAssociations()</i> on page 515	Returns the list of the appropriate OData elements.
public abstract IODataAssociationSet	<i>getAssociationSet(String)</i> on page 515	Returns the appropriate AssociationSet with for given association.
public abstract List< IODataAssociationSet >	<i>getAssociationSets()</i> on page 516	Returns the list of the appropriate OData elements.
public abstract IODataComplexType	<i>getComplexType(String)</i> on page 516	Returns The 'ComplexType' OData element associated with the reference.
public abstract List< IODataComplexType >	<i>getComplexTypes()</i> on page 516	Returns The list of the appropriate OData element.
public abstract IODataEntitySet	<i>getEntitySet(String)</i> on page 517	Returns The appropriate OData EntitySet.
public abstract IODataEntityType	<i>getEntityType(String)</i> on page 517	Returns The 'EntityType' OData element associated with the reference argument.
public abstract IODataEntityType	<i>getEntityTypeForCollection(String)</i> on page 517	Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.
public abstract List< IODataFunctionImport >	<i>getFunctionImports()</i> on page 518	Returns The list of the 'FunctionImport' OData element.
public abstract List< IODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 518	Returns List of FunctionImports valid for the appropriate collection.
public abstract IODataServiceDocument	<i>getServiceDocument()</i> on page 518	Returns the appropriate OData Service Document.
public abstract String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 518	Resolves the target collection Id of the given OData Navigation Property element.

Modifier and Type	Method	Description
public abstract void	<i>setServiceDocument(IOData-ServiceDocument)</i> on page 519	Maintains reference to the appropriate OData Service Document.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getAssociation(String) method

Returns the appropriate OData Association element with the given relationship attribute.

Syntax

```
public abstract IODataAssociation getAssociation (String relationship)
```

getAssociations() method

Returns the list of the appropriate OData elements.

Syntax

```
public abstract List< IODataAssociation > getAssociations ()
```

Returns

List of the appropriate OData elements

getAssociationSet(String) method

Returns the appropriate AssociationSet with for given association.

Syntax

```
public abstract IODataAssociationSet getAssociationSet (String association)
```

Parameters

- **association** – The association of the AssociationSet

Returns

The appropriate AssociationSet with for given association

getAssociationSets() method

Returns the list of the appropriate OData elements.

Syntax

```
public abstract List< IODataAssociationSet >  
getAssociationSets ()
```

Returns

List of the appropriate OData elements

getComplexType(String) method

Returns The 'ComplexType' OData element associated with the reference.

Syntax

```
public abstract IODataComplexType getComplexType (String  
complexTypeReference)
```

Parameters

- **complexTypeReference** – Reference to the appropriate Complex Type (example: 'namespace.complextypename')

Returns

The 'ComplexType' OData element associated with the reference

getComplexTypes() method

Returns The list of the appropriate OData element.

Syntax

```
public abstract List< IODataComplexType > getComplexTypes ()
```

Returns

The list of the appropriate OData element

getEntitySet(String) method

Returns The appropriate OData EntitySet.

Syntax

```
public abstract IODataEntitySet getEntitySet (String collectionId)
```

Parameters

- **collectionId** – The href of the collection to find the OData EntitySet for

Returns

The appropriate OData EntitySet

getEntityType(String) method

Returns The 'EntityType' OData element associated with the reference argument.

Syntax

```
public abstract IODataEntityType getEntityType (String entityTypeReference)
```

Parameters

- **entityTypeReference** – Reference to the appropriate Entity Type (example: 'namespace.entitytypename')

Returns

The 'EntityType' OData element associated with the reference argument

getEntityTypeForCollection(String) method

Returns the 'EntityType' OData element contained by the 'EntitySet' element that is associated with the collectionId matching.

Syntax

```
public abstract IODataEntityType getEntityTypeForCollection (String collectionId)
```

Parameters

- **collectionId** – The Id to be compared with the name of 'EntitySet' elements

Returns

The matching EntityType

getFunctionImports() method

Returns The list of the 'FunctionImport' OData element.

Syntax

```
public abstract List< IODataFunctionImport >  
getFunctionImports ()
```

Returns

The list of the 'FunctionImport' OData element

getFunctionImportsForCollection(String) method

Returns List of FunctionImports valid for the appropriate collection.

Syntax

```
public abstract List< IODataFunctionImport >  
getFunctionImportsForCollection (String collectionId)
```

Parameters

- **collectionId** – The href of the appropriate collection.

Returns

List of FunctionImports valid for the appropriate collection.

getServiceDocument() method

Returns the appropriate OData Service Document.

Syntax

```
public abstract IODataServiceDocument getServiceDocument ()
```

Returns

The appropriate OData Service Document

getTargetCollectionIdForNavigationProperty(String, String) method

Resolves the target collection Id of the given OData Navigation Property element.

Syntax

```
public abstract String  
getTargetCollectionIdForNavigationProperty (  
    String sourceCollectionId,  
    String navigationPropertyName  
)
```

Parameters

- **sourceCollectionId** – The source Id of the source collection that is linked with the target collection
- **navigationPropertyName** – The name of the Navigation Property

Returns

The Id of the target collection

setServiceDocument(IODataServiceDocument) method

Maintains reference to the appropriate OData Service Document.

Syntax

```
public abstract void setServiceDocument
(IODataServiceDocument serviceDocument)
```

Parameters

- **serviceDocument** – The appropriate OData Service Document

ACTION_FOR variable

name of the appropriate Odata attribute

Syntax

```
public static final String ACTION_FOR
```

ATTRIBUTE_ENTITYSET variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYSET
```

ATTRIBUTE_ENTITYTYPE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYTYPE
```

ATTRIBUTE_NAME variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_NAMESPACE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_NAMESPACE
```

ELEMENT_COMPLEXTYPE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_COMPLEXTYPE
```

ELEMENT_DATASERVICES variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_DATASERVICES
```

ELEMENT_EDMX variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_EDMX
```

ELEMENT_ENTITYCONTAINER variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ENTITYCONTAINER
```

ELEMENT_ENTITYSET variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ENTITYSET
```

ELEMENT_ENTITYTYPE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ENTITYTYPE
```

ELEMENT_FUNCTIONALIMPORT variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

ELEMENT_SCHEMA variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_SCHEMA
```

IODataServiceDocument interface

Represents the OData Service Document.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataServiceDocument extends
  IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataServiceDocument* on page 280

Members

All members of *IODataServiceDocument*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_SERVICE	Name of the appropriate OData element.
public static final String	ELEMENT_WORKSPACE	Name of the appropriate OData element.
public static final String	ELEMENT_COLLECTION	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_LANG	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_BASE	Name of the appropriate OData attribute.
public static final String	URL_SUFFIX_METADATA	URL value suffix for retrieving OData Schema document.

Methods

Modifier and Type	Method	Description
public abstract List< IOData-Collection >	<i>getAllCollections()</i> on page 526	Returns the list of all 'collection' OData element contained by the 'workspace' elements.
public abstract String	<i>getBaseUrl()</i> on page 526	Returns The value of the 'base' OData attribute.
public abstract String	<i>getEtag()</i> on page 526	Returns The value of the 'etag' OData attribute.
public abstract String	<i>getLanguage()</i> on page 526	Returns the value of the 'lang' OData attribute.
public abstract IODataOpenSearchDescription	<i>getOpenSearchDescription(String)</i> on page 527	Returns the appropriate OpenSearch Description Document for the given collection.
public abstract IODataSchema	<i>getSchema()</i> on page 527	Returns the appropriate OData Schema document.
public abstract String	<i>getSchemaUrl()</i> on page 527	Returns The full URL that can be used for retrieving the OData Schema document.
public abstract List< IOData-Workspace >	<i>getWorkspaces()</i> on page 527	Returns the list of appropriate OData elements.
public abstract void	<i>setOpenSearchDescription(String, IODataOpenSearchDescription)</i> on page 528	Maintains the appropriate OpenSearch Description Document for the given collection.
public abstract void	<i>setSchema(IODataSchema)</i> on page 528	Maintains the appropriate OData Schema document.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getAllCollections() method

Returns the list of all 'collection' OData element contained by the 'workspace' elements.

Syntax

```
public abstract List< IODataCollection > getAllCollections ()
```

Returns

The list of all 'collection' OData element contained by the 'workspace' elements

getBaseUrl() method

Returns The value of the 'base' OData attribute.

Syntax

```
public abstract String getBaseUrl ()
```

Returns

The value of the 'base' OData attribute

getEtag() method

Returns The value of the 'etag' OData attribute.

Syntax

```
public abstract String getEtag ()
```

Returns

The value of the 'etag' OData attribute

getLanguage() method

Returns the value of the 'lang' OData attribute.

Syntax

```
public abstract String getLanguage ()
```

Returns

The value of the 'lang' OData attribute

getOpenSearchDescription(String) method

Returns the appropriate OpenSearch Description Document for the given collection.

Syntax

```
public abstract IODataOpenSearchDescription
getOpenSearchDescription (String collectionId)
```

Parameters

- **collectionId** – The Id of the collection

Returns

The appropriate OpenSearch Description Document

getSchema() method

Returns the appropriate OData Schema document.

Syntax

```
public abstract IODataSchema getSchema ()
```

Returns

The appropriate OData Schema document

getSchemaUrl() method

Returns The full URL that can be used for retrieving the OData Schema document.

Syntax

```
public abstract String getSchemaUrl ()
```

Returns

The full URL that can be used for retrieving the OData Schema document

getWorkspaces() method

Returns the list of appropriate OData elements.

Syntax

```
public abstract List< IODataWorkspace > getWorkspaces ()
```

Returns

The list of appropriate OData elements

setOpenSearchDescription(String, IODataOpenSearchDescription) method
Maintains the appropriate OpenSearch Description Document for the given collection.

Syntax

```
public abstract void setOpenSearchDescription (  
    String collectionId,  
    IODataOpenSearchDescription openSearchDescription  
)
```

Parameters

- **collectionId** – The Id of the collection
- **openSearchDescription** – The appropriate OpenSearch Description Document

setSchema(IODataSchema) method
Maintains the appropriate OData Schema document.

Syntax

```
public abstract void setSchema (IODataSchema schema)
```

Parameters

- **schema** – The appropriate OData Schema document

ATTRIBUTE_BASE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_BASE
```

ATTRIBUTE_LANG variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_LANG
```

ELEMENT_COLLECTION variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_COLLECTION
```

***ELEMENT_SERVICE* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_SERVICE
```

***ELEMENT_WORKSPACE* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_WORKSPACE
```

***URL_SUFFIX_METADATA* variable**

URL value suffix for retrieving OData Schema document.

Syntax

```
public static final String URL_SUFFIX_METADATA
```

***IODataSubscriptionEntry* interface**

Subclass of ODataEntry to be used for subscription s.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataSubscriptionEntry extends  
IODataEntry
```

Implemented interfaces

- *IODataEntry* on page 415

Derived classes

- *ODataSubscriptionEntry* on page 289

Members

All members of IODataSubscriptionEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_DELIVERYADDRESS	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ELEMENT_COLLECTION	Name of the appropriate OData element.
public static final String	ELEMENT_FILTER	Name of the appropriate OData element.
public static final String	ELEMENT_SELECT	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getCollection()</i> on page 538	Returns The value of the appropriate entry property.
public abstract String	<i>getDeliveryAddress()</i> on page 539	Returns The value of the appropriate entry property.
public abstract String	<i>getFilter()</i> on page 539	Returns The value of the appropriate entry property.
public abstract String	<i>getSelect()</i> on page 539	Returns The value of the appropriate entry property.
public abstract void	<i>setCollection(String)</i> on page 539	Sets the value of the appropriate entry property.
public abstract void	<i>setDeliveryAddress(String)</i> on page 539	Sets the value of the appropriate entry property.
public abstract void	<i>setFilter(String)</i> on page 540	Sets the value of the appropriate entry property.
public abstract void	<i>setSelect(String)</i> on page 540	Sets the value of the appropriate entry property.

Inherited members from IODataEntry

Modifier and Type	Member	Description
public abstract List< IOData-Link >	<i>getActionLinks()</i> on page 425	Returns OData Link objects that are set as action links (Has semantics (SAP name-space) attribute with value 'action')

Modifier and Type	Member	Description
public abstract String	<i>getAuthorName()</i> on page 425	Returns The value of the 'name' OData element of the 'author' OData element.
public cacheState	<i>getCachestate()</i> on page 426	
public Long	<i>getCacheTimestamp()</i> on page 426	
public abstract String	<i>getCollectionId()</i> on page 426	Returns the Id of the OCata Collection that this Entry belongs to.
public abstract String	<i>getContentType()</i> on page 426	Returns the content type of the entry.
public abstract String	<i>getEtag()</i> on page 426	Returns the Id of the OData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 427	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public abstract List< IODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.
public abstract List< IODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.

Modifier and Type	Member	Description
public abstract List< IODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 427	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.
public abstract List< IODataIcon >	<i>getIcons()</i> on page 428	Returns the list of the appropriate OData elements.
public abstract String	<i>getId()</i> on page 428	Returns The Id of this OData Entry (value of appropriate OData Id element)
public boolean	<i>getIsLocal()</i> on page 428	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 428	Returns the values of the properties that are marked as key properties in the OData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 428	Returns The parsed value of the 'updated' OData Element.
public abstract List< IODataLink >	<i>getLinks()</i> on page 429	Returns the list of the appropriate OData elements.
public abstract String	<i>getMediaSrc()</i> on page 429	Returns the media source if the entry has a media content.
public abstract List< IODataProperty >	<i>getPropertiesData()</i> on page 429	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document.
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 429	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.

Modifier and Type	Member	Description
public abstract List< IODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 430	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with the given attribute value.
public abstract IParserDocument	<i>getPropertiesDocument()</i> on page 430	Returns the representer document of OData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 431	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 431	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 432	Returns the all the values of properties contained by this OData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List< String[] >)</i> on page 432	Return list of property values for the given property paths.
public abstract List< IODataLink >	<i>getRelatedDataLinks()</i> on page 432	Returns OData Link objects that represents links to Related Data.
public abstract List< IODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 433	Returns the value and meta information (retrieved from OData Schema document) of the properties of this OData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract IODataSchema	<i>getSchema()</i> on page 433	Returns the appropriate OData Schema object.

Modifier and Type	Member	Description
public abstract IODataLink	<i>getSelfLink()</i> on page 433	Returns OData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract IODataLink	<i>getSubscriptionLink()</i> on page 433	Returns OData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 434	Returns The value of the appropriate OData element.
public abstract String	<i>getTitle()</i> on page 434	Returns The value of the appropriate OData element.
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 434	Puts the new property element as a sub-element of the 'complex properties' OData element.
public abstract void	<i>putContentType(String)</i> on page 434	Puts the content type for a new entry object.
public abstract void	<i>putId(String)</i> on page 435	Sets id of this OData Entry document (value of appropriate OData Id element)
public abstract void	<i>putMediaSrc(String)</i> on page 435	Puts the media source for a new entry object.
public abstract void	<i>putPropertyValue(String, String)</i> on page 435	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 436	Puts the new property element as a sub-element of the 'properties' OData element.
public abstract void	<i>setAuthorName(String)</i> on page 436	Sets the value of the 'name' OData element of the 'author' OData element.
public void	<i>setCachestate(cache.State)</i> on page 436	
public void	<i>setCacheTimestamp(Long)</i> on page 436	

Modifier and Type	Member	Description
public abstract void	<i>setCollectionId(String)</i> on page 437	Maintains the Id of the OData Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 437	
public abstract void	<i>setSchema(IODataSchema)</i> on page 437	Maintains the reference to the appropriate OData Schema object.
public abstract void	<i>setSummary(String)</i> on page 437	Sets the value of the appropriate OData element.
public abstract void	<i>setTitle(String)</i> on page 437	Sets the value of the appropriate OData element.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getCollection() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getCollection ()
```

Returns

The value of the appropriate entry property

getDeliveryAddress() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getDeliveryAddress ()
```

Returns

The value of the appropriate entry property

getFilter() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getFilter ()
```

Returns

The value of the appropriate entry property

getSelect() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getSelect ()
```

Returns

The value of the appropriate entry property

setCollection(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setCollection (String collection)
```

Parameters

- **collection** – The new value of the appropriate entry property

setDeliveryAddress(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setDeliveryAddress (String deliveryAddress)
```

Parameters

- **deliveryAddress** –

setFilter(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setFilter (String filterString)
```

Parameters

- **filterString** – The new value of the appropriate entry property

setSelect(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setSelect (String selectString)
```

Parameters

- **selectString** – The new value of the appropriate entry property

ELEMENT_COLLECTION variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_COLLECTION
```

ELEMENT_DELIVERYADDRESS variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_DELIVERYADDRESS
```

ELEMENT_FILTER variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_FILTER
```

***ELEMENT_SELECT* variable**

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_SELECT
```

***IODataURL* interface**

Represents the appropriate OData element.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataURL extends IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *ODataURL* on page 310

Members

All members of IODataURL, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_URL	Name of the appropriate OData element.
public static final String	ATTRIBUTE_TEMPLATE	Name of the appropriate OData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate OData attribute.

Methods

Modifier and Type	Method	Description
public abstract List< String >	<i>getMandatoryTemplateParameters()</i> on page 545	Returns the list of mandatory template parameter names.
public abstract List< String >	<i>getOptionalTemplateParameters()</i> on page 546	Returns the list of optional template parameter names.

Modifier and Type	Method	Description
public abstract String	<i>getTemplate()</i> on page 546	Returns the value of the appropriate OData attribute.
public abstract List< String >	<i>getTemplateParameters()</i> on page 546	Returns the list of all template parameter names.
public abstract String	<i>getType()</i> on page 546	Returns the value of the appropriate OData attribute.
public abstract String	<i>getUrl()</i> on page 546	Returns the full URL of this OData attribute without parameters.
public abstract String	<i>getUrlFromTemplate(Map< String, String >)</i> on page 547	Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List<IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List<IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getMandatoryTemplateParameters() method

Returns the list of mandatory template parameter names.

Syntax

```
public abstract List< String > getMandatoryTemplateParameters
()
```

Returns

the list of mandatory template parameter names

getOptionalTemplateParameters() method

Returns the list of optional template parameter names.

Syntax

```
public abstract List< String > getOptionalTemplateParameters  
( )
```

Returns

the list of optional template parameter names

getTemplate() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getTemplate ( )
```

Returns

The value of the appropriate OData attribute

getTemplateParameters() method

Returns the list of all template parameter names.

Syntax

```
public abstract List< String > getTemplateParameters ( )
```

Returns

the list of all template parameter names

getType() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getType ( )
```

Returns

The value of the appropriate OData attribute

getUrl() method

Returns the full URL of this OData attribute without parameters.

Syntax

```
public abstract String getUrl ( )
```

Returns

The full URL this OData attribute without parameters

getUrlFromTemplate(Map< String, String >) method

Returns the full URL of this OData attribute extended with parameter names and values according to the given parameter map.

Syntax

```
public abstract String getUrlFromTemplate (Map< String, String
> parameters)
```

Returns

The full URL this OData attribute with parameters names and values

ATTRIBUTE_TEMPLATE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TEMPLATE
```

ATTRIBUTE_TYPE variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

ELEMENT_URL variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_URL
```

IODataWorkspace interface

Consists of APIs related to OData Workspace.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IODataWorkspace extends
IParserDocument
```

Implemented interfaces

- *IParserDocument* on page 565

Derived classes

- *IODataWorkspace* on page 319

Members

All members of IODataWorkspace, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_WORKSPACE	Name of the appropriate OData element.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate OData attribute.
public static final String	ELEMENT_TITLE	Name of the appropriate OData element.

Methods

Modifier and Type	Method	Description
public abstract List< IOData-Collection >	<i>getCollections()</i> on page 552	Returns The list of of 'collection' OData element.
public abstract String	<i>getSemantics()</i> on page 552	Returns the value of the appropriate OData attribute.
public abstract String	<i>getTitle()</i> on page 552	Returns the value of the appropriate OData element.

Inherited members from IParserDocument

Modifier and Type	Member	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< IParser-Document >, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 586	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

getCollections() method

Returns The list of of 'collection' OData element.

Syntax

```
public abstract List< IODataCollection > getCollections ()
```

Returns

The list of of 'collection' OData element.

getSemantics() method

Returns the value of the appropriate OData attribute.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate OData attribute

getTitle() method

Returns the value of the appropriate OData element.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate OData element

ATTRIBUTE_SEMANTICS variable

Name of the appropriate OData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ELEMENT_TITLE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_TITLE
```

ELEMENT_WORKSPACE variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_WORKSPACE
```

IParser interface

Main interface for OData parser.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IParser
```

Derived classes

- *Parser* on page 325

Members

All members of IParser, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	FORMAT_XML	XML Format for Building Post Body.
public static final int	FORMAT_JSON	JSON Format for Building Post Body.

Methods

Modifier and Type	Method	Description
public abstract String	<i>buildODataDocument(IParser-Document)</i> on page 556	Builds a valid OData Entry XML Post body from the entry argument.

Modifier and Type	Method	Description
public String	<i>buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int)</i> on page 556	Builds a valid OData Entry JSON Post body from the entry argument.
public void	<i>enableParserPerformanceLog(boolean, Context)</i> on page 557	This method is to be called if performance data point are to be enabled for Parser.
public abstract IParserDocument	<i>parse(String)</i> on page 557	Parses the Source and converts it to a Java Object containing all the information that were contained by the source.
public abstract IParserDocument	<i>parse(InputStream)</i> on page 558	Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.
public abstract List<IODataEntry >	<i>parseFunctionImportResult(String, IODataFunctionImport, IODataSchema)</i> on page 558	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..
public abstract List<IODataEntry >	<i>parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema)</i> on page 559	Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..
public abstract List<IODataEntry >	<i>parseODataEntries(String, String, IODataSchema)</i> on page 559	Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

Modifier and Type	Method	Description
public abstract List<IODataEntry >	<i>parseODataEntries(InputStream, String, IODataSchema)</i> on page 560	Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.
public abstract IODataError	<i>parseODataError(String)</i> on page 560	Parses the OData Error.
public abstract IODataError	<i>parseODataError(InputStream)</i> on page 561	Parses the OData Error from stream.
public IODataFeed	<i>parseODataFeed(String, String, IODataSchema)</i> on page 561	Parse OData Feed, support for Delta Query.
public IODataFeed	<i>parseODataFeed(InputStream, String, IODataSchema)</i> on page 562	Parse OData Feed from stream, support for Delta Query.
public abstract IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(String, String, IODataServiceDocument)</i> on page 562	Parses the OData Open Search Description.
public abstract IODataOpenSearchDescription	<i>parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument)</i> on page 563	Parses the OData Open Search Description from stream.
public abstract IODataSchema	<i>parseODataSchema(String, IODataServiceDocument)</i> on page 563	Parses the OData Schema.
public abstract IODataSchema	<i>parseODataSchema(InputStream, IODataServiceDocument)</i> on page 564	Parses the OData Schema from stream.
public abstract IODataServiceDocument	<i>parseODataServiceDocument(String)</i> on page 564	Parses the OData Service Document.
public abstract IODataServiceDocument	<i>parseODataServiceDocument(InputStream)</i> on page 565	Parses the OData Service Document from stream.

buildODataDocument(IParserDocument) method

Builds a valid OData Entry XML Post body from the entry argument.

Syntax

```
public abstract String buildODataDocument (IParserDocument
document) throws ParseException, IllegalArgumentException
```

Parameters

- **entry** – The ODataEntry object to build the from
- **document** – The ParserDocument object to build the from

Returns

The built document

Exceptions

- **ParseException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds and representation of the document argument
- **ParseException class** – If building document has failed
- **IllegalArgumentException** – If the argument is null

buildODataEntryRequestBody(IODataEntry, String, IODataSchema, int) method

Builds a valid OData Entry JSON Post body from the entry argument.

Syntax

```
public String buildODataEntryRequestBody (
    IODataEntry entry,
    String collectionId,
    IODataSchema schema,
    int formatType
) throws ParseException
```

Parameters

- **entry** – The ODataEntry object to build the from
- **collectionID** –
- **entry** – The ODataEntry object to build the from
- **collectionID** – Collection t which the entry would be posted
- **schema** – Schema of the service
- **formatType** – Format of the post body to be built 1 - Atom/XML 2 - JSON

Returns

The built document

Exceptions

- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null Builds a valid OData Entry XML or JSON Post body from the entry argument
- **ParserException class** – If building has failed
- **IllegalArgumentException** – If the argument is null

enableParserPerformanceLog(boolean, Context) method

This method is to be called if performance data point are to be enabled for Parser.

Syntax

```
public void enableParserPerformanceLog (
    boolean perflog,
    Context applicationContext
)
```

Parameters

- **perflog** –
- **applicationContext** –

parse(String) method

Parses the Source and converts it to a Java Object containing all the information that were contained by the source.

Syntax

```
public abstract IParserDocument parse (String document) throws
ParserException, IllegalArgumentException
```

Parameters

- **A** – syntactically valid document

Returns

The Object representation of the parsed document

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parse(InputStream) method

Parses the stream source of document and converts it to a Java Object containing all the information that were contained by the source.

Syntax

```
public abstract IParserDocument parse (InputStream stream)  
throws ParseException, IllegalArgumentException
```

Parameters

- **stream** – A stream that holds a syntactically valid document

Returns

The Object representation of the parsed document

Exceptions

- **ParseException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

parseFunctionImportResult(String, IODataFunctionImport, IODataSchema) method

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,.

Syntax

```
public abstract List< IODataEntry > parseFunctionImportResult  
(  
    String document,  
    IODataFunctionImport functionImport,  
    IODataSchema schema  
) throws ParseException, IllegalArgumentException
```

Parameters

- **document** – The Function Import result document
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

Returns

List of OData Entry containing the result values

Exceptions

- **ParseException class** – If parsing document has failed

- **IllegalArgumentException** – If either of the arguments is null

parseFunctionImportResult(InputStream, IODataFunctionImport, IODataSchema) method

Parser a non error result of the execution of a Function Import OData document The result will be converted to a list of OData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property..

Syntax

```
public abstract List< IODataEntry > parseFunctionImportResult (
    InputStream stream,
    IODataFunctionImport functionImport,
    IODataSchema schema
) throws ParseException, IllegalArgumentException
```

Parameters

- **stream** – The function Import result stream
- **functionImport** – The OData Function Import document
- **schema** – The appropriate OData Schema document

Returns

List of OData Entry containing the result values

Exceptions

- **ParseException class** – If parsing document has failed
- **IllegalArgumentException** – If either of the arguments is null

parseODataEntries(String, String, IODataSchema) method

Parses SAPData structure that represent either a single OData Entry or an OData Feed with several OData entries.

Syntax

```
public abstract List< IODataEntry > parseODataEntries (
    String entries,
    String collectionId,
    IODataSchema schema
) throws ParseException, IllegalArgumentException
```

Parameters

- **entries** – The source of either a single OData Entry or OData Feed of several OData entries

- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

Returns

The list of the OData Entries contained by the source

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataEntries(InputStream, String, IODataSchema) method

Parses SAPData structure from stream that represent either a single OData Entry or an OData Feed of several OData entries.

Syntax

```
public abstract List< IODataEntry > parseODataEntries (
    InputStream stream,
    String collectionId,
    IODataSchema schema
) throws ParserException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds the source of either a single OData Entry or OData Feed of several OData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant OData schema document

Returns

The list of the OData Entries contained by the source

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataError(String) method

Parses the OData Error.

Syntax

```
public abstract IODataError parseODataError (String error)
throws ParserException, IllegalArgumentException
```

Parameters

- **error** – The OData Error

Returns

The OData Error document

Exceptions

- **ParserException class** – If the If the document source is invalid source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataError(InputStream) method

Parses the OData Error from stream.

Syntax

```
public abstract IODataError parseODataError (InputStream stream)
throws ParserException, IllegalArgumentException
```

Parameters

- **stream** – The OData Error as stream

Returns

The OData Error document

Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataFeed(String, String, IODataSchema) method

Parse OData Feed, support for Delta Query.

Syntax

```
public IODataFeed parseODataFeed (
    String feed,
    String collectionId,
    IODataSchema schema
) throws ParserException
```

Parameters

- **feed** –
- **collectionId** –

- **schema** –

Exceptions

- **SDMParseException** –

parseODataFeed(InputStream, String, IODataSchema) method
Parse OData Feed from stream, support for Delta Query.

Syntax

```
public IODataFeed parseODataFeed (  
    InputStream stream,  
    String collectionId,  
    IODataSchema schema  
) throws ParseException
```

Parameters

- **stream** –
- **collectionId** –
- **schema** –

Exceptions

- **ParseException class** –

parseODataOpenSearchDescription(String, String, IODataServiceDocument) method
Parses the OData Open Search Description.

Syntax

```
public abstract IODataOpenSearchDescription  
parseODataOpenSearchDescription (  
    String openSearchDescription,  
    String collectionId,  
    IODataServiceDocument serviceDocument  
) throws ParseException, IllegalArgumentException
```

Parameters

- **openSearchDescription** – The OData Open Search Description

Returns

OData Open Search Description document

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument) method

Parses the OData Open Search Description from stream.

Syntax

```
public abstract IODataOpenSearchDescription
parseODataOpenSearchDescription (
    InputStream stream,
    String collectionId,
    IODataServiceDocument serviceDocument
) throws ParseException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds the OData Open Search Description .

Returns

OData Open Search Description document

Exceptions

- **ParserException class** – If the stream source is invalid.
- **IllegalArgumentException** – If the argument is null.

parseODataSchema(String, IODataServiceDocument) method

Parses the OData Schema.

Syntax

```
public abstract IODataSchema parseODataSchema (
    String schema,
    IODataServiceDocument serviceDocument
) throws ParseException, IllegalArgumentException
```

Parameters

- **schema** – The OData Schema
- **serviceDocument** – The appropriate OData Service Document object

Returns

The OData Schema document

Exceptions

- **ParserException class** – If the document source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataSchema(InputStream, IODataServiceDocument) method

Parses the OData Schema from stream.

Syntax

```
public abstract IODataSchema parseODataSchema (  
    InputStream stream,  
    IODataServiceDocument serviceDocument  
) throws ParserException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds OData Schema
- **serviceDocument** – The appropriate OData Service Document object

Returns

The OData Schema document

Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

parseODataServiceDocument(String) method

Parses the OData Service Document.

Syntax

```
public abstract IODataServiceDocument  
parseODataServiceDocument (String serviceDocument) throws  
ParserException, IllegalArgumentException
```

Parameters

- **serviceDocument** – The OData Service Document

Returns

The OData Service Document

Exceptions

- **ParserException class** – If the document source is invalid

- **IllegalArgumentException** – If the argument is null

parseODataServiceDocument(InputStream) method

Parses the OData Service Document from stream.

Syntax

```
public abstract IODataServiceDocument
parseODataServiceDocument (InputStream stream) throws
ParserException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds OData Service Document

Returns

The OData Service Document

Exceptions

- **ParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

FORMAT_JSON variable

JSON Format for Building Post Body.

Syntax

```
public static final int FORMAT_JSON
```

FORMAT_XML variable

XML Format for Building Post Body.

Syntax

```
public static final int FORMAT_XML
```

IParserDocument interface

Represents a general XML-compatible, persistable object.

Package

```
com.sap.mobile.lib.parser
```

Syntax

```
public abstract interface IParserDocument extends IPersistable
```

Implemented interfaces

- *IPersistable* on page 592

Derived interfaces

- *IODataAssociation* on page 368
- *IODataCollection* on page 381
- *IODataComplexType* on page 393
- *IODataEntitySet* on page 398
- *IODataEntityType* on page 405
- *IODataEntry* on page 415
- *IODataError* on page 440
- *IODataFunctionImport* on page 448
- *IODataIcon* on page 457
- *IODataLink* on page 463
- *IODataNavigationProperty* on page 474
- *IODataOpenSearchDescription* on page 480
- *IODataParameter* on page 486
- *IODataProperty* on page 492
- *IODataSchema* on page 509
- *IODataServiceDocument* on page 521
- *IODataURL* on page 541
- *IODataWorkspace* on page 547

Members

All members of `IParserDocument`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ROOT_DOCUMENT_NAME	The default root element name for a new document.
public static Map< String, String >	DEFAULT_PREFIXMAP-PING	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static String	ELEMENT_FEED	Name of the appropriate OData element.
public static final String	ELEMENT_ID	Name of the appropriate OData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_ETAG	Name of the appropriate OData element.
public static final String	XMLNS_ATOM_URI	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	XMLNS_GENERICPLAYER_URI	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	XMLNS_SAP_URI	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .
public static final String	XMLNS_EDM_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	XMLNS_EDMX_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	XMLNS_METADATA_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	XMLNS_DATASERVICES_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	XMLNS_APPLICATION_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	ATTRIBUTE_VALUEPREFIX_EDMTYPE	Value prefix for EDM Type type values.
public static final String	EDMTIME_PATTERN	EDM Time pattern.
public static final String[]	EDMDATETIME_PATTERNS	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Variable	Description
public static final String[]	EDMDATETIMEOFFSET_PATTERNS	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Methods

Modifier and Type	Method	Description
public abstract IParserDocument	<i>clone()</i> on page 574	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 574	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 575	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 575	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 575	Returns all the values of attributes contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocuments(String...)</i> on page 576	Returns the elements contained by the element with the given route.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 576	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< IParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 577	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract IParserDocument	<i>getDocument(String...)</i> on page 577	Returns the first element with the given route.
public abstract List< IParserDocument >	<i>getDocuments(String...)</i> on page 578	Returns all the elements with the given route.

Modifier and Type	Method	Description
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 578	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List<IParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 579	Returns the elements with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 579	Returns the first element with the given route that contains the given attribute with the given value.
public abstract IParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 580	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 580	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 581	
public abstract String	<i>getPrefixForUri(String)</i> on page 581	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 581	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 581	Returns the value of the first element with the given route.
public abstract List<String >	<i>getValues(String...)</i> on page 582	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 582	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Method	Description
public abstract void	<i>putDocument(IParserDocument, String...)</i> on page 583	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 583	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 584	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 584	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 584	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 585	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<IParserDocument>, String...)</i> on page 585	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 586	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Method	Description
public abstract void	<i>setValues(List<String>, String...)</i> on page 586	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 586	Returns the XML string representation of this object.

Inherited members from IPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

Usage

XML like elements, values and attributes can be access via routes Routes are list of element names where each element contains the next element in the list

Elements can be retrieved as a new IParserDocument containing all the attributes, values and child elements of the represented element.

Empty routes always refer to the given object the method invoked on

IParserDocument.EDMSIMPLETYPES enum

Enum for all the available simple types.

Members

All members of EDMSIMPLETYPES, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	BINARY	
public	BOOLEAN	
public	DATETIME	
public	TIME	

Modifier and Type	Variable	Description
public	DATETIMEOFFSET	
public	DECIMAL	
public	FLOAT	
public	DOUBLE	
public	GUID	
public	SBYTE	
public	INT16	
public	INT32	
public	INT64

public	STRING	
public	SINGLE	

*BINARY variable**Syntax*

```
public BINARY
```

*BOOLEAN variable**Syntax*

```
public BOOLEAN
```

*BYTE variable**Syntax*

```
public BYTE
```

*DATETIME variable**Syntax*

```
public DATETIME
```

*DATETIMEOFFSET variable**Syntax*

```
public DATETIMEOFFSET
```

*DECIMAL variable**Syntax*

```
public DECIMAL
```

*DOUBLE variable**Syntax*

```
public DOUBLE
```

*FLOAT variable**Syntax*

```
public FLOAT
```

*GUID variable**Syntax*

```
public GUID
```

*INT16 variable**Syntax*

```
public INT16
```

*INT32 variable**Syntax*

```
public INT32
```

*INT64 variable**Syntax*

```
public INT64
```

SBYTE variable

Syntax

```
public SBYTE
```

SINGLE variable

Syntax

```
public SINGLE
```

STRING variable

Syntax

```
public STRING
```

TIME variable

Syntax

```
public TIME
```

clone() method

Creates a copy of this object.

Syntax

```
public abstract IParserDocument clone () throws  
CloneNotSupportedException
```

Returns

The new copy of this object

getAttribute(String...) method

Returns the value of the first attribute with the given route.

Syntax

```
public abstract String getAttribute (String... route) throws  
IllegalArgumentException
```

Parameters

- **route** – The route to the attribute

Returns

The value of the first attribute or null if there is no such attribute

Exceptions

- **IllegalArgumentException** – if the argument is null.

getAttributes(String...) method

Returns all the values of attributes with the given route.

Syntax

```
public abstract List< String > getAttributes (String... route)
throws IllegalArgumentException
```

Parameters

- **route** – The route to the attributes

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildAttributeMap(String...) method

Returns all the name-value pairs of attributes contained by the element with the given route.

Syntax

```
public abstract Map< String, String > getChildAttributeMap
(String... route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child attributes

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildAttributes(String...) method

Returns all the values of attributes contained by the element with the given route.

Syntax

```
public abstract List< String > getChildAttributes (String...
route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child attributes

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildDocuments(String...) method

Returns the elements contained by the element with the given route.

Syntax

```
public abstract List< IParserDocument > getChildDocuments  
(String... route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child elements

Returns

List of elements as new IParser documents

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildDocumentsWithAttribute(String, String, String...) method

Returns the elements contained by the element with the given route and having the given attribute with the given value.

Syntax

```
public abstract List< IParserDocument >  
getChildDocumentsWithAttribute (  
    String attributeName,  
    String attributeValue,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute

- **attributeValue** – The expected value of the attribute

Returns

List of elements as new IParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getChildDocumentsWithAttribute(String, String, boolean, String...) method

Returns the elements contained by the element with the given route and having the given attribute with the given value.

Syntax

```
public abstract List< IParserDocument >
getChildDocumentsWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault,
    String... route
)
```

Parameters

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

Returns

List of elements as new IParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocument(String...) method

Returns the first element with the given route.

Syntax

```
public abstract IParserDocument getDocument (String... route)
throws IllegalArgumentException
```

Parameters

- **route** – The route to the element

Returns

The element as a new IParser document or null if there is no such element

Exceptions

- **IllegalArgumentException** – if the argument is null.

getDocuments(String...) method

Returns all the elements with the given route.

Syntax

```
public abstract List< IParserDocument > getDocuments  
(String... route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the elements

Returns

List of elements as new IParser documents

Exceptions

- **IllegalArgumentException** – if the argument is null.

getDocumentsWithAttribute(String, String, String...) method

Returns the elements with the given route that contains the given attribute with the given value.

Syntax

```
public abstract List< IParserDocument >  
getDocumentsWithAttribute (  
    String attributeName,  
    String attributeValue,  
    String... route  
)
```

Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute

- **attributeValue** – The expected value of the attribute

Returns

List of elements as new IParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocumentsWithAttribute(String, String, boolean, String...) method

Returns the elements with the given route that contains the given attribute with the given value.

Syntax

```
public abstract List< IParserDocument >
getDocumentsWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault,
    String... route
)
```

Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

Returns

List of elements as new IParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocumentWithAttribute(String, String, String...) method

Returns the first element with the given route that contains the given attribute with the given value.

Syntax

```
public abstract IParserDocument getDocumentWithAttribute (
    String attributeName,
    String attributeValue,
    String... route
)
```

Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

Returns

The element as a new IParser document or null if there is no such element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocumentWithAttribute(String, String, boolean, String...) method

Returns the first element with the given route that contains the given attribute with the given value.

Syntax

```
public abstract IParserDocument getDocumentWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault,
    String... route
)
```

Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

Returns

The element as a new IParser document or null if there is no such element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getElementName() method

Returns The name of the root element of this document.

Syntax

```
public abstract String getElementName ()
```

Returns

The name of the root element of this document

*getFunctionImportComplexPropertyValue(String...) method**Syntax*

```
public abstract String getFunctionImportComplexPropertyValue
(String... route)
```

getPrefixForUri(String) method

Returns the appropriate name-space prefix for the given XML name-space URI.

Syntax

```
public abstract String getPrefixForUri (String uri) throws
IllegalArgumentException
```

Parameters

- **uri** – An XML names-pace URI

Returns

The appropriate name-space prefix

Exceptions

- **IllegalArgumentException** – if the argument is null.

getStrings() method

Returns all the string values contained by this document.

Syntax

```
public abstract String[] getStrings ()
```

Returns

all the string values contained by this document

getValue(String...) method

Returns the value of the first element with the given route.

Syntax

```
public abstract String getValue (String... route) throws
IllegalArgumentException
```

Parameters

- **route** – The route to the element

Returns

The value of the first element or null if there is no such element

Exceptions

- **IllegalArgumentException** – if the argument is null.

getValues(String...) method

Returns all the values of elements with the given route.

Syntax

```
public abstract List< String > getValues (String... route) throws  
IllegalArgumentException
```

Parameters

- **route** – The route to the elements

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

putAttribute(String, String...) method

Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Syntax

```
public abstract void putAttribute (  
    String value,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **value** – The new value
- **route** – The route to the attribute

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

putDocument(IParserDocument, String...) method

Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.

Syntax

```
public abstract void putDocument (
    IParserDocument document,
    String... route
) throws IllegalArgumentException
```

Parameters

- **document** – The new document
- **route** – The route to the parent element of the new document

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

putValue(String, String...) method

Sets the value of the first element with the given route.

Syntax

```
public abstract void putValue (
    String value,
    String... route
) throws IllegalArgumentException
```

Parameters

- **value** – The new value
- **route** – The route to the element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

removeAttribute(String...) method

Removes first element with the given route.

Syntax

```
public abstract boolean removeAttribute (String... route)
```

Parameters

- **route** – The route to the attribute to remove

Returns

true if at least one attribute has been removed or false otherwise

removeAttributes(String...) method

Removes all the attribute with the given route.

Syntax

```
public abstract boolean removeAttributes (String... route)
```

Parameters

- **route** – The route to the attributes to remove

Returns

true if at least one attribute has been removed or false otherwise

removeDocument(String...) method

Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Syntax

```
public abstract boolean removeDocument (String... route) throws  
IllegalArgumentException
```

Parameters

- **route** – The route to the element to remove

Returns

true if at least one element has been removed or false otherwise

setAttributes(List< String >, String...) method

Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Syntax

```
public abstract void setAttributes (
    List< String > values,
    String... route
) throws IllegalArgumentException
```

Parameters

- **values** – The new values of the attributes
- **route** – The route to the attributes

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

setDocuments(List< IParserDocument >, String...) method

Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Syntax

```
public abstract void setDocuments (
    List< IParserDocument > documents,
    String... route
) throws IllegalArgumentException
```

Parameters

- **documents** – The list of new documents or nulls if one or more document should be removed
- **route** – The route to the elements

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

setElementName(String, String...) method

Sets the name of the root element with the given route Use empty route for setting root name of this document.

Syntax

```
public abstract void setElementName (  
    String name,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **name** – The new name of the root element
- **route** – The route to the element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

setValues(List< String >, String...) method

Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Syntax

```
public abstract void setValues (  
    List< String > values,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **values** – The new values of the elements
- **route** – The route to the elements

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

toXMLString() method

Returns the XML string representation of this object.

Syntax

```
public abstract String toXMLString ()
```

Returns

The XML string representation of this object

ATTRIBUTE_ETAG variable

Name of the appropriate OData element.

Syntax

```
public static final String ATTRIBUTE_ETAG
```

ATTRIBUTE_VALUEPREFIX_EDMTYPE variable

Value prefix for EDM Type type values.

Syntax

```
public static final String ATTRIBUTE_VALUEPREFIX_EDMTYPE
```

DEFAULT_PREFIXMAPPING variable

The default XML Namespace-to-Prefix mapping used for building XMLS.

Syntax

```
public static Map< String, String > DEFAULT_PREFIXMAPPING
```

EDMDATETIME_PATTERNS variable

Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Syntax

```
public static final String[] EDMDATETIME_PATTERNS
```

EDMDATETIMEOFFSET_PATTERNS variable

Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Syntax

```
public static final String[] EDMDATETIMEOFFSET_PATTERNS
```

EDMTIME_PATTERN variable

EDM Time pattern.

Syntax

```
public static final String EDMTIME_PATTERN
```

ELEMENT_FEED variable

Name of the appropriate OData element.

Syntax

```
public static String ELEMENT_FEED
```

ELEMENT_ID variable

Name of the appropriate OData element.

Syntax

```
public static final String ELEMENT_ID
```

ROOT_DOCUMENT_NAME variable

The default root element name for a new document.

Syntax

```
public static final String ROOT_DOCUMENT_NAME
```

XMLNS_APPLICATION_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

Syntax

```
public static final String XMLNS_APPLICATION_URI
```

XMLNS_ATOM_URI variable

Constant for XMLNS URI: <http://www.w3.org/2005/Atom>.

Syntax

```
public static final String XMLNS_ATOM_URI
```

XMLNS_DATASERVICES_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

Syntax

```
public static final String XMLNS_DATASERVICES_URI
```

XMLNS_EDM_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/05/edm>.

Syntax

```
public static final String XMLNS_EDM_URI
```

XMLNS_EDMX_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/06/edm.x>.

Syntax

```
public static final String XMLNS_EDMX_URI
```

XMLNS_GENERICPLAYER_URI variable

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData/GenericPlayer>.

Syntax

```
public static final String XMLNS_GENERICPLAYER_URI
```

XMLNS_METADATA_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices/metadata>.

Syntax

```
public static final String XMLNS_METADATA_URI
```

XMLNS_SAP_URI variable

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData>.

Syntax

```
public static final String XMLNS_SAP_URI
```

*persistence package**dao package**model package**RouteManagerSchema class**Package*

```
com.sap.mobile.lib.persistence.dao.model
```

Syntax

```
public class RouteManagerSchema implements IDbSchema
```

Members

All members of RouteManagerSchema, including inherited members. **Methods**

Modifier and Type	Method	Description
public byte[]	<i>getBlobCloumn()</i> on page 590	
public void	<i>setBlobCloumn(byte[])</i> on page 590	

*getBlobCloumn() method***Syntax**

```
public byte[] getBlobCloumn ()
```

*setBlobCloumn(byte[]) method***Syntax**

```
public void setBlobCloumn (byte[] blobCloumn)
```

EncryptionKeyManager class

Consists of the methods related to Encryptoin key required for SQL Cipher Encryption.

Package

```
com.sap.mobile.lib.persistence
```

Syntax

```
public class EncryptionKeyManager
```

Members

All members of EncryptionKeyManager, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static String	encryptionKey	

Methods

Modifier and Type	Method	Description
public static String	<i>getEncryptionKey(Context)</i> on page 591	Returns the Encryption key,Generates unique 128 bit encryption for first time,and subsequent call returns the key set by setEncryptionKey API .

Modifier and Type	Method	Description
public static String	<i>resetEncryptionKey(Context)</i> on page 591	This API reset the encryption key along with clearing all the cache and Queued offline requests and returns the new generated unique 128 bit key.
public static void	<i>setEncryptionKey(String, Context)</i> on page 592	Set the Encryption key,Expected to be set to null before Application goes to background.

getEncryptionKey(Context) method

Returns the Encryption key,Generates unique 128 bit encryption for first time,and subsequent call returns the key set by setEncryptionKey API .

Syntax

```
public static String getEncryptionKey (Context context) throws PersistenceException
```

Parameters

- **Context:** – Application Context.

Returns

key: returns the Encryption key,Generates unique 128 bit encryption.

Remarks

Application if not using MAFLogonComponent is expected to securely persist this key across application Life Cycle using data vault.

```
EncryptionKeyManager.getEncryptionKey (getApplicaitonContext ( ) ) ;
```

resetEncryptionKey(Context) method

This API reset the encryption key along with clearing all the cache and Queued offline requests and returns the new generated unique 128 bit key.

Syntax

```
public static String resetEncryptionKey (Context context) throws PersistenceException
```

Parameters

- **Context:** – Application Context.

Returns

key: returns the Encryption key,Generates unique 128 bit encryption.

```
EncryptionKeyManager.resetEncryptionKey(getApplicaitonContext());
```

setEncryptionKey(String, Context) method

Set the Encryption key,Expected to be set to null before Application goes to background.

Syntax

```
public static void setEncryptionKey (  
    String Key,  
    Context context  
) throws PersistenceException
```

Parameters

- **key:** – This is the key which is generated by getEncryptionKey and same key must be set every time application is opened or brought to foreground.
- **Context:** – Application Context.

Remarks

And must be set with Key which is generated using getEncryptionkey on Application.

```
EncryptionKeyManager.setEncryptionKey("encryptionkey",getApplicatio  
nContext());
```

encryptionKey variable

Syntax

```
protected static String encryptionKey
```

IPersistable interface

Interface that any object should implement that is to store by SDMPersistence.

Package

```
com.sap.mobile.lib.persistence
```

Syntax

```
public interface IPersistable
```

Derived classes

- *Logger* on page 716

Derived interfaces

- *IParserDocument* on page 565

Members

All members of IPersistable, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>read(BufferedReader)</i> on page 593	
public void	<i>write(BufferedWriter)</i> on page 593	

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException class** – if data can not be loaded from the reader.

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException class** – if data can not be written into the writer

request package

Base class for connection handlers.

BaseRequest class

Consists of the methods used to make Create,Read,Update, and Delete operations on HTTP backend.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class BaseRequest implements IRequest
```

Implemented interfaces

- *IRequest* on page 663

Derived classes

- *BatchRequest* on page 605

Members

All members of BaseRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	mUrl	
protected int	mRequestMethod	
protected byte[]	mData	
protected Map< String, String >	mHeaders	
protected int	mPriority	
protected transient INetListener	mListener	
protected HashMap< String, String >	eTagMap	
protected static String	HostURL	
protected static String	xsrftoken	
protected static ArrayList< String >	setCookie	
protected static boolean	isStreamEnabled	

Methods

Modifier and Type	Method	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 596	Disables delta query handling.
public byte[]	<i>getData()</i> on page 597	If the request method is POST, this method is called from the network library.

Modifier and Type	Method	Description
public InputStream	<i>getDataStream()</i> on page 597	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 597	Returns the request headers set.
public INetListener	<i>getListener()</i> on page 598	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 598	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 599	Returns the request method.
public String	<i>getRequestUrl()</i> on page 599	Returns the URL where the request must be fired.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 599	internal
public boolean	<i>isStreamEnabled()</i> on page 599	Specifies if the data streaming is enabled for this request.
public void	<i>setData(byte[])</i> on page 600	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 600	Set the request data stream in case of POST request.
public void	<i>setETag(String, int)</i> on page 601	sets the Etag for the request
public void	<i>setHeaders(Map< String, String >)</i> on page 601	Set the request headers.
public void	<i>setListener(INetListener)</i> on page 601	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(int)</i> on page 602	Sets the priority of the request.
public void	<i>setRequestMethod(int)</i> on page 602	Sets the request method.

Modifier and Type	Method	Description
public void	<i>setRequestUrl(String)</i> on page 603	Sets the URL for the request.
public void	<i>setStreamEnabled(boolean)</i> on page 603	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public boolean	<i>useCookies()</i> on page 603	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Inherited members from IRequest

Modifier and Type	Member	Description
public void	<i>setListener(final INetListener)</i> on page 669	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(final int)</i> on page 670	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 670	Sets the type of HTTP request method.
public void	<i>setRequestUrl(final String)</i> on page 671	Sets the URL for the request.

disableDeltaHandling(boolean) method

Disables delta query handling.

Syntax

```
public void disableDeltaHandling (boolean disable)
```

Parameters

- **disable** – If set to true it disables delta handling

Returns

None

Remarks

By default delta handling is enabled.

getData() method

If the request method is POST, this method is called from the network library.

Syntax

```
public byte[] getData ()
```

Parameters

- **none** –

Returns

the content data

Remarks

This method will return with the content to be sent to the server.

```
BaseRequest getrequest = new BaseRequest(); byte[] data = getrequest.getData();
```

getDataStream() method

If the request method is POST, this method is called from the network library.

Syntax

```
public InputStream getDataStream ()
```

Parameters

- **none** –

Returns

the content data stream.

Remarks

This method must return with the content stream to be sent to the server.

```
BaseRequest request = new BaseRequest(); InputStream in = request.getDataStream();
```

getHeaders() method

Returns the request headers set.

Syntax

```
public Map< String, String > getHeaders ()
```

Parameters

- **none** –

Returns

the request headers

```
BaseRequest getrequest = new BaseRequest(); Map<String, String> headers =  
getrequest.getHeaders();
```

getListener() method

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

Syntax

```
public INetListener getListener ()
```

Parameters

- **none** –

Returns

the listener or null.

Remarks

Method will return null if there is no registered listener.

```
class example implements INetListener{ .... public void makeGetRequest(...) throws  
Exception { .... BaseRequest getrequest = new BaseRequest();  
getrequest.getListener(); } ... }
```

getPriority() method

Returns the priority of the request.

Syntax

```
public int getPriority ()
```

Parameters

- **none** –

Returns

the priority i.e. int value

```
BaseRequest getrequest = new BaseRequest(); int priority = getrequest.getPriority();
```

getRequestMethod() method

Returns the request method.

Syntax

```
public int getRequestMethod ()
```

Parameters

- **none** –

Returns

the request method, with a value of IRequest.REQUEST_METHOD_* constants.

```
BaseRequest getrequest = new BaseRequest(); int method = getrequest.getRequestMethod();
```

getRequestUrl() method

Returns the URL where the request must be fired.

Syntax

```
public String getRequestUrl ()
```

Parameters

- **None** –

Returns

the URL.

```
BaseRequest getrequest = new BaseRequest(); String url = getrequest.getRequestUrl();
```

isDeltaHandlingDisabled() method

internal

Syntax

```
public boolean isDeltaHandlingDisabled ()
```

isStreamEnabled() method

Specifies if the data streaming is enabled for this request.

Syntax

```
public boolean isStreamEnabled ()
```

Parameters

- **none** –

Returns

use of data Streaming in the network library

```
BaseRequest request = new BaseRequest(); boolean isStreamUsed =  
request.isStreamEnabled();
```

setData(byte[]) method

Set the request data in case of POST request.

Syntax

```
public void setData (byte[] data)
```

Parameters

- **data** – the request data to set

Returns

none

```
BaseRequest getrequest = new BaseRequest(); String postBody= "<atom:entry xmlns:atom=  
\"http://www.w3.org/2005/Atom\">" + "<atom:content type=\"application/xml\">" +  
"<m:properties xmlns:m=\"http://schemas.microsoft.com/ado/2007/08/dataservices/  
metadata\" *xmlns:d=\"http://schemas.microsoft.com/ado/2007/08/dataservices\">" +  
"<d:agencynum>09964571</d:agencynum>" + "<d:NAME ></d:NAME>" +  
"<d:STREET />" + "<d:POSTBOX />" + * "<d:POSTCODE />" + "<d:CITY />" +  
"<d:COUNTRY />" + "<d:REGION />" + "<d:TELEPHONE>+9945007007</  
d:TELEPHONE>" + "<d:URL />" + "<d:LANGU />" + "<d:CURRENCY />" +  
"<d:mimeType>text/html</d:mimeType>" + "</m:properties>" + "</atom:content>" + "</  
atom:entry>"; post1.setData(postBody.getBytes());
```

setDataStream(InputStream) method

Set the request data stream in case of POST request.

Syntax

```
public void setDataStream (InputStream inputStream)
```

Parameters

- **InputStream** – the request data stream to set

Returns

none

```
BaseRequest request = new BaseRequest(); InputStream in = new  
InputStream(); ....request.setDataStream(in);
```

setETag(String, int) method

sets the Etag for the request

Syntax

```
public void setETag (
    String tag,
    int i
) throws IllegalArgumentException
```

Parameters

- **tag** – etag header value
- **i** – etag header name

Returns

none

```
BaseRequest getrequest = new BaseRequest(); getrequest.setETag("tag String",1);
```

setHeaders(Map< String, String >) method

Set the request headers.

Syntax

```
public void setHeaders (Map< String, String > headers)
```

Parameters

- **headers** – the request headers to set none

```
Map<String, String> headers1 = new HashMap<String, String>(); headers1.put("Content-
Type", "application/atom+xml"); BaseRequest getrequest = new BaseRequest();
getrequest.setHeaders(headers1);
```

setListener(INetListener) method

Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

Syntax

```
public void setListener (INetListener listener)
```

Parameters

- **listener** – the listener to set.

Returns

none

Remarks

By default, the BaseRequest object included in the connectivity layer will contain no registered listeners.

Setting this object is not mandatory. However, it can be used to handle incidental errors.

```
class example implements INetListener { .... public void makeGetRequest(...) throws  
Exception { .... BaseRequest getrequest = new BaseRequest();  
getrequest.setListener(this); } ... }
```

setPriority(int) method

Sets the priority of the request.

Syntax

```
public void setPriority (int value)
```

Parameters

- **value** – the priority of the request to set.

Returns

none

Remarks

Allowed values: IRequest.PRIORITY_HIGH and IRequest.PRIORITY_NORMAL. In case of a different value, the default IRequest.PRIORITY_NORMAL will be used by the network. If the network layer finds an IRequest with IRequest.PRIORITY_HIGH priority in the queue, that request will be executed first. If there are more than one IRequests with IRequest.PRIORITY_HIGH priority, the network layer will choose an execution order. If the priority is not one of the predefined values, the priority will be set by default to IRequest.PRIORITY_NORMAL

```
BaseRequest getrequest = new BaseRequest(); getrequest.setPriority(1);
```

setRequestMethod(int) method

Sets the request method.

Syntax

```
public void setRequestMethod (int requestMethod)
```

Parameters

- **requestMethod** – one of the IRequest.REQUEST_METHOD_* constants.

Returns

none

```
BaseRequest getrequest = new BaseRequest();
getrequest.setRequestMethod(IRequest.REQUEST_METHOD_GET);
```

setRequestUrl(String) method

Sets the URL for the request.

Syntax

```
public void setRequestUrl (String aUrl)
```

Parameters

- **aUrl** – the URL to set.

Returns

none

```
BaseRequest getrequest = new BaseRequest(); getrequest.setRequestUrl("http://abc.com/
resource");
```

setStreamEnabled(boolean) method

Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.

Syntax

```
public void setStreamEnabled (boolean streamEnabled)
```

Parameters

- **streamEnabled** –

Returns

none

```
BaseRequest request = new BaseRequest(); request.setStreamEnabled(true);
```

useCookies() method

This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Syntax

```
public boolean useCookies ()
```

Parameters

- **none** – the use of cookies in the network library

Remarks

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the BaseRequest implementation.

```
BaseRequest getRequest = new BaseRequest(); boolean usecookie = getRequest.useCookies();
```

eTagMap variable

Syntax

```
protected HashMap< String, String > eTagMap
```

HostURL variable

Syntax

```
protected static String HostURL
```

isStreamEnabled variable

Syntax

```
protected static boolean isStreamEnabled
```

mData variable

Syntax

```
protected byte[] mData
```

mHeaders variable

Syntax

```
protected Map< String, String > mHeaders
```

mListener variable

Syntax

```
protected transient INetListener mListener
```

mPriority variable

Syntax

```
protected int mPriority
```

mRequestMethod variable*Syntax*

```
protected int mRequestMethod
```

mUrl variable*Syntax*

```
protected String mUrl
```

setCookie variable*Syntax*

```
protected static ArrayList< String > setCookie
```

xsrftoken variable*Syntax*

```
protected static String xsrfToken
```

BatchRequest class

Consists of methods related to batch request.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class BatchRequest extends BaseRequest
```

Base class

- *BaseRequest* on page 593

Members

All members of *BatchRequest*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	batchRequestURL	
protected ArrayList< Object >	batchRequestList	
protected static String	BATCH_BOUNDARY_TEXT	

Constructors

Modifier and Type	Constructor	Description
public	<i>BatchRequest(String)</i> on page 608	Initializes the BatchRequest by providing the request URL.

Methods

Modifier and Type	Method	Description
public void	<i>addRequestToChangeset(IRequest)</i> on page 608	Adds a modify request such as HTTP POST/PUT/DELETE request to the change set.
public void	<i>addRetrieveRequestToBatch(IRequest)</i> on page 609	Adds a retrieve request to the batch.
public void	<i>closeExistingChangeSet()</i> on page 609	Closes the existing change set and adds the subsequent modify requests to a different change set.

Inherited members from BaseRequest

Modifier and Type	Member	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 596	Disables delta query handling.
public byte[]	<i>getData()</i> on page 597	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 597	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 597	Returns the request headers set.
public INetListener	<i>getListener()</i> on page 598	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 598	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 599	Returns the request method.

Modifier and Type	Member	Description
public String	<i>getRequestUrl()</i> on page 599	Returns the URL where the request must be fired.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 599	internal
public boolean	<i>isStreamEnabled()</i> on page 599	Specifies if the data streaming is enabled for this request.
public void	<i>setData(byte[])</i> on page 600	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 600	Set the request data stream in case of POST request.
public void	<i>setETag(String, int)</i> on page 601	sets the Etag for the request
public void	<i>setHeaders(Map<String, String>)</i> on page 601	Set the request headers.
public void	<i>setListener(INetListener)</i> on page 601	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(int)</i> on page 602	Sets the priority of the request.
public void	<i>setRequestMethod(int)</i> on page 602	Sets the request method.
public void	<i>setRequestUrl(String)</i> on page 603	Sets the URL for the request.
public void	<i>setStreamEnabled(boolean)</i> on page 603	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public boolean	<i>useCookies()</i> on page 603	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Inherited members from IRequest

Modifier and Type	Member	Description
public void	<i>setListener</i> (final <i>INetListener</i>) on page 669	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority</i> (final <i>int</i>) on page 670	Sets the priority of the request.
public void	<i>setRequestMethod</i> (final <i>int</i>) on page 670	Sets the type of HTTP request method.
public void	<i>setRequestUrl</i> (final <i>String</i>) on page 671	Sets the URL for the request.

Usage

Batch Request is to be used when more than one retrieve/modify requests need to be clubbed.

BatchRequest(String) constructor

Initializes the BatchRequest by providing the request URL.

Syntax

```
public BatchRequest (String url)
```

Parameters

- **url** – URL with which the Batch Request needs to be initialized.

Returns

Object of Batch Request.

```
BatchRequest batch = new
```

```
BatchRequest(Utils.appSettings.getApplicationEndPoint().toString()+"$batch");
```

addRequestToChangeset(IRequest) method

Adds a modify request such as HTTP POST/PUT/DELETE request to the change set.

Syntax

```
public void addRequestToChangeset (IRequest modifyRequest) throws  
ConnectivityException
```

Parameters

- **modifyRequest** – Request such as HTTP POST/PUT/DELETE.

Returns

None

Exceptions

- **ConnectivityException class** –

```
deleteRequest.setRequestMethod(SDMBaseRequest.REQUEST_METHOD_DELETE);
deleteRequest.setRequestUrl("TravelagencyCollection('09964571')");
batch.addRequestToChangeset(deleteRequest);
```

addRetrieveRequestToBatch(IRequest) method

Adds a retrieve request to the batch.

Syntax

```
public void addRetrieveRequestToBatch (IRequest getRequest)
throws ConnectivityException
```

Parameters

- **getRequest** – Retrieve request to be added to the batch.

Returns

None

Exceptions

- **ConnectivityException class** –

```
batch.addRetrieveRequestToBatch(getrequest);
```

closeExistingChangeSet() method

Closes the existing change set and adds the subsequent modify requests to a different change set.

Syntax

```
public void closeExistingChangeSet () throws
ConnectivityException
```

Parameters

- **None** –

Returns

None

Exceptions

- **ConnectivityException class** –

batch.addRetrieveRequestToBatch(get1); batch.addRequestToChangeset(post1);
 batch.addRequestToChangeset(put1); batch.closeExistingChangeSet(); // To close this
 change set and separate the subsequent requests to a different change set

batch.addRequestToChangeset(delete1); batch.closeExistingChangeSet();

BATCH_BOUNDARY_TEXT variable

Syntax

```
protected static String BATCH_BOUNDARY_TEXT
```

batchRequestList variable

Syntax

```
protected ArrayList< Object > batchRequestList
```

batchRequestURL variable

Syntax

```
protected String batchRequestURL
```

BundleRequest class

Consists of the methods used to bundle many requests into one.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class BundleRequest implements IBundleRequest
```

Implemented interfaces

- *IBundleRequest* on page 653

Members

All members of BundleRequest, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>BundleRequest()</i> on page 611	

Methods

Modifier and Type	Method	Description
public void	<i>addRequest</i> (final <i>IRequest</i>) on page 611	
public void	<i>clearRequests</i> () on page 611	Cleans out the request storage.
public <i>IRequest</i> []	<i>getRequests</i> () on page 612	Returns all the requests from the storage.
public void	<i>removeRequest</i> (final <i>IRequest</i>) on page 612	

Inherited members from *IBundleRequest*

Modifier and Type	Member	Description
public void	<i>addRequest</i> (<i>IRequest</i>) on page 654	Adds a request to the storage.
public void	<i>removeRequest</i> (<i>IRequest</i>) on page 655	Removes the specific request from the storage.

Usage

Separate requests can be added and executed using *BundleRequest*.

BundleRequest() constructor

Syntax

```
public BundleRequest ()
```

addRequest(final *IRequest*) method

Syntax

```
public void addRequest (final IRequest request)
```

clearRequests() method

Cleans out the request storage.

Syntax

```
public void clearRequests ()
```

Parameters

- **None** –

Returns

None

```
BundleRequest bundleRequest = new BundleRequest(); ... bundleRequest.clearRequests();
```

getRequests() method

Returns all the requests from the storage.

Syntax

```
public IRequest[] getRequests ()
```

Parameters

- **None** –

Returns

the array of requests.

```
BundleRequest bundleRequest = new BundleRequest();... BaseRequest[] requests=  
bundleRequest.getRequests();
```

removeRequest(final IRequest) method

Syntax

```
public void removeRequest (final IRequest request)
```

ConnectivityException class

connectivityException is used in request Library.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class ConnectivityException
```

Members

All members of ConnectivityException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ConnectivityException()</i> on page 613	Constructs a new connectivityException.
public	<i>ConnectivityException(String)</i> on page 613	Constructs a new connectivityException.

Modifier and Type	Constructor	Description
public	<i>ConnectivityException(String, Throwable)</i> on page 613	Constructs a new connectivityException.
public	<i>ConnectivityException(Throwable)</i> on page 613	Constructs a new connectivityException.

ConnectivityException() constructor

Constructs a new connectivityException.

Syntax

```
public ConnectivityException ()
```

ConnectivityException(String) constructor

Constructs a new connectivityException.

Syntax

```
public ConnectivityException (String detailMessage)
```

Parameters

- **detailMessage** – the message to set.

ConnectivityException(String, Throwable) constructor

Constructs a new connectivityException.

Syntax

```
public ConnectivityException (
    String detailMessage,
    Throwable throwable
)
```

Parameters

- **detailMessage** – the message to set.
- **throwable** – the Throwable to set.

ConnectivityException(Throwable) constructor

Constructs a new connectivityException.

Syntax

```
public ConnectivityException (Throwable throwable)
```

Parameters

- **throwable** – the Throwable to set.

ConnectivityParameters class

Consists of the methods used to set the HTTP Parameters used for connection with the backend.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class ConnectivityParameters implements
IConnectivityParameters
```

Implemented interfaces

- *IConnectivityParameters* on page 655

Members

All members of ConnectivityParameters, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static Boolean	isXcsrfEnabled	
public static boolean	autoredirectenabled	

Methods

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 615	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 616	Returns the base URL for the requests.
public Certificate[]	<i>getCertificate()</i> on page 616	
public String	<i>getLanguage()</i> on page 616	Returns the language setting.
public final TrustManager[]	<i>getTrustManagers()</i> on page 617	Returns an array of TrustManager instances.
public String	<i>getUserName()</i> on page 617	Returns the username.

Modifier and Type	Method	Description
public String	<i>getUserPassword()</i> on page 617	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 618	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 618	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 618	Sets the base URL for requests.
public void	<i>setCertificate(Certificate[])</i> on page 618	
public void	<i>setLanguage(final String)</i> on page 618	
public void	<i>setServerCertificate(Certificate[])</i> on page 619	
public void	<i>setServerCertificate(Certificate)</i> on page 619	
public void	<i>setUserName(String)</i> on page 619	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 619	Sets the password.

Inherited members from IConnectivityParameters

Modifier and Type	Member	Description
public void	<i>setLanguage(String)</i> on page 659	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 660	Sets the server certificate array.
public void	<i>setServerCertificate(final Certificate)</i> on page 660	Sets a single server certificate.

enableXsrf(Boolean) method

Sets the XSRFEnabled flag.

Syntax

```
public void enableXsrf (Boolean isXsrfEnabled)
```

Parameters

- **isXsrfEnabled** – the boolean to set.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();  
param.enableXsrf(isXsrfEnabled);
```

getBaseUrl() method

Returns the base URL for the requests.

Syntax

```
public String getBaseUrl ()
```

Parameters

- **None** –

Returns

the base URL for the requests.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getBaseUrl();
```

getCertificate() method

Syntax

```
public Certificate[] getCertificate ()
```

getLanguage() method

Returns the language setting.

Syntax

```
public String getLanguage ()
```

Parameters

- **None** –

Returns

the language setting

```
ConnectivityParameters param = new ConnectivityParameters(); param.getLanguage();
```

getTrustManagers() method

Returns an array of TrustManager instances.

Syntax

```
public final TrustManager[] getTrustManagers ()
```

Parameters

- **None** –

Returns

the array

```
ConnectivityParameters param = new ConnectivityParameters(); param.getTrustManagers();
```

getUserName() method

Returns the username.

Syntax

```
public String getUserName ()
```

Parameters

- **None** –

Returns

the user name.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserName();
```

getUserPassword() method

Returns the password.

Syntax

```
public String getUserPassword ()
```

Parameters

- **None** –

Returns

the password.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserPassword();
```

isAutoRedirectEnabled() method

Returns whether auto redirect is enabled.

Syntax

```
public boolean isAutoRedirectEnabled ()
```

setAutoRedirectEnabled(boolean) method

Enables or disables auto redirect.

Syntax

```
public void setAutoRedirectEnabled (boolean paramboolean)
```

Parameters

- **paramboolean** – the boolean to set

setBaseUrl(String) method

Sets the base URL for requests.

Syntax

```
public void setBaseUrl (String baseUrl)
```

Parameters

- **baseUrl** – The base URL for the requests.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();  
param.setBaseUrl(baseUrl);
```

setCertificate(Certificate[]) method

Syntax

```
public void setCertificate (Certificate[] certificate)
```

setLanguage(final String) method

Syntax

```
public void setLanguage (final String language)
```

*setServerCertificate(Certificate[]) method**Syntax*

```
public void setServerCertificate (Certificate[] certificate) throws
KeyStoreException
```

*setServerCertificate(Certificate) method**Syntax*

```
public void setServerCertificate (Certificate arg0)
```

setUserName(String) method

Sets the username which must be used during authentication.

Syntax

```
public void setUserName (String aUserName)
```

Parameters

- **aUserName** – the user name to set.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setUserName(aUserName);
```

setUserPassword(String) method

Sets the password.

Syntax

```
public void setUserPassword (String aPassword)
```

Parameters

- **aPassword** – the password to set.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setUserPassword(aPassword);
```

*autoredirectenabled variable***Syntax**

```
public static boolean autoredirectenabled
```

*isXcsrfEnabled variable***Syntax**

```
public static Boolean isXcsrfEnabled
```

HttpChannelListeners class

Consists of interfaces and classes related to network edge authentication.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class HttpChannelListeners
```

Members

All members of HttpChannelListeners, including inherited members. **Nested classes**

Modifier and Type	Class	Description
publicclass	<i>Authenticationschema</i> on page 621	Consists of methods to set user credentials, realm and schema.
publicclass	<i>BasicCredetials</i> on page 622	Class represents basic credentials that is to be returned on a authentication challenge.
publicclass	<i>CookieCredetials</i> on page 623	Class represents cookie that is to be returned on a authentication challenge.

Nested interfaces

Modifier and Type	Interface	Description
publicinterface	<i>IAuthenticationChallengeListener</i> on page 624	Interface to be implemented to handle network edge authentication challenge.

Modifier and Type	Interface	Description
publicinterface	<i>ICredential</i> on page 625	Interface to be implemented to get the authorization headers like basic and cookie authentication header.
publicinterface	<i>IMutualSSLChallengeListener</i> on page 626	Interface to be implemented for Mutual SSL support.
publicinterface	<i>ISSLChallengeListener</i> on page 626	Interface to be implemented for single SSL support.

HttpChannelListeners.AuthenticationSchema class

Consists of methods to set user credentials, realm and schema.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public class AuthenticationSchema
```

Members

All members of AuthenticationSchema, including inherited members. **Variables**

Modifier and Type	Variable	Description
public String	realm	
public String	schemaName	

Methods

Modifier and Type	Method	Description
public String	<i>getRealm()</i> on page 621	
public String	<i>getSchemeName()</i> on page 622	
public void	<i>processChallenge(ICredential, IRequest)</i> on page 622	

getRealm() method

Syntax

```
public String getRealm ()
```

getSchemeName() method

Syntax

```
public String getSchemeName ()
```

processChallenge(ICredential, IRequest) method

Syntax

```
public void processChallenge (
    ICredential credentials,
    IRequest request
)
```

realm variable

Syntax

```
public String realm
```

schemaName variable

Syntax

```
public String schemaName
```

HttpChannelListeners.BasicCredetials class

Class represents basic credentials that is to be returned on a authentication challenge.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public class BasicCredetials implements ICredential
```

Implemented interfaces

- *ICredential* on page 625

Members

All members of **BasicCredetials**, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static String	uName	
public static String	passwd	

Constructors

Modifier and Type	Constructor	Description
public	<i>BasicCredetials(String, String)</i> on page 623	

Methods

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 623	

*BasicCredetials(String, String) constructor**Syntax*

```
public BasicCredetials (
    String username,
    String pwd
)
```

*getAuthHeader() method**Syntax*

```
public Map< String, Object > getAuthHeader ()
```

*passwd variable**Syntax*

```
public static String passwd
```

*uName variable**Syntax*

```
public static String uName
```

HttpChannelListeners.CookieCredetials class

Class represents cookie that is to be returned on a authentication challenge.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public class CookieCredetials implements ICredential
```

Implemented interfaces

- *ICredential* on page 625

Members

All members of *CookieCredetials*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static Cookie	cookieValue	

Constructors

Modifier and Type	Constructor	Description
public	<i>CookieCredetials(Cookie)</i> on page 624	

Methods

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 624	

*CookieCredetials(Cookie) constructor**Syntax*

```
public CookieCredetials (Cookie cookie)
```

*getAuthHeader() method**Syntax*

```
public Map< String, Object > getAuthHeader ()
```

*cookieValue variable**Syntax*

```
protected static Cookie cookieValue
```

HttpChannelListeners.IAuthenticationChallengeListner interface

Interface to be implemented to handle network edge authentication challenge.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public interface IAuthenticationChallengeListner
```

Derived classes

- *AuthenticationChallengeListener* on page 636

Members

All members of IAuthenticationChallengeListner, including inherited members. **Methods**

Modifier and Type	Method	Description
public ICredential	<i>OnAuthenticationFailed(Authenticationschema, HttpResponseMessage)</i> on page 625	

OnAuthenticationFailed(Authenticationschema, HttpResponseMessage) method

Syntax

```
public ICredential OnAuthenticationFailed (
    Authenticationschema authScheme,
    HttpResponseMessage response
)
```

HttpChannelListeners.ICredential interface

Interface to be implemented to get the authorization headers like basic and cookie authentication header.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public interface ICredential
```

Derived classes

- *BasicCredetials* on page 622
- *CookieCredetials* on page 623

Members

All members of ICredential, including inherited members. **Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 626	

*getAuthHeader() method**Syntax*

```
public Map< String, Object > getAuthHeader ( )
```

HttpChannelListeners.IMutualSSLChallengeListener interface

Interface to be implemented for Mutual SSL support.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public interface IMutualSSLChallengeListener
```

Members

All members of IMutualSSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public HttpClientCertInfo	<i>getClientCertificate()</i> on page 626	

*getClientCertificate() method**Syntax*

```
public HttpClientCertInfo getClientCertificate ( )
```

HttpChannelListeners.ISSLChallengeListener interface

Interface to be implemented for single SSL support.

Package

```
com.sap.mobile.lib.request.HttpChannelListeners
```

Syntax

```
public interface ISSLChallengeListener
```

Members

All members of ISSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>isServerTrusted(X509Certificate[])</i> on page 627	

isServerTrusted(X509Certificate[]) method

Syntax

```
public boolean isServerTrusted (X509Certificate[]
paramArrayOfX509Certificate)
```

PushRequest class

This class represents the need for receiving push messages.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class PushRequest implements IRequest
```

Implemented interfaces

- *IRequest* on page 663

Members

All members of PushRequest, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 629	Disables delta query handling.
public byte[]	<i>getData()</i> on page 629	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 630	Returns the request headers set.
public INetListener	<i>getListener()</i> on page 630	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 630	Returns the priority of the request.

Modifier and Type	Method	Description
public int	<i>getRequestMethod()</i> on page 631	Retrieves the request method type.
public String	<i>getRequestUrl()</i> on page 631	Returns the URL where the request must be invoked.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 631	internal
public void	<i>setData(byte[])</i> on page 632	Sets the request data in case of an HTTP POST request.
public void	<i>setHeaders(Map<String, String>)</i> on page 632	Sets the request headers.
public void	<i>setListener(INetListener)</i> on page 632	
public void	<i>setPriority(int)</i> on page 633	
public void	<i>setRequestMethod(int)</i> on page 633	
public void	<i>setRequestUrl(String)</i> on page 633	
public boolean	<i>useCookies()</i> on page 633	Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

Inherited members from IRequest

Modifier and Type	Member	Description
public void	<i>setListener(final INetListener)</i> on page 669	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(final int)</i> on page 670	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 670	Sets the type of HTTP request method.

Modifier and Type	Member	Description
public void	<i>setRequestUrl</i> (final String) on page 671	Sets the URL for the request.

Usage

Only an `INetListener` property is stored, who will receive the push messages. `AbstractConnectionHandler` implementation should store and use this listener for delivering push messages.

disableDeltaHandling(boolean) method

Disables delta query handling.

Syntax

```
public void disableDeltaHandling (boolean disable)
```

Parameters

- **disable** – If set to true it disables delta handling

Returns

None

Remarks

By default delta handling is enabled.

getData() method

If the request method is POST, this method is called from the network library.

Syntax

```
public byte[] getData ()
```

Parameters

- **None** –

Returns

the content data of the request.

Remarks

This method will return with the content to be sent to the server.

```
BaseRequest getrequest = new BaseRequest(); byte[] data = getrequest.getData();
```

getHeaders() method

Returns the request headers set.

Syntax

```
public Map< String, String > getHeaders ()
```

Parameters

- **None** –

Returns

the request headers

```
BaseRequest getrequest = new BaseRequest(); Map<String, String> headers =  
getrequest.getHeaders();
```

getListener() method

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

Syntax

```
public INetListener getListener ()
```

Parameters

- **None** –

Returns

the listener or null.

Remarks

Method will return null if there is no registered listener.

```
class example implements INetListener{ .... public void makeGetRequest(...) throws  
Exception { .... BaseRequest getrequest = new BaseRequest();  
getrequest.getListener(); } ... }
```

getPriority() method

Returns the priority of the request.

Syntax

```
public int getPriority ()
```

Parameters

- **None** –

Returns

The priority of the request. The value is integer.

```
BaseRequest getrequest = new BaseRequest(); int priority = getrequest.getPriority();
```

getRequestMethod() method

Retrieves the request method type.

Syntax

```
public int getRequestMethod ()
```

Parameters

- **None** –

Returns

Type of the HTTP request specified by IRequest.REQUEST_METHOD_* constants.

```
BaseRequest getrequest = new BaseRequest(); int method = getrequest.getRequestMethod();
```

getRequestUrl() method

Returns the URL where the request must be invoked.

Syntax

```
public String getRequestUrl ()
```

Parameters

- **None** –

Returns

the URL.

```
BaseRequest getrequest = new BaseRequest(); String url = getrequest. getRequestUrl();
```

isDeltaHandlingDisabled() method

internal

Syntax

```
public boolean isDeltaHandlingDisabled ()
```

setData(byte[]) method

Sets the request data in case of an HTTP POST request.

Syntax

```
public void setData (byte[] data)
```

Parameters

- **data** – the request data to set.

Returns

None

```
BaseRequest getRequest = new BaseRequest(); String postBody= "<atom:entry xmlns:atom=" +
"\http://www.w3.org/2005/Atom">" + "<atom:content type=\"application/xml\">" +
"<m:properties xmlns:m=\"http://schemas.microsoft.com/ado/2007/08/dataservices/" +
"metadata\" *xmlns:d=\"http://schemas.microsoft.com/ado/2007/08/dataservices\">" +
"<d:agencynum>09964571</d:agencynum>" + "<d:NAME ></d:NAME>" +
"<d:STREET />" + "<d:POSTBOX />" + * "<d:POSTCODE />" + "<d:CITY />" +
"<d:COUNTRY />" + "<d:REGION />" + "<d:TELEPHONE>+9945007007</" +
"d:TELEPHONE>" + "<d:URL />" + "<d:LANGU />" + "<d:CURRENCY />" +
"<d:mimeType>text/html</d:mimeType>" + "</m:properties>" + "</atom:content>" + "</" +
"atom:entry>"; post1.setData(postBody.getBytes());
```

setHeaders(Map< String, String >) method

Sets the request headers.

Syntax

```
public void setHeaders (Map< String, String > headers)
```

Parameters

- **headers** – the request headers to set.

Returns

None

```
Map<String, String> headers1 = new HashMap<String, String>(); headers1.put("Content-" +
"Type", "application/atom+xml"); BaseRequest getRequest = new BaseRequest();
getRequest.setHeaders(headers1);
```

setListener(INetListener) method

Syntax

```
public void setListener (INetListener aListener)
```

*setPriority(int) method**Syntax*

```
public void setPriority (int aPriority)
```

*setRequestMethod(int) method**Syntax*

```
public void setRequestMethod (int aRequestMethod)
```

*setRequestUrl(String) method**Syntax*

```
public void setRequestUrl (String aUrl)
```

useCookies() method

Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

Syntax

```
public boolean useCookies ()
```

Parameters

- **None** – Cookies in the network library.

Remarks

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the BaseRequest implementation.

```
BaseRequest getRequest = new BaseRequest(); boolean usecookie = getRequest.useCookies();
```

RequestManager class

Consists of the methods used to perform requests.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class RequestManager implements IRequestManager,
    IPreferenceChangeListener
```

Implemented interfaces

- *IRequestManager* on page 673
- *IPreferenceChangeListener* on page 84

Members

All members of RequestManager, including inherited members. **Nested classes**

Modifier and Type	Class	Description
publicclass	<i>AuthenticationChallengeListener</i> on page 636	The listener to register for authentication failure event.
publicclass	<i>MutualSSLChallengeListener</i> on page 637	Listener to set call back so that application can accept or reject the client certificate.
publicclass	<i>SSLChallengeListener</i> on page 637	Listener to set call back so that application can accept or reject the server certificate.

Variables

Modifier and Type	Variable	Description
public static final int	MAX_THREADS	
public static AuthenticationChallengeListener	authenticationListener	
protected static final String	TAG	
protected static ILogger	mLogger	
protected IConnectionHandler[]	mMainHandler	
protected Vector< Object >	mQueue	
protected Vector< IRequest >	mHQueue	
protected String	mMainHandlerClassName	
protected boolean	mPassportEnabled	
protected Vector< IRequest >	modifyingRequestQueue	
protected boolean	isPerformanceLoggingEnabled	

Modifier and Type	Variable	Description
protected	SuccessThread	Success notification worker instance.

Constructors

Modifier and Type	Constructor	Description
public	<i>RequestManager(ILogger, IPreferences, IConnectivityParameters, int)</i> on page 639	Instantiates the RequestManager class.

Methods

Modifier and Type	Method	Description
public void	<i>clearPendingRequests(ILogger, Context)</i> on page 639	Clears all the persisted requests from database.
public void	<i>enablePerformanceLogging()</i> on page 639	Enables performance logging for Core Services.
public IConnectivityParameters	<i>getConnectivityParameters()</i> on page 640	Returns the ConnectivityParameters object containing the settings used by the Request library.
public ILogger	<i>getLogger()</i> on page 640	
public boolean	<i>isPerformanceLoggingEnabled()</i> on page 640	Returns whether the Performance Logging is enabled or not.
public void	<i>makeRequest(final IRequest)</i> on page 641	Puts a request object into the RequestManager object.
public void	<i>makeRequest(final IBundleRequest)</i> on page 641	Puts a bundle request object into the RequestManager object.
public static void	<i>setAuthenticationChallengeListener(IAuthenticationChallengeListener)</i> on page 641	Sets the authentication challenge listener so that application is notified upon authentication failure.
public void	<i>setListener(INetListener)</i> on page 642	Sets the listener for receiving success/failure call backs upon invoking a request.

Modifier and Type	Method	Description
public void	<i>setMutualSSLChallengeListener(IMutualSSLChallengeListener)</i> on page 642	Sets the call back for the application to accept or reject the client certificate.
public void	<i>setSSLChallengeListener(SSLChallengeListener)</i> on page 642	Error notification worker.

Usage

This is the primary interface using which any kind of request could be performed.

RequestManager.AuthenticationChallengeListener class

The listener to register for authentication failure event.

Package

```
com.sap.mobile.lib.request.RequestManager
```

Syntax

```
public class AuthenticationChallengeListener implements
IAuthenticationChallengeListener
```

Implemented interfaces

- *IAuthenticationChallengeListener* on page 624

Members

All members of AuthenticationChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public ICredential	<i>OnAuthenticationFailed(Authenticationschema, HttpResponse)</i> on page 636	

OnAuthenticationFailed(Authenticationschema, HttpResponse) method

Syntax

```
public ICredential OnAuthenticationFailed (
    Authenticationschema authScheme,
    HttpResponse response
)
```

RequestManager.MutualSSLChallengeListener class

Listener to set call back so that application can accept or reject the client certificate.

Package

```
com.sap.mobile.lib.request.RequestManager
```

Syntax

```
public class MutualSSLChallengeListener
```

Members

All members of MutualSSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public HttpClientCertInfo	<i>getClientCertificate(String)</i> on page 637	

*getClientCertificate(String) method**Syntax*

```
public HttpClientCertInfo getClientCertificate (String certAlias)
```

Parameters

- **certificate** – alias name for client certificate the client certificate for the alias name passed as parameter

RequestManager.SSLChallengeListener class

Listener to set call back so that application can accept or reject the server certificate.

Package

```
com.sap.mobile.lib.request.RequestManager
```

Syntax

```
public class SSLChallengeListener
```

Members

All members of SSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>checkServerTrusted(X509Certificate[])</i> on page 638	Call back for the application to accept or reject the server certificate.

checkServerTrusted(X509Certificate[]) method

Call back for the application to accept or reject the server certificate.

Syntax

```
public boolean checkServerTrusted (X509Certificate[]  
paramArrayOfX509Certificate)
```

Parameters

- **paramArrayOfX509Certificate** – server certificates

Returns

True if the server is trusted, false otherwise

RequestManager.LIBRARY enum

Members

All members of LIBRARY, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	LOAD	
public	MISSING	
public	PRESENT	

LOAD variable

Syntax

```
public LOAD
```

MISSING variable

Syntax

```
public MISSING
```

PRESENT variable

Syntax

```
public PRESENT
```

RequestManager(ILogger, IPreferences, IConnectivityParameters, int) constructor
Instantiates the RequestManager class.

Syntax

```
public RequestManager (
    ILogger aLogger,
    IPreferences aPreferences,
    IConnectivityParameters aParameters,
    int aThreads
)
```

Parameters

- **aLogger** – com.sap.mobile.lib.supportability.ILogger implementation.
- **aPreferences** – com.sap.mobile.lib.configuration.IPreferences implementation.
- **aParameters** – com.sap.mobile.lib.request.IConnectivityParameters implementation.
- **aThreads** – the number of parallel threads.

clearPendingRequests(ILogger, Context) method
Clears all the persisted requests from database.

Syntax

```
public void clearPendingRequests (
    ILogger logger,
    Context context
)
```

Parameters

- **logger** – Logger instance.
- **context** – Application context.

Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
reqMan.clearPendingRequests(logger, context);
```

enablePerformanceLogging() method
Enables performance logging for Core Services.

Syntax

```
public void enablePerformanceLogging ()
```

Parameters

- **None** –

Returns

None

getConnectivityParameters() method

Returns the ConnectivityParameters object containing the settings used by the Request library.

Syntax

```
public IConnectivityParameters getConnectivityParameters ()
```

Parameters

- **None.** –

Returns

IConnectivityParameters Object containing the settings used by the Request library.

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);  
IConnectivityParameters params = reqMan.getConnectivityParameters();
```

getLogger() method

Syntax

```
public ILogger getLogger ()
```

isPerformanceLoggingEnabled() method

Returns whether the Performance Logging is enabled or not.

Syntax

```
public boolean isPerformanceLoggingEnabled ()
```

Parameters

- **None** –

Returns

boolean - True/False

makeRequest(final IRequest) method

Puts a request object into the RequestManager object.

Syntax

```
public void makeRequest (final IRequest aRequest)
```

Parameters

- **aRequest** – The request.

Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BaseRequest
request = new BaseRequest(); reqMan.makeRequest(request);
```

makeRequest(final IBundleRequest) method

Puts a bundle request object into the RequestManager object.

Syntax

```
public void makeRequest (final IBundleRequest aBundleRequest)
```

Parameters

- **aBundleRequest** – The request object.

Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BundleRequest
request = new BundleRequest(); reqMan.makeRequest(request);
```

setAuthenticationChallengeListener(IAuthenticationChallengeListner) method

Sets the authentication challenge listener so that application is notified upon authentication failure.

Syntax

```
public static void setAuthenticationChallengeListener
(IAuthenticationChallengeListner olistener)
```

Parameters

- **olistener** – The listener to be registered

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
reqMan.setAuthenticationChallengeListener(olistener);
```

setListener(INetListener) method

Sets the listener for receiving success/failure call backs upon invoking a request.

Syntax

```
public void setListener (INetListener listener)
```

Parameters

- **listener** – The listener to be set for call backs upon invoking a request.

Returns

None

Class INetListenerImpl implements INetListener { public void onError(IRequest arg0, IResponse arg1, IRequestStateElement arg2) { }

```
public void onSuccess(IRequest arg0, IResponse arg1) { } } INetListenerImpl listener = new INetListenerImpl(); RequestManager reqMan = new RequestManager(logger, pref, param, 1); reqMan.setListener(listener);
```

setMutualSSLChallengeListener(IMutualSSLChallengeListener) method

Sets the call back for the application to accept or reject the client certificate.

Syntax

```
public void setMutualSSLChallengeListener (IMutualSSLChallengeListener olistener)
```

Parameters

- **olistener** – The listener to register

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); reqMan.setMutualSSLChallengeListener(olistener);
```

setSSLChallengeListener(ISSLChallengeListener) method

Error notification worker.

Syntax

```
public void setSSLChallengeListener (ISSLChallengeListener olistener)
```

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); reqMan.setSSLChallengeListener(olistener);
```

*authenticationListener variable***Syntax**

```
public static AuthenticationChallengeListener
authenticationListener
```

*isPerformanceLoggingEnabled variable***Syntax**

```
protected boolean isPerformanceLoggingEnabled
```

*MAX_THREADS variable***Syntax**

```
public static final int MAX_THREADS
```

*mHQueue variable***Syntax**

```
protected Vector< IRequest > mHQueue
```

*mLogger variable***Syntax**

```
protected static ILogger mLogger
```

*mMainHandler variable***Syntax**

```
protected IConnectionHandler[] mMainHandler
```

*mMainHandlerClassName variable***Syntax**

```
protected String mMainHandlerClassName
```

*modifyingRequestQueue variable***Syntax**

```
protected Vector< IRequest > modifyingRequestQueue
```

mPassportEnabled variable

Syntax

```
protected boolean mPassportEnabled
```

mQueue variable

Syntax

```
protected Vector< Object > mQueue
```

successNotifier variable

Success notification worker instance.

Syntax

```
protected SuccessThread successNotifier
```

TAG variable

Syntax

```
protected static final String TAG
```

RequestStateElement class

Consists of information regarding the status of the request performed.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class RequestStateElement implements  
IRequestStateElement
```

Implemented interfaces

- *IRequestStateElement* on page 676

Members

All members of RequestStateElement, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected int	mErrorCode	Stores the error type.
protected int	mHttpStatus	Stores the HTTP status if available.

Modifier and Type	Variable	Description
protected HttpResponseMessage	mResponse	
protected Exception	mException	Stores the exception if available.

Constructors

Modifier and Type	Constructor	Description
public	<i>RequestStateElement()</i> on page 646	
public	<i>RequestStateElement(final int)</i> on page 646	
public	<i>RequestStateElement(final int, final Exception)</i> on page 646	
public	<i>RequestStateElement(final int, final int)</i> on page 646	
public	<i>RequestStateElement(final int, final int, final Exception)</i> on page 647	
public	<i>RequestStateElement(final int, HttpResponseMessage)</i> on page 647	
public	<i>RequestStateElement(final int, HttpResponseMessage, Exception)</i> on page 647	

Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 647	Returns the error code.
public Exception	<i>getException()</i> on page 648	Returns the exception if it is set.
public HttpResponseMessage	<i>getHttpResponse()</i> on page 648	Returns the HttpResponseMessage.
public int	<i>getHttpStatusCode()</i> on page 648	Returns the HTTP status if it is set.
public void	<i>setErrorCode(final int)</i> on page 649	Sets the error code.

Modifier and Type	Method	Description
public void	<i>setException</i> (final Exception) on page 649	Sets the exception.
public void	<i>setHttpResponse</i> (HttpResponse) on page 649	Sets the HttpResponse.
public void	<i>setHttpStatusCode</i> (int) on page 650	

Inherited members from IRequestStateElement

Modifier and Type	Member	Description
public abstract void	<i>setHttpStatusCode</i> (final int) on page 680	Sets the HTTP status.

RequestStateElement() constructor

Syntax

```
public RequestStateElement ()
```

RequestStateElement(final int) constructor

Syntax

```
public RequestStateElement (final int errorCode)
```

RequestStateElement(final int, final Exception) constructor

Syntax

```
public RequestStateElement (
    final int errorCode,
    final Exception exception
)
```

RequestStateElement(final int, final int) constructor

Syntax

```
public RequestStateElement (
    final int errorCode,
    final int httpStatus
)
```

*RequestStateElement(final int, final int, final Exception) constructor***Syntax**

```
public RequestStateElement (
    final int errorCode,
    final int httpStatus,
    final Exception exception
)
```

*RequestStateElement(final int, HttpResponse) constructor***Syntax**

```
public RequestStateElement (
    final int errorCode,
    HttpResponse response
)
```

*RequestStateElement(final int, HttpResponse, Exception) constructor***Syntax**

```
public RequestStateElement (
    final int errorCode,
    HttpResponse response,
    Exception exception
)
```

getErrorCode() method

Returns the error code.

Syntax

```
public int getErrorCode ()
```

Parameters

- **None** –

Returns

error code

Remarks

The error code can be any of the following:

- HTTP_ERROR
- PARSE_ERROR
- NETWORK_ERROR

- **AUTHENTICATION_ERROR**

RequestStateElement element; element.getErrorCode();

getException() method

Returns the exception if it is set.

Syntax

```
public Exception getException ()
```

Parameters

- **None** –

Returns

The exception stored in RequestStateElement.

RequestStateElement element; element.getException();

getHttpResponse() method

Returns the HttpResponse.

Syntax

```
public HttpResponse getHttpResponse ()
```

Parameters

- **None** –

Returns

The HttpResponse

RequestStateElement element; element.getHttpResponse();

getHttpStatusCode() method

Returns the HTTP status if it is set.

Syntax

```
public int getHttpStatusCode ()
```

Parameters

- **None** –

Returns

The HTTP status code, if available.

Remarks

If the HTTP status is not set, the default value is -1.

```
RequestStateElement element; int code =element.getHttpStatusCode();
```

setErrorCode(final int) method

Sets the error code.

Syntax

```
public void setErrorCode (final int code)
```

Parameters

- **code** – Error code.

Returns

None

```
RequestStateElement element; element.setErrorCode(0x06);
```

setException(final Exception) method

Sets the exception.

Syntax

```
public void setException (final Exception aException)
```

Parameters

- **aException** – the exception to be set.

Returns

None

```
RequestStateElement element; element.setException(new Exception());
```

setHttpResponse(HttpResponse) method

Sets the HttpResponse.

Syntax

```
public void setHttpResponse (HttpResponse aResponse)
```

Parameters

- **aResponse** – The HttpResponse

Returns

None

RequestStateElement element; HttpResponseMessage httpResponse;
element.setHttpResponse(httpResponse);

setHttpStatusCode(int) method

Syntax

```
public void setHttpStatusCode (int httpStatus)
```

mErrorCode variable

Stores the error type.

Syntax

```
protected int mErrorCode
```

mException variable

Stores the exception if available.

Syntax

```
protected Exception mException
```

mHttpStatus variable

Stores the HTTP status if available.

Syntax

```
protected int mHttpStatus
```

mResponse variable

Syntax

```
protected HttpResponseMessage mResponse
```

ResponseImpl class

Consists of methods to retrieve the response after the request is performed.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public class ResponseImpl implements IResponse
```

Implemented interfaces

- *IResponse* on page 681

Members

All members of `ResponseImpl`, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ResponseImpl(BasicStatusLine)</i> on page 651	

Methods

Modifier and Type	Method	Description
protected void	<i>addBatchResponse(IRequest, IResponse)</i> on page 651	
public ArrayList< IResponse >	<i>getBatchResponse()</i> on page 652	Returns the list of responses from batch response.
public HashMap< IRequest, IResponse >	<i>getBatchResponseMap()</i> on page 652	Returns the mapping of requests with corresponding responses within a batch response.
public Map< String, String >	<i>getHeadersMap()</i> on page 652	Returns all the response headers as a HashMap containing header name and header value.

*ResponseImpl(BasicStatusLine) constructor**Syntax*

```
public ResponseImpl (BasicStatusLine basicStatusLine)
```

*addBatchResponse(IRequest, IResponse) method**Syntax*

```
protected void addBatchResponse (
    IRequest requestItem,
    IResponse responseItem
)
```

getBatchResponse() method

Returns the list of responses from batch response.

Syntax

```
public ArrayList< IResponse > getBatchResponse ()
```

Parameters

- **None.** –

Returns

List of responses.

```
Response res; ArrayList<HttpResponse> res = res.getBatchResponse();
```

getBatchResponseMap() method

Returns the mapping of requests with corresponding responses within a batch response.

Syntax

```
public HashMap< IRequest, IResponse > getBatchResponseMap ()
```

Parameters

- **None.** –

Returns

Map of requests and responses.

```
Response res; HashMap<IRequest, HttpResponse> res = res.getBatchResponseMap();
```

getHeadersMap() method

Returns all the response headers as a HashMap containing header name and header value.

Syntax

```
public Map< String, String > getHeadersMap ()
```

Parameters

- **None** –

Returns

Response headers in the form of a hashmap.

```
Response res; Map<String,string> headers = res.getHeadersMap();
```

*ConnectionProtocolEnum enum**Members*

All members of ConnectionProtocolEnum, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	HTTPS	
public	HTTP	

*HTTP variable**Syntax*

```
public HTTP
```

*HTTPS variable**Syntax*

```
public HTTPS
```

IBundleRequest interface

Consists of interface for request bundle.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public interface IBundleRequest
```

Derived classes

- *BundleRequest* on page 610

Members

All members of IBundleRequest, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>addRequest(IRequest)</i> on page 654	Adds a request to the storage.
public void	<i>clearRequests()</i> on page 654	Cleans out the request storage.

Modifier and Type	Method	Description
public IRequest[]	<i>getRequests()</i> on page 655	Returns all the requests from the storage.
public void	<i>removeRequest(IRequest)</i> on page 655	Removes the specific request from the storage.

addRequest(IRequest) method

Adds a request to the storage.

Syntax

```
public void addRequest (IRequest request)
```

Parameters

- **request** – the request to be added.

Returns

None

Remarks

NOTE! Request priority

(`com.sap.mobile.com.sap.mobile.lib.request.Request.IRequest#setPriority(int)`) is ignored during request processing! Because requests are processed in the order they are added to the bundle, the order is considered to handle the priority.

```
BundleRequest bundleRequest = new BundleRequest(); BaseRequest request1 = new BaseRequest(); BaseRequest request2 = new BaseRequest(); bundleRequest.addRequest(request1); bundleRequest.addRequest(request2);
```

clearRequests() method

Cleans out the request storage.

Syntax

```
public void clearRequests ()
```

Parameters

- **None** –

Returns

None

```
BundleRequest bundleRequest = new BundleRequest(); ... bundleRequest.clearRequests();
```

getRequests() method

Returns all the requests from the storage.

Syntax

```
public IRequest[] getRequests ()
```

Parameters

- **None** –

Returns

the array of requests.

```
BundleRequest bundleRequest = new BundleRequest();... BaseRequest[] requests=
bundleRequest.getRequests();
```

removeRequest(IRequest) method

Removes the specific request from the storage.

Syntax

```
public void removeRequest (IRequest request)
```

Parameters

- **request** – the request to be removed.

Returns

None

```
BundleRequest bundleRequest = new BundleRequest(); BaseRequest request1 = new
BaseRequest(); ... bundleRequest.removeRequest(request1);
```

IConnectivityParameters interface

Consists of interface used to store connectivity properties like username, password etc.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public interface IConnectivityParameters extends
```

Derived classes

- *ConnectivityParameters* on page 614

*Members*All members of `IConnectivityParameters`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 657	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 657	Returns the base URL for the requests.
public String	<i>getLanguage()</i> on page 657	Returns the language setting.
public TrustManager[]	<i>getTrustManagers()</i> on page 658	Returns an array of TrustManager instances.
public String	<i>getUserName()</i> on page 658	Returns the username.
public String	<i>getUserPassword()</i> on page 658	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 659	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 659	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 659	Sets the base URL for requests.
public void	<i>setLanguage(String)</i> on page 659	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 660	Sets the server certificate array.
public void	<i>setServerCertificate(final Certificate)</i> on page 660	Sets a single server certificate.
public void	<i>setUserName(String)</i> on page 660	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 661	Sets the password.

enableXsrf(Boolean) method

Sets the XSRFEnabled flag.

Syntax

```
public void enableXsrf (Boolean isXsrfEnabled)
```

Parameters

- **isXsrfEnabled** – the boolean to set.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.enableXsrf(isXsrfEnabled);
```

getBaseUrl() method

Returns the base URL for the requests.

Syntax

```
public String getBaseUrl ()
```

Parameters

- **None** –

Returns

the base URL for the requests.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getBaseUrl();
```

getLanguage() method

Returns the language setting.

Syntax

```
public String getLanguage ()
```

Parameters

- **None** –

Returns

the language setting

```
ConnectivityParameters param = new ConnectivityParameters(); param.getLanguage();
```

getTrustManagers() method

Returns an array of TrustManager instances.

Syntax

```
public TrustManager[] getTrustManagers ()
```

Parameters

- **None** –

Returns

the array

```
ConnectivityParameters param = new ConnectivityParameters(); param.getTrustManagers();
```

getUserName() method

Returns the username.

Syntax

```
public String getUserName ()
```

Parameters

- **None** –

Returns

the user name.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserName();
```

getUserPassword() method

Returns the password.

Syntax

```
public String getUserPassword ()
```

Parameters

- **None** –

Returns

the password.

```
ConnectivityParameters param = new ConnectivityParameters(); param.getUserPassword();
```

isAutoRedirectEnabled() method

Returns whether auto redirect is enabled.

Syntax

```
public boolean isAutoRedirectEnabled ()
```

setAutoRedirectEnabled(boolean) method

Enables or disables auto redirect.

Syntax

```
public void setAutoRedirectEnabled (boolean paramboolean)
```

Parameters

- **paramboolean** – the boolean to set

setBaseUrl(String) method

Sets the base URL for requests.

Syntax

```
public void setBaseUrl (String baseUrl)
```

Parameters

- **baseUrl** – The base URL for the requests.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setBaseUrl(baseUrl);
```

setLanguage(String) method

Sets the language used in connection.

Syntax

```
public void setLanguage (String language)
```

Parameters

- **language** – to set

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();  
param.setLanguage(alanguage);
```

setServerCertificate(final Certificate[]) method

Sets the server certificate array.

Syntax

```
public void setServerCertificate (final Certificate[] certificate)  
throws KeyStoreException
```

Parameters

- **certificate** – array to set.

Returns

None

Exceptions

- **KeyStoreException** –

```
ConnectivityParameters param = new ConnectivityParameters(); param.  
setServerCertificate(aCertificate[]);
```

setServerCertificate(final Certificate) method

Sets a single server certificate.

Syntax

```
public void setServerCertificate (final Certificate certificate)
```

Parameters

- **certificate** – to set

setUserName(String) method

Sets the username which must be used during authentication.

Syntax

```
public void setUserName (String aUserName)
```

Parameters

- **aUserName** – the user name to set.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setUsername(aUserName);
```

setUserPassword(String) method

Sets the password.

Syntax

```
public void setUserPassword (String aPassword)
```

Parameters

- **aPassword** – the password to set.

Returns

None

```
ConnectivityParameters param = new ConnectivityParameters();
param.setUserPassword(aPassword);
```

INetListener interface

Consists of interface for request listener.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public interface INetListener
```

Derived classes

- *AppSettings* on page 755
- *ClientConnection* on page 760
- *UserManager* on page 776

Members

All members of INetListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onError(IRequest, IResponse, IRequestStateElement)</i> on page 662	Request library uses this method in case of error/failure scenario during a request operation.
public void	<i>onSuccess(IRequest, IResponse)</i> on page 662	Request library uses this method in case of successful request.

Usage

This interface must be implemented to get success/failure call backs for each request.

onError(IRequest, IResponse, IRequestStateElement) method

Request library uses this method in case of error/failure scenario during a request operation.

Syntax

```
public void onError (
    IRequest aRequest,
    IResponse aResponse,
    IRequestStateElement aRequestStateElement
)
```

Parameters

- **aRequest** – the request object.
- **aResponse** – the response object.
- **aRequestStateElement** – the RequestStateElement object.

Returns

None

Remarks

The listener registered for the request receives the request object, the HttpResponseMessage object which contains the details about the server response, and a RequestStateElement object which provides more details about the occurred error. In case, the error occurs before sending any request to the server, the HttpResponseMessage object will be null.

```
public class Activity implements INetListener { ... public void onError(IRequest arg0,
IResponse arg1, IRequestStateElement arg2) {
arg1.getStatusLine().toString()
arg2.getErrorCode(); } ...}
```

onSuccess(IRequest, IResponse) method

Request library uses this method in case of successful request.

Syntax

```
public void onSuccess (
    IRequest aRequest,
    IResponse aResponse
)
```

Parameters

- **aRequest** – the request object.
- **aResponse** – the response object.

Returns

None

Remarks

The listener receives the request in form of parameter and an HttpResponseMessage object containing all the details about the server response.

```
public class Activity implements INetListener { .... public void onSuccess(IRequest arg0,
IResponse arg1) {
```

```
    HttpEntity resp = arg1.getEntity();
```

```
    String response="";
```

```
    response = EntityUtils.toString(resp); //process the response }...}
```

IRequest interface

Consists of interface for requests.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public interface IRequest extends
```

Derived classes

- *BaseRequest* on page 593
- *PushRequest* on page 627

Members

All members of IRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	PRIORITY_NORMAL	Normal priority. This is the default priority.

Modifier and Type	Variable	Description
public static final int	PRIORITY_HIGH	High priority. Requests with high priority will be executed first. If there are more than one IRequests with IRequest.PRIORITY_HIGH priority, the network layer will choose an execution order.
public static final int	REQUEST_METHOD_GET	HTTP GET method.
public static final int	REQUEST_METHOD_POST	HTTP POST method.
public static final int	REQUEST_METHOD_PUT	HTTP PUT method.
public static final int	REQUEST_METHOD_DELETE	HTTP DELETE method.
public static final int	ETAG_IF_MATCH	etag "if-match"
public static final int	ETAG_IF_NONE_MATCH	etag "if-none-match"
public static final int	ETAG_IF_RANGE	etag "if-range"

Methods

Modifier and Type	Method	Description
public void	<i>disableDeltaHandling(boolean)</i> on page 665	Disables delta query handling.
public byte[]	<i>getData()</i> on page 666	If the request method is POST, this method is called from the network library.
public Map< String, String >	<i>getHeaders()</i> on page 666	Returns the request headers set.
public INetListener	<i>getListener()</i> on page 667	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public int	<i>getPriority()</i> on page 667	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 667	Retrieves the request method type.

Modifier and Type	Method	Description
public String	<i>getRequestUrl()</i> on page 668	Returns the URL where the request must be invoked.
public boolean	<i>isDeltaHandlingDisabled()</i> on page 668	internal
public void	<i>setData(byte[])</i> on page 668	Sets the request data in case of an HTTP POST request.
public void	<i>setHeaders(Map<String, String>)</i> on page 669	Sets the request headers.
public void	<i>setListener(final INetListener)</i> on page 669	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority(final int)</i> on page 670	Sets the priority of the request.
public void	<i>setRequestMethod(final int)</i> on page 670	Sets the type of HTTP request method.
public void	<i>setRequestUrl(final String)</i> on page 671	Sets the URL for the request.
public boolean	<i>useCookies()</i> on page 671	Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

Usage

All request objects must implement this interface. The network layer uses this interface to interact with the request objects.

disableDeltaHandling(boolean) method

Disables delta query handling.

Syntax

```
public void disableDeltaHandling (boolean disable)
```

Parameters

- **disable** – If set to true it disables delta handling

Returns

None

Remarks

By default delta handling is enabled.

getData() method

If the request method is POST, this method is called from the network library.

Syntax

```
public byte[] getData ()
```

Parameters

- **None** –

Returns

the content data of the request.

Remarks

This method will return with the content to be sent to the server.

```
BaseRequest getrequest = new BaseRequest(); byte[] data = getrequest.getData();
```

getHeaders() method

Returns the request headers set.

Syntax

```
public Map< String, String > getHeaders ()
```

Parameters

- **None** –

Returns

the request headers

```
BaseRequest getrequest = new BaseRequest(); Map<String, String> headers =  
getrequest.getHeaders();
```

getListener() method

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

Syntax

```
public INetListener getListener ()
```

Parameters

- **None** –

Returns

the listener or null.

Remarks

Method will return null if there is no registered listener.

```
class example implements INetListener{ .... public void makeGetRequest(...) throws
Exception { .... BaseRequest getrequest = new BaseRequest();
getrequest.getListener(); } ... }
```

getPriority() method

Returns the priority of the request.

Syntax

```
public int getPriority ()
```

Parameters

- **None** –

Returns

The priority of the request. The value is integer.

```
BaseRequest getrequest = new BaseRequest(); int priority = getrequest.getPriority();
```

getRequestMethod() method

Retrieves the request method type.

Syntax

```
public int getRequestMethod ()
```

Parameters

- **None** –

Returns

Type of the HTTP request specified by IRequest.REQUEST_METHOD_* constants.

```
BaseRequest getrequest = new BaseRequest(); int method = getrequest.getRequestMethod();
```

getRequestUrl() method

Returns the URL where the request must be invoked.

Syntax

```
public String getRequestUrl ()
```

Parameters

- **None** –

Returns

the URL.

```
BaseRequest getrequest = new BaseRequest(); String url = getrequest.getRequestUrl();
```

isDeltaHandlingDisabled() method

internal

Syntax

```
public boolean isDeltaHandlingDisabled ()
```

setData(byte[]) method

Sets the request data in case of an HTTP POST request.

Syntax

```
public void setData (byte[] data)
```

Parameters

- **data** – the request data to set.

Returns

None

```
BaseRequest getrequest = new BaseRequest(); String postBody= "<atom:entry xmlns:atom=\n'http://www.w3.org/2005/Atom'>" + "<atom:content type='application/xml'>" +\n"<m:properties xmlns:m='http://schemas.microsoft.com/ado/2007/08/dataservices/\nmetadata' *xmlns:d='http://schemas.microsoft.com/ado/2007/08/dataservices'>" +\n"<d:agencynum>09964571</d:agencynum>" + "<d:NAME ></d:NAME>" +\n"<d:STREET />" + "<d:POSTBOX />" + * "<d:POSTCODE />" + "<d:CITY />" +\n"<d:COUNTRY />" + "<d:REGION />" + "<d:TELEPHONE>+9945007007</
```

```
d:TELEPHONE>" + "<d:URL />" + "<d:LANGU />" + "<d:CURRENCY />" +
"<d:mimeType>text/html</d:mimeType>" + "</m:properties>" + "</atom:content>" + "</
atom:entry>"; post1.setData(postBody.getBytes());
```

setHeaders(Map< String, String >) method

Sets the request headers.

Syntax

```
public void setHeaders (Map< String, String > headers)
```

Parameters

- **headers** – the request headers to set.

Returns

None

```
Map<String, String> headers1 = new HashMap<String, String>(); headers1.put("Content-
Type", "application/atom+xml"); BaseRequest getrequest = new BaseRequest();
getrequest.setHeaders(headers1);
```

setListener(final INetListener) method

Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

Syntax

```
public void setListener (final INetListener aListener)
```

Parameters

- **aListener** – the listener to be set.

Returns

None

Remarks

By default, the BaseRequest object included in the connectivity layer will contain no registered listeners.

```
class example implements INetListener{ .... public void makeGetRequest(...) throws
Exception { .... BaseRequest getrequest = new BaseRequest();
getrequest.setListener(this); } ... }
```

setPriority(final int) method

Sets the priority of the request.

Syntax

```
public void setPriority (final int aPriority)
```

Parameters

- **aPriority** – the priority of the request to set.

Returns

None

Remarks

Allowed values are `IRequest.PRIORITY_HIGH` or `IRequest.PRIORITY_NORMAL`. In case of a different value, the default `IRequest.PRIORITY_NORMAL` will be used by the network. If the network layer finds an `IRequest` with `IRequest.PRIORITY_HIGH` priority in the queue, that request will be executed first. If there are more than one `IRequests` with `IRequest.PRIORITY_HIGH` priority, the network layer will choose an execution order. If the priority is not one of the predefined values, the priority will be set to the default value `IRequest.PRIORITY_NORMAL`.

```
BaseRequest getRequest = new BaseRequest();  
getRequest.setPriority(IRequest.PRIORITY_NORMAL);
```

setRequestMethod(final int) method

Sets the type of HTTP request method.

Syntax

```
public void setRequestMethod (final int aRequestMethod)
```

Parameters

- **requestMethod** – Type of the HTTP request specified by `IRequest.REQUEST_METHOD_*` constants.

Returns

None

```
BaseRequest getRequest = new BaseRequest();  
getRequest.setRequestMethod(IRequest.REQUEST_METHOD_GET);
```

setRequestUrl(final String) method

Sets the URL for the request.

Syntax

```
public void setRequestUrl (final String aUrl)
```

Parameters

- **aUrl** – the URL to set.

Returns

None

```
BaseRequest getrequest = new BaseRequest(); getrequest.setRequestUrl("http://abc.com/resource");
```

useCookies() method

Network library uses this method to check whether it has to send cookies to the server when the current request is performed.

Syntax

```
public boolean useCookies ()
```

Parameters

- **None** – Cookies in the network library.

Remarks

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the BaseRequest implementation.

```
BaseRequest getrequest = new BaseRequest(); boolean usecookie = getrequest.useCookies();
```

ETAG_IF_MATCH variable

```
etag "if-match"
```

Syntax

```
public static final int ETAG_IF_MATCH
```

ETAG_IF_NONE_MATCH variable

```
etag "if-none-match"
```

Syntax

```
public static final int ETAG_IF_NONE_MATCH
```

ETAG_IF_RANGE variable

etag "if-range"

Syntax

```
public static final int ETAG_IF_RANGE
```

PRIORITY_HIGH variable

High priority.

Syntax

```
public static final int PRIORITY_HIGH
```

Remarks

Requests with high priority will be executed first. If there are more than one IRequests with IRequest.PRIORITY_HIGH priority, the network layer will choose an execution order.

PRIORITY_NORMAL variable

Normal priority.

Syntax

```
public static final int PRIORITY_NORMAL
```

Remarks

This is the default priority.

REQUEST_METHOD_DELETE variable

HTTP DELETE method.

Syntax

```
public static final int REQUEST_METHOD_DELETE
```

REQUEST_METHOD_GET variable

HTTP GET method.

Syntax

```
public static final int REQUEST_METHOD_GET
```

REQUEST_METHOD_POST variable

HTTP POST method.

Syntax

```
public static final int REQUEST_METHOD_POST
```

REQUEST_METHOD_PUT variable
HTTP PUT method.

Syntax

```
public static final int REQUEST_METHOD_PUT
```

IRequestManager interface

Consists of interface for execution of requests.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public interface IRequestManager
```

Derived classes

- *RequestManager* on page 633

Members

All members of *IRequestManager*, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>clearPendingRequests(ILogger, Context)</i> on page 674	Clears all the persisted requests from database.
public void	<i>enablePerformanceLogging()</i> on page 674	Enables performance logging for Core Services.
public IConnectivityParameters	<i>getConnectivityParameters()</i> on page 674	Returns the ConnectivityParameters object containing the settings used by the Request library.
public boolean	<i>isPerformanceLoggingEnabled()</i> on page 675	Returns whether the Performance Logging is enabled or not.
public void	<i>makeRequest(final IRequest)</i> on page 675	Puts a request object into the RequestManager object.
public void	<i>makeRequest(final IBundleRequest)</i> on page 675	Puts a bundle request object into the RequestManager object.

clearPendingRequests(ILogger, Context) method

Clears all the persisted requests from database.

Syntax

```
public void clearPendingRequests (
    ILogger logger ,
    Context context
)
```

Parameters

- **logger** – Logger instance.
- **context** – Application context.

Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
reqMan.clearPendingRequests(logger, context);
```

enablePerformanceLogging() method

Enables performance logging for Core Services.

Syntax

```
public void enablePerformanceLogging ()
```

Parameters

- **None** –

Returns

None

getConnectivityParameters() method

Returns the ConnectivityParameters object containing the settings used by the Request library.

Syntax

```
public IConnectivityParameters getConnectivityParameters ()
```

Parameters

- **None.** –

Returns

IConnectivityParameters Object containing the settings used by the Request library.

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1);
IConnectivityParameters params = reqMan.getConnectivityParameters();
```

isPerformanceLoggingEnabled() method

Returns whether the Performance Logging is enabled or not.

Syntax

```
public boolean isPerformanceLoggingEnabled ()
```

Parameters

- **None** –

Returns

boolean - True/False

makeRequest(final IRequest) method

Puts a request object into the RequestManager object.

Syntax

```
public void makeRequest (final IRequest aRequest)
```

Parameters

- **aRequest** – The request.

Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BaseRequest
request = new BaseRequest(); reqMan.makeRequest(request);
```

makeRequest(final IBundleRequest) method

Puts a bundle request object into the RequestManager object.

Syntax

```
public void makeRequest (final IBundleRequest aBundleRequest)
```

Parameters

- **aBundleRequest** – The request object.

Returns

None

```
RequestManager reqMan = new RequestManager(logger, pref, param, 1); BundleRequest
request = new BundleRequest(); reqMan.makeRequest(request);
```

IRequestStateElement interface

Consists of methods to store the information of an exception.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public abstract interface IRequestStateElement
```

Derived classes

- *RequestStateElement* on page 644

Members

All members of IRequestStateElement, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	NO_ERROR	
public static final int	HTTP_ERROR	Server response status > 302.
public static final int	PARSE_ERROR	Problem with parsing the response xml.
public static final int	NETWORK_ERROR	There was a network error during a read/write to/from stream.
public static final int	AUTHENTICATION_ERROR	Authentication error.
public static final int	CLIENT_ERROR	Client error.
public static final int	REQUEST_ERROR	Problem with parsing the request.

Methods

Modifier and Type	Method	Description
public abstract int	<i>getErrorCode()</i> on page 677	Returns the error code.
public abstract Exception	<i>getException()</i> on page 677	Returns the exception if it is set.
public abstract HttpResponseMessage	<i>getHttpResponse()</i> on page 678	Returns the HttpResponseMessage.
public abstract int	<i>getHttpStatusCode()</i> on page 678	Returns the HTTP status if it is set.

Modifier and Type	Method	Description
public abstract void	<i>setErrorCode</i> (final int) on page 679	Sets the error code.
public abstract void	<i>setException</i> (final Exception) on page 679	Sets the exception.
public abstract void	<i>setHttpResponse</i> (HttpResponse) on page 679	Sets the HttpResponse.
public abstract void	<i>setHttpStatusCode</i> (final int) on page 680	Sets the HTTP status.

Usage

Whenever there is an exception in the network layer, or there is an exception during the data parsing, this is sent by the network layer to the registered classes.

getErrorCode() method

Returns the error code.

Syntax

```
public abstract int getErrorCode ()
```

Parameters

- **None** –

Returns

error code

Remarks

The error code can be any of the following:

- HTTP_ERROR
- PARSE_ERROR
- NETWORK_ERROR
- AUTHENTICATION_ERROR

RequestStateElement element; element.getErrorCode();

getException() method

Returns the exception if it is set.

Syntax

```
public abstract Exception getException ()
```

Parameters

- **None** –

Returns

The exception stored in RequestStateElement.

RequestStateElement element; element.getException();

getHttpResponse() method

Returns the HttpResponse.

Syntax

```
public abstract HttpResponse getHttpResponse ()
```

Parameters

- **None** –

Returns

The HttpResponse

RequestStateElement element; element.getHttpResponse();

getHttpStatusCode() method

Returns the HTTP status if it is set.

Syntax

```
public abstract int getHttpStatusCode ()
```

Parameters

- **None** –

Returns

The HTTP status code, if available.

Remarks

If the HTTP status is not set, the default value is -1.

RequestStateElement element; int code =element.getHttpStatusCode();

setErrorCode(final int) method

Sets the error code.

Syntax

```
public abstract void setErrorCode (final int code)
```

Parameters

- **code** – Error code.

Returns

None

RequestStateElement element; element.setErrorCode(0x06);

setException(final Exception) method

Sets the exception.

Syntax

```
public abstract void setException (final Exception aException)
```

Parameters

- **aException** – the exception to be set.

Returns

None

RequestStateElement element; element.setException(new Exception());

setHttpResponse(HttpResponse) method

Sets the HttpResponse.

Syntax

```
public abstract void setHttpResponse (HttpResponse aResponse)
```

Parameters

- **aResponse** – The HttpResponse

Returns

None

RequestStateElement element; HttpResponse httpResponse;
element.setHttpResponse(httpResponse);

setHttpStatusCode(final int) method

Sets the HTTP status.

Syntax

```
public abstract void setHttpStatusCode (final int httpStatus)
```

Parameters

- **httpStatus** – Set the HTTP status.

Returns

None

RequestStateElement element; element.setHttpStatusCode(200);

AUTHENTICATION_ERROR variable

Authentication error.

Syntax

```
public static final int AUTHENTICATION_ERROR
```

CLIENT_ERROR variable

Client error.

Syntax

```
public static final int CLIENT_ERROR
```

HTTP_ERROR variable

Server response status > 302.

Syntax

```
public static final int HTTP_ERROR
```

NETWORK_ERROR variable

There was a network error during a read/write to/from stream.

Syntax

```
public static final int NETWORK_ERROR
```

NO_ERROR variable

Syntax

```
public static final int NO_ERROR
```

PARSE_ERROR variable

Problem with parsing the response xml.

Syntax

```
public static final int PARSE_ERROR
```

REQUEST_ERROR variable

Problem with parsing the request.

Syntax

```
public static final int REQUEST_ERROR
```

IResponse interface

Consists of interface for responses.

Package

```
com.sap.mobile.lib.request
```

Syntax

```
public interface IResponse extends
```

Derived classes

- *ResponseImpl* on page 650

Members

All members of IResponse, including inherited members. **Methods**

Modifier and Type	Method	Description
public ArrayList< IResponse >	<i>getBatchResponse()</i> on page 682	Returns the list of responses from batch response.
public HashMap< IRequest, IResponse >	<i>getBatchResponseMap()</i> on page 682	Returns the mapping of requests with corresponding responses within a batch response.
public Map< String, String >	<i>getHeadersMap()</i> on page 682	Returns all the response headers as a HashMap containing header name and header value.

Usage

All response objects must implement this interface. The network layer uses this interface to interact with the response objects.

getBatchResponse() method

Returns the list of responses from batch response.

Syntax

```
public ArrayList< IResponse > getBatchResponse ()
```

Parameters

- **None.** –

Returns

List of responses.

```
Response res; ArrayList<HttpResponse> res = res.getBatchResponse();
```

getBatchResponseMap() method

Returns the mapping of requests with corresponding responses within a batch response.

Syntax

```
public HashMap< IRequest, IResponse > getBatchResponseMap ()
```

Parameters

- **None.** –

Returns

Map of requests and responses.

```
Response res; HashMap<IRequest, HttpResponse> res = res.getBatchResponseMap();
```

getHeadersMap() method

Returns all the response headers as a HashMap containing header name and header value.

Syntax

```
public Map< String, String > getHeadersMap ()
```

Parameters

- **None** –

Returns

Response headers in the form of a hashmap.

```
Response res; Map<String,string> headers = res.getHeadersMap();
```

*sdmcache package**ISDMCache interface*

The *SDMCache* component is responsible for storing and accessing OData related objects in the memory of the device.

Package

```
com.sap.mobile.lib.sdmcache
```

Syntax

```
public interface ISDMCache extends ISDMPersistable
```

Implemented interfaces

- *ISDMPersistable* on page 1084

Derived classes

- *SDMCache* on page 1141

Members

All members of *ISDMCache*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	FULLTERM_PREFIX_SEARCH	Constant ID of Full Term Prefix-search algorithm: Searching for the full search-term as a prefix of searchable values.
public static final int	FULLTERM_CONTAIN_SEARCH	Constant ID of Full Term Contain-search algorithm: Searching for the full search-term as a part of searchable values.
public static final int	TOKENIZED_PREFIX_SEARCH	Constant ID of Tokenized Prefix-search algorithm: Searching for all the tokens of the search-term as a prefix of searchable values. Tokens can be found in different values of the same entry.

Modifier and Type	Variable	Description
public static final int	TOKENIZED_CON- TAIN_SEARCH	Constant ID of Tokenized Con- tain-search algorithm: Search- ing for all the tokens of the search-term as a part of search- able values. Tokens can be found in different values of the same entry.
public static final int	TOKENIZED_CON- TAIN_ALL_SEARCH	Constant ID of All Token Con- tain-search algorithm: Search- ing for all the tokens of the search-term as a part of search- able values. All tokens must be found in the same value.
public static final int	REGEX_SEARCH	Constant ID of regex search al- gorithm.
public static final int	DEFAULT_SEARCH	Constant ID of default algo- rithm:

Methods

Modifier and Type	Method	Description
public void	<i>clear()</i> on page 687	Removes all objects (including SDMODData Service Document and SDMODData Schema) from SDMCache.
public ISDMEntrySearch	<i>getEntrySearch()</i> on page 687	Returns the current search ob- ject that implements the search method that should be used dur- ing searching in entries.
public ISDMParserDocument	<i>getSDMODDataDocu- ment(String)</i> on page 687	Returns an SDMParserDocu- ment object with the specified key if it is stored in SDMCache or null otherwise.
public List< ISDMODDataEntry >	<i>getSDMODDataEntries(String)</i> on page 687	Returns all of the SDMODData Entries that belong to the speci- fied collection.

Modifier and Type	Method	Description
public ISDMODataEntry	<i>getSDMODataEntry(String)</i> on page 688	Returns an SDMOData Entry with the specified key if it is stored in SDMCache or null otherwise.
public ISDMODataSchema	<i>getSDMODataSchema()</i> on page 688	Returns the SDMOData Schema (aka Metadata) if it is stored in SDMCache or null otherwise.
public ISDMODataServiceDocument	<i>getSDMODataServiceDocument()</i> on page 688	Returns the SDMOData Service Document if it is stored in SDMCache or null otherwise.
public int	<i>getSearchAlgorithm()</i> on page 689	Returns the constant ID of the current search algorithm.
public List< ISDMParserDocument >	<i>getStoredDocuments()</i> on page 689	Returns all of the SDMParserDocuments from the store (including SDMODataEntries).
public boolean	<i>removeSDMODataDocument(String)</i> on page 689	Removes stored object from SDMCache with the specified key if it is stored.
public boolean	<i>removeSDMODataEntries(String)</i> on page 689	Removes SDMOData Entries from SDMCache that belong to the specified collection.
public void	<i>removeStoredDocuments()</i> on page 690	Removes all stored documents (except from Service Document and Schema) from SDMCache.
public List< ISDMODataEntry >	<i>searchSDMODataEntries(String, String)</i> on page 690	Returns all of the SDMOData Entries that belong to the specified collection and either of its searchable fields' value's token (tokenized with space) that starts with the searchTerm.
public void	<i>setEntrySearch(ISDMEntrySearch)</i> on page 691	Seats the new search object that implements the search method that should be used during searching in entries.

Modifier and Type	Method	Description
public void	<i>setSDMODataDocument(String, ISDMParserDocument)</i> on page 691	Stores an SDMParserDocument object in SDMCache.
public void	<i>setSDMODataEntries(List<ISDMODataEntry >)</i> on page 691	Stores several SDMOData Entries in SDMCache.
public void	<i>setSDMODataEntry(ISDMODataEntry)</i> on page 692	Stores an SDMOData Entry in SDMCache.
public void	<i>setSDMODataSchema(ISDMODataSchema)</i> on page 692	Stores SDMOData Schema in SDMCache.
public void	<i>setSDMODataServiceDocument(ISDMODataServiceDocument)</i> on page 692	Stores SDMOData Service Document in SDMCache.
public void	<i>setSearchAlgorithm(int)</i> on page 693	Sets the constant ID of the search algorithm that should be used during search in entries.

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Usage

List of features:

- Storing OData objects in the memory
- Accessing OData entries in the memory directly by their key
- Searching for OData entries in the memory using tokenized prefix search on their searchable fields
- Managing the number of stored OData entries based on the maximum size of the capacity, removing the a non-recently used OData entry first

clear() method

Removes all objects (including SDMOData Service Document and SDMOData Schema) from SDMCache.

Syntax

```
public void clear ()
```

getEntrySearch() method

Returns the current search object that implements the search method that should be used during searching in entries.

Syntax

```
public ISDMEntrySearch getEntrySearch ()
```

Returns

The current search object.

getSDMODataDocument(String) method

Returns an SDMParserDocument object with the specified key if it is stored in SDMCache or null otherwise.

Syntax

```
public ISDMParserDocument getSDMODataDocument (String key)
```

Parameters

- **key** – key of the document to be searched

Returns

SDMParserDocument or null

Exceptions

- **IllegalArgumentException** – if the argument is null.

getSDMODataEntries(String) method

Returns all of the SDMOData Entries that belong to the specified collection.

Syntax

```
public List< ISDMODataEntry > getSDMODataEntries (String collectionId)
```

Parameters

- **collectionId** – id of the collection

Returns

stored SDMODDataEntries of the specific collection or null

Exceptions

- **IllegalArgumentException** – if the argument is null.

getSDMODDataEntry(String) method

Returns an SDMODData Entry with the specified key if it is stored in SDMCache or null otherwise.

Syntax

```
public ISDMODDataEntry getSDMODDataEntry (String key)
```

Parameters

- **key** – key of the entry to be searched

Returns

SDMODDataEntry or null

Exceptions

- **IllegalArgumentException** – if the argument is null.

getSDMODDataSchema() method

Returns the SDMODData Schema (aka Metadata) if it is stored in SDMCache or null otherwise.

Syntax

```
public ISDMODDataSchema getSDMODDataSchema ()
```

Returns

Schema or null

getSDMODDataServiceDocument() method

Returns the SDMODData Service Document if it is stored in SDMCache or null otherwise.

Syntax

```
public ISDMODDataServiceDocument getSDMODDataServiceDocument ()
```

Returns

Service Document or null

getSearchAlgorithm() method

Returns the constant ID of the current search algorithm.

Syntax

```
public int getSearchAlgorithm ()
```

Returns

The constant ID of the current search algorithm.

getStoredDocuments() method

Returns all of the SDMParserDocuments from the store (including SDMODataEntries).

Syntax

```
public List< ISDMParserDocument > getStoredDocuments ()
```

Returns

List of stored SDMParserDocuments

removeSDMODataDocument(String) method

Removes stored object from SDMCache with the specified key if it is stored.

Syntax

```
public boolean removeSDMODataDocument (String key)
```

Parameters

- **key** – key of the entry to be removed

Returns

true of document has been found or false otherwise

Exceptions

- **IllegalArgumentException** – if the argument is null.

removeSDMODataEntries(String) method

Removes SDMOData Entries from SDMCache that belong to the specified collection.

Syntax

```
public boolean removeSDMODataEntries (String collectionId)
```

Parameters

- **collectionId** – id of the collection

Returns

true if any document has been found in the collection or false otherwise

Exceptions

- **IllegalArgumentException** – if the argument is null.

removeStoredDocuments() method

Removes all stored documents (except from Service Document and Schema) from SDMCache.

Syntax

```
public void removeStoredDocuments ()
```

searchSDMODataEntries(String, String) method

Returns all of the SDMOData Entries that belong to the specified collection and either of its searchable fields' value's token (tokenized with space) that starts with the searchTerm.

Syntax

```
public List< ISDMODataEntry > searchSDMODataEntries (  
    String searchTerm,  
    String collectionId  
)
```

Parameters

- **searchTerm** – search string
- **collectionId** – id of the collection to search in

Returns

stored SDMODataEntries of the specific collection which start with the search string or null

Exceptions

- **IllegalArgumentException** – if any of the arguments is null.

Remarks

If the searchTerm consists of more tokens (tokenized with space) all of the search term's token should be found as above. The property tag which will determine if a field is searchable or not can be set in the preferences using the key:

ISDMPreferences.CACHE_PARSER_SEARCH_ATTRIBUTE_STRING. By default sap:searchable will be used.

setEntrySearch(ISDMEEntrySearch) method

Seats the new search object that implements the search method that should be used during searching in entries.

Syntax

```
public void setEntrySearch (ISDMEEntrySearch entrySearch)
```

Parameters

- **entrySearch** – The new search object.

setSDMODDataDocument(String, ISDMParserDocument) method

Stores an SDMParserDocument object in SDMCache.

Syntax

```
public void setSDMODDataDocument (
    String key,
    ISDMParserDocument document
)
```

Parameters

- **document** – SDMParserDocument to be stored

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

It can be used to store data other than SDMODDataEntries in the cache.

setSDMODDataEntries(List< ISDMODDataEntry >) method

Stores several SDMODData Entries in SDMCache.

Syntax

```
public void setSDMODDataEntries (List< ISDMODDataEntry > entries)
```

Parameters

- **entries** – SDMODData Entries to be stored

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

The collection ID is read out from the entry.

setSDMODDataEntry(ISDMODDataEntry) method

Stores an SDMODData Entry in SDMCache.

Syntax

```
public void setSDMODDataEntry (ISDMODDataEntry entry)
```

Parameters

- **entry** – SDMODData Entry to be stored

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

The collection ID is read out from the entry.

setSDMODDataSchema(ISDMODDataSchema) method

Stores SDMODData Schema in SDMCache.

Syntax

```
public void setSDMODDataSchema (ISDMODDataSchema schema)
```

Parameters

- **schema** – SDMODData Schema to be stored

Exceptions

- **IllegalArgumentException** – if the argument is null.

setSDMODDataServiceDocument(ISDMODDataServiceDocument) method

Stores SDMODData Service Document in SDMCache.

Syntax

```
public void setSDMODDataServiceDocument  
(ISDMODDataServiceDocument serviceDocument)
```

Parameters

- **serviceDocument** – serviceDocument to be stored

Exceptions

- **IllegalArgumentException** – if the argument is null.

setSearchAlgorithm(int) method

Sets the constant ID of the search algorithm that should be used during search in entries.

Syntax

```
public void setSearchAlgorithm (int searchAlgorithm)
```

Parameters

- **searchAlgorithm** – The constant ID of the new search algorithm.

DEFAULT_SEARCH variable

Constant ID of default algorithm:

Syntax

```
public static final int DEFAULT_SEARCH
```

FULLTERM_CONTAIN_SEARCH variable

Constant ID of Full Term Contain-search algorithm: Searching for the full search-term as a part of searchable values.

Syntax

```
public static final int FULLTERM_CONTAIN_SEARCH
```

FULLTERM_PREFIX_SEARCH variable

Constant ID of Full Term Prefix-search algorithm: Searching for the full search-term as a prefix of searchable values.

Syntax

```
public static final int FULLTERM_PREFIX_SEARCH
```

REGEX_SEARCH variable

Constant ID of regex search algorithm.

Syntax

```
public static final int REGEX_SEARCH
```

TOKENIZED_CONTAIN_ALL_SEARCH variable

Constant ID of All Token Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.

Syntax

```
public static final int TOKENIZED_CONTAIN_ALL_SEARCH
```

Remarks

All tokens must be found in the same value.

TOKENIZED_CONTAIN_SEARCH variable

Constant ID of Tokenized Contain-search algorithm: Searching for all the tokens of the search-term as a part of searchable values.

Syntax

```
public static final int TOKENIZED_CONTAIN_SEARCH
```

Remarks

Tokens can be found in different values of the same entry.

TOKENIZED_PREFIX_SEARCH variable

Constant ID of Tokenized Prefix-search algorithm: Searching for all the tokens of the search-term as a prefix of searchable values.

Syntax

```
public static final int TOKENIZED_PREFIX_SEARCH
```

Remarks

Tokens can be found in different values of the same entry.

ISDMEntrySearch interface

Interface for search objects that can be used to search for entries in SDMCache.

Package

```
com.sap.mobile.lib.sdmcache
```

Syntax

```
public interface ISDMEntrySearch
```

Derived classes

- *SDMCache* on page 1141

Members

All members of ISDMEntrySearch, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>searchInEntry(String, String, List< String >, ISDMODataEntry, List< String[]>, int)</i> on page 695	Verifies whether the entry should be found during searching for the incoming search term.

searchInEntry(String, String, List< String >, ISDMODataEntry, List< String[]>, int)
method

Verifies whether the entry should be found during searching for the incoming search term.

Syntax

```
public boolean searchInEntry (
    String searchTerm,
    String collectionId,
    List< String > searchTokens,
    ISDMODataEntry entry,
    List< String[]> searchablePropertyPathes,
    int searchAlgorhythm
)
```

Parameters

- **searchTerm** – The full search-term that the search initiated with,
- **collectionId** – The id of the searched collection
- **searchTokens** – The tokens of splitted lower-case search-term.
- **entry** – The entry that should be checked.
- **searchablePropertyPathes** – The properties of the entry that's values should be used during search.
- **searchAlgorhythm** – The constant ID of the search algorithm.

Returns

True if the entry 'matches' with the given search-term, and false otherwise.

sdmconfiguration package

sdmconnectivity package

Base class for connection handlers.

ConnectionProtocolEnum enum

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.ConnectionProtocolEnum`

Members

All members of `ConnectionProtocolEnum`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	HTTPS	
public	HTTP	

*HTTP variable**Syntax*

```
public HTTP
```

*HTTPS variable**Syntax*

```
public HTTPS
```

*sdmparser package**sdm persistence package**SDMPersistence class**Package*

```
com.sap.mobile.lib.sdm persistence
```

Syntax

```
public class SDMPersistence implements ISDMPersistence,
ISDMPreferenceChangeListener
```

Implemented interfaces

- *ISDMPersistence* on page 1085
- *ISDMPreferenceChangeListener* on page 1094

Members

All members of `SDMPersistence`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static final String	SECURE_POSTFIX	
protected static final String	CACHE_KEY	
protected static final String	mLogTag	
protected File	defaultFolder

public void	<i>storeSDMCache(String, ISDMCache)</i> on page 704	Deprecated.

SDMPersistence(ISDMPreferences, ISDMLogger) constructor [deprecated]

Deprecated.

Syntax

```
public SDMPersistence (
    ISDMPreferences preferences,
    ISDMLogger logger
) throws SDMPersistenceException
```

Remarks

Deprecated

SDMPersistence(ISDMPreferences, ISDMLogger, byte[], String) constructor [deprecated]

Deprecated.

Syntax

```
public SDMPersistence (
    ISDMPreferences preferences,
    ISDMLogger logger,
    byte[] secretKey,
    String secretKeyAlgorithm
) throws SDMPersistenceException
```

Remarks

Deprecated

SDMPersistence(ISDMPreferences, ISDMLogger, byte[], String, ActivityManager) constructor

Syntax

```
protected SDMPersistence (
    ISDMPreferences preferences,
    ISDMLogger logger,
    byte[] secretKey,
    String secretKeyAlgorithm,
```

```
ActivityManager activityManager  
) throws SDMPersistenceException
```

clear() method [deprecated]

Deprecated.

Syntax

```
public void clear ()
```

Remarks

Deprecated

deleteFiles(final boolean) method

Syntax

```
protected void deleteFiles (final boolean secured)
```

generateSecretKey() method [deprecated]

Deprecated.

Syntax

```
public static byte[] generateSecretKey () throws  
NoSuchAlgorithmException
```

Remarks

Deprecated

generateSecretKey(String) method [deprecated]

Deprecated.

Syntax

```
public static byte[] generateSecretKey (String secretKeyAlgorithm)  
throws NoSuchAlgorithmException
```

Remarks

Deprecated

isDataPersisted(String) method [deprecated]

Deprecated.

Syntax

```
public boolean isDataPersisted (String key)
```

Remarks

Deprecated

*isValidKey(String) method**Syntax*

```
protected boolean isValidKey (String key)
```

loadDataStream(String) method [deprecated]

Deprecated.

Syntax

```
public InputStream loadDataStream (String key) throws  
SDMPersistenceException
```

Remarks

Deprecated

loadRawData(String) method [deprecated]

Deprecated.

Syntax

```
public byte[] loadRawData (String key) throws  
SDMPersistenceException
```

Remarks

Deprecated

loadSDMCache(ISDMCache) method [deprecated]

Deprecated.

Syntax

```
public boolean loadSDMCache (ISDMCache cache) throws  
SDMPersistenceException
```

Remarks

Deprecated

loadSDMCache(String, ISDMCache) method [deprecated]

Deprecated.

Syntax

```
public boolean loadSDMCache (  
    String key,  
    ISDMCache cache  
) throws SDMPersistenceException
```

Remarks

Deprecated

onPreferenceChanged(String, Object) method [deprecated]

Deprecated.

Syntax

```
public void onPreferenceChanged (  
    String key,  
    Object value  
)
```

Remarks

Deprecated

removeData(String) method [deprecated]

Deprecated.

Syntax

```
public boolean removeData (String key) throws  
SDMPersistenceException
```

Remarks

Deprecated

removeSDMCache() method [deprecated]

Deprecated.

Syntax

```
public boolean removeSDMCache () throws SDMPersistenceException
```

Remarks

Deprecated

removeSDMCache(String) method [deprecated]

Deprecated.

Syntax

```
public boolean removeSDMCache (String key) throws
SDMPersistenceException
```

Remarks

Deprecated

setEncryptionKey(byte[], String) method [deprecated]

Deprecated.

Syntax

```
public void setEncryptionKey (
    byte[] secretKey,
    String secretKeyAlgorithm
) throws SDMPersistenceException
```

Remarks

Deprecated

storeDataStream(String, InputStream) method [deprecated]

Deprecated.

Syntax

```
public void storeDataStream (
    String key,
    InputStream inputStream
) throws SDMPersistenceException
```

Remarks

Deprecated

storeObject(String, ISDMPersistable) method [deprecated]

Deprecated.

Syntax

```
public void storeObject (
    String key,
    ISDMPersistable object
) throws SDMPersistenceException
```

Remarks

Deprecated

storeRawData(String, byte[]) method [deprecated]

Deprecated.

Syntax

```
public void storeRawData (  
    String key,  
    byte[] data  
) throws SDMPersistenceException
```

Remarks

Deprecated

storeSDMCache(ISDMCache) method [deprecated]

Deprecated.

Syntax

```
public void storeSDMCache (ISDMCache cache) throws  
SDMPersistenceException
```

Remarks

Deprecated

storeSDMCache(String, ISDMCache) method [deprecated]

Deprecated.

Syntax

```
public void storeSDMCache (  
    String key,  
    ISDMCache cache  
) throws SDMPersistenceException
```

Remarks

Deprecated

supportability package

Logger class

ILogger implementation.

Package

```
com.sap.mobile.lib.supportability
```

Syntax

```
public class Logger implements ILogger, IPersistable
```

Implemented interfaces

- *ILogger* on page 739
- *IPersistable* on page 592

Members

All members of Logger, including inherited members. **Nested classes**

Modifier and Type	Class	Description
publicclass	<i>LogEntry</i> on page 720	A log entry.

Variables

Modifier and Type	Variable	Description
public static int	passportTraceLevel	
public static int	e2eStep	

Constructors

Modifier and Type	Constructor	Description
public	<i>Logger()</i> on page 724	Constructs a new Logger, an ILogger implementation.

Methods

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 724	Implementer should override this method!
public void	<i>cleanUp(final int)</i> on page 724	Deletes all entries weaker than the threshold priority.
public void	<i>d(final String, final String)</i> on page 724	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 725	Sends a DEBUG log message and logs the exception.
public void	<i>d(final String, final String, final String)</i> on page 725	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable, final String)</i> on page 725	Sends a DEBUG log message and logs the exception.
public void	<i>e(final String, final String)</i> on page 726	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable)</i> on page 726	Sends an ERROR log message and logs the exception.
public void	<i>e(final String, final String, final String)</i> on page 727	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable, final String)</i> on page 727	Sends an ERROR log message and logs the exception.

Modifier and Type	Method	Description
public Enumeration< LogEntry >	<i>getLogElements()</i> on page 727	
public Vector< LogEntry >	<i>getLogElements(final int)</i> on page 728	Get the log elements above (and including) the threshold.
public Vector< LogEntry >	<i>getLogElementsByCorrelationId(final String)</i> on page 728	
public Vector< LogEntry >	<i>getLogElementsByPID(final long)</i> on page 728	
public Vector< LogEntry >	<i>getLogElementsByTag(final String)</i> on page 728	
public Vector< LogEntry >	<i>getLogElementsByTimeStamp(final long, final long)</i> on page 728	
public final int	<i>getLogLevel()</i> on page 728	Returns the log level.
public void	<i>i(final String, final String)</i> on page 729	Sends an INFO log message.
public void	<i>i(final String, final String, final Throwable)</i> on page 729	Sends a INFO log message and logs the exception.
public void	<i>i(final String, final String, final String)</i> on page 730	Sends an INFO log message.
public void	<i>i(final String, final String, final Throwable, final String)</i> on page 730	Sends a INFO log message and logs the exception.
public void	<i>log(final int, final String, final String, final Throwable, String)</i> on page 730	Logs a log message.
public void	<i>logFullLocation(boolean)</i> on page 731	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation()</i> on page 731	To get the setting which controls log output should contain full location (class and method name) or not.

Modifier and Type	Method	Description
public boolean	<i>logsToAndroid()</i> on page 731	To get the setting which controls log output to Android log.
public void	<i>logToAndroid(final boolean)</i> on page 732	Setting to control log output to Android log.
public void	<i>p(final String, final String)</i> on page 732	Sends a PERFORMANCE log message.
public void	<i>p(final String, final String, final String)</i> on page 732	Sends a PERFORMANCE log message.
public void	<i>read(BufferedReader)</i> on page 733	
public void	<i>setHeaderData(final String, final String)</i> on page 733	Sets the log header fields.
public void	<i>setLogLevel(final int)</i> on page 734	Set the log level.
public void	<i>terminate()</i> on page 734	Clears collected log data.
public synchronized String	<i>toString()</i> on page 734	Get log data.
public void	<i>v(final String, final String)</i> on page 734	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable)</i> on page 735	Sends a VERBOSE log message and logs the exception.
public void	<i>v(final String, final String, final String)</i> on page 735	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable, final String)</i> on page 736	Sends a VERBOSE log message and logs the exception.
public void	<i>w(final String, final Throwable)</i> on page 736	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable)</i> on page 736	Sends a WARN log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>w</i> (<i>final String</i> , <i>final String</i>) on page 737	Sends a WARN log message.
public void	<i>w</i> (<i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 737	Sends a WARN log message and logs the exception.
public void	<i>w</i> (<i>final String</i> , <i>final String</i> , <i>final String</i>) on page 738	Sends a WARN log message.
public void	<i>w</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 738	Sends a WARN log message and logs the exception.
public void	<i>write</i> (<i>BufferedWriter</i>) on page 739	

Logger.LogEntry class

A log entry.

Package

```
com.sap.mobile.lib.supportability.Logger
```

Syntax

```
public class LogEntry
```

Members

All members of LogEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public long	when	
public int	priority	
public String	tag	
public String	message	
public String	caller	
public Throwable	ex	
public int	PID	

Constructors

Modifier and Type	Constructor	Description
public	<i>LogEntry()</i> on page 721	
public	<i>LogEntry(final int, final String, final String, final Throwable, final String, final int)</i> on page 721	

Methods

Modifier and Type	Method	Description
public LogEntry	<i>setCaller(String)</i> on page 722	
public LogEntry	<i>setMessage(final String)</i> on page 722	
public LogEntry	<i>setPID(int)</i> on page 722	
public LogEntry	<i>setPriority(int)</i> on page 722	
public LogEntry	<i>setPriority(String)</i> on page 722	
public LogEntry	<i>setTag(final String)</i> on page 722	
public LogEntry	<i>setThrowable(Throwable)</i> on page 722	
public LogEntry	<i>setWhen(long)</i> on page 722	
public String	<i>toString()</i> on page 723	

LogEntry() constructor

Syntax

```
public LogEntry ()
```

LogEntry(final int, final String, final String, final Throwable, final String, final int) constructor

Syntax

```
public LogEntry (
    final int priority,
    final String tag,
    final String message,
    final Throwable tr,
```

```
    final String location,  
    final int pid  
)
```

setCaller(String) method

Syntax

```
public LogEntry setCaller (String caller)
```

setMessage(final String) method

Syntax

```
public LogEntry setMessage (final String message)
```

setPID(int) method

Syntax

```
public LogEntry setPID (int pid)
```

setPriority(int) method

Syntax

```
public LogEntry setPriority (int priority)
```

setPriority(String) method

Syntax

```
public LogEntry setPriority (String logLevel)
```

setTag(final String) method

Syntax

```
public LogEntry setTag (final String tag)
```

setThrowable(Throwable) method

Syntax

```
public LogEntry setThrowable (Throwable ex)
```

setWhen(long) method

Syntax

```
public LogEntry setWhen (long when)
```

*toString() method***Syntax**

```
public String toString ()
```

*caller variable***Syntax**

```
public String caller
```

*ex variable***Syntax**

```
public Throwable ex
```

*message variable***Syntax**

```
public String message
```

*PID variable***Syntax**

```
public int PID
```

*priority variable***Syntax**

```
public int priority
```

*tag variable***Syntax**

```
public String tag
```

*when variable***Syntax**

```
public long when
```

Logger() constructor

Constructs a new Logger, an ILogger implementation.

Syntax

```
public Logger ()
```

canLog() method

Implementer should override this method!

Syntax

```
public boolean canLog ()
```

Returns

State of ability to log.

cleanUp(final int) method

Deletes all entries weaker than the threshold priority.

Syntax

```
public void cleanUp (final int threshold)
```

d(final String, final String) method

Sends a DEBUG log message.

Syntax

```
public void d (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,String)`

d(final String, final String, final Throwable) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,Throwable,String)`

d(final String, final String, final String) method

Sends a DEBUG log message.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

d(final String, final String, final Throwable, final String) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (
    final String tag,
    final String msg,
```

```
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,String)`

e(final String, final String, final Throwable) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (  
    final String tag,  
    final String msg,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,Throwable,String)`

e(final String, final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String, final Throwable, final String) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

getLogElements() method

Syntax

```
public Enumeration< LogEntry > getLogElements ()
```

getLogElements(final int) method

Get the log elements above (and including) the threshold.

Syntax

```
public Vector< LogEntry > getLogElements (final int threshold)
```

Parameters

- **threshold** – the desired level (inclusively)

Returns

log elements as Vector

getLogElementsByCorrelationId(final String) method

Syntax

```
public Vector< LogEntry > getLogElementsByCorrelationId (final String correlationId)
```

getLogElementsByPID(final long) method

Syntax

```
public Vector< LogEntry > getLogElementsByPID (final long PID)
```

getLogElementsByTag(final String) method

Syntax

```
public Vector< LogEntry > getLogElementsByTag (final String aTag)
```

getLogElementsByTimeStamp(final long, final long) method

Syntax

```
public Vector< LogEntry > getLogElementsByTimeStamp (
    final long start,
    final long end
)
```

getLogLevel() method

Returns the log level.

Syntax

```
public final int getLogLevel ()
```

Returns

the log level.

i(final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,String)`

i(final String, final String, final Throwable) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (  
    final String tag,  
    final String msg,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,Throwable,String)`

i(final String, final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

i(final String, final String, final Throwable, final String) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

log(final int, final String, final String, final Throwable, String) method

Logs a log message.

Syntax

```
public void log (  
    final int level,  
    final String tag,  
    final String msg,  
    final Throwable tr,
```

```
String location
)
```

Parameters

- **level** – the log level
- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

logFullLocation(boolean) method

Setting to control log full location (class-path and method name).

Syntax

```
public void logFullLocation (boolean logFullLocation)
```

Parameters

- **logFullLocation** – log i or do not log it.

logsFullLocation() method

To get the setting which controls log output should contain full location (class and method name) or not.

Syntax

```
public boolean logsFullLocation ()
```

Returns

logging with full location or not.

logsToAndroid() method

To get the setting which controls log output to Android log.

Syntax

```
public boolean logsToAndroid ()
```

Returns

logging to Android log or not logging.

logToAndroid(final boolean) method

Setting to control log output to Android log.

Syntax

```
public void logToAndroid (final boolean dolt)
```

Parameters

- **dolt** – log or do not log.

p(final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#p(String,String,String)`

p(final String, final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **location** – The line-level location of the log source (full class name of the class).

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws
PersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **PersistenceException** – if data can not be loaded from the reader.

setHeaderData(final String, final String) method

Sets the log header fields.

Syntax

```
public void setHeaderData (
    final String osVersion,
    final String appName,
    final String appVersion,
    final String thirdParty,
    final String hwVersion,
    final String user,
    final String timezone,
    final String language,
    final String baseUrl
)
```

Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (Connectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (Connectivity sets it)
- **baseUrl** – the URL used in Connectivity (connectivity sets it)

Remarks

A header field is set only if it is not null. Also, it is set only once; subsequent calls will not overwrite the first write.

setLogLevel(final int) method

Set the log level.

Syntax

```
public void setLogLevel (final int level)
```

Parameters

- **level** – the log level

terminate() method

Clears collected log data.

Syntax

```
public void terminate ()
```

toString() method

Get log data.

Syntax

```
public synchronized String toString ()
```

Returns

log data as string

v(final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,String)`

v(final String, final String, final Throwable) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,Throwable,String)`

v(final String, final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

v(final String, final String, final Throwable, final String) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,Throwable,String)`

w(final String, final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final String msg,
```

```

    final Throwable tr
)

```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,Throwable,String)`

w(final String, final String) method

Sends a WARN log message.

Syntax

```

public void w (
    final String tag,
    final String msg
)

```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,String)`

w(final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```

public void w (
    final String tag,
    final Throwable tr,
    final String location
)

```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
PersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **PersistenceException** – if data can not be written into the writer

*e2eStep variable**Syntax*

```
public static int e2eStep
```

*passportTraceLevel variable**Syntax*

```
public static int passportTraceLevel
```

ILogger interface

Consists of APIs and constants used by logging framework.

Package

```
com.sap.mobile.lib.supportability
```

Syntax

```
public interface ILogger
```

Derived classes

- *Logger* on page 716

Members

All members of ILogger, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	PERFORMANCE	Log level PERFORMANCE.
public static final int	VERBOSE	Log level VERBOSE.

Modifier and Type	Variable	Description
public static final int	DEBUG	Log level DEBUG.
public static final int	INFO	Log level INFO.
public static final int	WARN	Log level WARN.
public static final int	ERROR	Log level ERROR.
public static final int	ASSERT	Log level ASSERT.
public static final int	FATAL	Log level FATAL.

Methods

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 742	Implementer should override this method!
public void	<i>d(final String, final String)</i> on page 742	Sends a DEBUG log message.
public void	<i>d(final String, final String, final String)</i> on page 743	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 743	Sends a DEBUG log message and logs the exception.
public void	<i>d(final String, final String, final Throwable, final String)</i> on page 744	Sends a DEBUG log message and logs the exception.
public void	<i>e(final String, final String)</i> on page 744	Sends an ERROR log message.
public void	<i>e(final String, final String, final String)</i> on page 744	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable)</i> on page 745	Sends an ERROR log message and logs the exception.
public void	<i>e(final String, final String, final Throwable, final String)</i> on page 745	Sends an ERROR log message and logs the exception.
public int	<i>getLogLevel()</i> on page 746	Returns the log level.
public void	<i>i(final String, final String)</i> on page 746	Sends an INFO log message.

Modifier and Type	Method	Description
public void	<i>i(final String, final String, final String)</i> on page 746	Sends an INFO log message.
public void	<i>i(final String, final String, final Throwable)</i> on page 747	Sends a INFO log message and logs the exception.
public void	<i>i(final String, final String, final Throwable, final String)</i> on page 747	Sends a INFO log message and logs the exception.
public void	<i>logFullLocation(boolean)</i> on page 748	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation()</i> on page 748	To get the setting which controls log output should contain full location (class and method name) or not.
public void	<i>p(final String, final String)</i> on page 748	Sends a PERFORMANCE log message.
public void	<i>p(final String, final String, final String)</i> on page 749	Sends a PERFORMANCE log message.
public void	<i>setHeaderData(final String, final String)</i> on page 749	Sets the log header fields.
public void	<i>setLogLevel(final int)</i> on page 750	Set the log level.
public void	<i>v(final String, final String)</i> on page 750	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final String)</i> on page 750	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable)</i> on page 751	Sends a VERBOSE log message and logs the exception.
public void	<i>v(final String, final String, final Throwable, final String)</i> on page 751	Sends a VERBOSE log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>w(final String, final Throwable)</i> on page 752	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final Throwable, final String)</i> on page 752	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable)</i> on page 752	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable, final String)</i> on page 753	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String)</i> on page 753	Sends a WARN log message.
public void	<i>w(final String, final String, final String)</i> on page 754	Sends a WARN log message.

canLog() method

Implementer should override this method!

Syntax

```
public boolean canLog ()
```

Returns

State of ability to log.

d(final String, final String) method

Sends a DEBUG log message.

Syntax

```
public void d (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,String)`

d(final String, final String, final String) method

Sends a DEBUG log message.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

d(final String, final String, final Throwable) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#d(String,String,Throwable,String)`

d(final String, final String, final Throwable, final String) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,String)`

e(final String, final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (  
    final String tag,  
    final String msg,
```

```
    final String location
  )
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String, final Throwable) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#e(String,String,Throwable,String)`

e(final String, final String, final Throwable, final String) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

getLogLevel() method

Returns the log level.

Syntax

```
public int getLogLevel ()
```

Returns

the log level.

i(final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,String)`

i(final String, final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

i(final String, final String, final Throwable) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#i(String,String,Throwable,String)`

i(final String, final String, final Throwable, final String) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

logFullLocation(boolean) method

Setting to control log full location (class-path and method name).

Syntax

```
public void logFullLocation (boolean logFullLocation)
```

Parameters

- **logFullLocation** – log i or do not log it.

logsFullLocation() method

To get the setting which controls log output should contain full location (class and method name) or not.

Syntax

```
public boolean logsFullLocation ()
```

Returns

logging with full location or not.

p(final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#p(String,String,String)`

p(final String, final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

setHeaderData(final String, final String) method

Sets the log header fields.

Syntax

```
public void setHeaderData (
    final String osVersion,
    final String appName,
    final String appVersion,
    final String thirdParty,
    final String hwVersion,
    final String user,
    final String timezone,
    final String language,
    final String baseUrl
)
```

Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (Connectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (Connectivity sets it)

- **baseUrl** – the URL used in Connectivity (connectivity sets it)

Remarks

A header field is set only if it is not null. Also, it is set only once; subsequent calls will not overwrite the first write.

setLogLevel(final int) method

Set the log level.

Syntax

```
public void setLogLevel (final int level)
```

Parameters

- **level** – the log level

v(final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,String)`

v(final String, final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

v(final String, final String, final Throwable) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#v(String,String,Throwable,String)`

v(final String, final String, final Throwable, final String) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,Throwable,String)`

w(final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final String msg,
```

```
    final Throwable tr
  )
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,Throwable,String)`

w(final String, final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `Logger#w(String,String,String)`

w(final String, final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

ASSERT variable

Log level ASSERT.

Syntax

```
public static final int ASSERT
```

DEBUG variable

Log level DEBUG.

Syntax

```
public static final int DEBUG
```

ERROR variable

Log level ERROR.

Syntax

```
public static final int ERROR
```

FATAL variable

Log level FATAL.

Syntax

```
public static final int FATAL
```

INFO variable

Log level INFO.

Syntax

```
public static final int INFO
```

PERFORMANCE variable

Log level PERFORMANCE.

Syntax

```
public static final int PERFORMANCE
```

VERBOSE variable

Log level VERBOSE.

Syntax

```
public static final int VERBOSE
```

WARN variable

Log level WARN.

Syntax

```
public static final int WARN
```

*smp package**rest package**AppSettings class*

Consists of the methods used to retrieve/update Application settings from the SAP Mobile Platform.

Package

```
com.sap.smp.rest
```

Syntax

```
public class AppSettings implements ISDMNetListener,
INetListener
```

Implemented interfaces

- *ISDMNetListener* on page 837
- *INetListener* on page 661

Members

All members of AppSettings, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>AppSettings(ClientConnection)</i> on page 757	Initialize the AppSettings.

Methods

Modifier and Type	Method	Description
public String	<i>getApplicationEndPoint()</i> on page 757	Return the application end-point value.
public Object	<i>getConfigProperty(String)</i> on page 757	Return the value of the property for the provided key.
public HashMap< String, String >	<i>getConfigPropertyMap()</i> on page 758	Return a hash map of key and value pairs of properties.
public byte[]	<i>getCustomizationResourceBundle(String)</i> on page 758	Retrieve the customization resource bundle for the given resource name.
public com.sybase.persistence.DataVault.DVPasswordPolicy	<i>getPasswordPolicy()</i> on page 759	Return the DVPasswordPolicy (as defined in com.sybase.persistence.DataVault) which stores the information of the Password Policy.
public String	<i>getPushEndPoint()</i> on page 759	Return the Push end-point value.
public void	<i>setConfigProperty(HashMap<String, String >)</i> on page 759	Set the value(s) of properties sent as hash map of key and value pairs.

AppSettings(ClientConnection) constructor

Initialize the AppSettings.

Syntax

```
public AppSettings (ClientConnection clientCon)
```

Parameters

- **clientCon** – ClientConnection

```
AppSettings appSettings = new AppSettings(clientConnection);
```

getApplicationEndPoint() method

Return the application end-point value.

Syntax

```
public String getApplicationEndPoint () throws SMPException
```

Exceptions

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    String appEndPoint = appSettings.getApplicationEndPoint();
} catch (SMPException e) {
    e.printStackTrace();
}
```

getConfigProperty(String) method

Return the value of the property for the provided key.

Syntax

```
public Object getConfigProperty (String key) throws SMPException
```

Parameters

- **key** – Name of the property.

Exceptions

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    String property = (String) appSettings
        .getConfigProperty("d:AndroidGcmRegistrationId");
} catch (SMPException e) {
```

```
e.printStackTrace();  
}
```

getConfigPropertyMap() method

Return a hash map of key and value pairs of properties.

Syntax

```
public HashMap< String, String > getConfigPropertyMap () throws  
SMPEException
```

Exceptions

- **SMPEException class** –

```
try {  
    AppSettings appSettings = new AppSettings(clientConnection);  
    HashMap<String, String> property =  
appSettings.getConfigPropertyMap();  
} catch (SMPEException e) {  
    e.printStackTrace();  
}
```

getCustomizationResourceBundle(String) method

Retrieve the customization resource bundle for the given resource name.

Syntax

```
public byte[] getCustomizationResourceBundle (String  
CustomResource) throws SMPEException
```

Parameters

- **CustomResource** – Name of the customization resource bundle.

Exceptions

- **SMPEException class** –

```
try {  
    AppSettings appSettings = new AppSettings(clientConnection);  
    byte[] cust =  
appSettings.getCustomizationResourceBundle("MC1:1.1");  
} catch (SMPEException e) {  
    e.printStackTrace();  
}
```

getPasswordPolicy() method

Return the DVPasswordPolicy (as defined in com.sybase.persistence.DataVault) which stores the information of the Password Policy.

Syntax

```
public com.sybase.persistence.DataVault.DVPasswordPolicy
getPasswordPolicy () throws SMPException
```

Exceptions

- **SMPException class** –

Remarks

The application uses it to enforce the composition of the Password.

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    DVPasswordPolicy passwordPolicy =
appSettings.getPasswordPolicy();
} catch (SMPException e) {
    e.printStackTrace();
}
```

getPushEndPoint() method

Return the Push end-point value.

Syntax

```
public String getPushEndPoint () throws SMPException
```

Exceptions

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    String pushEndPoint = appSettings.getPushEndPoint();
} catch (SMPException e) {
    e.printStackTrace();
}
```

setConfigProperty(HashMap< String, String >) method

Set the value(s) of properties sent as hash map of key and value pairs.

Syntax

```
public void setConfigProperty (HashMap< String, String > list)
throws SMPException
```

Exceptions

- **SMPException class** –

```
try {
    AppSettings appSettings = new AppSettings(clientConnection);
    HashMap<String, String> property = new HashMap<String, String>();
    property.put("d:AndroidGcmRegistrationId", "1234565");
    appSettings.setConfigurationProperty(property);
} catch (SMPException e) {
    e.printStackTrace();
}
```

ClientConnection class

Consists of methods to establish connection with SAP Mobile Platform.

Package

```
com.sap.smp.rest
```

Syntax

```
public class ClientConnection implements ISDMNetListener,
INetListener
```

Implemented interfaces

- *ISDMNetListener* on page 837
- *INetListener* on page 661

Members

All members of ClientConnection, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ClientConnection(Context, String, String, String, RequestManager)</i> on page 762	Initialize the client connection with application context, application name, domain, security configuration and request manager.
public	<i>ClientConnection(Context, String, String, String, SDMRequestManager)</i> on page 763	Initialize the client connection with application context, application name, domain, security configuration and request manager.

Methods

Modifier and Type	Method	Description
public String	<i>getApplicationID()</i> on page 764	Return Application ID.
public RequestManager	<i>getDefaultRequestManager()</i> on page 764	
public String	<i>getDomain()</i> on page 764	Return Domain.
public SDMRequestManager	<i>getRequestManager()</i> on page 764	Return Request Manager object.
public String	<i>getSecurityConfig()</i> on page 764	Return Security Configuration.
public String	<i>getServerHost()</i> on page 765	Return Server host.
public void	<i>onError(IRequest, IResponse, IRequestStateElement)</i> on page 765	Request library uses this method in case of error/failure scenario during a request operation.
public void	<i>onSuccess(IRequest, IResponse)</i> on page 765	Request library uses this method in case of successful request.
public void	<i>setApplicationConnectionID(String)</i> on page 766	Set the application connection ID.
public void	<i>setConnectionProfile(String)</i> on page 766	Set the URL of the server.
public void	<i>setConnectionProfile(boolean, String, String, String, String)</i> on page 767	Set the value of host and port for the connection.
public void	<i>setDefaultRequestManager(RequestManager)</i> on page 767	
public void	<i>setTraceLevel(int)</i> on page 767	Set the end to end trace level.
public void	<i>startTrace()</i> on page 768	Start the end to end tracing.
public void	<i>stopTrace()</i> on page 768	Stop the end to end tracing.
public void	<i>uploadTrace()</i> on page 768	Upload the BTX file to solution manager for end to end tracing.

ClientConnection(Context, String, String, String, RequestManager) constructor

Initialize the client connection with application context, application name, domain, security configuration and request manager.

Syntax

```
public ClientConnection (  
    Context context,  
    String appID,  
    String Domain,  
    String securityConfig,  
    RequestManager requestManager  
)
```

Parameters

- **context** – Application context.
- **appID** – Application ID.
- **Domain** – Domain name.
- **securityConfig** – Security configuration of the application.
- **requestManager** – Instance of RequestManager.

Remarks

Note: Setting username and password in requestManager as part of param is mandatory.

```
        public static Logger logger;  
        public static Preferences pref;  
        public static ConnectivityParameters param;  
        public static RequestManager reqMan;  
        logger = new Logger();  
        pref = new Preferences(getApplicationContext,  
logger);  
pref.setBooleanPreference(IPreferences.PERSISTENCE_SECUREMODE,  
false);  
pref.setIntPreference(IPreferences.CONNECTIVITY_HTTPS_PORT, 443);  
pref.setIntPreference(IPreferences.CONNECTIVITY_CONNTIMEOUT,  
70000);  
pref.setIntPreference(IPreferences.CONNECTIVITY_SCONNTIMEOUT,  
70000);  
        param = new ConnectivityParameters();  
        param.setUserName(<username>);  
        param.setUserPassword(<password>);  
        reqMan = new RequestManager(logger, pref, param,  
1);  
  
        ClientConnection clientConnection = new
```

```
ClientConnection(getApplicationContext(), <Application id>="",
<Domain>, <SecurityConfig>, <RequestManager object>="");
```

ClientConnection(Context, String, String, String, SDMRequestManager) constructor

Initialize the client connection with application context, application name, domain, security configuration and request manager.

Syntax

```
public ClientConnection (
    Context context,
    String appID,
    String Domain,
    String securityConfig,
    SDMRequestManager requestManager
)
```

Parameters

- **context** – Application context.
- **appID** – Application ID.
- **Domain** – Domain name.
- **securityConfig** – Security configuration of the application.
- **requestManager** – Instance of SDMRequestManager.

Remarks

Note: Setting username and password in requestManager as part of param is mandatory.

```

        public static SDMLogger logger;
        public static SDMPreferences pref;
        public static SDMConnectivityParameters param;
        public static SDMRequestManager reqMan;
        logger = new SDMLogger();
        pref = new SDMPreferences(getApplicationContext,
logger);

pref.setBooleanPreference (ISDMPreferences.SDM_PERSISTENCE_SECUREMOD
E, false);

pref.setIntPreference (ISDMPreferences.SDM_CONNECTIVITY_HTTPS_PORT,
443);

pref.setIntPreference (ISDMPreferences.SDM_CONNECTIVITY_CONNTIMEOUT,
70000);

pref.setIntPreference (ISDMPreferences.SDM_CONNECTIVITY_SCONNTIMEOUT
, 70000);

        param = new
SDMConnectivityParameters();
        param.setUserName (<username>);
        param.setUserPassword (<password>);
        reqMan = new SDMRequestManager (logger, pref,
```

```
param, 1);  
  
        ClientConnection clientConnection = new  
ClientConnection(getApplicationContext(), <Application id>="",  
<Domain>, <SecurityConfig>, <RequestManager object>="");
```

getApplicationID() method

Return Application ID.

Syntax

```
public String getApplicationID ()  
  
clientConnection.getApplicationID();
```

getDefaultRequestManager() method

Syntax

```
public RequestManager getDefaultRequestManager ()
```

getDomain() method

Return Domain.

Syntax

```
public String getDomain ()  
  
clientConnection.getDomain();
```

getRequestManager() method

Return Request Manager object.

Syntax

```
public SDMRequestManager getRequestManager ()  
  
clientConnection.getRequestManager();
```

getSecurityConfig() method

Return Security Configuration.

Syntax

```
public String getSecurityConfig ()  
  
clientConnection.getSecurityConfig();
```

getServerHost() method

Return Server host.

Syntax

```
public String getServerHost ()
clientConnection.getServerHost ();
```

onError(IRequest, IResponse, IRequestStateElement) method

Request library uses this method in case of error/failure scenario during a request operation.

Syntax

```
public void onError (
    IRequest aRequest,
    IResponse aResponse,
    IRequestStateElement aRequestStateElement
)
```

Parameters

- **aRequest** – the request object.
- **aResponse** – the response object.
- **aRequestStateElement** – the RequestStateElement object.

Returns

None

Remarks

The listener registered for the request receives the request object, the HttpResponseMessage object which contains the details about the server response, and a RequestStateElement object which provides more details about the occurred error. In case, the error occurs before sending any request to the server, the HttpResponseMessage object will be null.

```
public class Activity implements INetListener { ... public void onError(IRequest arg0,
IResponse arg1, IRequestStateElement arg2) {
arg1.getStatusLine().toString()
arg2.getErrorCode(); } ...}
```

onSuccess(IRequest, IResponse) method

Request library uses this method in case of successful request.

Syntax

```
public void onSuccess (
    IRequest aRequest,
```

```
    IResponse aResponse  
)
```

Parameters

- **aRequest** – the request object.
- **aResponse** – the response object.

Returns

None

Remarks

The listener receives the request in form of parameter and an `HttpResponse` object containing all the details about the server response.

```
public class Activity implements INetListener { ... public void onSuccess(IRequest arg0,  
IResponse arg1) {
```

```
    HttpEntity resp = arg1.getEntity();
```

```
    String response="";
```

```
    response = EntityUtils.toString(resp); //process the response }...}
```

setApplicationConnectionID(String) method

Set the application connection ID.

Syntax

```
public void setApplicationConnectionID (String appConID)
```

Parameters

- **appConID** – Application connection ID.

Remarks

If it is set before invoking `userManager.register()` interface, the user is registered using this application connection ID.

```
clientConnection.setApplicationConnectionID("myAppConID");
```

setConnectionProfile(String) method

Set the URL of the server.

Syntax

```
public void setConnectionProfile (String url)
```

Parameters

- **url** – URL of the server.

```
clientConnection.setConnectionProfile("http://
<Host>:<port>");
```

setConnectionProfile(boolean, String, String, String, String) method

Set the value of host and port for the connection.

Syntax

```
public void setConnectionProfile (
    boolean isHttpRequest,
    String host,
    String port,
    String relayserverURLTemplate,
    String farmID
)
```

Parameters

- **isHttpRequest** –
 - whether HTTP or HTTPS
- **host** –
 - host of the server
- **port** –
 - port of the server
- **relayserverURLTemplate** – URL Template of Relay server
- **farmID** – Farm ID of the relay server

```
clientConnection.setConnectionProfile(true,<Host>,<port>, <Relay
server URL template>, <Relay server Farm Id>);
```

setDefaultRequestManager(RequestManager) method

Syntax

```
public void setDefaultRequestManager (RequestManager
defaultRequestManager)
```

setTraceLevel(int) method

Set the end to end trace level.

Syntax

```
public void setTraceLevel (int level)
```

Parameters

- **level** – Trace level defined in PropertyID class. It includes: TrcLvl_HIGH, TrcLvl_MEDIUM, TrcLvl_LOW and TrcLvl_NONE.

```
clientConnection.setTraceLevel (PropertyID.TrcLvl_HIGH);
```

startTrace() method

Start the end to end tracing.

Syntax

```
public void startTrace ()
```

```
clientConnection.startTrace();
```

stopTrace() method

Stop the end to end tracing.

Syntax

```
public void stopTrace () throws SMPException
```

SMPException class

```
clientConnection.stopTrace();
```

uploadTrace() method

Upload the BTX file to solution manager for end to end tracing.

Syntax

```
public void uploadTrace () throws SMPException
```

Exceptions

- **SMPException class** –

```
clientConnection.uploadTrace();
```

PropertyID class

Consists of Core services constants.

Package

```
com.sap.smp.rest
```

Syntax

```
public class PropertyID
```

Members

All members of PropertyID, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	TrcLvl_HIGH	Constant to indicate High Trace level for End to End Tracing.
public static final int	TrcLvl_MEDIUM	Constant to indicate Medium Trace level for End to End Tracing.
public static final int	TrcLvl_LOW	Constant to indicate Low Trace level for End to End Tracing.
public static final int	TrcLvl_NONE	Constant to indicate None Trace level for End to End Tracing.

TrcLvl_HIGH variable

Constant to indicate High Trace level for End to End Tracing.

Syntax

```
public static final int TrcLvl_HIGH
```

TrcLvl_LOW variable

Constant to indicate Low Trace level for End to End Tracing.

Syntax

```
public static final int TrcLvl_LOW
```

TrcLvl_MEDIUM variable

Constant to indicate Medium Trace level for End to End Tracing.

Syntax

```
public static final int TrcLvl_MEDIUM
```

TrcLvl_NONE variable

Constant to indicate None Trace level for End to End Tracing.

Syntax

```
public static final int TrcLvl_NONE
```

SMPEXception class

This Class represents the exception thrown by the SMP REST library.

Package

```
com.sap.smp.rest
```

Syntax

```
public class SMPEXception
```

Members

All members of SMPEXception, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	ANY_INPUT_FIELD_NULL	Any of the input fields passed is null.
public static final int	APPLICATION_USER_ALREADY_REGISTERED	Attempt to register an application user which is already registered.
public static final int	APPLICATION_USER_NOT_REGISTERED	Attempt to delete the user which has not been registered.
public static final int	REGISTRATION_FAILED_UNKNOWN_ERROR	User registration timed out.
public static final int	REGISTRATION_LISTENER_NULL	Asynchronous user registration listener not registered with UserManager.
public static final int	SUP_INTERNAL_PARSING_ERROR	SUP Internal Parsing Error.
public static final int	EMPTY_RESPONSE_FROM_SERVER	Empty response string received from server.
public static final int	SINGLETON_INITIALIZATION_FAILED	singleton Initialization failed
public static final int	UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS	Update Settings consists of one or more read only fields.
public static final int	APPLICATION_ID_NULL	Application is not initialized.

Modifier and Type	Variable	Description
public static final int	JSON_PARSING_FAILED	Internal error, JSON parsing has failed.
public static final int	INVALID_MODULE_ID	Invalid module handle ID.
public static final int	CAPTCHA_LISTENER_NULL	Captcha listener is null.
public static final int	CLASS_INITIALIZATION_FAILED	Class initialization failed.
public static final int	E2E_NOT_STARTED	E2E Not started.
public static final int	BTX_UPLOAD_ERROR	E2E BTX upload error.
public static final int	HTTP_ERROR	HTTP error.
public static final int	PARSE_ERROR	Parse error.
public static final int	NETWORK_ERROR	Network error: Obtained when the URL is unreachable. Check AndroidManifest.xml if it has proper permissions.
public static final int	AUTHENTICATION_ERROR	Error while authenticating user.

Constructors

Modifier and Type	Constructor	Description
public	<i>SMPEException(int)</i> on page 772	Constructs a SMPEException with specified error code.
public	<i>SMPEException(int, String)</i> on page 772	Constructs a SMPEException with specified error code and error message.
public	<i>SMPEException(String)</i> on page 772	Constructs a SMPEException with specified error message.

Methods

Modifier and Type	Method	Description
public int	<i>getErrorCode()</i> on page 772	Returns the error code of this SMPEException.

Modifier and Type	Method	Description
public String	<i>toString()</i> on page 773	Returns the complete error description of this SMPEException.

SMPEException(int) constructor

Constructs a SMPEException with specified error code.

Syntax

```
public SMPEException (int errorCode)
```

Parameters

- **errorCode** –

SMPEException(int, String) constructor

Constructs a SMPEException with specified error code and error message.

Syntax

```
public SMPEException (
    int errorCode,
    String message
)
```

Parameters

- **errorCode** –
- **message** – - error message

SMPEException(String) constructor

Constructs a SMPEException with specified error message.

Syntax

```
public SMPEException (String message)
```

Parameters

- **message** – - error message

getErrorCode() method

Returns the error code of this SMPEException.

Syntax

```
public int getErrorCode ()
```

toString() method

Returns the complete error description of this SMPEException.

Syntax

```
public String toString ()
```

ANY_INPUT_FIELD_NULL variable

Any of the input fields passed is null.

Syntax

```
public static final int ANY_INPUT_FIELD_NULL
```

APPLICATION_ID_NULL variable

Application is not initialized.

Syntax

```
public static final int APPLICATION_ID_NULL
```

APPLICATION_USER_ALREADY_REGISTERED variable

Attempt to register an application user which is already registered.

Syntax

```
public static final int APPLICATION_USER_ALREADY_REGISTERED
```

APPLICATION_USER_NOT_REGISTERED variable

Attempt to delete the user which has not been registered.

Syntax

```
public static final int APPLICATION_USER_NOT_REGISTERED
```

AUTHENTICATION_ERROR variable

Error while authenticating user.

Syntax

```
public static final int AUTHENTICATION_ERROR
```

BTX_UPLOAD_ERROR variable

E2E BTX upload error.

Syntax

```
public static final int BTX_UPLOAD_ERROR
```

CAPTCHA_LISTENER_NULL variable

Captcha listener is null.

Syntax

```
public static final int CAPTCHA_LISTENER_NULL
```

CLASS_INITIALIZATION_FAILED variable

Class initialization failed.

Syntax

```
public static final int CLASS_INITIALIZATION_FAILED
```

E2E_NOT_STARTED variable

E2E Not started.

Syntax

```
public static final int E2E_NOT_STARTED
```

EMPTY_RESPONSE_FROM_SERVER variable

Empty response string received from server.

Syntax

```
public static final int EMPTY_RESPONSE_FROM_SERVER
```

HTTP_ERROR variable

HTTP error.

Syntax

```
public static final int HTTP_ERROR
```

INVALID_MODULE_ID variable

Invalid module handle ID.

Syntax

```
public static final int INVALID_MODULE_ID
```

JSON_PARSING_FAILED variable

Internal error, JSON parsing has failed.

Syntax

```
public static final int JSON_PARSING_FAILED
```

NETWORK_ERROR variable

Network error: Obtained when the URL is unreachable.

Syntax

```
public static final int NETWORK_ERROR
```

Remarks

Check AndroidManifest.xml if it has proper permissions.

PARSE_ERROR variable

Parse error.

Syntax

```
public static final int PARSE_ERROR
```

REGISTRATION_FAILED_UNKNOWN_ERROR variable

User registration timed out.

Syntax

```
public static final int REGISTRATION_FAILED_UNKNOWN_ERROR
```

REGISTRATION_LISTENER_NULL variable

Asynchronous user registration listener not registered with UserManager.

Syntax

```
public static final int REGISTRATION_LISTENER_NULL
```

SINGLETON_INITIALIZATION_FAILED variable

singleton Initialization failed

Syntax

```
public static final int SINGLETON_INITIALIZATION_FAILED
```

SUP_INTERNAL_PARSING_ERROR variable

SUP Internal Parsing Error.

Syntax

```
public static final int SUP_INTERNAL_PARSING_ERROR
```

UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS variable

Update Settings consists of one or more read only fields.

Syntax

```
public static final int
UPDATE_SETTINGS_CONTAINS_READONLY_FIELDS
```

UserManager class

Consists of the methods to Register the user with the SAP Mobile Platform.

Package

```
com.sap.smp.rest
```

Syntax

```
public class UserManager implements ISDMNetListener,
INetListener
```

Implemented interfaces

- *ISDMNetListener* on page 837
- *INetListener* on page 661

Members

All members of UserManager, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>UserManager(ClientConnection)</i> on page 777	Initialize the UserManager.

Methods

Modifier and Type	Method	Description
public void	<i>deleteUser()</i> on page 777	Delete the current user from the SMP server.
public String	<i>getApplicationConnectionId()</i> on page 778	Return the application connection ID obtained from the server after successful registration.

Modifier and Type	Method	Description
public boolean	<i>isUserRegistered()</i> on page 778	Deprecated. This API has been deprecated as application developer can determine with the Application Connection Id to know whether user is registered or not.
public boolean	<i>registerUser(boolean)</i> on page 778	Register the user with SAP Mobile Server.
public boolean	<i>registerUser(String, boolean)</i> on page 779	Register the user with the SAP Mobile Server.
public void	<i>setCaptchaChallengeListener(ISMPCaptchaChallengeListener)</i> on page 780	Set the CAPTCHA challenge listener in case of CAPTCHA enabled by the SAP Mobile Server.
public void	<i>setUserRegistrationListener(ISMPUserRegistrationListener)</i> on page 780	Set the registration listener for asynchronous registration.

UserManager(ClientConnection) constructor

Initialize the UserManager.

Syntax

```
public UserManager (ClientConnection clientCon)
```

Parameters

- **clientCon** – ClientConnection

```
UserManager userManager = new UserManager (clientConnection)
```

deleteUser() method

Delete the current user from the SMP server.

Syntax

```
public void deleteUser () throws SMPException
```

Exceptions

- **SMPException class** –

```
UserManager userManager = new UserManager (clientConnection);
userManager.deleteUser ();
```

getApplicationConnectionId() method

Return the application connection ID obtained from the server after successful registration.

Syntax

```
public String getApplicationConnectionId () throws SMPException  
  
UserManager userManager = new UserManager(clientConnection);  
userManager.getApplicationConnectionId();
```

isUserRegistered() method [deprecated]

Deprecated. This API has been deprecated as application developer can determine with the Application Connection Id to know whether user is registered or not.

Syntax

```
public boolean isUserRegistered ()
```

Remarks

Deprecated This API has been deprecated as application developer can determine with the Application Connection Id to know whether user is registered or not.

registerUser(boolean) method

Register the user with SAP Mobile Server.

Syntax

```
public boolean registerUser (boolean isSynchronous) throws  
SMPException
```

Parameters

- **isSynchronous** – Specifies whether it is synchronous or asynchronous registration.

Exceptions

- **SMPException class** –

Remarks

It requires to send username and password as a part of request manager during client connection initialization. If asynchronous, the user has to implement and register IODPUserRegistrationListener to retrieve a callback.

```
Try{  
UserManager userManager = new UserManager(clientConnection);  
userManager.registerUser(true); //for synchronous  
registration  
}
```

```

Catch(SMPEException e){
}

Try{
  UserManager userManager = new UserManager(clientConnection);
  userManager.setUserRegistrationListener(this);
  userManager.registerUser(false);           //for Asynchronous
  registration
}
Catch(SMPEException e){
}

    public void onAsyncRegistrationResult(State
registrationState,ClientConnection conn, int errCode, String errMsg)
{
    // TODO Auto-generated method stub
    if(registrationState == State.SUCCESS)
    {
        Log.i("RegistrationState Success",conn.getServerHost()+
+conn.getApplicationID()+conn.getDomain()+
+conn.getRequestManager().toString());

    }
    if(registrationState == State.FAILURE)
    {
        Log.i("Registration State Failure",errCode+errMsg
+conn.getServerHost());
    }
}

```

registerUser(String, boolean) method

Register the user with the SAP Mobile Server.

Syntax

```

public boolean registerUser (
    String captcha,
    boolean isSynchronous
) throws SMPEException

```

Parameters

- **isSynchronous** – Specifies whether it is synchronous or asynchronous registration.
- **captcha** – The CAPTCHA text obtained in the first registration call.

Exceptions

- **SMPEException class** –

Remarks

It requires to send username and password as a part of request manager during client connection initialization. CAPTCHA text should be passed to the user during the first registration by the CAPTCHA challenge listener callback. If asynchronous, the user has to implement and register IODPUserRegistrationListener to retrieve a callback.

```
Try{
  UserManager userManager = new UserManager(clientConnection);
  UserManager.registerUser(<captcha text>,true);
}
Catch(SMPEXception e){
}
```

setCaptchaChallengeListener(ISMPCaptchaChallengeListener) method

Set the CAPTCHA challenge listener in case of CAPTCHA enabled by the SAP Mobile Server.

Syntax

```
public void setCaptchaChallengeListener
(ISMPCaptchaChallengeListener captchaListener)
```

Parameters

- **captchaListener** – SMP CAPTCHA challenge listener to be registered to retrieve a callback.

Remarks

User has to implement the IODPCaptchaChallengeListener and set it using the above listener to get the captcha callback. The callback method validateCaptcha has to return the CAPTCHA text for registering the user. Alternately, it can also return null in which case, the captcha text has to be stored by the application and a subsequent registerUser(captchaText, isSynchronous) has to be explicitly called.

```
UserManager userManager = new UserManager(clientConnection);
userManager.setCaptchaChallengeListener (<ISMPCaptchaChallengeListen
er Object>);
```

setUserRegistrationListener(ISMPUserRegistrationListener) method

Set the registration listener for asynchronous registration.

Syntax

```
public void setUserRegistrationListener
(ISMPUserRegistrationListener registrationListener)
```

Parameters

- **registrationListener** – SMP user registration listener.

Remarks

User has to implement the ISMPUserRegistrationListener and set it using the above listener to get the registration callback.

```
UserManager userManager = new UserManager(clientConnection);
userManager.setUserRegistrationListener(<ISMPUserRegistrationListener Object>);
```

SMPCClientListeners interface

Consists of Interfaces used for Asynchronous user registrations with SAP Mobile Platform.

Package

```
com.sap.smp.rest
```

Syntax

```
public interface SMPCClientListeners
```

Members

All members of SMPCClientListeners, including inherited members. **Nested interfaces**

Modifier and Type	Interface	Description
publicinterface	<i>ISMPCaptchaChallengeListener</i> on page 781	Interface to get the Captcha Challenge.
publicinterface	<i>ISMPUserRegistrationListener</i> on page 782	Interface to get the result of Asynchronous Registration call.

SMPCClientListeners.ISMPCaptchaChallengeListener interface

Interface to get the Captcha Challenge.

Package

```
com.sap.smp.rest.SMPCClientListeners
```

Syntax

```
public interface ISMPCaptchaChallengeListener
```

Members

All members of ISMPCaptchaChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>validateCaptcha(String)</i> on page 782	Call back method to return the CAPTCHA text for registering the user.

***validateCaptcha(String)* method**

Call back method to return the CAPTCHA text for registering the user.

Syntax

```
public String validateCaptcha (String image)
```

Parameters

- **image** – Base64 encoded Captcha image.

```
public String validateCaptcha(String image){
    //Show the image to the user.
    //Get the Captcha text
    return <captchaText>;
}
```

***SMPClientListeners.ISMPUserRegistrationListener* interface**

Interface to get the result of Asynchronous Registration call.

Package

```
com.sap.smp.rest.SMPClientListeners
```

Syntax

```
public interface ISMPUserRegistrationListener
```

Members

All members of ISMPUserRegistrationListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onAsyncRegistrationResult(State, ClientConnection, int, String)</i> on page 783	Call back method upon Asynchronous Registration call.

***SMPClientListeners.ISMPUserRegistrationListener.State* enum**

Enum to represent the status of Asynchronous Registration call.

Members

All members of State, including inherited members. **Variables**

Modifier and Type	Variable	Description
public	SUCCESS	
public	FAILURE	

```
if (ISMPUserRegistrationListener.State.SUCCESS == registrationState) {
    Log.i("SMP", "RegistrationState: Success");
}
```

FAILURE variable

Syntax

```
public FAILURE
```

SUCCESS variable

Syntax

```
public SUCCESS
```

onAsyncRegistrationResult(State, ClientConnection, int, String) method

Call back method upon Asynchronous Registration call.

Syntax

```
public void onAsyncRegistrationResult (
    State registrationState,
    ClientConnection clientConnection,
    int errorCode,
    String errorMsg
)
```

Parameters

- **registrationState** – represents the status of the Asynchronous Registration call.
- **clientConnection** – ClientConnection object to uniquely identify the Asynchronous Registration call.
- **errorCode** – Error Code in case of registrationState being 'FAILURE'.
- **errorMsg** – Error Message in case of registrationState being 'FAILURE'.

```
        Try{
            UserManager userManager = new
UserManager(clientConnection);
            userManager.setUserRegistrationListener(this);
            userManager.registerUser(false); //for
Asynchronous registration
        }
        Catch (SMPEXception e) {
        }
```

```
        public void onAsyncRegistrationResult(State
registrationState,ClientConnection conn, int errCode, String errMsg)
{
    TODO Auto-generated method stub
        if(registrationState == State.SUCCESS)
        {
            Log.i("Registration State
Success",conn.getServerHost()+conn.getApplicationID()
+conn.getDomain()+conn.getRequestManager().toString());

        }
        if(registrationState == State.FAILURE)
        {
            Log.i("Registration State Failure",errCode+errMsg
+conn.getServerHost());
        }
    }
}
```

Deprecated API List

Starting with SAP Mobile Platform 3.0, the following protocols, classes, and methods are officially deprecated. SAP recommends you update the APIs to the newly refactored APIs listed in the section SAP Mobile Platform SDK > Developer > Migration > Migrating Native OData Applications. The deprecated SDM APIs are supported for backward compatibility in SAP Mobile Platform 3.0.

Deprecated Interfaces

- *ClientCertListener* on page 803

AbstractConnectionHandler class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.AbstractConnectionHandler`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public abstract class AbstractConnectionHandler implements  
ISDMConnectionHandler
```

Implemented interfaces

- *ISDMConnectionHandler* on page 809

Members

All members of `AbstractConnectionHandler`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static final int	MAX_TIMEOUT_COUNT	
protected static final String	TAG	
protected ISDMRequest	mRequest	
protected boolean	mCleanupRequestsOnError	
protected boolean	mError	
protected boolean	mUpdateListener	
protected ISDMConnectivity-Parameters	params	
protected ISDMLogger	mLogger	

Modifier and Type	Variable	Description
protected ISDMPreferences	mPreferences	
protected int	codeArray	
protected boolean	mStop	
protected ISDMRequestManager	mRequestManager	
protected TrustManager[]	mTrustManagers	

Constructors

Modifier and Type	Constructor	Description
public	<i>AbstractConnectionHandler</i> (<i>final ISDMRequestManager</i> , <i>final ISDMLogger</i> , <i>final ISDMPreferences</i>) on page 789	The default constructor.

Methods

Modifier and Type	Method	Description
protected String	<i>addBackendLanguageToUrl</i> (<i>String</i>) on page 790	Adds backend language URL parameter to the parameter.
protected String	<i>getBasicAuthHeader</i> () on page 790	Calculates the http basic authentication header value.
protected String	<i>getHost</i> (<i>String</i>) on page 790	Extracts the host part from URL string.
protected static String	<i>getIMEI</i> () on page 791	
public static String	<i>getRequestTypeById</i> (<i>int</i>) on page 791	
public boolean	<i>isSuccessful</i> () on page 791	Do we have error?
public abstract int	<i>makeHttpRequest</i> () on page 791	Make the request.
public void	<i>processRequestsFromQueue</i> () on page 791	Pick a request/bundle from the queue and process it/them.
protected String	<i>processUrl</i> (<i>String</i>) on page 791	

Modifier and Type	Method	Description
public void	<i>setCleanupRequestsOnError(boolea</i> n) on page 792	Sets whether the thread should clean up the request queue in case of errors.
public void	<i>terminate()</i> on page 792	Close the thread.

Inherited members from ISDMConnectionHandler

Modifier and Type	Member	Description
public static final int	<i>AUTHENTICATION_ERROR</i> on page 811	
public static final int	<i>BAD_COVERAGE</i> on page 811	
public static final String	<i>CRLF</i> on page 811	
public static final int	<i>ERROR</i> on page 811	
public static final int	<i>FAILED_LOGIN</i> on page 811	
public static final int	<i>FAILED_LOGOUT</i> on page 811	
public static final int	<i>FAILURE</i> on page 812	
public static final int	<i>LOG</i> on page 812	
public static final int	<i>NO_ERROR</i> on page 812	
public static final int	<i>RETRY</i> on page 812	
public static final int	<i>SUCCESS</i> on page 812	
public static final int	<i>TIMEOUT</i> on page 812	

AbstractConnectionHandler(final *ISDMRequestManager*, final *ISDMLogger*, final *ISDMPreferences*) constructor

The default constructor.

Syntax

```
public AbstractConnectionHandler (
    final ISDMRequestManager requestManager,
    final ISDMLogger logger,
    final ISDMPreferences preferences
)
```

Parameters

- **requestManager** – the SDMRequestManager instance
- **logger** – the ISDMLogger implementation
- **preferences** – the ISDMPreferences implementation

addBackendLanguageToUrl(String) method

Adds backend language URL parameter to the parameter.

Syntax

```
protected String addBackendLanguageToUrl (String requestUrl)
```

Returns

String the URL containing the backend language URL parameter

getBasicAuthHeader() method

Calculates the http basic authentication header value.

Syntax

```
protected String getBasicAuthHeader () throws IOException
```

Returns

String basic authentication header

Exceptions

- **IOException** – Base64OutputStream.encodeAsString can throw IOException. If this IOException is thrown, then the client must stop sending the request

Remarks

In the SAP Data protocol, basic authentication protocol is used for authentication

getHost(String) method

Extracts the host part from URL string.

Syntax

```
protected String getHost (String str)
```

Parameters

- **str** – the URL string

Returns

the possible host part

*getIMEI() method**Syntax*

```
protected static String getIMEI ()
```

*getRequestTypeById(int) method**Syntax*

```
public static String getRequestTypeById (int type)
```

isSuccessful() method

Do we have error?

Syntax

```
public boolean isSuccessful ()
```

Returns

true if we have

makeHttpRequest() method

Make the request.

Syntax

```
public abstract int makeHttpRequest ()
```

Returns

internal status code

processRequestsFromQueue() method

Pick a request/bundle from the queue and process it/them.

Syntax

```
public void processRequestsFromQueue ()
```

*processUrl(String) method**Syntax*

```
protected String processUrl (String requestUrl)
```

setCleanupRequestsOnError(boolean) method

Sets whether the thread should clean up the request queue in case of errors.

Syntax

```
public void setCleanupRequestsOnError (boolean value)
```

Parameters

- **value** – the setting

terminate() method

Close the thread.

Syntax

```
public void terminate ()
```

Remarks

Invoked when the application exits.

codeArray variable

Syntax

```
protected int codeArray
```

MAX_TIMEOUT_COUNT variable

Syntax

```
protected static final int MAX_TIMEOUT_COUNT
```

mCleanupRequestsOnError variable

Syntax

```
protected boolean mCleanupRequestsOnError
```

mError variable

Syntax

```
protected boolean mError
```

mLogger variable

Syntax

```
protected ISDMLogger mLogger
```

*mPreferences variable**Syntax*

```
protected ISDMPreferences mPreferences
```

*mRequest variable**Syntax*

```
protected ISDMRequest mRequest
```

*mRequestManager variable**Syntax*

```
protected ISDMRequestManager mRequestManager
```

*mStop variable**Syntax*

```
protected boolean mStop
```

*mTrustManagers variable**Syntax*

```
protected TrustManager[] mTrustManagers
```

*mUpdateListener variable**Syntax*

```
protected boolean mUpdateListener
```

*params variable**Syntax*

```
protected ISDMConnectivityParameters params
```

*TAG variable**Syntax*

```
protected static final String TAG
```

ConnectionFactory class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.ConnectionFactory` ConnectionFactory class implementation, which is responsible to create the connection.

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class ConnectionFactory implements  
ISDMPreferenceChangeListener
```

Implemented interfaces

- *ISDMPreferenceChangeListener* on page 1094

Members

All members of ConnectionFactory, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>ConnectionFactory</i> (final <i>ISDMLogger</i> , final <i>ISDMRequestManager</i> , final <i>ISDMPreferences</i>) on page 795	

Methods

Modifier and Type	Method	Description
public void	<i>clearHeaders</i> () on page 795	
public void	<i>close</i> () on page 795	
public static DefaultHttpClient	<i>getHttpClient</i> (final <i>String</i>) on page 795	
public HttpResponse	<i>makeRequest</i> (final <i>String</i> , final <i>byte[]</i>) on page 795	Make the request.
public void	<i>onPreferenceChanged</i> (<i>String</i> , <i>Object</i>) on page 796	Callback method for preference change event.
public void	<i>setConnectionHeader</i> (final <i>String</i> , final <i>String</i>) on page 796	

Modifier and Type	Method	Description
public void	<i>setRequestMethod</i> (final int) on page 796	Set the HTTP request method.

Usage

This class contains the platform related connection handling. This means, that for RIM and Android devices, the same network component can be used, only this ConnectionFactory must be different, because contains platform specific classes.

ConnectionFactory(final ISDMLogger, final ISDMRequestManager, final ISDMPreferences) constructor

Syntax

```
public ConnectionFactory (
    final ISDMLogger logger,
    final ISDMRequestManager requestManager,
    final ISDMPreferences preferences
)
```

clearHeaders() method

Syntax

```
public void clearHeaders ()
```

close() method

Syntax

```
public void close ()
```

getHttpClient(final String) method

Syntax

```
public static DefaultHttpClient getHttpClient (final String
requestUrl)
```

makeRequest(final String, final byte[]) method

Make the request.

Syntax

```
public HttpResponse makeRequest (
    final String url,
    final byte[] data
) throws Exception
```

Parameters

- **url** – the URL of the request
- **data** –

Returns

the server response

Exceptions

- **Exception** –

onPreferenceChanged(String, Object) method

Callback method for preference change event.

Syntax

```
public void onPreferenceChanged (  
    String key,  
    Object value  
)
```

Parameters

- **key** – key of the preference
- **value** – value of the preference

setConnectionHeader(final String, final String) method

Syntax

```
public void setConnectionHeader (  
    final String key,  
    final String value  
)
```

setRequestMethod(final int) method

Set the HTTP request method.

Syntax

```
public void setRequestMethod (final int method)
```

Parameters

- **method** –

CookieJar class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.CookieJar`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class CookieJar
```

Members

All members of `CookieJar`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static Map< String, Map >	cookieArray	
protected static Map< String, Cookie >	httpCookieList	

Constructors

Modifier and Type	Constructor	Description
public	<i>CookieJar()</i> on page 797	

Methods

Modifier and Type	Method	Description
public void	<i>addCookie(Cookie)</i> on page 798	
public void	<i>clear()</i> on page 798	
public boolean	<i>clearExpired(Date)</i> on page 798	
public List< Cookie >	<i>getCookies()</i> on page 798	
protected void	<i>setCookie(DefaultHttpClient, Object)</i> on page 798	

*CookieJar() constructor**Syntax*

```
public CookieJar ()
```

addCookie(Cookie) method

Syntax

```
public void addCookie (Cookie httpCookie)
```

clear() method

Syntax

```
public void clear ()
```

clearExpired(Date) method

Syntax

```
public boolean clearExpired (Date date)
```

getCookies() method

Syntax

```
public List< Cookie > getCookies ()
```

setCookie(DefaultHttpClient, Object) method

Syntax

```
protected void setCookie (  
    DefaultHttpClient client,  
    Object cookieObjectMap  
)
```

cookieArray variable

Syntax

```
protected static Map< String, Map > cookieArray
```

httpCookieList variable

Syntax

```
protected static Map< String, Cookie > httpCookieList
```

HttpsTrustManager class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.HttpsTrustManager`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class HttpsTrustManager
```

Members

All members of `HttpsTrustManager`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static TrustManager-Listener	s_oAppListener	
protected static ClientCertListener	c_oAppListener	
protected static final String	TAG	
public static HttpsClientCertInfo	s_oLastClientCertInfo	

Constructors

Modifier and Type	Constructor	Description
public	<i>HttpsTrustManager(TrustManager[])</i> on page 800	

Methods

Modifier and Type	Method	Description
public void	<i>checkClientTrusted(X509Certificate[], String)</i> on page 800	
public void	<i>checkServerTrusted(X509Certificate[], String)</i> on page 801	
public String	<i>chooseClientAlias(String[], Principal[], Socket)</i> on page 801	

Modifier and Type	Method	Description
public String	<i>chooseServerAlias(String, Principal[], Socket)</i> on page 801	
public X509Certificate[]	<i>getAcceptedIssuers()</i> on page 801	
public X509Certificate[]	<i>getCertificateChain(String)</i> on page 801	
public String[]	<i>getClientAliases(String, Principal[])</i> on page 801	
public PrivateKey	<i>getPrivateKey(String)</i> on page 802	
public String[]	<i>getServerAliases(String, Principal[])</i> on page 802	
public static synchronized void	<i>setClientCertificateListener(ClientCertListener)</i> on page 802	
public static synchronized void	<i>setTrustManagerListener(TrustManagerListener)</i> on page 802	

HttpsTrustManager(TrustManager[]) constructor

Syntax

```
public HttpsTrustManager (TrustManager[] trustManagers) throws
GeneralSecurityException
```

checkClientTrusted(X509Certificate[], String) method

Syntax

```
public void checkClientTrusted (
    X509Certificate[] aoChain,
    String sAuthType
) throws CertificateException
```

checkServerTrusted(X509Certificate[], String) method

Syntax

```
public void checkServerTrusted (
    X509Certificate[] chain,
    String sAuthType
) throws CertificateException
```

chooseClientAlias(String[], Principal[], Socket) method

Syntax

```
public String chooseClientAlias (
    String[] keyType,
    Principal[] issuers,
    Socket socket
)
```

chooseServerAlias(String, Principal[], Socket) method

Syntax

```
public String chooseServerAlias (
    String keyType,
    Principal[] issuers,
    Socket socket
)
```

getAcceptedIssuers() method

Syntax

```
public X509Certificate[] getAcceptedIssuers ()
```

getCertificateChain(String) method

Syntax

```
public X509Certificate[] getCertificateChain (String alias)
```

getClientAliases(String, Principal[]) method

Syntax

```
public String[] getClientAliases (
    String keyType,
    Principal[] issuers
)
```

getPrivateKey(String) method

Syntax

```
public PrivateKey getPrivateKey (String alias)
```

getServerAliases(String, Principal[]) method

Syntax

```
public String[] getServerAliases (
    String keyType,
    Principal[] issuers
)
```

setClientCertificateListener(ClientCertListener) method

Syntax

```
public static synchronized void setClientCertificateListener
(ClientCertListener clientListener)
```

setTrustManagerListener(TrustManagerListener) method

Syntax

```
public static synchronized void setTrustManagerListener
(TrustManagerListener oListener)
```

c_oAppListener variable

Syntax

```
protected static ClientCertListener c_oAppListener
```

s_oAppListener variable

Syntax

```
protected static TrustManagerListener s_oAppListener
```

s_oLastClientCertInfo variable

Syntax

```
public static HttpClientCertInfo s_oLastClientCertInfo
```

*TAG variable**Syntax*

```
protected static final String TAG
```

HttpsTrustManager.ClientCertListener interface

Deprecated. since 3.0, Use

```
com.sap.mobile.lib.request.HttpsTrustManager.ClientCertListener
```

Package

```
com.sap.mobile.lib.sdmconnectivity.HttpsTrustManager
```

Syntax

```
public abstract interface ClientCertListener
```

Derived classes

- *MutualSSLChallengeListener* on page 1742

Members

All members of ClientCertListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract HttpsClientCertInfo	<i>getClientCertificate(String)</i> on page 803	

*getClientCertificate(String) method**Syntax*

```
public abstract HttpsClientCertInfo getClientCertificate  
(String certAlias)
```

HttpsTrustManager.HttpsClientCertInfo class

Deprecated. since 3.0, Use

```
com.sap.mobile.lib.request.HttpsTrustManager.HttpsClientCertInfo
```

Package

```
com.sap.mobile.lib.sdmconnectivity.HttpsTrustManager
```

Syntax

```
public class HttpsClientCertInfo
```

Members

All members of `HttpsClientCertInfo`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected <code>X509Certificate</code>	<code>X509Certificate</code>	
protected <code>PrivateKey</code>	<code>PrivateKey</code>	

Constructors

Modifier and Type	Constructor	Description
public	<code>HttpsClientCertInfo(java.security.cert.X509Certificate, PrivateKey)</code> on page 804	

HttpsClientCertInfo(java.security.cert.X509Certificate, PrivateKey) constructor

Syntax

```
public HttpsClientCertInfo (
    java.security.cert.X509Certificate xcer,
    PrivateKey pk
)
```

*PrivateKey variable**Syntax*

```
protected PrivateKey PrivateKey
```

*X509Certificate variable**Syntax*

```
protected X509Certificate X509Certificate
```

HttpsTrustManager.TrustManagerListener interface

Deprecated. since 3.0, Use

`com.sap.mobile.lib.request.HttpsTrustManager.TrustManagerListener`

Package

```
com.sap.mobile.lib.sdmconnectivity.HttpsTrustManager
```

Syntax

```
public abstract interface TrustManagerListener
```

Derived classes

- *SSLChallengeListener* on page 1742

Members

All members of TrustManagerListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract boolean	<i>checkServerTrusted(X509Certificate[])</i> on page 805	

*checkServerTrusted(X509Certificate[]) method**Syntax*

```
public abstract boolean checkServerTrusted (X509Certificate[]
paramArrayOfX509Certificate)
```

ISDMBundleRequest interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IBundleRequest Interface for request bundle.

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public interface ISDMBundleRequest
```

Derived classes

- *SDMBundleRequest* on page 1139

Members

All members of ISDMBundleRequest, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>addRequest(ISDMRequest)</i> on page 806	Adds a request to the storage.
public void	<i>clearRequests()</i> on page 806	Cleans out the request storage.
public ISDMRequest[]	<i>getRequests()</i> on page 806	Returns all requests from the storage.

Modifier and Type	Method	Description
public void	<i>removeRequest(ISDMRequest)</i> on page 806	Removes the specific request from the storage.

addRequest(ISDMRequest) method

Adds a request to the storage.

Syntax

```
public void addRequest (ISDMRequest request)
```

Parameters

- **request** – the request to be added

Remarks

NOTE! Request priority

(com.sap.mobile.lib.sdmconnectivity.ISDMRequest#setPriority(int)) is ignored during request processing! Because requests are processed in the order they are added to the bundle, the order is considered to handle the priority.

clearRequests() method

Cleans out the request storage.

Syntax

```
public void clearRequests ()
```

getRequests() method

Returns all requests from the storage.

Syntax

```
public ISDMRequest[] getRequests ()
```

Returns

the array of requests

removeRequest(ISDMRequest) method

Removes the specific request from the storage.

Syntax

```
public void removeRequest (ISDMRequest request)
```

Parameters

- **request** – the request to be removed

ISDMCacheLoadListener interface

Deprecated. since 3.0 SDMCacheLoadListener should be responsible for reacting on notifications send after number of SDMOData entries loaded from the file system.

Package

```
com.sap.mobile.lib.sdmpersistence
```

Syntax

```
public interface ISDMCacheLoadListener
```

Members

All members of ISDMCacheLoadListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onLoadFinished(ISDMCache)</i> on page 807	
public void	<i>onSDMODataEntriesLoaded(ISDMCache, List< ISDMODataEntry >)</i> on page 808	
public void	<i>onSDMODataSchemaLoaded(ISDMCache, ISDMODataSchema)</i> on page 808	
public void	<i>onSDMODataServiceDocumentLoaded(ISDMCache, ISDMODataServiceDocument)</i> on page 808	

onLoadFinished(ISDMCache) method

Syntax

```
public void onLoadFinished (ISDMCache cache)
```

Parameters

- **cache** – The cache is finished loading from the file system.

onSDMODataEntriesLoaded(ISDMCache, List< ISDMODataEntry >) method

Syntax

```
public void onSDMODataEntriesLoaded (
    ISDMCache cache,
    List< ISDMODataEntry > entries
)
```

Parameters

- **cache** – The cache the SDMOData Entries were inserted into.
- **entries** – The entries that were loaded from the file system.

onSDMODataSchemaLoaded(ISDMCache, ISDMODataSchema) method

Syntax

```
public void onSDMODataSchemaLoaded (
    ISDMCache cache,
    ISDMODataSchema schema
)
```

Parameters

- **cache** – The cache the SDMOData Schema was inserted into.
- **schema** – The SDMOData Schema loaded from the file system.

onSDMODataServiceDocumentLoaded(ISDMCache, ISDMODataServiceDocument) method

Syntax

```
public void onSDMODataServiceDocumentLoaded (
    ISDMCache cache,
    ISDMODataServiceDocument serviceDocument
)
```

Parameters

- **cache** – The cache the SDMOData Service Document was inserted into.
- **serviceDocument** – The SDMOData Service Document loaded from the file system.

ISDMConnectionHandler interface

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.IConnectionHandler` Interface for connection handler implementations.

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public abstract interface ISDMConnectionHandler
```

Derived classes

- *AbstractConnectionHandler* on page 787

Members

All members of `ISDMConnectionHandler`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	NO_ERROR	
public static final int	ERROR	
public static final int	BAD_COVERAGE	
public static final int	SUCCESS	
public static final int	FAILURE	
public static final int	FAILED_LOGIN	
public static final int	FAILED_LOGOUT	
public static final int	RETRY	
public static final int	LOG	
public static final int	AUTHENTICATION_ERROR	
public static final int	TIMEOUT	
public static final String	CRLF	

Methods

Modifier and Type	Method	Description
public abstract boolean	<i>isSuccessful()</i> on page 810	Do we have error?

Modifier and Type	Method	Description
public abstract int	<i>makeHttpRequest()</i> on page 810	Make the request.
public abstract void	<i>processRequestsFromQueue()</i> on page 810	Pick a request/bundle from the queue and process it/them.
public abstract void	<i>setCleanupRequestsOnError(boolean)</i> on page 810	Sets whether the thread should clean up the request queue in case of errors.
public abstract void	<i>terminate()</i> on page 811	Close the thread.

isSuccessful() method

Do we have error?

Syntax

```
public abstract boolean isSuccessful ()
```

Returns

true if we have

makeHttpRequest() method

Make the request.

Syntax

```
public abstract int makeHttpRequest ()
```

Returns

internal status code

processRequestsFromQueue() method

Pick a request/bundle from the queue and process it/them.

Syntax

```
public abstract void processRequestsFromQueue ()
```

setCleanupRequestsOnError(boolean) method

Sets whether the thread should clean up the request queue in case of errors.

Syntax

```
public abstract void setCleanupRequestsOnError (boolean value)
```

Parameters

- **value** – the setting

terminate() method

Close the thread.

Syntax

```
public abstract void terminate ()
```

Remarks

Invoked when the application exits.

*AUTHENTICATION_ERROR variable**Syntax*

```
public static final int AUTHENTICATION_ERROR
```

*BAD_COVERAGE variable**Syntax*

```
public static final int BAD_COVERAGE
```

*CRLF variable**Syntax*

```
public static final String CRLF
```

*ERROR variable**Syntax*

```
public static final int ERROR
```

*FAILED_LOGIN variable**Syntax*

```
public static final int FAILED_LOGIN
```

*FAILED_LOGOUT variable**Syntax*

```
public static final int FAILED_LOGOUT
```

FAILURE variable

Syntax

```
public static final int FAILURE
```

LOG variable

Syntax

```
public static final int LOG
```

NO_ERROR variable

Syntax

```
public static final int NO_ERROR
```

RETRY variable

Syntax

```
public static final int RETRY
```

SUCCESS variable

Syntax

```
public static final int SUCCESS
```

TIMEOUT variable

Syntax

```
public static final int TIMEOUT
```

ISDMConnectivityParameters interface

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.IConnectivityParameters`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public interface ISDMConnectivityParameters
```

Derived classes

- *SDMConnectivityParameters* on page 1155

Members

All members of `ISDMConnectivityParameters`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 813	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 814	
public String	<i>getLanguage()</i> on page 814	Returns the language setting.
public TrustManager[]	<i>getTrustManagers()</i> on page 814	Returns an array filled with TrustManager instances.
public String	<i>getUserName()</i> on page 814	Returns the username.
public String	<i>getUserPassword()</i> on page 815	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 815	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 815	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 815	Sets the base URL for requests.
public void	<i>setLanguage(String)</i> on page 815	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 816	Sets the server certificate.
public void	<i>setServerCertificate(final Certificate)</i> on page 816	Sets a single server certificate.
public void	<i>setUserName(String)</i> on page 816	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 816	Sets the password.

enableXsrf(Boolean) method

Sets the XSRFEnabled flag.

Syntax

```
public void enableXsrf (Boolean isXsrfEnabled)
```

Parameters

- **isXsrfEnabled** – the boolean to set.

getBaseUrl() method

Syntax

```
public String getBaseUrl ()
```

Returns

the base URL for the requests.

getLanguage() method

Returns the language setting.

Syntax

```
public String getLanguage ()
```

Returns

the language setting

getTrustManagers() method

Returns an array filled with TrustManager instances.

Syntax

```
public TrustManager[] getTrustManagers ()
```

Returns

the array.

getUserName() method

Returns the username.

Syntax

```
public String getUserName ()
```

Returns

the user name.

getUserPassword() method

Returns the password.

Syntax

```
public String getUserPassword ()
```

Returns

the password.

isAutoRedirectEnabled() method

Returns whether auto redirect is enabled.

Syntax

```
public boolean isAutoRedirectEnabled ()
```

setAutoRedirectEnabled(boolean) method

Enables or disables auto redirect.

Syntax

```
public void setAutoRedirectEnabled (boolean paramboolean)
```

Parameters

- **paramboolean** – the boolean to set

setBaseUrl(String) method

Sets the base URL for requests.

Syntax

```
public void setBaseUrl (String baseUrl)
```

Parameters

- **baseUrl** –

setLanguage(String) method

Sets the language used in connection.

Syntax

```
public void setLanguage (String language)
```

Parameters

- **language** – to set

setServerCertificate(final Certificate[]) method

Sets the server certificate.

Syntax

```
public void setServerCertificate (final Certificate[] certificate)  
throws KeyStoreException
```

Parameters

- **certificate** – to set.

Exceptions

- **KeyStoreException** –

setServerCertificate(final Certificate) method

Sets a single server certificate.

Syntax

```
public void setServerCertificate (final Certificate certificate)
```

Parameters

- **certificate** – to set

setUserName(String) method

Sets the username which must be used during authentication.

Syntax

```
public void setUserName (String aUserName)
```

Parameters

- **aUserName** – the user name to set.

setUserPassword(String) method

Sets the password.

Syntax

```
public void setUserPassword (String aPassword)
```

Parameters

- **aPassword** – the password to set.

ISDMLocalSchema interface

Deprecated. since 3.0, Use ILocalSchema

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public interface ISDMLocalSchema
```

Derived classes

- *SDMODataReturnSchema* on page 1519

ISDMLogger interface

Deprecated. since 3.0, Use com.sap.mobile.lib.supportability.ILogger

Package

```
com.sap.mobile.lib.supportability
```

Syntax

```
public interface ISDMLogger
```

Derived classes

- *SDMLogger* on page 1171

Members

All members of ISDMLogger, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	PERFORMANCE	Log level PERFORMANCE.
public static final int	VERBOSE	Log level VERBOSE.
public static final int	DEBUG	Log level DEBUG.
public static final int	INFO	Log level INFO.
public static final int	WARN	Log level WARN.
public static final int	ERROR	Log level ERROR.

Modifier and Type	Variable	Description
public static final int	ASSERT	Log level ASSERT.
public static final int	FATAL	Log level FATAL.

Methods

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 821	Implementer should override this method!
public void	<i>d(final String, final String)</i> on page 821	Sends a DEBUG log message.
public void	<i>d(final String, final String, final String)</i> on page 821	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 822	Sends a DEBUG log message and logs the exception.
public void	<i>d(final String, final String, final Throwable, final String)</i> on page 822	Sends a DEBUG log message and logs the exception.
public void	<i>e(final String, final String)</i> on page 823	Sends an ERROR log message.
public void	<i>e(final String, final String, final String)</i> on page 823	Sends an ERROR log message.
public void	<i>e(final String, final String, final Throwable)</i> on page 823	Sends an ERROR log message and logs the exception.
public void	<i>e(final String, final String, final Throwable, final String)</i> on page 824	Sends an ERROR log message and logs the exception.
public int	<i>getLogLevel()</i> on page 824	Returns the log level.
public void	<i>i(final String, final String)</i> on page 825	Sends an INFO log message.
public void	<i>i(final String, final String, final String)</i> on page 825	Sends an INFO log message.
public void	<i>i(final String, final String, final Throwable)</i> on page 825	Sends a INFO log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>i(final String, final String, final Throwable, final String)</i> on page 826	Sends a INFO log message and logs the exception.
public void	<i>logFullLocation(boolean)</i> on page 826	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation()</i> on page 827	To get the setting which controls log output should contain full location (class and method name) or not.
public void	<i>p(final String, final String)</i> on page 827	Sends a PERFORMANCE log message.
public void	<i>p(final String, final String, final String)</i> on page 827	Sends a PERFORMANCE log message.
public void	<i>setHeaderData(final String, final String)</i> on page 828	Sets the log header fields.
public void	<i>setLogLevel(final int)</i> on page 828	Set the log level.
public void	<i>v(final String, final String)</i> on page 829	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final String)</i> on page 829	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable)</i> on page 829	Sends a VERBOSE log message and logs the exception.
public void	<i>v(final String, final String, final Throwable, final String)</i> on page 830	Sends a VERBOSE log message and logs the exception.
public void	<i>w(final String, final Throwable)</i> on page 830	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final Throwable, final String)</i> on page 831	Sends a WARN log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>w(final String, final String, final Throwable)</i> on page 831	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable, final String)</i> on page 832	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String)</i> on page 832	Sends a WARN log message.
public void	<i>w(final String, final String, final String)</i> on page 832	Sends a WARN log message.
public void	<i>wtf(final String, final Throwable)</i> on page 833	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf(final String, final Throwable, final String)</i> on page 833	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf(final String, final String)</i> on page 834	Use com.sap.mobile.lib.supportability.ILogger#w(String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf(final String, final String, final String)</i> on page 834	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf(final String, final String, final Throwable)</i> on page 835	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable) What a Terrible Failure: Reports an exception that should never happen.

Modifier and Type	Method	Description
public void	<i>wtf</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 835	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.

***canLog()* method**

Implementer should override this method!

Syntax

```
public boolean canLog ()
```

Returns

State of ability to log.

***d*(*final String*, *final String*) method**

Sends a DEBUG log message.

Syntax

```
public void d (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,String)`

***d*(*final String*, *final String*, *final String*) method**

Sends a DEBUG log message.

Syntax

```
public void d (
    final String tag,
    final String msg,
```

```
        final String location
    )
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

d(final String, final String, final Throwable) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,Throwable,String)`

d(final String, final String, final Throwable, final String) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLLogger#e(String,String,String)`

e(final String, final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String, final Throwable) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (
    final String tag,
```

```
    final String msg,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,Throwable,String)`

e(final String, final String, final Throwable, final String) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

getLogLevel() method

Returns the log level.

Syntax

```
public int getLogLevel ()
```

Returns

the log level.

i(final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,String)`

i(final String, final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

i(final String, final String, final Throwable) method

Sends an INFO log message and logs the exception.

Syntax

```
public void i (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,Throwable,String)`

i(final String, final String, final Throwable, final String) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

logFullLocation(boolean) method

Setting to control log full location (class-path and method name).

Syntax

```
public void logFullLocation (boolean logFullLocation)
```

Parameters

- **logFullLocation** – log i or do not log it.

logsFullLocation() method

To get the setting which controls log output should contain full location (class and method name) or not.

Syntax

```
public boolean logsFullLocation ()
```

Returns

logging with full location or not.

p(final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#p(String,String,String)`

p(final String, final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **location** – The line-level location of the log source (full class name of the class).

setHeaderData(final String, final String) method

Sets the log header fields.

Syntax

```
public void setHeaderData (  
    final String osVersion,  
    final String appName,  
    final String appVersion,  
    final String thirdParty,  
    final String hwVersion,  
    final String user,  
    final String timezone,  
    final String language,  
    final String baseUrl  
)
```

Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (SDMConnectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (SDMConnectivity sets it)
- **baseUrl** – the URL used in Connectivity (SDMconnectivity sets it)

Remarks

A header field is set only if it is not null. Also, it is set only once; subsequent calls will not overwrite the first write.

setLogLevel(final int) method

Set the log level.

Syntax

```
public void setLogLevel (final int level)
```

Parameters

- **level** – the log level

v(final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#v(String,String,String)`

v(final String, final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

v(final String, final String, final Throwable) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#v(String,String,Throwable,String)`

v(final String, final String, final Throwable, final String) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,Throwable,String)`

w(final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,String,Throwable,String)`

w(final String, final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,String,String)`

w(final String, final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (  
    final String tag,  
    final String msg,
```

```
    final String location
  )
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

wtf(final String, final Throwable) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, Throwable)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (
    final String tag,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

Remarks

Similar to `wtf(String, final String)`, with an exception to log. Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,Throwable,String)`

wtf(final String, final Throwable, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (
    final String tag,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

Remarks

Similar to `wtf(String, final String)`, with an exception to log.

wtf(final String, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String)` What a Terrible Failure: Reports a condition that should never happen.

Syntax

```
public void wtf (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,String,String)`

wtf(final String, final String, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, String)` What a Terrible Failure: Reports a condition that should never happen.

Syntax

```
public void wtf (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

wtf(final String, final String, final Throwable) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Similar to `wtf(finalString, Throwable)`, also with a message. Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,String,Throwable,String)`

wtf(final String, final String, final Throwable, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

Remarks

Similar to `wtf(finalString, Throwable)`, also with a message.

ASSERT variable

Log level ASSERT.

Syntax

```
public static final int ASSERT
```

DEBUG variable

Log level DEBUG.

Syntax

```
public static final int DEBUG
```

ERROR variable

Log level ERROR.

Syntax

```
public static final int ERROR
```

FATAL variable

Log level FATAL.

Syntax

```
public static final int FATAL
```

INFO variable

Log level INFO.

Syntax

```
public static final int INFO
```

PERFORMANCE variable

Log level PERFORMANCE.

Syntax

```
public static final int PERFORMANCE
```

VERBOSE variable

Log level VERBOSE.

Syntax

```
public static final int VERBOSE
```

WARN variable
Log level WARN.

Syntax

```
public static final int WARN
```

ISDMNetListener interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.INetListener The NetListener interface.

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public interface ISDMNetListener
```

Derived classes

- *AppSettings* on page 755
- *ClientConnection* on page 760
- *UserManager* on page 776

Members

All members of ISDMNetListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onError(ISDMRequest, ISDMResponse, ISDMRequestStateElement)</i> on page 837	This method is used by the connectivity layer when an error occurs during a request operation.
public void	<i>onSuccess(ISDMRequest, ISDMResponse)</i> on page 838	This is used by the connectivity library in case of a successful request.

onError(ISDMRequest, ISDMResponse, ISDMRequestStateElement) method

This method is used by the connectivity layer when an error occurs during a request operation.

Syntax

```
public void onError (
    ISDMRequest aRequest,
    ISDMResponse aResponse,
```

```
ISDMRequestStateElement aRequestStateElement  
)
```

Parameters

- **aRequest** – the request.
- **aResponse** – the response.
- **aRequestStateElement** – the SDMRequestStateElement object.

Remarks

As parameter the listener object will receive the request object, the SDMHttResponse object containing the details about the server response and a SDMRequestStateElement object, which provides more details about the occurred error. In case the error happened before sending any request to the server, the SDMHttResponse object can be null.

onSuccess(ISDMRequest, ISDMResponse) method

This is used by the connectivity library in case of a successful request.

Syntax

```
public void onSuccess (  
    ISDMRequest aRequest,  
    ISDMResponse aResponse  
)
```

Parameters

- **aRequest** – the request.
- **aResponse** – the response.

Remarks

As parameter the listener will receive the request itself, and an SDMHttResponse object containing all the details about the server response.

ISDMODataAssociation interface

Deprecated. since 3.0, Use IODataAssociation Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataAssociation extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataAssociation* on page 1195

Derived interfaces

- *ISDMODDataAssociationSet* on page 849

Members

All members of ISDMODDataAssociation, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ASSOCIATION	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_ASSOCIATION	Name of the appropriate SDMODData attribute.
public static final String	ELEMENT_ASSOCIATIONEND	Name of the appropriate SDMODData element.

Methods

Modifier and Type	Method	Description
public abstract ISDMODDataAssociationEnd	<i>getAssociationEnd(String)</i> on page 844	Returns the value of the appropriate Association End SDMODData element with the given role.
public abstract List< ISDMODDataAssociationEnd >	<i>getAssociationEnds()</i> on page 845	Returns list of the appropriate SDMODData elements.
public abstract String	<i>getName()</i> on page 845	Returns the value of the appropriate SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMODData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getAssociationEnd(String) method

Returns the value of the appropriate Association End SDMOData element with the given role.

Syntax

```
public abstract ISDMODataAssociationEnd getAssociationEnd
(String role)
```

Parameters

- **role** – The expected value of the appropriate SDMOData attribute

Returns

the value of the appropriate Association End SDMOData element

getAssociationEnds() method

Returns list of the appropriate SDMOData elements.

Syntax

```
public abstract List< ISDMODataAssociationEnd >
getAssociationEnds ()
```

Returns

list of the appropriate SDMOData elements

getName() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getName ()
```

Returns

the value of the appropriate SDMOData attribute

ATTRIBUTE_ASSOCIATION variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_ASSOCIATION
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ELEMENT_ASSOCIATION variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ASSOCIATION
```

***ELEMENT_ASSOCIATIONEND* variable**

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_ASSOCIATIONEND
```

***ISDMODDataAssociation.ISDMODDataAssociationEnd* interface**

Deprecated. since 3.0, Use IODataAssociationEnd Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser.ISDMODDataAssociation
```

Syntax

```
public abstract interface ISDMODDataAssociationEnd
```

Derived classes

- *SDMODDataAssociationEnd* on page 1210

Members

All members of ISDMODDataAssociationEnd, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_ROLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_ENTITYSET	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_MULTIPLICITY	Name of the appropriate SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getCollectionId()</i> on page 847	Returns the value of the appropriate EntitySet SDMODData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getEntitySet()</i> on page 847	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getMultiplicity()</i> on page 847	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getRole()</i> on page 848	Returns the value of the appropriate SDMOData attribute.
public abstract String	<i>getType()</i> on page 848	Returns the value of the appropriate SDMOData attribute.

getCollectionId() method

Returns the value of the appropriate EntitySet SDMOData attribute.

Syntax

```
public abstract String getCollectionId ()
```

Returns

the value of the appropriate EntitySet SDMOData attribute

getEntitySet() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getEntitySet ()
```

Returns

the value of the appropriate SDMOData attribute

getMultiplicity() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getMultiplicity ()
```

Returns

the value of the appropriate SDMOData attribute

getRole() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getRole ()
```

Returns

the value of the appropriate SDMODData attribute

getType() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getType ()
```

Returns

the value of the appropriate SDMODData attribute

ATTRIBUTE_ENTITYSET variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYSET
```

ATTRIBUTE_MULTIPLICITY variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_MULTIPLICITY
```

ATTRIBUTE_ROLE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_ROLE
```

ATTRIBUTE_TYPE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

ISDMODataAssociationSet interface

Deprecated. since 3.0, Use IODataAssociationSet Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataAssociationSet extends
ISDMODataAssociation
```

Implemented interfaces

- *ISDMODataAssociation* on page 838

Derived classes

- *SDMODataAssociationSet* on page 1221

Members

All members of ISDMODataAssociationSet, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ASSOCIATION-SET	Name of the appropriate SDMOData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getAssociation()</i> on page 855	Returns the value of appropriate SDMOData element.

Inherited members from ISDMODataAssociation

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 845	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 845	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 845	Name of the appropriate SDMOData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ASSOCIATIONEND</i> on page 846	Name of the appropriate SDMODData element.
public abstract ISDMODDataAssociationEnd	<i>getAssociationEnd(String)</i> on page 844	Returns the value of the appropriate Association End SDMODData element with the given role.
public abstract List< ISDMODDataAssociationEnd >	<i>getAssociationEnds()</i> on page 845	Returns list of the appropriate SDMODData elements.
public abstract String	<i>getName()</i> on page 845	Returns the value of the appropriate SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Modifier and Type	Member	Description
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getAssociation() method

Returns the value of appropriate SDMODData element.

Syntax

```
public abstract String getAssociation ()
```

Returns

the value of appropriate SDMODData element

ELEMENT_ASSOCIATIONSET variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_ASSOCIATIONSET
```

ISDMODDataCollection interface

Deprecated. since 3.0, Use IODataCollection Represents the 'Collection' element of the SDMODData Service Document.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataCollection extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataCollection* on page 1241

Members

All members of ISDMODDataCollection, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_COLLECTION	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate SDMSMODData attribute.

Modifier and Type	Variable	Description
public static final String	ELEMENT_TITLE	Name of the appropriate SDMODData element.
public static final String	ELEMENT_MEMBERTITLE	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_HREF	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_CREATABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_UPDATABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_DELETABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_SEARCHABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_FILTERABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_DISPLAYORDER	Name of the appropriate SDMODData extension attribute.
public static final String	ATTRIBUTE_VALUE_REL_SEARCH	Possible value of the appropriate SDMODData attribute.
public static final String	ELEMENT_LINK	Name of the appropriate SDMODData element.

Methods

Modifier and Type	Method	Description
public abstract int	<i>getDisplayOrder()</i> on page 863	Returns the value of the appropriate SDMODData extension attribute.
public abstract String	<i>getHref()</i> on page 863	Returns the value of the 'href' SDMODData attribute.
public abstract List< ISDMO-DataIcon >	<i>getIcons()</i> on page 863	Returns list of the appropriate SDMODData elements.

Modifier and Type	Method	Description
public abstract String	<i>getId()</i> on page 863	Returns the value of the 'href' SDMODData attribute as a relative href (matchable with appropriate entitySet)
public abstract List< ISDMO-DataLink >	<i>getLinks()</i> on page 863	Returns the value of the appropriate SDMODData elements.
public abstract String	<i>getMemberTitle()</i> on page 864	Returns the value of the appropriate SDMSDMODData element.
public abstract ISDMODData-Link	<i>getSearchLink()</i> on page 864	Returns SDMSDMODData Link object that should be used for retrieving Open Search Description XML.
public abstract String	<i>getSemantics()</i> on page 864	Returns the value of the appropriate SDMODData attribute.
public abstract ISDMODData-Link	<i>getSubscriptionLink()</i> on page 864	Returns SDMSDMODData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getTitle()</i> on page 865	Returns the value of the appropriate SDMODData element.
public abstract String	<i>getUrl()</i> on page 865	Returns SDMSDMODData Link object that should be used for self related operations.
public abstract boolean	<i>isCreatable()</i> on page 865	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isDeletable()</i> on page 865	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isFilterable()</i> on page 865	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isSearchable()</i> on page 866	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 866	Returns the value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public abstract void	<i>setEntitySet(ISDMODataEntitySet)</i> on page 866	Sets the data held by the appropriate element of the SDMOData Schema.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getDisplayOrder() method

Returns the value of the appropriate SDMODData extension attribute.

Syntax

```
public abstract int getDisplayOrder ()
```

Returns

The value of the appropriate SDMODData extension attribute

getHref() method

Returns the value of the 'href' SDMODData attribute.

Syntax

```
public abstract String getHref ()
```

Returns

The value of the 'href' SDMODData attribute

getIcons() method

Returns list of the appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODDataIcon > getIcons ()
```

Returns

list of the appropriate SDMODData elements

getId() method

Returns the value of the 'href' SDMODData attribute as a relative href (matchable with appropriate entitySet)

Syntax

```
public abstract String getId ()
```

Returns

The value of the 'href' SDMODData attribute

getLinks() method

Returns the value of the appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODDataLink > getLinks ()
```

Returns

The value of the appropriate SDMOData elements

getMemberTitle() method

Returns the value of the appropriate SDMSDMOData element.

Syntax

```
public abstract String getMemberTitle ()
```

Returns

The value of the appropriate SDMSDMOData element

getSearchLink() method

Returns SDMSDMOData Link object that should be used for retrieving Open Search Description XML.

Syntax

```
public abstract ISDMODataLink getSearchLink ()
```

Returns

SDMSDMOData Link for search

getSemantics() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate SDMOData attribute

getSubscriptionLink() method

Returns SDMSDMOData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public abstract ISDMODataLink getSubscriptionLink ()
```

Returns

SDMSDMOData Link for subscribe

getTitle() method

Returns the value of the appropriate SDMODData element.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate SDMODData element

getUrl() method

Returns SDMSDMODData Link object that should be used for self related operations.

Syntax

```
public abstract String getUrl ()
```

Returns

SDMSDMODData Link for self Returns the full URL of the collectionThe full URL of the collection

isCreatable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isCreatable ()
```

Returns

The value of the appropriate SDMODData attribute

isDeletable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isDeletable ()
```

Returns

The value of the appropriate SDMODData attribute

isFilterable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isFilterable ()
```

Returns

The value of the appropriate SDMODData attribute

isSearchable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isSearchable ()
```

Returns

The value of the appropriate SDMODData attribute

isUpdatable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isUpdatable ()
```

Returns

The value of the appropriate SDMODData attribute

setEntitySet(ISDMODDataEntitySet) method

Sets the data held by the appropriate element of the SDMODData Schema.

Syntax

```
public abstract void setEntitySet (ISDMODDataEntitySet entitySet)
```

Parameters

- **entitySet** – The SDMODData EntitySet to use the data from.

Remarks

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

ATTRIBUTE_CREATABLE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_CREATABLE
```

ATTRIBUTE_DELETABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_DELETABLE
```

ATTRIBUTE_DISPLAYORDER variable

Name of the appropriate SDMOData extension attribute.

Syntax

```
public static final String ATTRIBUTE_DISPLAYORDER
```

ATTRIBUTE_FILTERABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_FILTERABLE
```

ATTRIBUTE_HREF variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_HREF
```

ATTRIBUTE_SEARCHABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEARCHABLE
```

ATTRIBUTE_SEMANTICS variable

Name of the appropriate SDMSDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_UPDATABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_UPDATABLE
```

ATTRIBUTE_VALUE_REL_SEARCH variable

Possible value of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_VALUE_REL_SEARCH
```

ELEMENT_COLLECTION variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_COLLECTION
```

ELEMENT_LINK variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_LINK
```

ELEMENT_MEMBERTITLE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_MEMBERTITLE
```

ELEMENT_TITLE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_TITLE
```

ISDMODataComplexType interface

Deprecated. since 3.0, Use `IODataComplexType` Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataComplexType extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataComplexType* on page 1263

Members

All members of *ISDMODataComplexType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_COMPLEXTYPE	Name of the appropriate <i>SDMOData</i> element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate <i>SDMOData</i> attribute.
public static final String	ELEMENT_PROPERTY	Name of the appropriate <i>SDMOData</i> element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 874	Returns the value of the appropriate <i>SDMOData</i> element.
public abstract List< <i>ISDMODataProperty</i> >	<i>getProperties()</i> on page 874	Returns the list of the appropriate <i>SDMOData</i> elements.

Inherited members from *ISDMParserDocument*

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate <i>SDMOData</i> element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract <i>ISDMParserDocument</i>	<i>clone()</i> on page 1069	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getName() method

Returns the value of the appropriate SDMODData element.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMODData element

getProperties() method

Returns the list of the appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODDataProperty > getProperties ()
```

Returns

The list of the appropriate SDMODData elements

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ELEMENT_COMPLEXTYPE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_COMPLEXTYPE
```

ELEMENT_PROPERTY variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_PROPERTY
```

ISDMODataEntitySet interface

Deprecated. since 3.0, Use IODataEntitySet Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataEntitySet extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataEntitySet* on page 1277

Members

All members of ISDMODataEntitySet, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ENTITYSET	Name of the appropriate SDMOData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_CREATABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_UPDATABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_DELETABLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_SEARCHABLE	Name of the appropriate SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 881	
public abstract boolean	<i>isCreatable()</i> on page 881	
public abstract boolean	<i>isDeletable()</i> on page 881	
public abstract boolean	<i>isSearchable()</i> on page 882	
public abstract boolean	<i>isSearchable(String)</i> on page 882	Returns the value of the given SDMODData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 882	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	ATTRIBUTE_ETAG on page 1082	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_VALUEPREFIX_EDMTYPE on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getName() method

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMOData attribute

isCreatable() method

Syntax

```
public abstract boolean isCreatable ()
```

Returns

The value of the appropriate SDMOData attribute

isDeletable() method

Syntax

```
public abstract boolean isDeletable ()
```

Returns

The value of the appropriate SDMOData attribute

isSearchable() method

Syntax

```
public abstract boolean isSearchable ()
```

Returns

The value of the appropriate SDMOData attribute

isSearchable(String) method

Returns the value of the given SDMOData attribute.

Syntax

```
public abstract boolean isSearchable (String searchAttributeName)
```

Parameters

- **searchAttributeName** – The name of the SDMOData attribute

Returns

The value of the given SDMOData attribute

isUpdatable() method

Syntax

```
public abstract boolean isUpdatable ()
```

Returns

The value of the appropriate SDMOData attribute

ATTRIBUTE_CREATABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_CREATABLE
```

ATTRIBUTE_DELETABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_DELETABLE
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_SEARCHABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEARCHABLE
```

ATTRIBUTE_UPDATABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_UPDATABLE
```

ELEMENT_ENTITYSET variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ENTITYSET
```

ISDMODataEntityType interface

Deprecated. since 3.0, Use IODataEntityType Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataEntityType extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataEntityType* on page 1293

*Members*All members of ISDMODataEntityType, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ENTITYTYPE	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_HASSTREAM	Name of the appropriate SDMODData attribute.
public static final String	ELEMENT_KEY	Name of the appropriate SDMODData element.
public static final String	ELEMENT_PROPERTYREF	Name of the appropriate SDMODData element.
public static final String	ELEMENT_PROPERTY	Name of the appropriate SDMODData element.

Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataProperty >	<i>getGPUseInSearchProperties-Data()</i> on page 890	Returns The list of appropriate SDMODData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 891	Returns The list of appropriate SDMODData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInListProperties-Data()</i> on page 891	Returns The list of appropriate SDMODData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.
public abstract List< String >	<i>getKeyPropertyNames()</i> on page 891	Returns the list of the values of the 'PropertyRef' SDMODData element contained by the 'Key' SDMODData element.

Modifier and Type	Method	Description
public abstract String	<i>getName()</i> on page 891	Returns The value of the appropriate SDMODData attribute.
public abstract List< ISDMO-DataNavigationProperty >	<i>getNavigationProperties()</i> on page 892	Returns The list of appropriate SDMODData elements.
public abstract ISDMODDataNavigationProperty	<i>getNavigationProperty(String)</i> on page 892	Returns The appropriate SDMODData element with the given name.
public abstract List< ISDMO-DataProperty >	<i>getProperties()</i> on page 892	Returns The list of appropriate SDMODData elements.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 892	Returns The list of appropriate SDMODData elements with given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 893	Returns The list of appropriate SDMODData elements with given attribute value.
public abstract ISDMODDataProperty	<i>getProperty(String)</i> on page 893	Returns The appropriate SDMODData element with the given name.
public abstract List< ISDMO-DataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 893	Returns The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getSearchablePropertiesData(String)</i> on page 893	Returns The list of appropriate SDMODData elements with 'true' attribute value of the given attribute.
public abstract boolean	<i>hasStream()</i> on page 894	Returns The value of the appropriate SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getGPUseInSearchPropertiesData() method

Returns The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

Syntax

```
public abstract List< ISDMODataProperty >
getGPUseInSearchPropertiesData ()
```

Returns

The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value

getGPVisibleInDetailPropertiesData() method

Returns The list of appropriate SDMODData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >
getGPVisibleInDetailPropertiesData ()
```

Returns

The list of appropriate SDMODData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value

getGPVisibleInListPropertiesData() method

Returns The list of appropriate SDMODData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >
getGPVisibleInListPropertiesData ()
```

Returns

The list of appropriate SDMODData elements with 'true' visible-in-list (Generic Player names-pace) attribute value

getKeyPropertyNames() method

Returns the list of the values of the 'PropertyRef' SDMODData element contained by the 'Key' SDMODData element.

Syntax

```
public abstract List< String > getKeyPropertyNames ()
```

Returns

The list of the values of the 'PropertyRef' SDMODData element

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getNavigationProperties() method

Returns The list of appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODataNavigationProperty >  
getNavigationProperties ()
```

Returns

The list of appropriate SDMODData elements

getNavigationProperty(String) method

Returns The appropriate SDMODData element with the given name.

Syntax

```
public abstract ISDMODataNavigationProperty  
getNavigationProperty (String name)
```

Returns

The appropriate SDMODData element with the given name

getProperties() method

Returns The list of appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODataProperty > getProperties ()
```

Returns

The list of appropriate SDMODData elements

getPropertiesWithAttribute(String, String) method

Returns The list of appropriate SDMODData elements with given attribute value.

Syntax

```
public abstract List< ISDMODataProperty >  
getPropertiesWithAttribute (  
    String attributeName,  
    String attributeValue  
)
```

Returns

The list of appropriate SDMODData elements with given attribute value

getPropertiesWithAttribute(String, String, boolean) method

Returns The list of appropriate SDMODData elements with given attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >
getPropertiesWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Returns

The list of appropriate SDMODData elements with given attribute value

getProperty(String) method

Returns The appropriate SDMODData element with the given name.

Syntax

```
public abstract ISDMODDataProperty getProperty (String
propertyName)
```

Returns

The appropriate SDMODData element with the given name

getSAPSearchablePropertiesData() method

Returns The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >
getSAPSearchablePropertiesData ()
```

Returns

The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value

getSearchablePropertiesData(String) method

Returns The list of appropriate SDMODData elements with 'true' attribute value of the given attribute.

Syntax

```
public abstract List< ISDMODDataProperty >
getSearchablePropertiesData (String searchAttributeName)
```

Returns

The list of appropriate SDMOData elements with 'true' attribute value of the given attribute

hasStream() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract boolean hasStream ()
```

Returns

The value of the appropriate SDMOData attribute

ATTRIBUTE_HASSTREAM variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_HASSTREAM
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ELEMENT_ENTITYTYPE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ENTITYTYPE
```

ELEMENT_KEY variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_KEY
```

ELEMENT_PROPERTY variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_PROPERTY
```

ELEMENT_PROPERTYREF variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_PROPERTYREF
```

ISDMODDataEntry interface

Deprecated. since 3.0, Use IODataEntry Represents the 'entry' SDMODData element with maintained reference to the appropriate SDMODData Schema document.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataEntry extends  
ISDMParserDocument,
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataEntry* on page 1313
- *SDMODDataReturnTypeInfoEntry* on page 1490

Derived interfaces

- *ISDMODDataSubscriptionEntry* on page 1021

Members

All members of ISDMODDataEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	PROPERTY_LEVEL_SEPARATOR	
public static final String	ELEMENT_ENTRY	Name of the appropriate SDMODData element.
public static final String	ELEMENT_TITLE	Name of the appropriate SDMODData element.
public static final String	ELEMENT_SUMMARY	Name of the appropriate SDMODData element.

Modifier and Type	Variable	Description
public static final String	ELEMENT_CATEGORY	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_TERM	Name of the appropriate SDMODData attribute.
public static final String	ELEMENT_CONTENT	Name of the appropriate SDMODData element.
public static final String	ELEMENT_PROPERTIES	Name of the appropriate SDMODData element.
public static final String	ELEMENT_LINK	Name of the appropriate SDMODData element.
public static final String	ELEMENT_UPDATED	Name of the appropriate SDMODData element.
public static final String	ELEMENT_AUTHOR	Name of the appropriate SDMODData element.
public static final String	ELEMENT_NAME	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_VALUE_SEMANTICS_ACTION	Value option for appropriate SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataLink >	<i>getActionLinks()</i> on page 905	Returns SDMODData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 906	Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.
public cacheState	<i>getCachestate()</i> on page 906	
public Long	<i>getCacheTimestamp()</i> on page 906	

Modifier and Type	Method	Description
public abstract String	<i>getCollectionId()</i> on page 906	Returns the Id of the SDMOcata Collection that this Entry belongs to.
public abstract String	<i>getEtag()</i> on page 906	Returns the Id of the SDMOData Collection that this Entry belongs to.
public abstract String	<i>getFilterUrl()</i> on page 907	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public abstract List< ISDMODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 907	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' use-in-search (Generic Player name-space) attribute value.
public abstract List< ISDMODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 907	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.
public abstract List< ISDMODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 907	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.
public abstract List< ISDMODataIcon >	<i>getIcons()</i> on page 908	Returns the list of the appropriate SDMOData elements.
public abstract String	<i>getId()</i> on page 908	Returns The Id of this SDMOData Entry (value of appropriate SDMOData Id element)
public boolean	<i>getIsLocal()</i> on page 908	

Modifier and Type	Method	Description
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 908	Returns the values of the properties that are marked as key properties in the SDMOData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 908	Returns The parsed value of the 'updated' SDMOData Element.
public abstract List< ISDMO-DataLink >	<i>getLinks()</i> on page 909	Returns the list of the appropriate SDMOData elements.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesData()</i> on page 909	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-data Entry document.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 909	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 910	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract ISDMParserDocument	<i>getPropertiesDocument()</i> on page 910	Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 910	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValueParsed(String...)</i> on page 911	Returns the value of the appropriate property parsed to it's real type.

Modifier and Type	Method	Description
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 912	Returns the all the values of properties contained by this SDMOData Entry document. Key for the properties will be their name or their full path in case they are enclosed by Complex Types.
public abstract List< String >	<i>getPropertyValues(List< String[]>)</i> on page 912	Return list of property values for the given property paths.
public abstract List< ISDMODataLink >	<i>getRelatedDataLinks()</i> on page 912	Returns SDMOData Link objects that represents links to Related Data.
public abstract List< ISDMODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 913	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract ISDMODataSchema	<i>getSchema()</i> on page 913	Returns the appropriate SDMOData Schema object.
public abstract ISDMODataLink	<i>getSelfLink()</i> on page 913	Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract ISDMODataLink	<i>getSubscriptionLink()</i> on page 913	Returns SDMOData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 914	Returns The value of the appropriate SDMOData element.
public abstract String	<i>getTitle()</i> on page 914	Returns The value of the appropriate SDMOData element.
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 914	Puts the new property element as a sub-element of the 'complex properties' SDMOData element.

Modifier and Type	Method	Description
public abstract void	<i>putId(String)</i> on page 915	Sets id of this SDMODData Entry document (value of appropriate SDMODData Id element)
public abstract void	<i>putPropertyValue(String, String)</i> on page 915	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 915	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public abstract void	<i>setAuthorName(String)</i> on page 916	Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.
public void	<i>setCachestate(cache.State)</i> on page 916	
public void	<i>setCacheTimestamp(Long)</i> on page 916	
public abstract void	<i>setCollectionId(String)</i> on page 916	Maintains the Id of the SDMO-Cata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 916	
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 917	Maintains the reference to the appropriate SDMODData Schema object.
public abstract void	<i>setSummary(String)</i> on page 917	Sets the value of the appropriate SDMODData element.
public abstract void	<i>setTitle(String)</i> on page 917	Sets the value of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIX_MAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getActionLinks() method

Returns SDMOData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')

Syntax

```
public abstract List< ISDMODataLink > getActionLinks ()
```

Returns

List of SDMOData Action Link documents

getAuthorName() method

Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.

Syntax

```
public abstract String getAuthorName ()
```

Returns

The value of the 'name' SDMODData element of the 'author' SDMODData element

getCachestate() method

Syntax

```
public cacheState getCachestate ()
```

getCacheTimestamp() method

Syntax

```
public Long getCacheTimestamp ()
```

getCollectionId() method

Returns the Id of the SDMOCata Collection that this Entry belongs to.

Syntax

```
public abstract String getCollectionId ()
```

Returns

The Id of the SDMOCata Collection that this Entry belongs to

getEtag() method

Returns the Id of the SDMODData Collection that this Entry belongs to.

Syntax

```
public abstract String getEtag ()
```

Returns

The Id of the SDMODData Collection that this Entry belongs to

getFilterUrl() method

Returns the full execution URL that can be used for filtering collection search for this single entry.

Syntax

```
public abstract String getFilterUrl ()
```

Returns

The full filter URL

getGPUseInSearchPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' use-in-search (Generic Player namespace) attribute value.

Syntax

```
public abstract List< ISDMODataProperty >
getGPUseInSearchPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInDetailPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-detail (Generic Player namespace) attribute value.

Syntax

```
public abstract List< ISDMODataProperty >
getGPVisibleInDetailPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInListPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-list (Generic Player namespace) attribute value.

Syntax

```
public abstract List< ISDMODataProperty >
getGPVisibleInListPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getIcons() method

Returns the list of the appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODDataIcon > getIcons ()
```

Returns

The list of the appropriate SDMODData elements

getId() method

Returns The Id of this SDMODData Entry (value of appropriate SDMODData Id element)

Syntax

```
public abstract String getId ()
```

Returns

The Id of this SDMODData Entry

getIsLocal() method

Syntax

```
public boolean getIsLocal ()
```

getKeyPropertyValues() method

Returns the values of the properties that are marked as key properties in the SDMODData Schema document.

Syntax

```
public abstract Map< String, String > getKeyPropertyValues ()
```

Returns

The name-value pairs of the key properties

getLastUpdated() method

Returns The parsed value of the 'updated' SDMODData Element.

Syntax

```
public abstract Date getLastUpdated ()
```

Returns

The parsed value of the value of the 'updated' SDMODData element or null is parsing failed

getLinks() method

Returns the list of the appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODDataLink > getLinks ()
```

Returns

The list of the appropriate SDMODData elements

getPropertiesData() method

Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMODData Entry document.

Syntax

```
public abstract List< ISDMODDataProperty > getPropertiesData ()
```

Returns

The meta-informations and values of the contained properties

getPropertiesDataWithAttribute(String, String) method

Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMODData Entry document with the given attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >
getPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

Returns

The meta-informations and values of the appropriate properties

getPropertiesDataWithAttribute(String, String, boolean) method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.

Syntax

```
public abstract List< ISDMODataProperty >
getPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

Returns

The meta-informations and values of the appropriate properties

getPropertiesDocument() method

Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

Syntax

```
public abstract ISDMParseDocument getPropertiesDocument ()
```

Returns

The SDMParseDocument representation of SDMOData 'properties' (Metadata name-space) document

getPropertyValue(String...) method

Returns the value of the appropriate property.

Syntax

```
public abstract String getPropertyValue (String... propertyPath)
throws IllegalArgumentException
```

Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

Returns

The value of the property

Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous.

Remarks

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

getPropertyValueParsed(String...) method

Returns the value of the appropriate property parsed to it's real type.

Syntax

```
public abstract< T > T getPropertyValueParsed (String...  
propertyPath) throws ClassCastException
```

Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

Returns

The value of the property

Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous
- **ClassCastException** – if the property value can not be parsed to the expected type

Remarks

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

getPropertyValues() method

Returns the all the values of properties contained by this SDMODData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

Syntax

```
public abstract Map< String, String > getPropertyValues ()
```

Returns

The name/path and value pairs of the contained properties

Remarks

The name of the properties will contain their current name-space prefixes.

getPropertyValues(List< String[]>) method

Return list of property values for the given property paths.

Syntax

```
public abstract List< String > getPropertyValues (List<  
String[]> propertyPathes)
```

Parameters

- **propertyPathes** – Name of the property or path including the name of the enclosing Complex Types

Returns

The list of the values of the properties

getRelatedDataLinks() method

Returns SDMODData Link objects that represents links to Related Data.

Syntax

```
public abstract List< ISDMODDataLink > getRelatedDataLinks ()
```

Returns

List of SDMODData Related Link documents

getSAPSearchablePropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' searchable (SAP name-space) attribute value.

Syntax

```
public abstract List< ISDMODataProperty >
getSAPSearchablePropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getSchema() method

Returns the appropriate SDMOData Schema object.

Syntax

```
public abstract ISDMODataSchema getSchema ()
```

Returns

The appropriate SDMOData Schema object.

getSelfLink() method

Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

Syntax

```
public abstract ISDMODataLink getSelfLink ()
```

Returns

SDMSDMOData self Link

getSubscriptionLink() method

Returns SDMOData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public abstract ISDMODataLink getSubscriptionLink ()
```

Returns

SDMOData Link for subscribe

getSummary() method

Returns The value of the appropriate SDMODData element.

Syntax

```
public abstract String getSummary ()
```

Returns

The value of the appropriate SDMODData element

getTitle() method

Returns The value of the appropriate SDMODData element.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate SDMODData element

putComplexPropertyValue(String, String...) method

Puts the new property element as a sub-element of the 'complex properties' SDMODData element.

Syntax

```
public abstract void putComplexPropertyValue (
    String propertyValue,
    String... propertyName
)
```

Parameters

- **propertyName** – The route of the property with or without name-space until the complex type.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putId(String) method

Sets id of this SDMOData Entry document (value of appropriate SDMOData Id element)

Syntax

```
public abstract void putId (String id) throws
IllegalArgumentException
```

Parameters

- **id** – The new id.

putPropertyValue(String, String) method

Puts the new property element as a sub-element of the 'properties' SDMOData element.

Syntax

```
public abstract void putPropertyValue (
    String propertyName,
    String propertyValue
)
```

Parameters

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putPropertyValue(String, String, boolean) method

Puts the new property element as a sub-element of the 'properties' SDMOData element.

Syntax

```
public abstract void putPropertyValue (
    String propertyName,
    String propertyValue,
    boolean useDefaultPrefix
)
```

Parameters

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.

- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

setAuthorName(String) method

Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.

Syntax

```
public abstract void setAuthorName (String authorName)
```

Parameters

- **authorName** – The new value of the element

setCachestate(cacheState) method

Syntax

```
public void setCachestate (cacheState cachestate)
```

setCacheTimestamp(Long) method

Syntax

```
public void setCacheTimestamp (Long timestamp)
```

setCollectionId(String) method

Maintains the Id of the SDMOCata Collection that this Entry belongs to.

Syntax

```
public abstract void setCollectionId (String collectionId)
```

Parameters

- **collectionId** – The Id of the SDMOCata Collection that this Entry belongs to

setIsLocal(boolean) method

Syntax

```
public void setIsLocal (boolean isLocal)
```

setSchema(ISDMODataSchema) method

Maintains the reference to the appropriate SDMOData Schema object.

Syntax

```
public abstract void setSchema (ISDMODataSchema schema)
```

Parameters

- **schema** – The appropriate SDMOData Schema object.

setSummary(String) method

Sets the value of the appropriate SDMOData element.

Syntax

```
public abstract void setSummary (String summary)
```

Parameters

- **summary** – The new value of the element

setTitle(String) method

Sets the value of the appropriate SDMOData element.

Syntax

```
public abstract void setTitle (String title)
```

Parameters

- **title** – The new value of the element

ATTRIBUTE_SEMANTICS variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_TERM variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_TERM
```

ATTRIBUTE_VALUE_SEMANTICS_ACTION variable

Value option for appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_VALUE_SEMANTICS_ACTION
```

ELEMENT_AUTHOR variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_AUTHOR
```

ELEMENT_CATEGORY variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_CATEGORY
```

ELEMENT_CONTENT variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_CONTENT
```

ELEMENT_ENTRY variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ENTRY
```

ELEMENT_LINK variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_LINK
```

ELEMENT_NAME variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_NAME
```

***ELEMENT_PROPERTIES* variable**

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_PROPERTIES
```

***ELEMENT_SUMMARY* variable**

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_SUMMARY
```

***ELEMENT_TITLE* variable**

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_TITLE
```

***ELEMENT_UPDATED* variable**

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_UPDATED
```

PROPERTY_LEVEL_SEPARATOR* variable**Syntax***

```
public static final String PROPERTY_LEVEL_SEPARATOR
```

***ISDMODataError* interface**

Deprecated. since 3.0, Use `IODataError` Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataError extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataError* on page 1349

Members

All members of ISDMODataError, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ERROR	Name of the appropriate SDMOData element.
public static final String	ATTRIBUTE_LANGUAGE	Name of the appropriate SDMOData attribute.
public static final String	ELEMENT_ERRORCODE	Name of the appropriate SDMOData element.
public static final String	ELEMENT_MESSAGE	Name of the appropriate SDMOData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getErrorCode()</i> on page 925	Returns The value of the 'code' SDMOData element.
public abstract String	<i>getLang()</i> on page 925	Returns The value of the appropriate SDMOData attribute of the 'message' element.
public abstract String	<i>getMessage()</i> on page 926	Return the localized error message.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getErrorCode() method

Returns The value of the 'code' SDMODData element.

Syntax

```
public abstract String getErrorCode ()
```

Returns

The value of the 'code' SDMODData element

getLang() method

Returns The value of the appropriate SDMODData attribute of the 'message' element.

Syntax

```
public abstract String getLang ()
```

Returns

The value of the appropriate SDMODData attribute of the 'message' element

getMessage() method

Return the localized error message.

Syntax

```
public abstract String getMessage ()
```

Returns

The value of the 'message' SDMODData element

ATTRIBUTE_LANGUAGE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_LANGUAGE
```

ELEMENT_ERROR variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_ERROR
```

ELEMENT_ERRORCODE variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_ERRORCODE
```

ELEMENT_MESSAGE variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_MESSAGE
```

ISDMODDataFunctionImport interface

Deprecated. since 3.0, Use IODataFunctionImport Represents the 'FunctionImport' SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataFunctionImport extends
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataFunctionImport* on page 1364

Members

All members of ISDMODataFunctionImport, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_FUNCTIONALIMPORT	Name of the appropriate SDMOData element.
public static final String	ELEMENT_PARAMETER	Name of the appropriate SDMOData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_ACTION_FOR	Name of the appropriate SDMSDMOData attribute.
public static final String	ATTRIBUTE_RETURNTYPE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_HTTPMETHOD	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_ENTITYSET	Name of the appropriate SDMOData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getActionFor()</i> on page 933	Returns The value of the appropriate SDMOData attribute.
public abstract String	<i>getCollectionId()</i> on page 933	Returns The value of the 'EntitySet' SDMOData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getEntitySet()</i> on page 934	Returns The value of the 'EntitySet' SDMODData attribute.
public abstract String	<i>getExecutionUrl(Map< String, String >)</i> on page 934	Calculate the full execution URL for executing this Function Import according to the passed paramteres.
public abstract String	<i>getHTTPMethod()</i> on page 934	Returns The value of the appropriate SDMODData attribute.
public abstract List< String >	<i>getInputParameterNames()</i> on page 934	Returns The list of the appropriate SDMODData element with 'In' or 'InOut' attribute value.
public abstract String	<i>getName()</i> on page 935	Returns The value of the appropriate SDMODData attribute.
public abstract List< String >	<i>getOutputParameterNames()</i> on page 935	Returns The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value.
public abstract List< ISDMO-DataParameter >	<i>getParameters()</i> on page 935	Returns The list of the appropriate SDMODData element.
public abstract String	<i>getReturnType()</i> on page 935	Returns The value of the appropriate SDMODData attribute.
public RETURNTYPE_ENUM	<i>getReturnTypeEnum()</i> on page 935	Returns The return type of this Function Import SDMODData document.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getActionFor() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getActionFor ()
```

Returns

The value of the appropriate SDMOData attribute

getCollectionId() method

Returns The value of the 'EntitySet' SDMOData attribute.

Syntax

```
public abstract String getCollectionId ()
```

Returns

The value of the 'EntitySet' SDMOData attribute

getEntitySet() method

Returns The value of the 'EntitySet' SDMOData attribute.

Syntax

```
public abstract String getEntitySet ()
```

Returns

The value of the 'EntitySet' SDMOData attribute

getExecutionUrl(Map< String, String >) method

Calculate the full execution URL for executing this Function Import according to the passed paramteres.

Syntax

```
public abstract String getExecutionUrl (Map< String, String >  
parameters)
```

Returns

The full execution URL

getHTTPMethod() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getHTTPMethod ()
```

Returns

The value of the appropriate SDMOData attribute

getInputParameterNames() method

Returns The list of the appropriate SDMOData element with 'In' or 'InOut' attribute value.

Syntax

```
public abstract List< String > getInputParameterNames ()
```

Returns

The list of the appropriate SDMOData element with 'In' or 'InOut' attribute value

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getOutputParameterNames() method

Returns The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value.

Syntax

```
public abstract List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value

getParameters() method

Returns The list of the appropriate SDMODData element.

Syntax

```
public abstract List< ISDMODDataParameter > getParameters ()
```

Returns

The list of the appropriate SDMODData element

getReturnType() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getReturnType ()
```

Returns

The value of the appropriate SDMODData attribute

getReturnTypeEnum() method

Returns The return type of this Function Import SDMODData document.

Syntax

```
public RETURNSTYPE_ENUM getReturnTypeEnum ()
```

Returns

The return type of this Function Import SDMOData document

ATTRIBUTE_ACTION_FOR variable

Name of the appropriate SDMSDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_ACTION_FOR
```

ATTRIBUTE_ENTITYSET variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYSET
```

ATTRIBUTE_HTTPMETHOD variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_HTTPMETHOD
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_RETURNTYPE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_RETURNTYPE
```

ELEMENT_FUNCTIONALIMPORT variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

ELEMENT_PARAMETER variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_PARAMETER
```

ISDMODDataIcon interface

Deprecated. since 3.0, Use IODataIcon Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public interface ISDMODDataIcon extends ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataIcon* on page 1383

Members

All members of ISDMODDataIcon, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_ICON	Name of the appropriate SDMSDMODData element.
public static final String	ATTRIBUTE_WIDTH	Name of the appropriate SDMSDMODData attribute.
public static final String	ATTRIBUTE_HEIGHT	Name of the appropriate SDMSDMODData attribute.

Methods

Modifier and Type	Method	Description
public int	<i>getHeight()</i> on page 943	Returns The value of the appropriate SDMODData attribute.
public String	<i>getUrl()</i> on page 943	Returns The value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public int	<i>getWidth()</i> on page 943	Returns The value of the appropriate SDMOData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.

Modifier and Type	Member	Description
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getHeight() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public int getHeight ()
```

Returns

The value of the appropriate SDMOData attribute

getUrl() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getUrl ()
```

Returns

The value of the appropriate SDMOData attribute

getWidth() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public int getWidth ()
```

Returns

The value of the appropriate SDMOData attribute

ATTRIBUTE_HEIGHT variable

Name of the appropriate SDMSDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_HEIGHT
```

ATTRIBUTE_WIDTH variable

Name of the appropriate SDMSDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_WIDTH
```

ELEMENT_ICON variable

Name of the appropriate SDMSMODData element.

Syntax

```
public static final String ELEMENT_ICON
```

ISDMODDataLink interface

Deprecated. since 3.0, Use IODataLink Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataLink extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataLink* on page 1399

Members

All members of ISDMODDataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_LINK	Name of the appropriate SDMODData element.
public static final String	ELEMENT_INLINE	Name of the appropriate SDMODData element.
public static final String	ELEMENT_PARAMETER	Name of the appropriate SDMODData element.
public static final String	ELEMENT_PARAMETER- SET	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_REL_VAL- UE_EDIT	Value option for the appropriate SDMODData parameter.
public static final String	ATTRIBUTE_REL_VAL- UE_SELF	Value option for the appropriate SDMODData parameter.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_HREF	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_REL	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_TITLE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_VALUE-PART_RELATED	String that should be part of every rel attribute of a Related Data Link.
public static final String	ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION	String that should be end of every rel attribute of a Subscription Link.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getHref()</i> on page 951	Returns the value of the appropriate SDMOData attribute.
public abstract List< ISDMODataEntry >	<i>getInlineEntries()</i> on page 951	Returns the list of SDMOData Entries contained by the appropriate SDMOData 'inline' element.
public abstract List< String >	<i>getInputParameterNames()</i> on page 952	Returns the list of the appropriate SDMOData Parameter elements that should be used as input parameter.
public abstract List< String >	<i>getOutputParameterNames()</i> on page 952	Returns the list of the appropriate SDMOData Parameter elements that should be used as output parameter.
public abstract List< ISDMODataParameter >	<i>getParameters()</i> on page 952	Returns the list of the appropriate SDMOData Parameter elements.

Modifier and Type	Method	Description
public abstract String	<i>getRel()</i> on page 952	Returns the value of the appropriate SDMODData attribute.
public abstract ISDMODData-Schema	<i>getSchema()</i> on page 953	Returns the Schema that is to be used for 'Inline entries'.
public abstract String	<i>getSemantics()</i> on page 953	Returns The value of the appropriate SDMODData extension (vCard) attribute.
public abstract String	<i>getTargetCollectionId()</i> on page 953	Returns the Id of the collection that this link points to (if any)
public abstract String	<i>getTitle()</i> on page 953	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getUrl()</i> on page 953	Returns the full URL for this SDMODData Link object without parameters.
public abstract String	<i>getUrlWithParameters(Map<String, String >)</i> on page 954	Returns the full URL for this SDMODData Link object extended with the given parameter names and values.
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 954	Sets the Schema that is to be used for 'Inline entries'.
public abstract void	<i>setTargetCollectionId(String)</i> on page 954	Maintains the Id of the collection that this link points to (if any)

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getHref() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getHref ()
```

Returns

The value of the appropriate SDMODData attribute

getInlineEntries() method

Returns the list of SDMODData Entries contained by the appropriate SDMODData 'inline' element.

Syntax

```
public abstract List< ISDMODDataEntry > getInlineEntries ()
```

Returns

The List of 'inline' SDMODData Entries

getInputParameterNames() method

Returns the list of the appropriate SDMOData Parameter elements that should be used as input parameter.

Syntax

```
public abstract List< String > getInputParameterNames ()
```

Returns

The list of the appropriate SDMOData Parameter elements that should be used as input parameter

getOutputParameterNames() method

Returns the list of the appropriate SDMOData Parameter elements that should be used as output parameter.

Syntax

```
public abstract List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate SDMOData Parameter elements that should be used as output parameter

getParameters() method

Returns the list of the appropriate SDMOData Parameter elements.

Syntax

```
public abstract List< ISDMODataParameter > getParameters ()
```

Returns

The list of the appropriate SDMOData Parameter elements

getRel() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getRel ()
```

Returns

The value of the appropriate SDMOData attribute

getSchema() method

Returns the Schema that is to be used for 'Inline entries'.

Syntax

```
public abstract ISDMODataSchema getSchema ()
```

Returns

The relevant schema

getSemantics() method

Returns The value of the appropriate SDMODData extension (vCard) attribute.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate SDMODData extension (vCard) attribute

getTargetCollectionId() method

Returns the Id of the collection that this link points to (if any)

Syntax

```
public abstract String getTargetCollectionId ()
```

Returns

The Id of the collection that this link points to

getTitle() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate SDMODData attribute

getUrl() method

Returns the full URL for this SDMODData Link object without parameters.

Syntax

```
public abstract String getUrl ()
```

Returns

The full URL of this link without parameters

getUrlWithParameters(Map< String, String >) method

Returns the full URL for this SDMOData Link object extended with the given parameter names and values.

Syntax

```
public abstract String getUrlWithParameters (Map< String,  
String > parameters)
```

Returns

The full URL of this link with parameters

setSchema(ISDMODataSchema) method

Sets the Schema that is to be used for 'Inline entries'.

Syntax

```
public abstract void setSchema (ISDMODataSchema schema)
```

Parameters

- **schema** – The relevant schema

setTargetCollectionId(String) method

Maintains the Id of the collection that this link points to (if any)

Syntax

```
public abstract void setTargetCollectionId (String  
targetCollectionId)
```

Parameters

- **targetCollectionId** – The Id of the collection that this link points to

ATTRIBUTE_HREF variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_HREF
```

ATTRIBUTE_REL variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_REL
```

ATTRIBUTE_REL_VALUE_EDIT variable

Value option for the appropriate SDMOData parameter.

Syntax

```
public static final String ATTRIBUTE_REL_VALUE_EDIT
```

ATTRIBUTE_REL_VALUE_SELF variable

Value option for the appropriate SDMOData parameter.

Syntax

```
public static final String ATTRIBUTE_REL_VALUE_SELF
```

ATTRIBUTE_SEMANTICS variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_TITLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_TITLE
```

ATTRIBUTE_VALUEPART_RELATED variable

String that should be part of every rel attribute of a Related Data Link.

Syntax

```
public static final String ATTRIBUTE_VALUEPART_RELATED
```

ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION variable

String that should be end of every rel attribute of a Subscription Link.

Syntax

```
public static final String ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION
```

ELEMENT_INLINE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_INLINE
```

ELEMENT_LINK variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_LINK
```

ELEMENT_PARAMETER variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_PARAMETER
```

ELEMENT_PARAMETERSET variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_PARAMETERSET
```

ISDMODataNavigationProperty interface

Deprecated. since 3.0, Use IODataNavigationProperty Represents the appropriate SDMOData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataNavigationProperty extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataNavigationProperty* on page 1419

Members

All members of ISDMODataNavigationProperty, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_NAVIGATION-PROPERTY	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_RELATIONSHIP	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_FROMROLE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_TOROLE	Name of the appropriate SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getFromRole()</i> on page 962	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getName()</i> on page 962	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getRelationship()</i> on page 963	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getToRole()</i> on page 963	Returns The value of the appropriate SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.

Modifier and Type	Member	Description
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getFromRole() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getFromRole ()
```

Returns

The value of the appropriate SDMODData attribute

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getRelationship() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getRelationship ()
```

Returns

The value of the appropriate SDMODData attribute

getToRole() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getToRole ()
```

Returns

The value of the appropriate SDMODData attribute

ATTRIBUTE_FROMROLE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_FROMROLE
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_RELATIONSHIP variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_RELATIONSHIP
```

ATTRIBUTE_TOROLE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_TOROLE
```

***ELEMENT_NAVIGATIONPROPERTY* variable**

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_NAVIGATIONPROPERTY
```

***ISDMODDataOpenSearchDescription* interface**

Deprecated. since 3.0, Use IODataOpenSearchDescription Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataOpenSearchDescription
extends ISDMParserDocument,
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataOpenSearchDescription* on page 1435

Members

All members of ISDMODDataOpenSearchDescription, including inherited members.

Variables

Modifier and Type	Variable	Description
public static final String	ELEMENT_OPENSEARCH-DESCRIPTION	Name of the appropriate SDMODData element.
public static final String	ELEMENT_SHORTNAME	Name of the appropriate SDMODData element.
public static final String	ELEMENT_DESCRIPTION	Name of the appropriate SDMODData element.
public static final String	ELEMENT_URL	Name of the appropriate SDMODData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getDescription()</i> on page 970	Returns The value of the appropriate SDMOData element.
public abstract String	<i>getShortName()</i> on page 970	Returns The value of the appropriate SDMOData element.
public abstract List< ISDMO-DataURL >	<i>getUrls()</i> on page 970	Returns The list of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getDescription() method

Returns The value of the appropriate SDMODData element.

Syntax

```
public abstract String getDescription ()
```

Returns

The value of the appropriate SDMODData element

getShortName() method

Returns The value of the appropriate SDMODData element.

Syntax

```
public abstract String getShortName ()
```

Returns

The value of the appropriate SDMODData element

getUrls() method

Returns The list of the appropriate SDMODData element.

Syntax

```
public abstract List< ISDMODDataURL > getUrls ()
```

Returns

The list of the appropriate SDMODData element

ELEMENT_DESCRIPTION variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_DESCRIPTION
```

ELEMENT_OPENSEARCHDESCRIPTION variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_OPENSEARCHDESCRIPTION
```

ELEMENT_SHORTNAME variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_SHORTNAME
```

ELEMENT_URL variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_URL
```

ISDMODDataParameter interface

Deprecated. since 3.0, Use IODataParameter Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataParameter extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataParameter* on page 1451

Members

All members of ISDMODDataParameter, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_PARAMETER	Name of the appropriate SDMODData element.
public static final String	VALUE_MODE_IN	Value option for the 'Mode' SDMODData attribute.
public static final String	VALUE_MODE_OUT	Value option for the 'Mode' SDMODData attribute.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_MODE	Name of the appropriate SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getMode()</i> on page 977	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getName()</i> on page 977	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getType()</i> on page 977	Returns The value of the appropriate SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.

public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getMode() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getMode ()
```

Returns

The value of the appropriate SDMOData attribute

getName() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMOData attribute

getType() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getType ()
```

Returns

The value of the appropriate SDMOData attribute

ATTRIBUTE_MODE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_MODE
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_TYPE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

ELEMENT_PARAMETER variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_PARAMETER
```

VALUE_MODE_IN variable

Value option for the 'Mode' SDMODData attribute.

Syntax

```
public static final String VALUE_MODE_IN
```

VALUE_MODE_OUT variable

Value option for the 'Mode' SDMODData attribute.

Syntax

```
public static final String VALUE_MODE_OUT
```

ISDMODDataProperty interface

Deprecated. since 3.0, Use IODataProperty Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataProperty extends
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataProperty* on page 1466

Members

All members of ISDMODataProperty, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_PROPERTY	Name of the appropriate SDMOData element.
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_NULLABLE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_FIXED-LENGTH	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_LABEL	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_CREATABLE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_UPDATABLE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_DELETABLE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_SEARCHABLE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_FILTERABLE	Name of the appropriate SDMOData attribute.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_UNICODE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_DEFAULTVALUE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_PRECISION	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_SCALE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_COLLATION	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_MAXLENGTH	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_USEINSEARCH	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_VISIBLEINLIST	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_VISIBLEINDEXTAIL	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_LIST_DISPLAYORDER	Name of the display-order SDMODData attribute.
public static final String	ATTRIBUTE_DETAIL_DISPLAYORDER	Name of the display-order SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract List< ISDMODataProperty >	<i>getChildPropertiesData()</i> on page 987	Returns all the child properties added to this document with putChildProperty method.
public abstract List< ISDMODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 988	Returns list of appropriate contained Property SDMODData elements with the given attribute value.

Modifier and Type	Method	Description
public abstract List< ISDMODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 988	Returns list of appropriate contained Property SDMODData elements with the given attribute value.
public abstract ISDMODataProperty	<i>getChildPropertyData(String)</i> on page 989	Return a single child property added with putChildProperty method.
public abstract String	<i>getCollation()</i> on page 989	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getDefault Value()</i> on page 989	Returns the value of the appropriate SDMODData attribute.
public abstract int	<i>getDetailDisplayOrder()</i> on page 989	In current version it return the same value as getListDisplayOrder.
public abstract String	<i>getLabel()</i> on page 990	Returns The value of the appropriate SDMODData attribute.
public abstract int	<i>getListDisplayOrder()</i> on page 990	In current version it returns the same value as getDetailDisplayOrder.
public abstract int	<i>getMaxLength()</i> on page 990	Returns the value of the appropriate SDMODData attribute with default Value = 0;.
public abstract String	<i>getName()</i> on page 990	Returns The value of the appropriate SDMODData attribute.
public abstract String	<i>getPrecision()</i> on page 990	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getScale()</i> on page 991	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getSemantics()</i> on page 991	Returns the value of the appropriate SDMODData attribute with default Value = 0;.
public abstract String	<i>getType()</i> on page 991	Returns The value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public abstract String	<i>getValue()</i> on page 991	Returns the value of the property if there is a single property instance that is represented by this object and value is set with <i>setValue</i> method.
public abstract boolean	<i>hasFixedLength()</i> on page 992	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isComplex()</i> on page 992	Returns if the property has complex type and has child properties.
public abstract boolean	<i>isCreatable()</i> on page 992	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isDeletable()</i> on page 992	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isFilterable()</i> on page 992	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isNullable()</i> on page 993	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isSearchable()</i> on page 993	Returns The value of the appropriate SDMODData attribute.
public abstract boolean	<i>isUnicode()</i> on page 993	Returns the value of the appropriate SDMODData attribute.
public abstract boolean	<i>isUpdatable()</i> on page 993	Returns The value of the appropriate SDMODData attribute.
public abstract void	<i>putChildPropertyData(ISDMODDataProperty)</i> on page 994	Put new child property to this property document.
public abstract void	<i>setValue(String)</i> on page 994	Sets the value of the property, represented by this object.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Usage

May contain additional data retrieved from several source documents

getChildPropertiesData() method

Returns all the child properties added to this document with putChildProperty method.

Syntax

```
public abstract List< ISDMODataProperty >
getChildPropertiesData ()
```

Returns

List of child properties.

getChildPropertiesDataWithAttribute(String, String) method

Returns list of appropriate contained Property SDMODData elements with the given attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >  
getChildPropertiesDataWithAttribute (  
    String attributeName,  
    String attributeValue  
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

Returns

list of appropriate contained Property SDMODData elements with the given attribute value

getChildPropertiesDataWithAttribute(String, String, boolean) method

Returns list of appropriate contained Property SDMODData elements with the given attribute value.

Syntax

```
public abstract List< ISDMODDataProperty >  
getChildPropertiesDataWithAttribute (  
    String attributeName,  
    String attributeValue,  
    boolean addByDefault  
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

Returns

list of appropriate contained Property SDMODData elements with the given attribute value

getChildPropertyData(String) method

Return a single child property added with putChildProperty method.

Syntax

```
public abstract ISDMODataProperty getChildPropertyData
(String propertyName)
```

Parameters

- **propertyName** – The name of the child property that should be returned.

Returns

The found child property or null if there is no child property with the given name.

getCollation() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getCollation ()
```

Returns

The value of the appropriate SDMOData attribute

getDefaultValue() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getDefaultValue ()
```

Returns

The value of the appropriate SDMOData attribute

getDetailDisplayOrder() method

In current version it return the same value as getListDisplayOrder.

Syntax

```
public abstract int getDetailDisplayOrder ()
```

Returns

The value of 'display-order' attribute with defaultValue = 0;

getLabel() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getLabel ()
```

Returns

The value of the appropriate SDMODData attribute

getListDisplayOrder() method

In current version it returns the same value as getDetailDisplayOrder.

Syntax

```
public abstract int getListDisplayOrder ()
```

Returns

The value of 'display-order' attribute with defaultValue = 0;

getMaxLength() method

Returns the value of the appropriate SDMODData attribute with defaultValue = 0;.

Syntax

```
public abstract int getMaxLength ()
```

Returns

The value of the appropriate SDMODData attribute with defaultValue = 0;

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getPrecision() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getPrecision ()
```

Returns

The value of the appropriate SDMOData attribute

getScale() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getScale ()
```

Returns

The value of the appropriate SDMOData attribute

getSemantics() method

Returns the value of the appropriate SDMOData attribute with default value = 0;.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate SDMOData attribute with default value = 0;

getType() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getType ()
```

Returns

The value of the appropriate SDMOData attribute

getValue() method

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

Syntax

```
public abstract String getValue ()
```

Returns

the value of the property instance represented by this object.

Remarks

Otherwise it returns null.

Typically this object contains value only if this object was returned by an SDMODData Entry.

hasFixedLength() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean hasFixedLength ()
```

Returns

The value of the appropriate SDMODData attribute

isComplex() method

Returns if the property has complex type and has child properties.

Syntax

```
public abstract boolean isComplex ()
```

Returns

true if the property has complex type and has child properties.

isCreatable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isCreatable ()
```

Returns

The value of the appropriate SDMODData attribute

isDeletable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isDeletable ()
```

Returns

The value of the appropriate SDMODData attribute

isFilterable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public abstract boolean isFilterable ()
```

Returns

The value of the appropriate SDMOData attribute

isNullable() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract boolean isNullabe ( )
```

Returns

The value of the appropriate SDMOData attribute

isSearchable() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract boolean isSearchable ( )
```

Returns

The value of the appropriate SDMOData attribute

isUnicode() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract boolean isUnicode ( )
```

Returns

The value of the appropriate SDMOData attribute

isUpdatable() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public abstract boolean isUpdatable ( )
```

Returns

The value of the appropriate SDMOData attribute

putChildPropertyData(ISDMODataProperty) method

Put new child property to this property document.

Syntax

```
public abstract void putChildPropertyData (ISDMODataProperty  
property)
```

Parameters

- **property** – The child property

setValue(String) method

Sets the value of the property, represented by this object.

Syntax

```
public abstract void setValue (String value)
```

Parameters

- **value** – The value of the property instance represented by this object.

Remarks

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an SDMODData Entry object.

ATTRIBUTE_COLLATION variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_COLLATION
```

ATTRIBUTE_CREATABLE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_CREATABLE
```

ATTRIBUTE_DEFAULTVALUE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_DEFAULTVALUE
```

ATTRIBUTE_DELETABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_DELETABLE
```

ATTRIBUTE_DETAIL_DISPLAYORDER variable

Name of the display-order SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_DETAIL_DISPLAYORDER
```

ATTRIBUTE_FILTERABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_FILTERABLE
```

ATTRIBUTE_FIXEDLENGTH variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_FIXEDLENGTH
```

ATTRIBUTE_LABEL variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_LABEL
```

ATTRIBUTE_LIST_DISPLAYORDER variable

Name of the display-order SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_LIST_DISPLAYORDER
```

ATTRIBUTE_MAXLENGTH variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_MAXLENGTH
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_NULLABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NULLABLE
```

ATTRIBUTE_PRECISION variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_PRECISION
```

ATTRIBUTE_SCALE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SCALE
```

ATTRIBUTE_SEARCHABLE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEARCHABLE
```

ATTRIBUTE_SEMANTICS variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ATTRIBUTE_TYPE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

ATTRIBUTE_UNICODE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_UNICODE
```

ATTRIBUTE_UPDATABLE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_UPDATABLE
```

ATTRIBUTE_USEINSEARCH variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_USEINSEARCH
```

ATTRIBUTE_VISIBLEINDETAIL variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_VISIBLEINDETAIL
```

ATTRIBUTE_VISIBLEINLIST variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_VISIBLEINLIST
```

ELEMENT_PROPERTY variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_PROPERTY
```

ISDMODDataSchema interface

Deprecated. since 3.0, Use IODataSchema Represents the SDMODData Service Document.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataSchema extends
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODataSchema* on page 1552

Members

All members of ISDMODataSchema, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_NAME	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_ENTITYTYPE	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_ENTITYSET	Name of the appropriate SDMOData attribute.
public static final String	ATTRIBUTE_NAMESPACE	Name of the appropriate SDMOData attribute.
public static final String	ELEMENT_EDMX	Name of the appropriate SDMOData element.
public static final String	ELEMENT_DATASERVICES	Name of the appropriate SDMOData element.
public static final String	ELEMENT_SCHEMA	Name of the appropriate SDMOData element.
public static final String	ELEMENT_ENTITYCONTAINER	Name of the appropriate SDMOData element.
public static final String	ELEMENT_ENTITYSET	Name of the appropriate SDMOData element.
public static final String	ACTION_FOR	name of the appropriate SDMOData attribute
public static final String	ELEMENT_FUNCTIONALIMPORT	Name of the appropriate SDMOData element.

Modifier and Type	Variable	Description
public static final String	ELEMENT_COMPLEXTYPE	Name of the appropriate SDMODData element.
public static final String	ELEMENT_ENTITYTYPE	Name of the appropriate SDMODData element.

Methods

Modifier and Type	Method	Description
public abstract ISDMODDataAssociation	<i>getAssociation(String)</i> on page 1005	Returns the appropriate SDMODData Association element with the given relationship attribute.
public abstract List< ISDMODDataAssociation >	<i>getAssociations()</i> on page 1005	Returns the list of the appropriate SDMODData elements.
public abstract ISDMODDataAssociationSet	<i>getAssociationSet(String)</i> on page 1005	Returns the appropriate AssociationSet with for given association.
public abstract List< ISDMODDataAssociationSet >	<i>getAssociationSets()</i> on page 1006	Returns the list of the appropriate SDMODData elements.
public abstract ISDMODDataComplexType	<i>getComplexType(String)</i> on page 1006	Returns The 'ComplexType' SDMODData element associated with the reference.
public abstract List< ISDMODDataComplexType >	<i>getComplexTypes()</i> on page 1006	Returns The list of the appropriate SDMODData element.
public abstract ISDMODDataEntitySet	<i>getEntitySet(String)</i> on page 1006	Returns The appropriate SDMODData EntitySet.
public abstract ISDMODDataEntityType	<i>getEntityType(String)</i> on page 1007	Returns The 'EntityType' SDMODData element associated with the reference argument.
public abstract ISDMODDataEntityType	<i>getEntityTypeForCollection(String)</i> on page 1007	Returns the 'EntityType' SDMODData element contained by the 'EntitySet' element that is associated with the collectionId matching.
public abstract List< ISDMODDataFunctionImport >	<i>getFunctionImports()</i> on page 1007	Returns The list of the 'FunctionImport' SDMODData element.

Modifier and Type	Method	Description
public abstract List< ISDMODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 1008	Returns List of FunctionImports valid for the appropriate collection.
public abstract ISDMODataServiceDocument	<i>getServiceDocument()</i> on page 1008	Returns the appropriate SDMOData Service Document.
public abstract String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 1008	Resolves the target collection Id of the given SDMOData Navigation Property element.
public abstract void	<i>setServiceDocument(ISDMODataServiceDocument)</i> on page 1009	Maintains reference to the appropriate SDMOData Service Document.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List<String>, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getAssociation(String) method

Returns the appropriate SDMOData Association element with the given relationship attribute.

Syntax

```
public abstract ISDMODataAssociation getAssociation (String
relationShip)
```

getAssociations() method

Returns the list of the appropriate SDMOData elements.

Syntax

```
public abstract List< ISDMODataAssociation > getAssociations
()
```

Returns

List of the appropriate SDMOData elements

getAssociationSet(String) method

Returns the appropriate AssociationSet with for given association.

Syntax

```
public abstract ISDMODataAssociationSet getAssociationSet
(String association)
```

Parameters

- **association** – The association of the AssociationSet

Returns

The appropriate AssociationSet with for given association

getAssociationSets() method

Returns the list of the appropriate SDMODData elements.

Syntax

```
public abstract List< ISDMODDataAssociationSet >  
getAssociationSets ()
```

Returns

List of the appropriate SDMODData elements

getComplexType(String) method

Returns The 'ComplexType' SDMODData element associated with the reference.

Syntax

```
public abstract ISDMODDataComplexType getComplexType (String  
complexTypeReference)
```

Parameters

- **complexTypeReference** – Reference to the appropriate Complex Type (example: 'namespace.complextypename')

Returns

The 'ComplexType' SDMODData element associated with the reference

getComplexTypes() method

Returns The list of the appropriate SDMODData element.

Syntax

```
public abstract List< ISDMODDataComplexType > getComplexTypes  
( )
```

Returns

The list of the appropriate SDMODData element

getEntitySet(String) method

Returns The appropriate SDMODData EntitySet.

Syntax

```
public abstract ISDMODDataEntitySet getEntitySet (String  
collectionId)
```

Parameters

- **collectionId** – The href of the collection to find the SDMOData EntitySet for

Returns

The appropriate SDMOData EntitySet

getEntityType(String) method

Returns The 'EntityType' SDMOData element associated with the reference argument.

Syntax

```
public abstract ISDMODataEntityType getEntityType (String
entityTypeReference)
```

Parameters

- **entityTypeReference** – Reference to the appropriate Entity Type (example: 'namespace.entitytypename')

Returns

The 'EntityType' SDMOData element associated with the reference argument

getEntityTypeForCollection(String) method

Returns the 'EntityType' SDMOData element contained by the 'EntitySet' element that is associated with the collectionId matching.

Syntax

```
public abstract ISDMODataEntityType getEntityTypeForCollection
(String collectionId)
```

Parameters

- **collectionId** – The Id to be compared with the name of 'EntitySet' elements

Returns

The matching EntityType

getFunctionImports() method

Returns The list of the 'FunctionImport' SDMOData element.

Syntax

```
public abstract List< ISDMODataFunctionImport >
getFunctionImports ()
```

Returns

The list of the 'FunctionImport' SDMOData element

getFunctionImportsForCollection(String) method

Returns List of FunctionImports valid for the appropriate collection.

Syntax

```
public abstract List< ISDMODataFunctionImport >  
getFunctionImportsForCollection (String collectionId)
```

Parameters

- **collectionId** – The href of the appropriate collection.

Returns

List of FunctionImports valid for the appropriate collection.

getServiceDocument() method

Returns the appropriate SDMOData Service Document.

Syntax

```
public abstract ISDMODataServiceDocument getServiceDocument ()
```

Returns

The appropriate SDMOData Service Document

getTargetCollectionIdForNavigationProperty(String, String) method

Resolves the target collection Id of the given SDMOData Navigation Property element.

Syntax

```
public abstract String  
getTargetCollectionIdForNavigationProperty (  
    String sourceCollectionId,  
    String navigationPropertyName  
)
```

Parameters

- **sourceCollectionId** – The source Id of the source collection that is linked with the target collection
- **navigationPropertyName** – The name of the Navigation Property

Returns

The Id of the target collection

setServiceDocument(ISDMODataServiceDocument) method
Maintains reference to the appropriate SDMOData Service Document.

Syntax

```
public abstract void setServiceDocument
(ISDMODataServiceDocument serviceDocument)
```

Parameters

- **serviceDocument** – The appropriate SDMOData Service Document

ACTION_FOR variable

name of the appropriate SDMOData attribute

Syntax

```
public static final String ACTION_FOR
```

ATTRIBUTE_ENTITYSET variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYSET
```

ATTRIBUTE_ENTITYTYPE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_ENTITYTYPE
```

ATTRIBUTE_NAME variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAME
```

ATTRIBUTE_NAMESPACE variable

Name of the appropriate SDMOData attribute.

Syntax

```
public static final String ATTRIBUTE_NAMESPACE
```

ELEMENT_COMPLEXTYPE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_COMPLEXTYPE
```

ELEMENT_DATASERVICES variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_DATASERVICES
```

ELEMENT_EDMX variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_EDMX
```

ELEMENT_ENTITYCONTAINER variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ENTITYCONTAINER
```

ELEMENT_ENTITYSET variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ENTITYSET
```

ELEMENT_ENTITYTYPE variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ENTITYTYPE
```

ELEMENT_FUNCTIONALIMPORT variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_FUNCTIONALIMPORT
```

***ELEMENT_SCHEMA* variable**

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_SCHEMA
```

***ISDMODDataServiceDocument* interface**

Deprecated. since 3.0, Use IODataServiceDocument Represents the SDMODData Service Document.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataServiceDocument extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataServiceDocument* on page 1572

Members

All members of ISDMODDataServiceDocument, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_SERVICE	Name of the appropriate SDMODData element.
public static final String	ELEMENT_WORKSPACE	Name of the appropriate SDMODData element.
public static final String	ELEMENT_COLLECTION	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_LANG	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_BASE	Name of the appropriate SDMODData attribute.

Modifier and Type	Variable	Description
public static final String	URL_SUFFIX_METADATA	URL value suffix for retrieving SDMODData Schema document.

Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataCollection >	<i>getAllCollections()</i> on page 1017	Returns the list of all 'collection' SDMODData element contained by the 'workspace' elements.
public abstract String	<i>getBaseUrl()</i> on page 1018	Returns The value of the 'base' SDMODData attribute.
public abstract String	<i>getEtag()</i> on page 1018	Returns The value of the 'etag' SDMODData attribute.
public abstract String	<i>getLanguage()</i> on page 1018	Returns the value of the 'lang' SDMODData attribute.
public abstract ISDMODDataOpenSearchDescription	<i>getOpenSearchDescription(String)</i> on page 1018	Returns the appropriate Open-Search Description Document for the given collection.
public abstract ISDMODDataSchema	<i>getSchema()</i> on page 1019	Returns the appropriate SDMO-Data Schema document.
public abstract String	<i>getSchemaUrl()</i> on page 1019	Returns The full URL that can be used for retrieving the SDMODData Schema document.
public abstract List< ISDMO-DataWorkspace >	<i>getWorkspaces()</i> on page 1019	Returns the list of appropriate SDMODData elements.
public abstract void	<i>setOpenSearchDescription(String, ISDMODDataOpenSearchDescription)</i> on page 1019	Maintains the appropriate OpenSearch Description Document for the given collection.
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 1020	Maintains the appropriate SDMODData Schema document.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getAllCollections() method

Returns the list of all 'collection' SDMOData element contained by the 'workspace' elements.

Syntax

```
public abstract List< ISDMODataCollection > getAllCollections()
()
```

Returns

The list of all 'collection' SDMOData element contained by the 'workspace' elements

getBaseUrl() method

Returns The value of the 'base' SDMOData attribute.

Syntax

```
public abstract String getBaseUrl ()
```

Returns

The value of the 'base' SDMOData attribute

getEtag() method

Returns The value of the 'etag' SDMOData attribute.

Syntax

```
public abstract String getEtag ()
```

Returns

The value of the 'etag' SDMOData attribute

getLanguage() method

Returns the value of the 'lang' SDMOData attribute.

Syntax

```
public abstract String getLanguage ()
```

Returns

The value of the 'lang' SDMOData attribute

getOpenSearchDescription(String) method

Returns the appropriate OpenSearch Description Document for the given collection.

Syntax

```
public abstract ISDMODataOpenSearchDescription  
getOpenSearchDescription (String collectionId)
```

Parameters

- **collectionId** – The Id of the collection

Returns

The appropriate OpenSearch Description Document

getSchema() method

Returns the appropriate SDMOData Schema document.

Syntax

```
public abstract ISDMODataSchema getSchema ()
```

Returns

The appropriate SDMOData Schema document

getSchemaUrl() method

Returns The full URL that can be used for retrieving the SDMOData Schema document.

Syntax

```
public abstract String getSchemaUrl ()
```

Returns

The full URL that can be used for retrieving the SDMOData Schema document

getWorkspaces() method

Returns the list of appropriate SDMOData elements.

Syntax

```
public abstract List< ISDMODataWorkspace > getWorkspaces ()
```

Returns

The list of appropriate SDMOData elements

setOpenSearchDescription(String, ISDMODataOpenSearchDescription) method

Maintains the appropriate OpenSearch Description Document for the given collection.

Syntax

```
public abstract void setOpenSearchDescription (
    String collectionId,
    ISDMODataOpenSearchDescription openSearchDescription
)
```

Parameters

- **collectionId** – The Id of the collection
- **openSearchDescription** – The appropriate OpenSearch Description Document

setSchema(ISDMODataSchema) method

Maintains the appropriate SDMODData Schema document.

Syntax

```
public abstract void setSchema (ISDMODataSchema schema)
```

Parameters

- **schema** – The appropriate SDMODData Schema document

ATTRIBUTE_BASE variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_BASE
```

ATTRIBUTE_LANG variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_LANG
```

ELEMENT_COLLECTION variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_COLLECTION
```

ELEMENT_SERVICE variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_SERVICE
```

ELEMENT_WORKSPACE variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_WORKSPACE
```

***URL_SUFFIX_METADATA* variable**

URL value suffix for retrieving SDMOData Schema document.

Syntax

```
public static final String URL_SUFFIX_METADATA
```

***ISDMODataSubscriptionEntry* interface**

Deprecated. since 3.0, Use IODataSubscriptionEntry Subclass of SDMODataEntry to be used for subscription s.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODataSubscriptionEntry extends  
ISDMODataEntry
```

Implemented interfaces

- *ISDMODataEntry* on page 895

Derived classes

- *SDMODataSubscriptionEntry* on page 1591

Members

All members of ISDMODataSubscriptionEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_DELIVERYADDRESS	Name of the appropriate SDMOData element.
public static final String	ELEMENT_COLLECTION	Name of the appropriate SDMOData element.
public static final String	ELEMENT_FILTER	Name of the appropriate SDMOData element.
public static final String	ELEMENT_SELECT	Name of the appropriate SDMOData element.

Methods

Modifier and Type	Method	Description
public abstract String	<i>getCollection()</i> on page 1032	Returns The value of the appropriate entry property.
public abstract String	<i>getDeliveryAddress()</i> on page 1033	Returns The value of the appropriate entry property.
public abstract String	<i>getFilter()</i> on page 1033	Returns The value of the appropriate entry property.
public abstract String	<i>getSelect()</i> on page 1033	Returns The value of the appropriate entry property.
public abstract void	<i>setCollection(String)</i> on page 1033	Sets the value of the appropriate entry property.
public abstract void	<i>setDeliveryAddress(String)</i> on page 1033	Sets the value of the appropriate entry property.
public abstract void	<i>setFilter(String)</i> on page 1034	Sets the value of the appropriate entry property.
public abstract void	<i>setSelect(String)</i> on page 1034	Sets the value of the appropriate entry property.

Inherited members from ISDMODataEntry

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 917	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 917	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 918	Value option for appropriate SDMODData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 918	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 918	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 918	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ENTRY</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_LINK</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_NAME</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_TITLE</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 919	Name of the appropriate SDMOData element.
public abstract List< ISDMO-DataLink >	<i>getActionLinks()</i> on page 905	Returns SDMOData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')
public abstract String	<i>getAuthorName()</i> on page 906	Returns The value of the 'name' SDMOData element of the 'author' SDMOData element.
public cacheState	<i>getCachestate()</i> on page 906	
public Long	<i>getCacheTimestamp()</i> on page 906	
public abstract String	<i>getCollectionId()</i> on page 906	Returns the Id of the SDMOCa-ta Collection that this Entry belongs to.
public abstract String	<i>getEtag()</i> on page 906	Returns the Id of the SDMODa-ta Collection that this Entry belongs to.

Modifier and Type	Member	Description
public abstract String	<i>getFilterUrl()</i> on page 907	Returns the full execution URL that can be used for filtering collection search for this single entry.
public abstract List< ISDMO-DataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 907	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' use-in-search (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 907	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 907	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.
public abstract List< ISDMO-DataIcon >	<i>getIcons()</i> on page 908	Returns the list of the appropriate SDMOData elements.
public abstract String	<i>getId()</i> on page 908	Returns The Id of this SDMO-Data Entry (value of appropriate SDMOData Id element)
public boolean	<i>getIsLocal()</i> on page 908	
public abstract Map< String, String >	<i>getKeyPropertyValues()</i> on page 908	Returns the values of the properties that are marked as key properties in the SDMOData Schema document.
public abstract Date	<i>getLastUpdated()</i> on page 908	Returns The parsed value of the 'updated' SDMOData Element.

Modifier and Type	Member	Description
public abstract List< ISDMO-DataLink >	<i>getLinks()</i> on page 909	Returns the list of the appropriate SDMOData elements.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesData()</i> on page 909	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-data Entry document.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 909	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract List< ISDMO-DataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 910	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public abstract ISDMParserDocument	<i>getPropertiesDocument()</i> on page 910	Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public abstract String	<i>getPropertyValue(String...)</i> on page 910	Returns the value of the appropriate property.
public abstract< T > T	<i>getPropertyValue-Parsed(String...)</i> on page 911	Returns the value of the appropriate property parsed to it's real type.
public abstract Map< String, String >	<i>getPropertyValues()</i> on page 912	Returns the all the values of properties contained by this SDMOData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

Modifier and Type	Member	Description
public abstract List< String >	<i>getPropertyValues(List< String[]>)</i> on page 912	Return list of property values for the given property paths.
public abstract List< ISDMO-DataLink >	<i>getRelatedDataLinks()</i> on page 912	Returns SDMOData Link objects that represents links to Related Data.
public abstract List< ISDMO-DataProperty >	<i>getSAPSearchableProperties-Data()</i> on page 913	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMO-Data Entry document with 'true' searchable (SAP name-space) attribute value.
public abstract ISDMOData-Schema	<i>getSchema()</i> on page 913	Returns the appropriate SDMO-Data Schema object.
public abstract ISDMOData-Link	<i>getSelfLink()</i> on page 913	Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public abstract ISDMOData-Link	<i>getSubscriptionLink()</i> on page 913	Returns SDMOData Link object that should be used for subscription or null if there is no subscription link defined.
public abstract String	<i>getSummary()</i> on page 914	Returns The value of the appropriate SDMOData element.
public abstract String	<i>getTitle()</i> on page 914	Returns The value of the appropriate SDMOData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 919	
public abstract void	<i>putComplexPropertyValue(String, String...)</i> on page 914	Puts the new property element as a sub-element of the 'complex properties' SDMOData element.
public abstract void	<i>putId(String)</i> on page 915	Sets id of this SDMOData Entry document (value of appropriate SDMOData Id element)

Modifier and Type	Member	Description
public abstract void	<i>putPropertyValue(String, String)</i> on page 915	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public abstract void	<i>putPropertyValue(String, String, boolean)</i> on page 915	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public abstract void	<i>setAuthorName(String)</i> on page 916	Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.
public void	<i>setCachestate(cache.State)</i> on page 916	
public void	<i>setCacheTimestamp(Long)</i> on page 916	
public abstract void	<i>setCollectionId(String)</i> on page 916	Maintains the Id of the SDMO-Cata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 916	
public abstract void	<i>setSchema(ISDMODDataSchema)</i> on page 917	Maintains the reference to the appropriate SDMODData Schema object.
public abstract void	<i>setSummary(String)</i> on page 917	Sets the value of the appropriate SDMODData element.
public abstract void	<i>setTitle(String)</i> on page 917	Sets the value of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getCollection() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getCollection ()
```

Returns

The value of the appropriate entry property

getDeliveryAddress() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getDeliveryAddress ()
```

Returns

The value of the appropriate entry property

getFilter() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getFilter ()
```

Returns

The value of the appropriate entry property

getSelect() method

Returns The value of the appropriate entry property.

Syntax

```
public abstract String getSelect ()
```

Returns

The value of the appropriate entry property

setCollection(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setCollection (String collection)
```

Parameters

- **collection** – The new value of the appropriate entry property

setDeliveryAddress(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setDeliveryAddress (String deliveryAddress)
```

Parameters

- **deliveryAddress** –

setFilter(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setFilter (String filterString)
```

Parameters

- **filterString** – The new value of the appropriate entry property

setSelect(String) method

Sets the value of the appropriate entry property.

Syntax

```
public abstract void setSelect (String selectString)
```

Parameters

- **selectString** – The new value of the appropriate entry property

ELEMENT_COLLECTION variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_COLLECTION
```

ELEMENT_DELIVERYADDRESS variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_DELIVERYADDRESS
```

ELEMENT_FILTER variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_FILTER
```

***ELEMENT_SELECT* variable**

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_SELECT
```

***ISDMODDataURL* interface**

Deprecated. since 3.0, Use IODataURL Represents the appropriate SDMODData element.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataURL extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataURL* on page 1625

Members

All members of ISDMODDataURL, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_URL	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_TEMPLATE	Name of the appropriate SDMODData attribute.
public static final String	ATTRIBUTE_TYPE	Name of the appropriate SDMODData attribute.

Methods

Modifier and Type	Method	Description
public abstract List< String >	<i>getMandatoryTemplateParameters()</i> on page 1041	Returns the list of mandatory template parameter names.

Modifier and Type	Method	Description
public abstract List< String >	<i>getOptionalTemplateParameters()</i> on page 1041	Returns the list of optional template parameter names.
public abstract String	<i>getTemplate()</i> on page 1041	Returns the value of the appropriate SDMODData attribute.
public abstract List< String >	<i>getTemplateParameters()</i> on page 1042	Returns the list of all template parameter names.
public abstract String	<i>getType()</i> on page 1042	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getUrl()</i> on page 1042	Returns the full URL of this SDMODData attribute without parameters.
public abstract String	<i>getUrlFromTemplate(Map< String, String >)</i> on page 1042	Returns the full URL of this SDMODData attribute extended with parameter names and values according to the given parameter map.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getMandatoryTemplateParameters() method

Returns the list of mandatory template parameter names.

Syntax

```
public abstract List< String > getMandatoryTemplateParameters
()
```

Returns

the list of mandatory template parameter names

getOptionalTemplateParameters() method

Returns the list of optional template parameter names.

Syntax

```
public abstract List< String > getOptionalTemplateParameters
()
```

Returns

the list of optional template parameter names

getTemplate() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public abstract String getTemplate ()
```

Returns

The value of the appropriate SDMOData attribute

getTemplateParameters() method

Returns the list of all template parameter names.

Syntax

```
public abstract List< String > getTemplateParameters ()
```

Returns

the list of all template parameter names

getType() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getType ()
```

Returns

The value of the appropriate SDMODData attribute

getUrl() method

Returns the full URL of this SDMODData attribute without parameters.

Syntax

```
public abstract String getUrl ()
```

Returns

The full URL this SDMODData attribute without parameters

getUrlFromTemplate(Map< String, String >) method

Returns the full URL of this SDMODData attribute extended with parameter names and values according to the given parameter map.

Syntax

```
public abstract String getUrlFromTemplate (Map< String, String  
> parameters)
```

Returns

The full URL this SDMODData attribute with parameters names and values

***ATTRIBUTE_TEMPLATE* variable**

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_TEMPLATE
```

***ATTRIBUTE_TYPE* variable**

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_TYPE
```

***ELEMENT_URL* variable**

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_URL
```

***ISDMODDataWorkspace* interface**

Deprecated. since 3.0, Use IODataWorkspace

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMODDataWorkspace extends  
ISDMParserDocument
```

Implemented interfaces

- *ISDMParserDocument* on page 1063

Derived classes

- *SDMODDataWorkspace* on page 1642

Members

All members of ISDMODDataWorkspace, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ELEMENT_WORKSPACE	Name of the appropriate SDMODData element.

Modifier and Type	Variable	Description
public static final String	ATTRIBUTE_SEMANTICS	Name of the appropriate SDMODData attribute.
public static final String	ELEMENT_TITLE	Name of the appropriate SDMODData element.

Methods

Modifier and Type	Method	Description
public abstract List< ISDMO-DataCollection >	<i>getCollections()</i> on page 1049	Returns The list of of 'collection' SDMODData element.
public abstract String	<i>getSemantics()</i> on page 1049	Returns the value of the appropriate SDMODData attribute.
public abstract String	<i>getTitle()</i> on page 1049	Returns the value of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

getCollections() method

Returns The list of of 'collection' SDMODData element.

Syntax

```
public abstract List< ISDMODataCollection > getCollections ()
```

Returns

The list of of 'collection' SDMODData element.

getSemantics() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public abstract String getSemantics ()
```

Returns

The value of the appropriate SDMODData attribute

getTitle() method

Returns the value of the appropriate SDMODData element.

Syntax

```
public abstract String getTitle ()
```

Returns

The value of the appropriate SDMODData element

ATTRIBUTE_SEMANTICS variable

Name of the appropriate SDMODData attribute.

Syntax

```
public static final String ATTRIBUTE_SEMANTICS
```

ELEMENT_TITLE variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_TITLE
```

ELEMENT_WORKSPACE variable

Name of the appropriate SDMODData element.

Syntax

```
public static final String ELEMENT_WORKSPACE
```

ISDMParser interface

Deprecated. since 3.0, Use IParser Main interface for SDMODData parser.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMParser
```

Derived classes

- *SDMParser* on page 1658

Members

All members of ISDMParser, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract String	<i>buildSDMODDataDocumentXML(ISDMParserDocument)</i> on page 1053	Replaced by com.sap.mobile.lib.parser.IParser#buildODataDocument(IParserDocument).

Modifier and Type	Method	Description
public String	<i>buildSDMODataEntryJson(ISDMODataEntry, String, ISDMODataSchema)</i> on page 1053	Replaced by com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody(ODataEntry ,String , IODataSchema , int).
public abstract String	<i>buildSDMODataEntryXML(ISDMODataEntry)</i> on page 1054	Replaced by com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody(ODataEntry ,String , IODataSchema , int).
public void	<i>enableParserPerformanceLog(boolean, Context)</i> on page 1054	Replaced by com.sap.mobile.lib.parser.IParser#enableParserPerformanceLog(boolean,Context).
public abstract List< ISDMODataEntry >	<i>parseFunctionImportResultXML(String, ISDMODataFunctionImport, ISDMODataSchema)</i> on page 1055	Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(String , IODataFunctionImport , IODataSchema).
public abstract List< ISDMODataEntry >	<i>parseFunctionImportResultXML(InputStream, ISDMODataFunctionImport, ISDMODataSchema)</i> on page 1055	Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(InputStream , IODataFunctionImport , IODataSchema).
public abstract List< ISDMODataEntry >	<i>parseSDMODataEntriesXML(String, String, ISDMODataSchema)</i> on page 1056	Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(String , String , IODataSchema).
public abstract List< ISDMODataEntry >	<i>parseSDMODataEntriesXML(InputStream, String, ISDMODataSchema)</i> on page 1057	Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(InputStream , String , IODataSchema).
public abstract ISDMODataError	<i>parseSDMODataErrorXML(String)</i> on page 1057	Replaced by com.sap.mobile.lib.parser.IParser#parseODataError(String).

Modifier and Type	Method	Description
public abstract ISDMODataError	<i>parseSDMODataErrorXML(InputStream)</i> on page 1058	Replaced by com.sap.mobile.lib.parser.IParser#parseODataError(InputStream).
public abstract ISDMODataOpenSearchDescription	<i>parseSDMODataOpenSearchDescriptionXML(String, String, ISDMODataServiceDocument)</i> on page 1058	Replaced by com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(String, String, IODataServiceDocument).
public abstract ISDMODataOpenSearchDescription	<i>parseSDMODataOpenSearchDescriptionXML(InputStream, String, ISDMODataServiceDocument)</i> on page 1059	Replaced by com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument).
public abstract ISDMODataSchema	<i>parseSDMODataSchemaXML(String, ISDMODataServiceDocument)</i> on page 1060	Replaced by com.sap.mobile.lib.parser.IParser#parseODataSchema(String, IODataServiceDocument).
public abstract ISDMODataSchema	<i>parseSDMODataSchemaXML(InputStream, ISDMODataServiceDocument)</i> on page 1060	Replaced by com.sap.mobile.lib.parser.IParser#parseODataSchema(InputStream, IODataServiceDocument).
public abstract ISDMODataServiceDocument	<i>parseSDMODataServiceDocumentXML(String)</i> on page 1061	Replaced by com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(String).
public abstract ISDMODataServiceDocument	<i>parseSDMODataServiceDocumentXML(InputStream)</i> on page 1061	Replaced by com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(InputStream).
public abstract ISDMParserDocument	<i>parseXML(String)</i> on page 1062	Replaced by com.sap.mobile.lib.parser.IParser#parse(String).
public abstract ISDMParserDocument	<i>parseXML(InputStream)</i> on page 1062	Replaced by com.sap.mobile.lib.parser.IParser#parse(InputStream).

buildSDMODataDocumentXML(ISDMParserDocument) method

Replaced by `com.sap.mobile.lib.parser.IParser#buildODataDocument(IParserDocument)`.

Syntax

```
public abstract String buildSDMODataDocumentXML
(ISDMParserDocument document) throws SDMParserException,
IllegalArgumentException
```

Parameters

- **document** – The SDMParserDocument object to build the XML from

Returns

The built document XML

Exceptions

- **SDMParserException class** – If building XML has failed
- **IllegalArgumentException** – If the argument is null

Remarks

Builds and XML representation of the document argument

buildSDMODataEntryJson(ISDMODataEntry, String, ISDMODataSchema) method

Replaced by

`com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody(IODataEntry ,String , IODataSchema , int)`.

Syntax

```
public String buildSDMODataEntryJson (
    ISDMODataEntry entry,
    String collectionId,
    ISDMODataSchema schema
)
```

Parameters

- **entry** – The SDMODataEntry object to build the XML from
- **collectionId** – Collection to which the post needs to be made

Returns

The built document Json

Remarks

Builds a valid SDMOData Entry JSON Post body from the entry argument

buildSDMODataEntryXML(ISDMODataEntry) method

Replaced by

com.sap.mobile.lib.parser.IParser#buildODataEntryRequestBody(IODataEntry ,String , IODataSchema , int).

Syntax

```
public abstract String buildSDMODataEntryXML (ISDMODataEntry  
entry) throws SDMParseException, IllegalArgumentException
```

Parameters

- **entry** – The SDMODataEntry object to build the XML from

Returns

The built document XML

Exceptions

- **SDMParseException class** – If building XML has failed
- **IllegalArgumentException** – If the argument is null

Remarks

Builds a valid SDMOData Entry XML from the entry argument

enableParserPerformanceLog(boolean, Context) method

Replaced by

com.sap.mobile.lib.parser.IParser#enableParserPerformanceLog(boolean,Context).

Syntax

```
public void enableParserPerformanceLog (  
    boolean perflog,  
    Context applicationContext  
)
```

Parameters

- **perflog** –
- **applicationContext** –

parseFunctionImportResultXML(String, ISDMODataFunctionImport, ISDMODataSchema) method

Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(String , IODataFunctionImport , IODataSchema).

Syntax

```
public abstract List< ISDMODataEntry >
parseFunctionImportResultXML (
    String xml,
    ISDMODataFunctionImport functionImport,
    ISDMODataSchema schema
) throws SDMParserException, IllegalArgumentException
```

Parameters

- **xml** – The Function Import result XML
- **functionImport** – The SDMOData Function Import document
- **schema** – The appropriate SDMOData Schema document

Returns

List of SDMOData Entry containing the result values

Exceptions

- **SDMParserException class** – If parsing XML has failed
- **IllegalArgumentException** – If either of the arguments is null

Remarks

Parser a non error result of the execution of a Function Import SDMOData document The result will be converted to a list of SDMOData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,

parseFunctionImportResultXML(InputStream, ISDMODataFunctionImport, ISDMODataSchema) method

Replaced by com.sap.mobile.lib.parser.IParser#parseFunctionImportResult(InputStream , IODataFunctionImport , IODataSchema).

Syntax

```
public abstract List< ISDMODataEntry >
parseFunctionImportResultXML (
    InputStream stream,
    ISDMODataFunctionImport functionImport,
    ISDMODataSchema schema
) throws SDMParserException, IllegalArgumentException
```

Parameters

- **stream** – The function Import result stream
- **functionImport** – The SDMODData Function Import document
- **schema** – The appropriate SDMODData Schema document

Returns

List of SDMODData Entry containing the result values

Exceptions

- **SDMParserException class** – If parsing XML has failed
- **IllegalArgumentException** – If either of the arguments is null

Remarks

Parser a non error result of the execution of a Function Import SDMODData document The result will be converted to a list of SDMODData Entry documents If the result was a simple type it can accessed due the result entries as if it were a property,

parseSDMODDataEntriesXML(String, String, ISDMODDataSchema) method

Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(String, String, IODataSchema).

Syntax

```
public abstract List< ISDMODDataEntry > parseSDMODDataEntriesXML  
(  
    String entriesXML,  
    String collectionId,  
    ISDMODDataSchema schema  
) throws SDMParserException, IllegalArgumentException
```

Parameters

- **entriesXML** – The XML source of either a single SDMODData Entry or SDMODData Feed of several SDMODData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant SDMODData schema document

Returns

The list of the SDMODData Entries contained by the source XML

Exceptions

- **SDMParserException class** – If the XML source is invalid

- **IllegalArgumentException** – If the argument is null

Remarks

Parses SAPData XML structure that represent either a single SDMODData Entry or an SDMODData Feed with several SDMODData entries

parseSDMODDataEntriesXML(InputStream, String, ISDMODDataSchema) method
Replaced by com.sap.mobile.lib.parser.IParser#parseODataEntries(InputStream, String, IODataSchema).

Syntax

```
public abstract List< ISDMODDataEntry > parseSDMODDataEntriesXML
(
    InputStream stream,
    String collectionId,
    ISDMODDataSchema schema
) throws SDMParseException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds the XML source of either a single SDMODData Entry or SDMODData Feed of several SDMODData entries
- **collectionId** – The id of the collection that the result entries should belong to
- **schema** – The relevant SDMODData schema document

Returns

The list of the SDMODData Entries contained by the source XML

Exceptions

- **SDMParseException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses SAPData XML structure from stream that represent either a single SDMODData Entry or an SDMODData Feed of several SDMODData entries

parseSDMODDataErrorXML(String) method

Replaced by com.sap.mobile.lib.parser.IParser#parseODataError(String).

Syntax

```
public abstract ISDMODDataError parseSDMODDataErrorXML (String
errorXML) throws SDMParseException, IllegalArgumentException
```

Parameters

- **errorXML** – The SDMOData Error XML

Returns

The SDMOData Error document

Exceptions

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Error XML

parseSDMODataErrorXML(InputStream) method

Replaced by com.sap.mobile.lib.parser.IParser#parseODataError(InputStream).

Syntax

```
public abstract ISDMODataError parseSDMODataErrorXML  
(InputStream stream) throws SDMParserException,  
IllegalArgumentException
```

Parameters

- **stream** – The SDMOData Error XML as stream

Returns

The SDMOData Error document

Exceptions

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Error XML from stream

parseSDMODataOpenSearchDescriptionXML(String, String, ISDMODataServiceDocument) method

Replaced by com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(String, String, IODataServiceDocument).

Syntax

```
public abstract ISDMODataOpenSearchDescription  
parseSDMODataOpenSearchDescriptionXML (
```

```
String openSearchDescriptionXML,
String collectionId,
ISDMODataServiceDocument serviceDocument
) throws SDMParseException, IllegalArgumentException
```

Parameters

- **openSearchDescriptionXML** – The SDMOData Open Search Description XML

Returns

SDMOData Open Search Description document

Exceptions

- **SDMParseException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Open Search Description XML

parseSDMODataOpenSearchDescriptionXML(InputStream, String, ISDMODataServiceDocument) method

Replaced by

com.sap.mobile.lib.parser.IParser#parseODataOpenSearchDescription(InputStream, String, IODataServiceDocument).

Syntax

```
public abstract ISDMODataOpenSearchDescription
parseSDMODataOpenSearchDescriptionXML (
    InputStream stream,
    String collectionId,
    ISDMODataServiceDocument serviceDocument
) throws SDMParseException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds the SDMOData Open Search Description XML.

Returns

SDMOData Open Search Description document

Exceptions

- **SDMParseException class** – If the stream source is invalid.
- **IllegalArgumentException** – If the argument is null.

Remarks

Parses the SDMOData Open Search Description XML from stream

parseSDMODataSchemaXML(String, ISDMODataServiceDocument) method

Replaced by

`com.sap.mobile.lib.parser.IParser#parseODataSchema(String, IODataServiceDocument)`.

Syntax

```
public abstract ISDMODataSchema parseSDMODataSchemaXML (  
    String schemaXML,  
    ISDMODataServiceDocument serviceDocument  
) throws SDMParserException, IllegalArgumentException
```

Parameters

- **schemaXML** – The SDMOData Schema XML
- **serviceDocument** – The appropriate SDMOData Service Document object

Returns

The SDMOData Schema document

Exceptions

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Schema XML

parseSDMODataSchemaXML(InputStream, ISDMODataServiceDocument)

method

Replaced by

`com.sap.mobile.lib.parser.IParser#parseODataSchema(InputStream, IODataServiceDocument)`.

Syntax

```
public abstract ISDMODataSchema parseSDMODataSchemaXML (  
    InputStream stream,  
    ISDMODataServiceDocument serviceDocument  
) throws SDMParserException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds SDMOData Schema XML

- **serviceDocument** – The appropriate SDMOData Service Document object

Returns

The SDMOData Schema document

Exceptions

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Schema XML from stream

parseSDMODataServiceDocumentXML(String) method

Replaced by com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(String).

Syntax

```
public abstract ISDMODataServiceDocument
parseSDMODataServiceDocumentXML (String serviceDocumentXML) throws
SDMParserException, IllegalArgumentException
```

Parameters

- **serviceDocumentXML** – The SDMOData Service Document XML

Returns

The SDMOData Service Document

Exceptions

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Service Document XML

parseSDMODataServiceDocumentXML(InputStream) method

Replaced by

com.sap.mobile.lib.parser.IParser#parseODataServiceDocument(InputStream).

Syntax

```
public abstract ISDMODataServiceDocument
parseSDMODataServiceDocumentXML (InputStream stream) throws
SDMParserException, IllegalArgumentException
```

Parameters

- **stream** – The stream that holds SDMOData Service Document XML

Returns

The SDMOData Service Document

Exceptions

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the SDMOData Service Document XML from stream

parseXML(String) method

Replaced by `com.sap.mobile.lib.parser.IParser#parse(String)`.

Syntax

```
public abstract ISDMParserDocument parseXML (String xml) throws  
SDMParserException, IllegalArgumentException
```

Parameters

- **xml** – A syntactically valid XML

Returns

The Object representation of the parsed XML

Exceptions

- **SDMParserException class** – If the XML source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the Source XML and converts it to a Java Object containing all the information that were contained by the source XML

parseXML(InputStream) method

Replaced by `com.sap.mobile.lib.parser.IParser#parse(InputStream)`.

Syntax

```
public abstract ISDMParserDocument parseXML (InputStream stream)  
throws SDMParserException, IllegalArgumentException
```

Parameters

- **stream** – A stream that holds a syntactically valid XML

Returns

The Object representation of the parsed XML

Exceptions

- **SDMParserException class** – If the stream source is invalid
- **IllegalArgumentException** – If the argument is null

Remarks

Parses the stream source of an XML and converts it to a Java Object containing all the information that were contained by the source XML

ISDMParserDocument interface

Deprecated. since 3.0, Use IParserDocument Represents a general XML-compatible, persistable object.

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public abstract interface ISDMParserDocument extends
ISDMPersistable,
```

Implemented interfaces

- *ISDMPersistable* on page 1084

Derived classes

- *SDMParserDocument* on page 1672

Members

All members of *ISDMParserDocument*, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ROOT_DOCUMENT_NAME	The default root element name for a new document.
public static Map< String, String >	DEFAULT_PREFIXMAP-PING	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static String	ELEMENT_FEED	Name of the appropriate SDMODData element.
public static final String	ELEMENT_ID	Name of the appropriate SDMODData element.
public static final String	ATTRIBUTE_ETAG	Name of the appropriate SDMODData element.
public static final String	XMLNS_ATOM_URI	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	XMLNS_GENERICPLAY-ER_URI	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	XMLNS_SAP_URI	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Modifier and Type	Variable	Description
public static final String	XMLNS_EDM_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	XMLNS_EDMX_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	XMLNS_METADATA_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	XMLNS_DATASERVICES_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	XMLNS_APPLICATION_URI	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	ATTRIBUTE_VALUEPREFIX_EDMTYPE	Value prefix for EDM Type type values.
public static final String	EDMTIME_PATTERN	EDM Time pattern.
public static final String[]	EDMDATETIME_PATTERNS	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	EDMDATETIMEOFFSET_PATTERNS	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Methods

Modifier and Type	Method	Description
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.

Modifier and Type	Method	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Method	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.

Modifier and Type	Method	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Usage

XML like elements, values and attributes can be access via routes Routes are list of element names where each element contains the next element in the list

Elements can be retrieved as a new ISDMParserDocument containing all the attributes, values and child elements of the represented element.

Empty routes always refer to the given object the method invoked on

clone() method

Creates a copy of this object.

Syntax

```
public abstract ISDMParserDocument clone () throws
CloneNotSupportedException
```

Returns

The new copy of this object

getAttribute(String...) method

Returns the value of the first attribute with the given route.

Syntax

```
public abstract String getAttribute (String... route) throws
IllegalArgumentException
```

Parameters

- **route** – The route to the attribute

Returns

The value of the first attribute or null if there is no such attribute

Exceptions

- **IllegalArgumentException** – if the argument is null.

getAttributes(String...) method

Returns all the values of attributes with the given route.

Syntax

```
public abstract List< String > getAttributes (String... route)  
throws IllegalArgumentException
```

Parameters

- **route** – The route to the attributes

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildAttributeMap(String...) method

Returns all the name-value pairs of attributes contained by the element with the given route.

Syntax

```
public abstract Map< String, String > getChildAttributeMap  
(String... route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child attributes

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildAttributes(String...) method

Returns all the values of attributes contained by the element with the given route.

Syntax

```
public abstract List< String > getChildAttributes (String...  
route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child attributes

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildDocuments(String...) method

Returns the elements contained by the element with the given route.

Syntax

```
public abstract List< ISDMParserDocument > getChildDocuments
(String... route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child elements

Returns

List of elements as new ISDMParser documents

Exceptions

- **IllegalArgumentException** – if the argument is null.

getChildDocumentsWithAttribute(String, String, String...) method

Returns the elements contained by the element with the given route and having the given attribute with the given value.

Syntax

```
public abstract List< ISDMParserDocument >
getChildDocumentsWithAttribute (
    String attributeName,
    String attributeValue,
    String... route
) throws IllegalArgumentException
```

Parameters

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute

- **attributeValue** – The expected value of the attribute

Returns

List of elements as new ISDMParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getChildDocumentsWithAttribute(String, String, boolean, String...) method

Returns the elements contained by the element with the given route and having the given attribute with the given value.

Syntax

```
public abstract List< ISDMParserDocument >
getChildDocumentsWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault,
    String... route
)
```

Parameters

- **route** – The route to the element with the child elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

Returns

List of elements as new ISDMParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocument(String...) method

Returns the first element with the given route.

Syntax

```
public abstract ISDMParserDocument getDocument (String... route)
throws IllegalArgumentException
```

Parameters

- **route** – The route to the element

Returns

The element as a new ISDMParser document or null if there is no such element

Exceptions

- **IllegalArgumentException** – if the argument is null.

getDocuments(String...) method

Returns all the elements with the given route.

Syntax

```
public abstract List< ISDMParserDocument > getDocuments
(String... route) throws IllegalArgumentException
```

Parameters

- **route** – The route to the elements

Returns

List of elements as new ISDMParser documents

Exceptions

- **IllegalArgumentException** – if the argument is null.

getDocumentsWithAttribute(String, String, String...) method

Returns the elements with the given route that contains the given attribute with the given value.

Syntax

```
public abstract List< ISDMParserDocument >
getDocumentsWithAttribute (
    String attributeName,
    String attributeValue,
    String... route
)
```

Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute

- **attributeValue** – The expected value of the attribute

Returns

List of elements as new ISDMParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocumentsWithAttribute(String, String, boolean, String...) method

Returns the elements with the given route that contains the given attribute with the given value.

Syntax

```
public abstract List< ISDMParserDocument >
getDocumentsWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault,
    String... route
)
```

Parameters

- **route** – The route to the elements
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

Returns

List of elements as new ISDMParser documents

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocumentWithAttribute(String, String, String...) method

Returns the first element with the given route that contains the given attribute with the given value.

Syntax

```
public abstract ISDMParserDocument getDocumentWithAttribute (
    String attributeName,
    String attributeValue,
    String... route
)
```

Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

Returns

The element as a new ISDMParser document or null if there is no such element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getDocumentWithAttribute(String, String, boolean, String...) method

Returns the first element with the given route that contains the given attribute with the given value.

Syntax

```
public abstract ISDMParserDocument getDocumentWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault,
    String... route
)
```

Parameters

- **route** – The route to the element
- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if element should be returned in case it does not contain the given attribute

Returns

The element as a new ISDMParser document or null if there is no such element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

getElementName() method

Returns The name of the root element of this document.

Syntax

```
public abstract String getElementName ()
```

Returns

The name of the root element of this document

getFunctionImportComplexPropertyValue(String...) method

Syntax

```
public abstract String getFunctionImportComplexPropertyValue  
(String... route)
```

getPrefixForUri(String) method

Returns the appropriate name-space prefix for the given XML name-space URI.

Syntax

```
public abstract String getPrefixForUri (String uri) throws  
IllegalArgumentException
```

Parameters

- **uri** – An XML names-pace URI

Returns

The appropriate name-space prefix

Exceptions

- **IllegalArgumentException** – if the argument is null.

getStrings() method

Returns all the string values contained by this document.

Syntax

```
public abstract String[] getStrings ()
```

Returns

all the string values contained by this document

getValue(String...) method

Returns the value of the first element with the given route.

Syntax

```
public abstract String getValue (String... route) throws  
IllegalArgumentException
```

Parameters

- **route** – The route to the element

Returns

The value of the first element or null if there is no such element

Exceptions

- **IllegalArgumentException** – if the argument is null.

getValues(String...) method

Returns all the values of elements with the given route.

Syntax

```
public abstract List< String > getValues (String... route) throws
IllegalArgumentException
```

Parameters

- **route** – The route to the elements

Returns

The list of values

Exceptions

- **IllegalArgumentException** – if the argument is null.

putAttribute(String, String...) method

Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.

Syntax

```
public abstract void putAttribute (
    String value,
    String... route
) throws IllegalArgumentException
```

Parameters

- **value** – The new value
- **route** – The route to the attribute

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

putDocument(ISDMParserDocument, String...) method

Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.

Syntax

```
public abstract void putDocument (
    ISDMParserDocument document,
    String... route
) throws IllegalArgumentException
```

Parameters

- **document** – The new document
- **route** – The route to the parent element of the new document

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

putValue(String, String...) method

Sets the value of the first element with the given route.

Syntax

```
public abstract void putValue (
    String value,
    String... route
) throws IllegalArgumentException
```

Parameters

- **value** – The new value
- **route** – The route to the element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

removeAttribute(String...) method

Removes first element with the given route.

Syntax

```
public abstract boolean removeAttribute (String... route)
```

Parameters

- **route** – The route to the attribute to remove

Returns

true if at least one attribute has been removed or false otherwise

removeAttributes(String...) method

Removes all the attribute with the given route.

Syntax

```
public abstract boolean removeAttributes (String... route)
```

Parameters

- **route** – The route to the attributes to remove

Returns

true if at least one attribute has been removed or false otherwise

removeDocument(String...) method

Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Syntax

```
public abstract boolean removeDocument (String... route) throws  
IllegalArgumentException
```

Parameters

- **route** – The route to the element to remove

Returns

true if at least one element has been removed or false otherwise

setAttributes(List< String >, String...) method

Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.

Syntax

```
public abstract void setAttributes (  
    List< String > values,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **values** – The new values of the attributes
- **route** – The route to the attributes

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

setDocuments(List< ISDMParseDocument >, String...) method

Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Syntax

```
public abstract void setDocuments (  
    List< ISDMParseDocument > documents,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **documents** – The list of new documents or nulls if one or more document should be removed
- **route** – The route to the elements

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

setElementName(String, String...) method

Sets the name of the root element with the given route Use empty route for setting root name of this document.

Syntax

```
public abstract void setElementName (
    String name,
    String... route
) throws IllegalArgumentException
```

Parameters

- **name** – The new name of the root element
- **route** – The route to the element

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

setValues(List< String >, String...) method

Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.

Syntax

```
public abstract void setValues (
    List< String > values,
    String... route
) throws IllegalArgumentException
```

Parameters

- **values** – The new values of the elements
- **route** – The route to the elements

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

toXMLString() method

Returns the XML string representation of this object.

Syntax

```
public abstract String toXMLString ()
```

Returns

The XML string representation of this object

ATTRIBUTE_ETAG variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ATTRIBUTE_ETAG
```

ATTRIBUTE_VALUEPREFIX_EDMTYPE variable

Value prefix for EDM Type type values.

Syntax

```
public static final String ATTRIBUTE_VALUEPREFIX_EDMTYPE
```

DEFAULT_PREFIXMAPPING variable

The default XML Namespace-to-Prefix mapping used for building XMLS.

Syntax

```
public static Map< String, String > DEFAULT_PREFIXMAPPING
```

EDMDATETIME_PATTERNS variable

Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Syntax

```
public static final String[] EDMDATETIME_PATTERNS
```

EDMDATETIMEOFFSET_PATTERNS variable

Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Syntax

```
public static final String[] EDMDATETIMEOFFSET_PATTERNS
```

EDMTIME_PATTERN variable

EDM Time pattern.

Syntax

```
public static final String EDMTIME_PATTERN
```

ELEMENT_FEED variable

Name of the appropriate SDMOData element.

Syntax

```
public static String ELEMENT_FEED
```

ELEMENT_ID variable

Name of the appropriate SDMOData element.

Syntax

```
public static final String ELEMENT_ID
```

ROOT_DOCUMENT_NAME variable

The default root element name for a new document.

Syntax

```
public static final String ROOT_DOCUMENT_NAME
```

XMLNS_APPLICATION_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

Syntax

```
public static final String XMLNS_APPLICATION_URI
```

XMLNS_ATOM_URI variable

Constant for XMLNS URI: <http://www.w3.org/2005/Atom>.

Syntax

```
public static final String XMLNS_ATOM_URI
```

XMLNS_DATASERVICES_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices>.

Syntax

```
public static final String XMLNS_DATASERVICES_URI
```

XMLNS_EDM_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/05/edm>.

Syntax

```
public static final String XMLNS_EDM_URI
```

XMLNS_EDMX_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/06/edm.x>.

Syntax

```
public static final String XMLNS_EDMX_URI
```

XMLNS_GENERICPLAYER_URI variable

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData/GenericPlayer>.

Syntax

```
public static final String XMLNS_GENERICPLAYER_URI
```

XMLNS_METADATA_URI variable

Constant for XMLNS URI: <http://schemas.microsoft.com/ado/2007/08/dataservices/metadata>.

Syntax

```
public static final String XMLNS_METADATA_URI
```

XMLNS_SAP_URI variable

Constant for XMLNS URI: <http://www.sap.com/Protocols/SAPData>.

Syntax

```
public static final String XMLNS_SAP_URI
```

ISDMPersistable interface

Deprecated. since 3.0, Use `com.sap.mobile.lib.persistence.IPersistable` Interface that any object should implement that is to store by `SDMPersistence`.

Package

```
com.sap.mobile.lib.sdmpersistence
```

Syntax

```
public interface ISDMPersistable
```

Derived classes

- *SDMLogger* on page 1171

Derived interfaces

- *ISDMCache* on page 683
- *ISDMParserDocument* on page 1063

Members

All members of ISDMPersistable, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException class** – if data can not be loaded from the reader.

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException class** – if data can not be written into the writer

ISDMPersistence interface

Deprecated. since 3.0 SDMPersistency is a low-level library responsible for data persistence.

Package

```
com.sap.mobile.lib.sdm persistence
```

Syntax

```
public abstract interface ISDMPersistence
```

Derived classes

- *SDMPersistence* on page 696

Members

All members of ISDMPersistence, including inherited members. **Methods**

Modifier and Type	Method	Description
public abstract void	<i>clear()</i> on page 1087	Deletes all data persisted by SDMPersistence.
public abstract boolean	<i>isDataPersisted(String)</i> on page 1087	Returns if the data with the given key is persisted.
public abstract InputStream	<i>loadDataStream(String)</i> on page 1087	Loads data stream stored in the file system.
public abstract< Textend- sISDMPersistable > boolean	<i>loadObject(String, T)</i> on page 1088	Loads an object stored in the file system.
public abstract byte[]	<i>loadRawData(String)</i> on page 1088	Loads raw data stored in the file system.
public abstract boolean	<i>loadSDMCache(ISDMCache)</i> on page 1089	Loads SDMCache from the file system.
public abstract boolean	<i>loadSDMCache(String, ISDMCache)</i> on page 1089	Loads SDMCache with the specified key extension from the file system.
public abstract boolean	<i>removeData(String)</i> on page 1090	
public abstract boolean	<i>removeSDMCache()</i> on page 1090	Removes the SDMCache from the file system.
public abstract boolean	<i>removeSDMCache(String)</i> on page 1091	Removes the SDMCache with the specified key extension from the file system.
public void	<i>setEncryptionKey(byte[], String)</i> on page 1091	Set the encryption key in a byte[] format.

Modifier and Type	Method	Description
public abstract void	<i>storeDataStream(String, InputStream)</i> on page 1091	Stores a data stream, in the file system.
public abstract void	<i>storeObject(String, ISDMPersistable)</i> on page 1092	Stores an ISDMPersistable object in the file system.
public abstract void	<i>storeRawData(String, byte[])</i> on page 1092	Stores a raw data in the file system.
public abstract void	<i>storeSDMCache(ISDMCache)</i> on page 1093	Stores SDMCache in the file system.
public abstract void	<i>storeSDMCache(String, ISDMCache)</i> on page 1093	Stores the SDMCache with the specified key extension in the file system.

clear() method

Deletes all data persisted by SDMPersistence.

Syntax

```
public abstract void clear ()
```

isDataPersisted(String) method

Returns if the data with the given key is persisted.

Syntax

```
public abstract boolean isDataPersisted (String key)
```

Parameters

- **key** – The key of the data

Returns

True if the data persisted false if not.

loadDataStream(String) method

Loads data stream stored in the file system.

Syntax

```
public abstract InputStream loadDataStream (String key) throws  
SDMPersistenceException, IllegalArgumentException
```

Parameters

- **key** – The key used for identifying the object and the input file.

Returns

The data stream

Exceptions

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'key' is null.

loadObject(String, T) method

Loads an object stored in the file system.

Syntax

```
public abstract< TextendsISDMPersistable > boolean loadObject  
(  
    String key,  
    T object  
) throws SDMPersistenceException, IllegalArgumentException
```

Parameters

- **<T>** – The class type of the stored object.
- **key** – The key used for identifying the object and the input file.
- **object** – The object to fill by the stored data.

Returns

true if the object has found and successfully loaded and false otherwise.

Exceptions

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'object' or parameter 'key' is null.

loadRawData(String) method

Loads raw data stored in the file system.

Syntax

```
public abstract byte[] loadRawData (String key) throws  
SDMPersistenceException, IllegalArgumentException
```

Parameters

- **key** – The key used for identifying the object and the input file.

Returns

The loaded raw data

Exceptions

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'key' is null.

loadSDMCache(ISDMCache) method

Loads SDMCache from the file system.

Syntax

```
public abstract boolean loadSDMCache (ISDMCache cache) throws
SDMPersistenceException, IllegalArgumentException
```

Parameters

- **cache** – The SDMCache object to fill by the data.

Returns

true if persisted SDMCache has found and successfully loaded, false otherwise.

Exceptions

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

loadSDMCache(String, ISDMCache) method

Loads SDMCache with the specified key extension from the file system.

Syntax

```
public abstract boolean loadSDMCache (
    String key,
    ISDMCache cache
) throws SDMPersistenceException
```

Parameters

- **key** – The key extension of the SDMCache
- **cache** – The SDMCache object to fill by the data.

Returns

true if persisted SDMCache has found and successfully loaded, false otherwise.

Exceptions

- **SDMPersistenceException class** – if object can not be loaded for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

removeData(String) method

Syntax

```
public abstract boolean removeData (String key) throws  
SDMPersistenceException, IllegalArgumentException
```

Parameters

- **key** – The key used for identifying the object and the file to delete.

Returns

boolean if persisted data with the given key found and successfully removed, false otherwise.

Exceptions

- **SDMPersistenceException class** – if persisted data can not be deleted for any reason.
- **IllegalArgumentException** – if parameter 'key' is null.

removeSDMCache() method

Removes the SDMCache from the file system.

Syntax

```
public abstract boolean removeSDMCache () throws  
SDMPersistenceException
```

Returns

true if persisted SDMCache has found and successfully removes, false otherwise.

Exceptions

- **SDMPersistenceException class** – if persisted SDMCache can not be deleted for any reason.

removeSDMCache(String) method

Removes the SDMCache with the specified key extension from the file system.

Syntax

```
public abstract boolean removeSDMCache (String key) throws
SDMPersistenceException
```

Parameters

- **key** – The key extension of the SDMCache

Returns

true if persisted SDMCache has found and successfully removes, false otherwise.

Exceptions

- **SDMPersistenceException class** – if persisted SDMCache can not be deleted for any reason.

setEncryptionKey(byte[], String) method

Set the encryption key in a byte[] format.

Syntax

```
public void setEncryptionKey (
    byte[] secretKey,
    String secretKeyAlgorithm
) throws SDMPersistenceException
```

Parameters

- **secretKey** – The secret key for encryption
- **secretKeyAlgorithm** – The algorithm of the Secret Key

Exceptions

- **SDMPersistenceException class** – if any error in encryption occurs

storeDataStream(String, InputStream) method

Stores a data stream, in the file system.

Syntax

```
public abstract void storeDataStream (
    String key,
    InputStream stream
) throws SDMPersistenceException, IllegalArgumentException
```

Parameters

- **key** – The key used for identifying the object and as a name for the output file.
- **stream** – The data stream to store

Exceptions

- **SDMPersistenceException class** – if data stream can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'stream' or parameter 'key' is null, or parameter 'key' contains illegal characters.

storeObject(String, ISDMPersistable) method

Stores an ISDMPersistable object in the file system.

Syntax

```
public abstract void storeObject (  
    String key,  
    ISDMPersistable object  
) throws SDMPersistenceException, IllegalArgumentException
```

Parameters

- **key** – The key used for identifying the object and as a name for the output file.
- **object** – The object to store.

Exceptions

- **SDMPersistenceException class** – if object can not be persisted for any reasons.
- **IllegalArgumentException** – if parameter 'object' or parameter 'key' is null, or parameter 'key' contains illegal characters.

storeRawData(String, byte[]) method

Stores a raw data in the file system.

Syntax

```
public abstract void storeRawData (  
    String key,  
    byte[] data  
) throws SDMPersistenceException, IllegalArgumentException
```

Parameters

- **key** – The key used for identifying the object and as a name for the output file.
- **data** – The data to store

Exceptions

- **SDMPersistenceException class** – if the data can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'data' or parameter 'key' is null, or parameter 'key' contains illegal characters.

storeSDMCache(ISDMCache) method

Stores SDMCache in the file system.

Syntax

```
public abstract void storeSDMCache (ISDMCache cache) throws
SDMPersistenceException, IllegalArgumentException
```

Parameters

- **cache** – The SDMCache to store

Exceptions

- **SDMPersistenceException class** – if SDMCache can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

storeSDMCache(String, ISDMCache) method

Stores the SDMCache with the specified key extension in the file system.

Syntax

```
public abstract void storeSDMCache (
    String key,
    ISDMCache cache
) throws SDMPersistenceException
```

Parameters

- **key** – The key extension of the SDMCache
- **cache** – The SDMCache to store

Exceptions

- **SDMPersistenceException class** – if SDMCache can not be persisted for any reason.
- **IllegalArgumentException** – if parameter 'cache' is null.

ISDMPreferenceChangeListener interface

Deprecated. since 3.0, Use `com.sap.mobile.lib.configuration.IPreferenceChangeListener` Interface for classes that are to listen changes of preferences.

Package

```
com.sap.mobile.lib.sdmconfiguration
```

Syntax

```
public interface ISDMPreferenceChangeListener
```

Derived classes

- *SDMCache* on page 1141
- *ConnectionFactory* on page 794
- *SDMRequestManager* on page 1733
- *SDMPersistence* on page 696

Members

All members of `ISDMPreferenceChangeListener`, including inherited members. **Methods**

Modifier and Type	Method	Description
public void	<i>onPreferenceChanged(String, Object)</i> on page 1094	Callback method for preference change event.

onPreferenceChanged(String, Object) method

Callback method for preference change event.

Syntax

```
public void onPreferenceChanged (
    String key,
    Object value
)
```

Parameters

- **key** – key of the preference
- **value** – value of the preference

ISDMPreferences interface

Deprecated. since 3.0, Use `com.sap.mobile.lib.configuration.IPreferences` Main interface for `SDMConfiguration`.

Package

```
com.sap.mobile.lib.sdmconfiguration
```

Syntax

```
public interface ISDMPreferences
```

Derived classes

- *SDMPreferences* on page 1708

Members

All members of ISDMPreferences, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	SDM_CONNECTIVITY_CONNTIMEOUT	Preference for connection time out.
public static final String	SDM_CONNECTIVITY_SCONNTIMEOUT	Preference for socket connection time out.
public static final String	SDM_CONNECTIVITY_HTTP_PORT	Preference for default HTTP port.
public static final String	SDM_CONNECTIVITY_HTTPS_PORT	Preference for default HTTPS port.
public static final String	SAP_APPLICATIONID_HEADER_VALUE	Preference for application ID (used in request headers)
public static final String	SDM_CONNECTIVITY_PROXY_HOST	Preference for proxy host if there is a proxy should be used.
public static final String	SDM_CONNECTIVITY_PROXY_PORT	Preference for proxy port if there is a proxy should be used.
public static final String	SDM_CONNECTIVITY_HANDLER_CLASS_NAME	Preference for full name (including package) of the class that should be initialized as connectivity handler.
public static final String	SDM_PARSER_FOLDER_PATH	Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.
public static final String	SDM_PERSISTENCE_FOLDER_PATH	Preference for the default folder where data should be persisted.

Modifier and Type	Variable	Description
public static final String	SDM_PERSISTENCE_SECUREMODE	Preference for indicator if persisted data should be encrypted.
public static final String	SDM_PERSISTENCE_BYTE_BUFFER_SIZE	Preference for the size of the buffer that is used during persistence. Should be changed only in case of low memory available.
public static final String	SDM_PERSISTENCE_CIPHER_TRANSFORMATION	Preference for the default cipher transformation algorithm. Should be matched with algorithm of the Secure Key generation used for data encryption.
public static final String	SDM_CACHE_CAPACITY	Preference for the maximum number of documents can be stored in cache.
public static final String	SDM_CACHE_MAX_SEARCH_RESULTS	Preference for the maximum entries that can be returned as a result of a search.
public static final String	SDM_CACHE_SEARCH_ATTRIBUTE_XMLNS	Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.
public static final String	SDM_CACHE_PARSER_SEARCH_ATTRIBUTE	Preference for the name of the XML attribute that should be used to decide if a property is searchable.
public static final String	SDM_LOG_LEVEL	Preference for the current log severity.
public static final String	SAPPASSPORT_ENABLED	Preference for the indicator to decide if SAP passport should be enabled or not.
public static final String	BUSINESSTRANSACTION_ENABLED	Preference for the indicator to decide if SAP passport should be enabled or not.

Modifier and Type	Variable	Description
public static final String	BYPASS_PROXY	Preference for the indicator to decide which URLs need the proxy bypassed.

Methods

Modifier and Type	Method	Description
public boolean	<i>containsPreference(String)</i> on page 1098	Checks the existence of the given preference.
public Boolean	<i>getBooleanPreference(String)</i> on page 1098	Returns the value of the given preference or null if there is no preference with the given key.
public Float	<i>getFloatPreference(String)</i> on page 1099	Returns the value of the given preference or null if there is no preference with the given key.
public Integer	<i>getIntPreference(String)</i> on page 1099	Returns the value of the given preference or null if there is no preference with the given key.
public Long	<i>getLongPreference(String)</i> on page 1100	Returns the value of the given preference or null if there is no preference with the given key.
public String	<i>getStringPreference(String)</i> on page 1100	Returns the value of the given preference or null if there is no preference with the given key.
public void	<i>registerPreferenceChangeListener(String, ISDMPreferenceChangeListener)</i> on page 1101	You can register a class implementing the ISDMPreferenceChangeListener interface for the change of a preference with the given key.
public void	<i>removePreference(String)</i> on page 1101	Removes the preferences with the given key.
public void	<i>resetPreference(String)</i> on page 1101	Resets the preference's value to its default value or to null if there is no default value for the given preference.

Modifier and Type	Method	Description
public void	<i>setBooleanPreference(String, boolean)</i> on page 1102	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setFloatPreference(String, float)</i> on page 1102	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setIntPreference(String, int)</i> on page 1103	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setLongPreference(String, long)</i> on page 1103	Sets and validates and persists the value of the preferences with the given type.
public void	<i>setStringPreference(String, String)</i> on page 1103	Sets and validates and persists the value of the preferences with the given type.
public void	<i>unRegisterPreferenceChangeListener(String, ISDMPreferenceChangeListener)</i> on page 1104	You can unregister a change listener.

containsPreference(String) method

Checks the existence of the given preference.

Syntax

```
public boolean containsPreference (String key)
```

Parameters

- **key** – The key of the preference

Returns

true if SDMPreference contains the given key or false otherwise

getBooleanPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Boolean getBooleanPreference (String key) throws  
SDMPPreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the boolean type preference with the given key

Exceptions

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

getFloatPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Float getFloatPreference (String key) throws
SDMPreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the float type preference with the given key

Exceptions

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

getIntPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Integer getIntPreference (String key) throws
SDMPreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the integer type preference with the given key

Exceptions

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

getLongPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public Long getLongPreference (String key) throws  
SDMPreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the long type preference with the given key

Exceptions

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

getStringPreference(String) method

Returns the value of the given preference or null if there is no preference with the given key.

Syntax

```
public String getStringPreference (String key) throws  
SDMPreferencesException
```

Parameters

- **key** – The key of the preference

Returns

the String type preference with the given key

Exceptions

- **SDMPreferencesException class** – if preference exists with the given key but with value of different type

registerPreferenceChangeListener(String, ISDMPreferenceChangeListener) method

You can register a class implementing the ISDMPreferenceChangeListener interface for the change of a preference with the given key.

Syntax

```
public void registerPreferenceChangeListener (
    String key,
    ISDMPreferenceChangeListener changeListener
)
```

Parameters

- **key** – key of the preference
- **changeListener** – listener object to be registered

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

If any of the arguments are null, an IllegalArgumentException is thrown.

removePreference(String) method

Removes the preferences with the given key.

Syntax

```
public void removePreference (String key) throws
SDMPreferencesException
```

Parameters

- **key** – The key of the preference

Exceptions

- **SDMPreferencesException class** – If the preference does not exist or it can not be removed (e.g. an SDM preference)

resetPreference(String) method

Resets the preference's value to its default value or to null if there is no default value for the given preference.

Syntax

```
public void resetPreference (String key)
```

Parameters

- **key** – The key of the preference

setBooleanPreference(String, boolean) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setBooleanPreference (
    String key,
    boolean value
) throws SDMPreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

setFloatPreference(String, float) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setFloatPreference (
    String key,
    float value
) throws SDMPreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

setIntPreference(String, int) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setIntPreference (
    String key,
    int value
) throws SDMPreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

setLongPreference(String, long) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setLongPreference (
    String key,
    long value
) throws SDMPreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

setStringPreference(String, String) method

Sets and validates and persists the value of the preferences with the given type.

Syntax

```
public void setStringPreference (
    String key,
    String value
) throws SDMPreferencesException
```

Parameters

- **key** – The key of the preference
- **value** – The new value of the preference

Exceptions

- **SDMPreferencesException class** – if the new value of the preference is invalid for any reasons

unRegisterPreferenceChangeListener(String, ISDMPreferenceChangeListener)
method

You can unregister a change listener.

Syntax

```
public void unRegisterPreferenceChangeListener (
    String key,
    ISDMPreferenceChangeListener changeListener
)
```

Parameters

- **key** – key of the preference
- **changeListener** – listener object to be unregistered

Exceptions

- **IllegalArgumentException** – if the argument is null.

Remarks

If any of the arguments are null, an `IllegalArgumentException` is thrown.

BUSINESSTRANSACTION_ENABLED variable

Preference for the indicator to decide if SAP passport should be enabled or not.

Syntax

```
public static final String BUSINESSTRANSACTION_ENABLED
```

BYPASS_PROXY variable

Preference for the indicator to decide which URLs need the proxy bypassed.

Syntax

```
public static final String BYPASS_PROXY
```

SAP_APPLICATIONID_HEADER_VALUE variable

Preference for application ID (used in request headers)

Syntax

```
public static final String SAP_APPLICATIONID_HEADER_VALUE
```

SAPPASSPORT_ENABLED variable

Preference for the indicator to decide if SAP passport should be enabled or not.

Syntax

```
public static final String SAPPASSPORT_ENABLED
```

SDM_CACHE_CAPACITY variable

Preference for the maximum number of documents can be stored in cache.

Syntax

```
public static final String SDM_CACHE_CAPACITY
```

SDM_CACHE_MAX_SEARCH_RESULTS variable

Preference for the maximum entries that can be returned as a result of a search.

Syntax

```
public static final String SDM_CACHE_MAX_SEARCH_RESULTS
```

SDM_CACHE_PARSER_SEARCH_ATTRIBUTE variable

Preference for the name of the XML attribute that should be used to decide if a property is searchable.

Syntax

```
public static final String SDM_CACHE_PARSER_SEARCH_ATTRIBUTE
```

SDM_CACHE_SEARCH_ATTRIBUTE_XMLNS variable

Preference for the XML namespace URI of the XML attribute that should be used to decide if a property is searchable.

Syntax

```
public static final String SDM_CACHE_SEARCH_ATTRIBUTE_XMLNS
```

SDM_CONNECTIVITY_CONNTIMEOUT variable

Preference for connection time out.

Syntax

```
public static final String SDM_CONNECTIVITY_CONNTIMEOUT
```

SDM_CONNECTIVITY_HANDLER_CLASS_NAME variable

Preference for full name (including package) of the class that should be initialized as connectivity handler.

Syntax

```
public static final String SDM_CONNECTIVITY_HANDLER_CLASS_NAME
```

SDM_CONNECTIVITY_HTTP_PORT variable

Preference for default HTTP port.

Syntax

```
public static final String SDM_CONNECTIVITY_HTTP_PORT
```

SDM_CONNECTIVITY_HTTPS_PORT variable

Preference for default HTTPS port.

Syntax

```
public static final String SDM_CONNECTIVITY_HTTPS_PORT
```

SDM_CONNECTIVITY_PROXY_HOST variable

Preference for proxy host if there is a proxy should be used.

Syntax

```
public static final String SDM_CONNECTIVITY_PROXY_HOST
```

SDM_CONNECTIVITY_PROXY_PORT variable

Preference for proxy port if there is a proxy should be used.

Syntax

```
public static final String SDM_CONNECTIVITY_PROXY_PORT
```

SDM_CONNECTIVITY_SCONNTIMEOUT variable

Preference for socket connection time out.

Syntax

```
public static final String SDM_CONNECTIVITY_SCONNTIMEOUT
```

SDM_LOG_LEVEL variable

Preference for the current log severity.

Syntax

```
public static final String SDM_LOG_LEVEL
```

SDM_PARSER_FOLDER_PATH variable

Preference for the default folder where Parser related information can be persisted Should not point to a folder that can be removed outside of the application.

Syntax

```
public static final String SDM_PARSER_FOLDER_PATH
```

SDM_PERSISTENCE_BYTE_BUFFER_SIZE variable

Preference for the size of the buffer that is used during persistence Should be changed only in case of low memory available.

Syntax

```
public static final String SDM_PERSISTENCE_BYTE_BUFFER_SIZE
```

SDM_PERSISTENCE_CIPHER_TRANSFORMATION variable

Preference for the default cipher transformation algorithm Should be matched with algorithm of the Secure Key generation used for data encryption.

Syntax

```
public static final String  
SDM_PERSISTENCE_CIPHER_TRANSFORMATION
```

SDM_PERSISTENCE_FOLDER_PATH variable

Preference for the default folder where data should be persisted.

Syntax

```
public static final String SDM_PERSISTENCE_FOLDER_PATH
```

SDM_PERSISTENCE_SECUREMODE variable

Preference for indicator if persisted data should be encrypted.

Syntax

```
public static final String SDM_PERSISTENCE_SECUREMODE
```

ISDMRequest interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IRequest Interface for requests.

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public interface ISDMRequest
```

Derived classes

- *SDMBaseRequest* on page 1129
- *SDMPushRequest* on page 1725

Members

All members of ISDMRequest, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	PRIORITY_NORMAL	Normal priority. This is the default priority.
public static final int	PRIORITY_HIGH	High priority. Requests with high priority will be executed first. If there are more than one IRequests with ISDMRequest.PRIORITY_HIGH priority, the network layer will choose an execution order.
public static final int	REQUEST_METHOD_GET	HTTP GET method.
public static final int	REQUEST_METHOD_POST	HTTP POST method.
public static final int	REQUEST_METHOD_PUT	HTTP PUT method.
public static final int	REQUEST_METHOD_DELETE	HTTP DELETE method.
public static final int	ETAG_IF_MATCH	etag "if-match"
public static final int	ETAG_IF_NONE_MATCH	etag "if-none-match"
public static final int	ETAG_IF_RANGE	etag "if-range"

Methods

Modifier and Type	Method	Description
public byte[]	<i>getData()</i> on page 1110	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 1111	If the request method is POST, this method is called from the network library.
public Object	<i>getE2eRequest()</i> on page 1111	Get the iRequest object from the ISDMRequest.
public Map< String, String >	<i>getHeaders()</i> on page 1111	Returns the request headers set.
public ISDMNetListener	<i>getListener()</i> on page 1111	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public String	<i>getPassport()</i> on page 1112	
public int	<i>getPriority()</i> on page 1112	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 1112	Returns the request method.
public String	<i>getRequestUrl()</i> on page 1112	Returns the URL where the request must be done.
public String	<i>getTransId()</i> on page 1112	
public boolean	<i>isStreamEnabled()</i> on page 1112	
public void	<i>setData(byte[])</i> on page 1113	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 1113	Set the request data stream in case of POST request.
public void	<i>setE2eRequest(Object)</i> on page 1113	Set the iRequest object into the ISDMRequest.
public void	<i>setHeaders(Map< String, String >)</i> on page 1113	Set the request headers.

Modifier and Type	Method	Description
public void	<i>setListener</i> (final ISDMNetListener) on page 1114	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPassport</i> (String) on page 1114	
public void	<i>setPriority</i> (final int) on page 1114	Sets the priority of the request.
public void	<i>setRequestMethod</i> (final int) on page 1115	Sets the request method.
public void	<i>setRequestUrl</i> (final String) on page 1115	Sets the URL for the request.
public void	<i>setStreamEnabled</i> (boolean) on page 1115	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public void	<i>setTransId</i> (String) on page 1115	
public boolean	<i>useCookies</i> () on page 1115	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Usage

All request objects must implement this interface. The network layer uses this interface to interact with the request objects

getData() method

If the request method is POST, this method is called from the network library.

Syntax

```
public byte[] getData ()
```

Returns

the content data.

Remarks

This method must return with the content to be sent to the server.

getDataStream() method

If the request method is POST, this method is called from the network library.

Syntax

```
public InputStream getDataStream ()
```

Returns

the content data stream.

Remarks

This method must return with the content stream to be sent to the server.

getE2eRequest() method

Get the IRequest object from the ISDMRequest.

Syntax

```
public Object getE2eRequest ()
```

Remarks

Used for E2E tracing.

getHeaders() method

Returns the request headers set.

Syntax

```
public Map< String, String > getHeaders ()
```

Returns

the request headers

getListener() method

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

Syntax

```
public ISDMNetListener getListener ()
```

Returns

the listener or null.

Remarks

Method will return null if there is no registered listener.

getPassport() method

Syntax

```
public String getPassport ()
```

getPriority() method

Returns the priority of the request.

Syntax

```
public int getPriority ()
```

Returns

the priority.

getRequestMethod() method

Returns the request method.

Syntax

```
public int getRequestMethod ()
```

Returns

the request method, with a value of ISDMRequest.REQUEST_METHOD_* constants.

getRequestUrl() method

Returns the URL where the request must be done.

Syntax

```
public String getRequestUrl ()
```

Returns

the URL.

getTransId() method

Syntax

```
public String getTransId ()
```

isStreamEnabled() method

Syntax

```
public boolean isStreamEnabled ()
```

setData(byte[]) method

Set the request data in case of POST request.

Syntax

```
public void setData (byte[] data)
```

Parameters

- **data** – the request data to set

setDataStream(InputStream) method

Set the request data stream in case of POST request.

Syntax

```
public void setDataStream (InputStream iStream)
```

Parameters

- **data** – the request data stream to set

setE2eRequest(Object) method

Set the iRequest object into the ISDMRequest.

Syntax

```
public void setE2eRequest (Object iRequest)
```

Parameters

- **iRequest** –

setHeaders(Map< String, String >) method

Set the request headers.

Syntax

```
public void setHeaders (Map< String, String > headers)
```

Parameters

- **headers** – the request headers to set

setListener(final ISDMNetListener) method

Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.

Syntax

```
public void setListener (final ISDMNetListener aListener)
```

Parameters

- **aListener** – the listener to set.

Remarks

By default, the SDMBaseRequest object included in the connectivity layer will contain no registered listeners.

Setting this object is not mandatory. However, it can be used to handle incidental errors.

setPassport(String) method

Syntax

```
public void setPassport (String passport)
```

setPriority(final int) method

Sets the priority of the request.

Syntax

```
public void setPriority (final int aPriority)
```

Parameters

- **aPriority** – the priority of the request to set.

Remarks

Allowed values: ISDMRequest.PRIORITY_HIGH and ISDMRequest.PRIORITY_NORMAL. In case of a different value, the default ISDMRequest.PRIORITY_NORMAL will be used by the network. If the network layer finds an ISDMRequest with ISDMRequest.PRIORITY_HIGH priority in the queue, that request will be executed first. If there are more than one IRequests with ISDMRequest.PRIORITY_HIGH priority, the network layer will choose an execution order. If the priority is not one of the predefined values, the priority will be set by default to ISDMRequest.PRIORITY_NORMAL

setRequestMethod(final int) method

Sets the request method.

Syntax

```
public void setRequestMethod (final int aRequestMethod)
```

Parameters

- **aRequestMethod** – one of the ISDMRequest.REQUEST_METHOD_* constants.

setRequestUrl(final String) method

Sets the URL for the request.

Syntax

```
public void setRequestUrl (final String aUrl)
```

Parameters

- **aUrl** – the URL to set.

setStreamEnabled(boolean) method

Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.

Syntax

```
public void setStreamEnabled (boolean streamEnabled)
```

Parameters

- **streamEnabled** –

*setTransId(String) method**Syntax*

```
public void setTransId (String transId)
```

useCookies() method

This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Syntax

```
public boolean useCookies ()
```

Returns

the use of cookies in the network library.

Remarks

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the `SDMBaseRequest` implementation.

ETAG_IF_MATCH variable

etag "if-match"

Syntax

```
public static final int ETAG_IF_MATCH
```

ETAG_IF_NONE_MATCH variable

etag "if-none-match"

Syntax

```
public static final int ETAG_IF_NONE_MATCH
```

ETAG_IF_RANGE variable

etag "if-range"

Syntax

```
public static final int ETAG_IF_RANGE
```

PRIORITY_HIGH variable

High priority.

Syntax

```
public static final int PRIORITY_HIGH
```

Remarks

Requests with high priority will be executed first. If there are more than one `IRequests` with `ISDMRequest.PRIORITY_HIGH` priority, the network layer will choose an execution order.

PRIORITY_NORMAL variable

Normal priority.

Syntax

```
public static final int PRIORITY_NORMAL
```

Remarks

This is the default priority.

REQUEST_METHOD_DELETE variable
HTTP DELETE method.

Syntax

```
public static final int REQUEST_METHOD_DELETE
```

REQUEST_METHOD_GET variable
HTTP GET method.

Syntax

```
public static final int REQUEST_METHOD_GET
```

REQUEST_METHOD_POST variable
HTTP POST method.

Syntax

```
public static final int REQUEST_METHOD_POST
```

REQUEST_METHOD_PUT variable
HTTP PUT method.

Syntax

```
public static final int REQUEST_METHOD_PUT
```

ISDMRequestManager interface
Deprecated. since 3.0, Use com.sap.mobile.lib.request.IRequestManager

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public interface ISDMRequestManager
```

Derived classes

- *SDMRequestManager* on page 1733

Members

All members of ISDMRequestManager, including inherited members. **Methods**

Modifier and Type	Method	Description
public Vector< ISDMRequest >	<i>getAllRequests()</i> on page 1118	Returns all requests from the connectivity component which are in the queue.
public ISDMConnectivity-Parameters	<i>getConnectivityParameters()</i> on page 1119	Returns the ConnectivityParameters object containing the settings used by the library.
public int	<i>getQueueSize()</i> on page 1119	Returns the number of requests from the connectivity component which are in the queue.
public Object	<i>getRequest()</i> on page 1119	Returns an ISDMRequest from the queue(s)
public boolean	<i>hasRequests()</i> on page 1119	Returns a boolean indicating the queue has requests or doesn't.
public void	<i>makeRequest(final ISDMRequest)</i> on page 1119	Put a request object into the ISDMRequestManager.
public void	<i>makeRequest(final ISDMBundleRequest)</i> on page 1120	
public void	<i>sendOnSuccess(final ISDMNetListener, final ISDMRequest, final ISDMResponse)</i> on page 1120	Used to notify the ISDMNetListener implementation about successful request, without blocking ISDMConnectivity threads and reducing the concurrency on the application.
public void	<i>setMainHandlerClassName(final String)</i> on page 1120	Sets the class name of the ISDMConnectionHandler implementation.
public void	<i>terminate()</i> on page 1120	Terminates all the requests in the queue.

getAllRequests() method

Returns all requests from the connectivity component which are in the queue.

Syntax

```
public Vector< ISDMRequest > getAllRequests ()
```

Returns

all the requests currently in the queue.

getConnectivityParameters() method

Returns the ConnectivityParameters object containing the settings used by the library.

Syntax

```
public ISDMConnectivityParameters getConnectivityParameters
()
```

getQueueSize() method

Returns the number of requests from the connectivity component which are in the queue.

Syntax

```
public int getQueueSize ()
```

Returns

the number of requests currently in the queue.

getRequest() method

Returns an ISDMRequest from the queue(s)

Syntax

```
public Object getRequest ()
```

Returns

an ISDMRequest implementation

hasRequests() method

Returns a boolean indicating the queue has requests or doesn't.

Syntax

```
public boolean hasRequests ()
```

Returns

whether the queue has requests or it doesn't

makeRequest(final ISDMRequest) method

Put a request object into the SDMRequestManager.

Syntax

```
public void makeRequest (final ISDMRequest aRequest)
```

Parameters

- **aRequest** – the request.

makeRequest(final ISDMBundleRequest) method

Syntax

```
public void makeRequest (final ISDMBundleRequest aBundleRequest)
```

sendOnSuccess(final ISDMNetListener, final ISDMRequest, final ISDMResponse) method

Used to notify the ISDMNetListener implementation about successful request, without blocking ISDMConnectivity threads and reducing the concurrency on the application.

Syntax

```
public void sendOnSuccess (  
    final ISDMNetListener listener ,  
    final ISDMRequest request ,  
    final ISDMResponse response  
)
```

Parameters

- **listener** – ISDMNetListener instance
- **request** – ISDMRequest instance
- **response** – HttpResponse instance

setMainHandlerClassName(final String) method

Sets the class name of the ISDMConnectionHandler implementation.

Syntax

```
public void setMainHandlerClassName (final String classname)
```

Parameters

- **classname** – the name as String

Remarks

Default class: com.sap.mobile.lib.sdmconnectivity.SocketConnectionHandler

terminate() method

Terminates all the requests in the queue.

Syntax

```
public void terminate ()
```

ISDMRequestStateElement interface

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.IRequestStateElement`

Package

`com.sap.mobile.lib.sdmconnectivity`

Syntax

```
public abstract interface ISDMRequestStateElement
```

Derived classes

- *SDMRequestStateElement* on page 1744

Members

All members of `ISDMRequestStateElement`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final int	NO_ERROR	
public static final int	HTTP_ERROR	Server response status > 302.
public static final int	PARSE_ERROR	Problem with parsing the response xml.
public static final int	NETWORK_ERROR	There was a network error during a read/write to/from stream.
public static final int	AUTHENTICATION_ERROR	Authentication error.
public static final int	CLIENT_ERROR	Client error.
public static final int	REQUEST_ERROR	Problem with parsing the request.

Methods

Modifier and Type	Method	Description
public abstract int	<i>getErrorCode()</i> on page 1122	Returns the error code.
public abstract Exception	<i>getException()</i> on page 1122	Returns the Exception if it was set.
public abstract HttpResponseMessage	<i>getHttpResponse()</i> on page 1123	Returns the HttpResponseMessage.

Modifier and Type	Method	Description
public abstract int	<i>getHttpStatusCode()</i> on page 1123	Returns the HTTP status if it was set.
public abstract void	<i>setErrorCode(final int)</i> on page 1123	Sets the error code.
public abstract void	<i>setException(final Exception)</i> on page 1123	Sets the Exception.
public abstract void	<i>setHttpResponse(HttpResponse)</i> on page 1124	Sets the HttpResponse.
public abstract void	<i>setHttpStatusCode(final int)</i> on page 1124	Sets the HTTP status.

getErrorCode() method

Returns the error code.

Syntax

```
public abstract int getErrorCode ()
```

Remarks

The error code can be the following:

- HTTP_ERROR
- PARSE_ERROR
- NETWORK_ERROR
- AUTHENTICATION_ERROR

getException() method

Returns the Exception if it was set.

Syntax

```
public abstract Exception getException ()
```

Returns

the Exception stored in SDMRequestStateElement.

Remarks

If not, the returned value will be null.

getHttpResponse() method

Returns the HttpResponse.

Syntax

```
public abstract HttpResponse getHttpResponse ()
```

Returns

The HttpResponse

getHttpStatusCode() method

Returns the HTTP status if it was set.

Syntax

```
public abstract int getHttpStatusCode ()
```

Returns

the HTTP status code, if available.

Remarks

If there was no http status set, the value is -1.

setErrorCode(final int) method

Sets the error code.

Syntax

```
public abstract void setErrorCode (final int code)
```

Parameters

- **code** –

setException(final Exception) method

Sets the Exception.

Syntax

```
public abstract void setException (final Exception aException)
```

Parameters

- **aException** – the Exception to set.

setHttpResponse(HttpResponse) method

Sets the HttpResponse.

Syntax

```
public abstract void setHttpResponse (HttpResponse aResponse)
```

Parameters

- **aResponse** – The HttpResponse

setHttpStatusCode(final int) method

Sets the HTTP status.

Syntax

```
public abstract void setHttpStatusCode (final int httpStatus)
```

Parameters

- **httpStatus** – to set

AUTHENTICATION_ERROR variable

Authentication error.

Syntax

```
public static final int AUTHENTICATION_ERROR
```

CLIENT_ERROR variable

Client error.

Syntax

```
public static final int CLIENT_ERROR
```

HTTP_ERROR variable

Server response status > 302.

Syntax

```
public static final int HTTP_ERROR
```

NETWORK_ERROR variable

There was a network error during a read/write to/from stream.

Syntax

```
public static final int NETWORK_ERROR
```

*NO_ERROR variable**Syntax*

```
public static final int NO_ERROR
```

PARSE_ERROR variable

Problem with parsing the response xml.

Syntax

```
public static final int PARSE_ERROR
```

REQUEST_ERROR variable

Problem with parsing the request.

Syntax

```
public static final int REQUEST_ERROR
```

ISDMResponse interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.IResponse

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public interface ISDMResponse extends
```

Derived classes

- *SDMResponseImpl* on page 1750

Members

All members of ISDMResponse, including inherited members. **Methods**

Modifier and Type	Method	Description
public String	<i>getCookie()</i> on page 1126	
public String	<i>getCorelationId()</i> on page 1126	
public int	<i>getCurrentOffset()</i> on page 1126	

Modifier and Type	Method	Description
public int	<i>getDataStream(byte[], int)</i> on page 1126	Used to obtain the data in stream.
public int	<i>getDataStream(byte[], int, int, String)</i> on page 1127	
public Map< String, String >	<i>getHeadersMap()</i> on page 1127	
public boolean	<i>isDataAvailable()</i> on page 1127	To check whether the response object is available or it needs to be streamed in chunks.
public void	<i>setCorelationId(String)</i> on page 1127	

*getCookie() method**Syntax*

```
public String getCookie ()
```

*getCorelationId() method**Syntax*

```
public String getCorelationId ()
```

*getCurrentOffset() method**Syntax*

```
public int getCurrentOffset ()
```

getDataStream(byte[], int) method

Used to obtain the data in stream.

Syntax

```
public int getDataStream (
    byte[] chunk,
    int chunkSize
)
```

Parameters

- **chunk** –

- **offset** –

Remarks

Returns the chunk of data of size 'chunkSize' from the given offset.

getDataStream(byte[], int, int, String) method

Syntax

```
public int getDataStream (
    byte[] chunk,
    int chunkSize,
    int offset,
    String cookie
)
```

getHeadersMap() method

Syntax

```
public Map< String, String > getHeadersMap ()
```

isDataAvailable() method

To check whether the response object is available or it needs to be streamed in chunks.

Syntax

```
public boolean isDataAvailable ()
```

setCorelationId(String) method

Syntax

```
public void setCorelationId (String coRelationId)
```

RouteManager class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.RouteManager

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class RouteManager
```

Members

All members of RouteManager, including inherited members. **Methods**

Modifier and Type	Method	Description
public static void	<i>addHeaders(HttpUriRequest, DefaultHttpClient)</i> on page 1128	
public static SUPRoute	<i>getRoute(String)</i> on page 1128	

addHeaders(HttpUriRequest, DefaultHttpClient) method

Syntax

```
public static void addHeaders (
    HttpUriRequest request,
    DefaultHttpClient httpClient
)
```

getRoute(String) method

Syntax

```
public static SUPRoute getRoute (String URL)
```

SAPSSLSocketFactory class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.SAPSSLSocketFactory

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class SAPSSLSocketFactory
```

Members

All members of SAPSSLSocketFactory, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SAPSSLSocketFactory(KeyStore, TrustManager[])</i> on page 1129	

Methods

Modifier and Type	Method	Description
public Socket	<i>createSocket(Socket, String, int, boolean)</i> on page 1129	
public Socket	<i>createSocket()</i> on page 1129	

SAPSSLSocketFactory(KeyStore, TrustManager[]) constructor

Syntax

```
public SAPSSLSocketFactory (
    KeyStore truststore,
    TrustManager[] trustManagers
) throws NoSuchAlgorithmException, KeyManagementException,
KeyStoreException, UnrecoverableKeyException
```

createSocket(Socket, String, int, boolean) method

Syntax

```
public Socket createSocket (
    Socket socket,
    String host,
    int port,
    boolean autoClose
) throws IOException, UnknownHostException
```

createSocket() method

Syntax

```
public Socket createSocket () throws IOException
```

SDMBaseRequest class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.BaseRequest

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class SDMBaseRequest implements ISDMRequest
```

Implemented interfaces

- *ISDMRequest* on page 1108

*Members*All members of `SDMBaseRequest`, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	mUrl	
protected int	mRequestMethod	
protected byte[]	mData	
protected Map< String, String >	mHeaders	
protected int	mPriority	
protected ISDMNetListener	mListener	
protected HashMap< String, String >	eTagMap	
protected static String	HostURL	
protected static String	xsrftoken	
protected static ArrayList< String >	setCookie	
protected static boolean	isStreamEnabled	

Methods

Modifier and Type	Method	Description
public byte[]	<i>getData()</i> on page 1133	If the request method is POST, this method is called from the network library.
public InputStream	<i>getDataStream()</i> on page 1133	If the request method is POST, this method is called from the network library.
public Request	<i>getE2eRequest()</i> on page 1133	Get the iRequest object from the ISDMRequest.
public Map< String, String >	<i>getHeaders()</i> on page 1134	Returns the request headers set.

Modifier and Type	Method	Description
public ISDMNetListener	<i>getListener()</i> on page 1134	Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.
public String	<i>getPassport()</i> on page 1134	
public int	<i>getPriority()</i> on page 1134	Returns the priority of the request.
public int	<i>getRequestMethod()</i> on page 1135	Returns the request method.
public String	<i>getRequestUrl()</i> on page 1135	Returns the URL where the request must be done.
public String	<i>getTransId()</i> on page 1135	
public boolean	<i>isStreamEnabled()</i> on page 1135	
public void	<i>setData(byte[])</i> on page 1135	Set the request data in case of POST request.
public void	<i>setDataStream(InputStream)</i> on page 1135	Set the request data stream in case of POST request.
public void	<i>setE2eRequest(Object)</i> on page 1136	Set the iRequest object into the ISDMRequest.
public void	<i>setETag(String, int)</i> on page 1136	
public void	<i>setHeaders(Map<String, String>)</i> on page 1136	Set the request headers.
public void	<i>setListener(ISDMNetListener)</i> on page 1136	
public void	<i>setPassport(String)</i> on page 1136	
public void	<i>setPriority(int)</i> on page 1137	
public void	<i>setRequestMethod(int)</i> on page 1137	

Modifier and Type	Method	Description
public void	<i>setRequestUrl(String)</i> on page 1137	
public void	<i>setStreamEnabled(boolean)</i> on page 1137	Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.
public void	<i>setTransId(String)</i> on page 1137	
public boolean	<i>useCookies()</i> on page 1137	This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Inherited members from ISDMRequest

Modifier and Type	Member	Description
public static final int	<i>ETAG_IF_MATCH</i> on page 1116	etag "if-match"
public static final int	<i>ETAG_IF_NONE_MATCH</i> on page 1116	etag "if-none-match"
public static final int	<i>ETAG_IF_RANGE</i> on page 1116	etag "if-range"
public static final int	<i>PRIORITY_HIGH</i> on page 1116	High priority.
public static final int	<i>PRIORITY_NORMAL</i> on page 1116	Normal priority.
public static final int	<i>REQUEST_METHOD_DELETE</i> on page 1117	HTTP DELETE method.
public static final int	<i>REQUEST_METHOD_GET</i> on page 1117	HTTP GET method.
public static final int	<i>REQUEST_METHOD_POST</i> on page 1117	HTTP POST method.
public static final int	<i>REQUEST_METHOD_PUT</i> on page 1117	HTTP PUT method.

Modifier and Type	Member	Description
public void	<i>setListener</i> (final ISDMNetListener) on page 1114	Client can register listeners to be used by the connectivity layer to notify the implementation about the result of the request.
public void	<i>setPriority</i> (final int) on page 1114	Sets the priority of the request.
public void	<i>setRequestMethod</i> (final int) on page 1115	Sets the request method.
public void	<i>setRequestUrl</i> (final String) on page 1115	Sets the URL for the request.

***getData()* method**

If the request method is POST, this method is called from the network library.

Syntax

```
public byte[] getData ()
```

Returns

the content data.

Remarks

This method must return with the content to be sent to the server.

***getDataStream()* method**

If the request method is POST, this method is called from the network library.

Syntax

```
public InputStream getDataStream ()
```

Returns

the content data stream.

Remarks

This method must return with the content stream to be sent to the server.

***getE2eRequest()* method**

Get the iRequest object from the ISDMRequest.

Syntax

```
public Request getE2eRequest ()
```

Remarks

Used for E2E tracing.

getHeaders() method

Returns the request headers set.

Syntax

```
public Map< String, String > getHeaders ()
```

Returns

the request headers

getListener() method

Returns the listener to be used by the connectivity library to notify the registered listener about a successful or failed request operation.

Syntax

```
public ISDMNetListener getListener ()
```

Returns

the listener or null.

Remarks

Method will return null if there is no registered listener.

getPassport() method

Syntax

```
public String getPassport ()
```

getPriority() method

Returns the priority of the request.

Syntax

```
public int getPriority ()
```

Returns

the priority.

getRequestMethod() method

Returns the request method.

Syntax

```
public int getRequestMethod ()
```

Returns

the request method, with a value of ISDMRequest.REQUEST_METHOD_* constants.

getRequestUrl() method

Returns the URL where the request must be done.

Syntax

```
public String getRequestUrl ()
```

Returns

the URL.

*getTransId() method**Syntax*

```
public String getTransId ()
```

*isStreamEnabled() method**Syntax*

```
public boolean isStreamEnabled ()
```

setData(byte[]) method

Set the request data in case of POST request.

Syntax

```
public void setData (byte[] data)
```

Parameters

- **data** – the request data to set

setDataStream(InputStream) method

Set the request data stream in case of POST request.

Syntax

```
public void setDataStream (InputStream iStream)
```

Parameters

- **data** – the request data stream to set

setE2eRequest(Object) method

Set the iRequest object into the ISDMRequest.

Syntax

```
public void setE2eRequest (Object iRequest)
```

Parameters

- **iRequest** –

setETag(String, int) method

Syntax

```
public void setETag (  
    String tag,  
    int i  
) throws IllegalArgumentException
```

setHeaders(Map< String, String >) method

Set the request headers.

Syntax

```
public void setHeaders (Map< String, String > headers)
```

Parameters

- **headers** – the request headers to set

setListener(ISDMNetListener) method

Syntax

```
public void setListener (ISDMNetListener listener)
```

setPassport(String) method

Syntax

```
public void setPassport (String passport)
```

*setPriority(int) method**Syntax*

```
public void setPriority (int value)
```

*setRequestMethod(int) method**Syntax*

```
public void setRequestMethod (int requestMethod)
```

*setRequestUrl(String) method**Syntax*

```
public void setRequestUrl (String aUrl)
```

setStreamEnabled(boolean) method

Used to enable streaming of data when the size of the data to be fetched is greater than 200KB.

Syntax

```
public void setStreamEnabled (boolean streamEnabled)
```

Parameters

- **streamEnabled** –

*setTransId(String) method**Syntax*

```
public void setTransId (String transId)
```

useCookies() method

This method is used by the network library to check whether it has to send cookies to the server when the current request is performed.

Syntax

```
public boolean useCookies ()
```

Returns

the use of cookies in the network library.

Remarks

Some requests may deny sending any cookies to the server, in this case this method can be used by the request to signal to the network library. The default value for this is false in the `SDMBaseRequest` implementation.

eTagMap variable

Syntax

```
protected HashMap< String, String > eTagMap
```

HostURL variable

Syntax

```
protected static String HostURL
```

isStreamEnabled variable

Syntax

```
protected static boolean isStreamEnabled
```

mData variable

Syntax

```
protected byte[] mData
```

mHeaders variable

Syntax

```
protected Map< String, String > mHeaders
```

mListener variable

Syntax

```
protected ISDMNetListener mListener
```

mPriority variable

Syntax

```
protected int mPriority
```

mRequestMethod variable**Syntax**

```
protected int mRequestMethod
```

mUrl variable**Syntax**

```
protected String mUrl
```

setCookie variable**Syntax**

```
protected static ArrayList< String > setCookie
```

xsrftoken variable**Syntax**

```
protected static String xsrftoken
```

SDMBundleRequest class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.BundleRequest`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class SDMBundleRequest implements ISDMBundleRequest
```

Implemented interfaces

- *ISDMBundleRequest* on page 805

Members

All members of *SDMBundleRequest*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMBundleRequest()</i> on page 1140	

Methods

Modifier and Type	Method	Description
public void	<i>addRequest</i> (final ISDMRequest) on page 1140	
public void	<i>clearRequests</i> () on page 1140	Cleans out the request storage.
public ISDMRequest[]	<i>getRequests</i> () on page 1140	Returns all requests from the storage.
public void	<i>removeRequest</i> (final ISDMRequest) on page 1141	

Inherited members from ISDMBundleRequest

Modifier and Type	Member	Description
public void	<i>addRequest</i> (ISDMRequest) on page 806	Adds a request to the storage.
public void	<i>removeRequest</i> (ISDMRequest) on page 806	Removes the specific request from the storage.

SDMBundleRequest() constructor*Syntax*

```
public SDMBundleRequest ()
```

*addRequest(final ISDMRequest) method**Syntax*

```
public void addRequest (final ISDMRequest request)
```

clearRequests() method

Cleans out the request storage.

Syntax

```
public void clearRequests ()
```

getRequests() method

Returns all requests from the storage.

Syntax

```
public ISDMRequest[] getRequests ()
```

Returns

the array of requests

*removeRequest(final ISDMRequest) method**Syntax*

```
public void removeRequest (final ISDMRequest request)
```

SDMCache class

Deprecated. since 3.0, Use Cache The SDMCache component is responsible for storing and accessing OData related objects in the memory of the device.

Package

```
com.sap.mobile.lib.sdmcache
```

Syntax

```
public class SDMCache implements ISDMCache,
ISDMPreferenceChangeListener, ISDMEntrySearch
```

Implemented interfaces

- *ISDMCache* on page 683
- *ISDMPreferenceChangeListener* on page 1094
- *ISDMEntrySearch* on page 694

Members

All members of SDMCache, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	ALL_ENTRY_SEARCH_TERM	
protected static final String	ENTRY_TYPE_ODATASBASEDOCUMENT	Search property tag to be used In the default cache search algorithm, this tag will be checked to identify the fields which are included in the search. If configured to be an empty string, all fields are included.
protected static final String	ENTRY_TYPE_ODATAENTRY	
protected static final String	ENTRY_KEY_ODATASERVICEDOCUMENT	

Modifier and Type	Variable	Description
protected static final String	ENTRY_KEY_ODATASCHE- MA	
protected static final String	NON_SAPDATA_DOCU- MENTS_HASHMAP_KEY

public void	<i>write(BufferedWriter)</i> on page 1151	

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Usage

Technical Details: For capacity management, SDMCache uses an LRU (least recently used) like algorithm that ensures that the most recently used entries are not removed first because of reaching the maximum capacity. SDMCache currently supports only the tokenized prefix search as stated above. As a future improvement SDMCache is also going to support custom search logic. SDMCache is an implementer of the android.os.Parcelable interface provided by Android SDK. SDMCache depends on SAPData specific interfaces of SDMParser but does not depend on the real implementation of SDMParser.

SDMCache(ISDMPreferences, ISDMLogger) constructor

Syntax

```
public SDMCache (
    ISDMPreferences preferences,
    ISDMLogger logger
)
```

SDMCache(ISDMPreferences, ISDMLogger, ISDMODataServiceDocument, ISDMODataSchema) constructor

Syntax

```
public SDMCache (  
    ISDMPreferences preferences,  
    ISDMLogger logger,  
    ISDMODataServiceDocument serviceDocument,  
    ISDMODataSchema schema  
)
```

addSearchablePropertyPath(ISDMODataProperty, String, List< String[]>, String...) method

Syntax

```
protected void addSearchablePropertyPath (  
    ISDMODataProperty property,  
    String searchField,  
    List< String[]> searchablePropertyPathes,  
    String... path  
)
```

clear() method

Syntax

```
public void clear ()
```

createStore() method

Syntax

```
protected Map< String, ISDMParserDocument > createStore ()
```

fullTermContainSearch(String, ISDMODataEntry, List< String[]>) method

Syntax

```
protected boolean fullTermContainSearch (  
    String searchTerm,  
    ISDMODataEntry entry,  
    List< String[]> searchablePropertyPathes  
)
```

fullTermPrefixSearch(String, ISDMODataEntry, List< String[]>) method

Syntax

```
protected boolean fullTermPrefixSearch (
    String searchTerm,
    ISDMODataEntry entry,
    List< String[]> searchablePropertyPathes
)
```

getEntrySearch() method

Syntax

```
public ISDMEntrySearch getEntrySearch ()
```

getSDMODataDocument(String) method

Syntax

```
public ISDMParserDocument getSDMODataDocument (String key)
```

getSDMODataEntries(String) method

Syntax

```
public List< ISDMODataEntry > getSDMODataEntries (String
collectionId)
```

getSDMODataEntry(String) method

Syntax

```
public ISDMODataEntry getSDMODataEntry (String key)
```

getSDMODataSchema() method

Syntax

```
public ISDMODataSchema getSDMODataSchema ()
```

getSDMODataServiceDocument() method

Syntax

```
public ISDMODataServiceDocument getSDMODataServiceDocument ()
```

getSearchAlgorithm() method

Syntax

```
public int getSearchAlgorithm ()
```

getStoredDocuments() method

Syntax

```
public List< ISDMParseDocument > getStoredDocuments ()
```

onPreferenceChanged(String, Object) method

Syntax

```
public void onPreferenceChanged (  
    String key,  
    Object value  
)
```

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

regexSearch(String, ISDMODataEntry) method

Syntax

```
protected boolean regexSearch (  
    String searchTerm,  
    ISDMODataEntry entry  
)
```

removeSDMODataDocument(String) method

Syntax

```
public boolean removeSDMODataDocument (String key)
```

removeSDMODataEntries(String) method

Syntax

```
public boolean removeSDMODataEntries (String collectionId)
```

*removeStoredDocuments() method**Syntax*

```
public void removeStoredDocuments ()
```

searchInEntry(String, String, List< String >, ISDMODataEntry, List< String[]>, int) method

Verifies whether the entry should be found during searching for the incoming search term.

Syntax

```
public boolean searchInEntry (
    String searchTerm,
    String collectionId,
    List< String > searchTokens,
    ISDMODataEntry entry,
    List< String[]> searchablePropertyPaths,
    int searchAlgorhythm
)
```

Parameters

- **searchTerm** – The full search-term that the search initiated with,
- **collectionId** – The id of the searched collection
- **searchTokens** – The tokens of splitted lower-case search-term.
- **entry** – The entry that should be checked.
- **searchablePropertyPaths** – The properties of the entry that's values should be used during search.
- **searchAlgorhythm** – The constant ID of the search algorithm.

Returns

True if the entry 'matches' with the given search-term, and false otherwise.

*searchSDMODataEntries(String, String) method**Syntax*

```
public List< ISDMODataEntry > searchSDMODataEntries (
    String searchTerm,
    String collectionId
)
```

*searchSDMODataEntries(String, String, int) method**Syntax*

```
public List< ISDMODataEntry > searchSDMODataEntries (
    String searchTerm,
```

```
String collectionId,  
int searchAlgorithm  
)
```

setEntrySearch(ISDMEnterSearch) method

Syntax

```
public void setEntrySearch (ISDMEnterSearch entrySearch)
```

setSDMODataDocument(String, ISDMParserDocument) method

Syntax

```
public void setSDMODataDocument (  
String key,  
ISDMParserDocument document  
)
```

setSDMODataEntries(List< ISDMODataEntry >) method

Syntax

```
public void setSDMODataEntries (List< ISDMODataEntry > entries)
```

setSDMODataEntry(ISDMODataEntry) method

Syntax

```
public void setSDMODataEntry (ISDMODataEntry entry)
```

Exceptions

- **IllegalAccessException** –

setSDMODataSchema(ISDMODataSchema) method

Syntax

```
public void setSDMODataSchema (ISDMODataSchema schema)
```

setSDMODataServiceDocument(ISDMODataServiceDocument) method

Syntax

```
public void setSDMODataServiceDocument  
(ISDMODataServiceDocument serviceDocument)
```

*setSearchAlgorithm(int) method***Syntax**

```
public void setSearchAlgorithm (int searchAlgorithm)
```

*tokenizedContainAllSearch(List< String >, ISDMODataEntry, List< String[]>) method***Syntax**

```
protected boolean tokenizedContainAllSearch (
    List< String > searchTermTokens,
    ISDMODataEntry entry,
    List< String[]> searchablePropertyPathes
)
```

*tokenizedContainSearch(List< String >, ISDMODataEntry, List< String[]>) method***Syntax**

```
protected boolean tokenizedContainSearch (
    List< String > searchTermTokens,
    ISDMODataEntry entry,
    List< String[]> searchablePropertyPathes
)
```

*tokenizedPrefixSearch(List< String >, ISDMODataEntry, List< String[]>) method***Syntax**

```
protected boolean tokenizedPrefixSearch (
    List< String > searchTermTokens,
    ISDMODataEntry entry,
    List< String[]> searchablePropertyPathes
)
```

*write(BufferedWriter) method***Syntax**

```
public void write (BufferedWriter writer) throws
SDMPersistenceException
```

*ALL_ENTRY_SEARCH_TERM variable***Syntax**

```
public static final String ALL_ENTRY_SEARCH_TERM
```

cacheCapacity variable

Syntax

```
protected int cacheCapacity
```

collectionStore variable

Syntax

```
protected HashMap< String, Map< String, ISDMParserDocument > >  
collectionStore
```

ENTRY_KEY_ODATASHEMA variable

Syntax

```
protected static final String ENTRY_KEY_ODATASHEMA
```

ENTRY_KEY_ODATASERVICEDOCUMENT variable

Syntax

```
protected static final String ENTRY_KEY_ODATASERVICEDOCUMENT
```

ENTRY_TYPE_ODATAENTRY variable

Syntax

```
protected static final String ENTRY_TYPE_ODATAENTRY
```

ENTRY_TYPE_ODATASBASEDOCUMENT variable

Search property tag to be used In the default cache search algorithm, this tag will be checked to identify the fields which are included in the search.

Syntax

```
protected static final String ENTRY_TYPE_ODATASBASEDOCUMENT
```

Remarks

If configured to be an empty string, all fields are included.

entrySearch variable

Syntax

```
protected ISDMEnterSearch entrySearch
```

logger variable

Logger object.

Syntax

```
protected ISDMLogger logger
```

maxSearchResult variable***Syntax***

```
protected int maxSearchResult
```

mLogTag variable***Syntax***

```
protected String mLogTag
```

mPerformanceTime variable***Syntax***

```
protected long mPerformanceTime
```

mTimerStart variable***Syntax***

```
protected long mTimerStart
```

NON_SAPDATA_DOCUMENTS_HASHMAP_KEY variable***Syntax***

```
protected static final String NON_SAPDATA_DOCUMENTS_HASHMAP_KEY
```

preferences variable***Syntax***

```
protected ISDMPreferences preferences
```

schema variable***Syntax***

```
protected ISDMODataSchema schema
```

*searchAlgorithm variable***Syntax**

```
protected int searchAlgorithm
```

*searchField variable***Syntax**

```
protected String searchField
```

*serviceDocument variable***Syntax**

```
protected ISDMODataServiceDocument serviceDocument
```

SDMConnectivityException class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.ConnectivityException
SDMConnectivityException is used in SDMConnectivity.

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class SDMConnectivityException
```

Members

All members of SDMConnectivityException, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMConnectivityException()</i> on page 1155	Constructs a new SDMconnectivityException.
public	<i>SDMConnectivityException(String)</i> on page 1155	Constructs a new SDMconnectivityException.
public	<i>SDMConnectivityException(String, Throwable)</i> on page 1155	Constructs a new SDMconnectivityException.
public	<i>SDMConnectivityException(Throwable)</i> on page 1155	Constructs a new SDMconnectivityException.

SDMConnectivityException() constructor

Constructs a new `SDMconnectivityException`.

Syntax

```
public SDMConnectivityException ()
```

SDMConnectivityException(String) constructor

Constructs a new `SDMconnectivityException`.

Syntax

```
public SDMConnectivityException (String detailMessage)
```

Parameters

- **detailMessage** – the message to set.

SDMConnectivityException(String, Throwable) constructor

Constructs a new `SDMconnectivityException`.

Syntax

```
public SDMConnectivityException (
    String detailMessage,
    Throwable throwable
)
```

Parameters

- **detailMessage** – the message to set.
- **throwable** – the `Throwable` to set.

SDMConnectivityException(Throwable) constructor

Constructs a new `SDMconnectivityException`.

Syntax

```
public SDMConnectivityException (Throwable throwable)
```

Parameters

- **throwable** – the `Throwable` to set.

SDMConnectivityParameters class

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.ConnectivityParameters`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class SDMConnectivityParameters implements
ISDMConnectivityParameters
```

Implemented interfaces

- *ISDMConnectivityParameters* on page 812

Members

All members of SDMConnectivityParameters, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static Boolean	isXcsrfEnabled	
public static Boolean	autoredirectenabled	

Methods

Modifier and Type	Method	Description
public void	<i>enableXsrf(Boolean)</i> on page 1157	Sets the XSRFEnabled flag.
public String	<i>getBaseUrl()</i> on page 1157	
public String	<i>getLanguage()</i> on page 1158	Returns the language setting.
public final TrustManager[]	<i>getTrustManagers()</i> on page 1158	Returns an array filled with TrustManager instances.
public String	<i>getUserName()</i> on page 1158	Returns the username.
public String	<i>getUserPassword()</i> on page 1158	Returns the password.
public boolean	<i>isAutoRedirectEnabled()</i> on page 1158	Returns whether auto redirect is enabled.
public void	<i>setAutoRedirectEnabled(boolean)</i> on page 1159	Enables or disables auto redirect.
public void	<i>setBaseUrl(String)</i> on page 1159	Sets the base URL for requests.
public void	<i>setLanguage(final String)</i> on page 1159	

Modifier and Type	Method	Description
public void	<i>setServerCertificate(Certificate[])</i> on page 1159	
public void	<i>setServerCertificate(Certificate)</i> on page 1159	
public void	<i>setUserName(String)</i> on page 1159	Sets the username which must be used during authentication.
public void	<i>setUserPassword(String)</i> on page 1160	Sets the password.

Inherited members from ISDMConnectivityParameters

Modifier and Type	Member	Description
public void	<i>setLanguage(String)</i> on page 815	Sets the language used in connection.
public void	<i>setServerCertificate(final Certificate[])</i> on page 816	Sets the server certificate.
public void	<i>setServerCertificate(final Certificate)</i> on page 816	Sets a single server certificate.

enableXsrf(Boolean) method

Sets the XSRFEnabled flag.

Syntax

```
public void enableXsrf (Boolean isXsrfEnabled)
```

Parameters

- **isXsrfEnabled** – the boolean to set.

getBaseUrl() method

Syntax

```
public String getBaseUrl ()
```

Returns

the base URL for the requests.

getLanguage() method

Returns the language setting.

Syntax

```
public String getLanguage ()
```

Returns

the language setting

getTrustManagers() method

Returns an array filled with TrustManager instances.

Syntax

```
public final TrustManager[] getTrustManagers ()
```

Returns

the array.

getUserName() method

Returns the username.

Syntax

```
public String getUserName ()
```

Returns

the user name.

getUserPassword() method

Returns the password.

Syntax

```
public String getUserPassword ()
```

Returns

the password.

isAutoRedirectEnabled() method

Returns whether auto redirect is enabled.

Syntax

```
public boolean isAutoRedirectEnabled ()
```

setAutoRedirectEnabled(boolean) method

Enables or disables auto redirect.

Syntax

```
public void setAutoRedirectEnabled (boolean paramboolean)
```

Parameters

- **paramboolean** – the boolean to set

setBaseUrl(String) method

Sets the base URL for requests.

Syntax

```
public void setBaseUrl (String baseUrl)
```

Parameters

- **baseUrl** –

*setLanguage(final String) method**Syntax*

```
public void setLanguage (final String language)
```

*setServerCertificate(Certificate[]) method**Syntax*

```
public void setServerCertificate (Certificate[] certificate) throws  
KeyStoreException
```

*setServerCertificate(Certificate) method**Syntax*

```
public void setServerCertificate (Certificate arg0)
```

setUserName(String) method

Sets the username which must be used during authentication.

Syntax

```
public void setUsername (String aUserName)
```

Parameters

- **aUserName** – the user name to set.

setUserPassword(String) method

Sets the password.

Syntax

```
public void setUserPassword (String aPassword)
```

Parameters

- **aPassword** – the password to set.

autoredirectenabled variable

Syntax

```
public static Boolean autoredirectenabled
```

isXcsrfEnabled variable

Syntax

```
public static Boolean isXcsrfEnabled
```

SDMConstants interface

Deprecated. since 3.0, Use com.sap.mobile.lib.configuration.Constants

Package

```
com.sap.mobile.lib.sdmconfiguration
```

Syntax

```
public interface SDMConstants
```

Derived classes

- *SDMPreferences* on page 1708

Members

All members of SDMConstants, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static final String	SDM_SHARED_PREFEREN- CES	Shared preferences.

Modifier and Type	Variable	Description
public static final int	DEFAULT_CONNECTION_TIMEOUT	Default connection timeout.
public static final int	DEFAULT_SOCKET_CONNECTION_TIMEOUT	Default socket connection timeout.
public static final int	DEFAULT_HTTP_PORT	Default HTTP port.
public static final int	DEFAULT_HTTPS_PORT	Default HTTPS port.
public static final String	DEFAULT_SAP_APPLICATIONID_HEADER_VALUE	Default application ID.
public static final String	DEFAULT_PROXY_HOST	Default proxy host.
public static final int	DEFAULT_PROXY_PORT	Default proxy port.
public static final String	SDM_HTTP_HANDLER_CLASS	Socket Connection handler class.
public static final String	SDM_IMO_HANDLER_CLASS	IMO Connection handler class.
public static final String	DEFAULT_HANDLER_CLASS_NAME	Default handler class.
public static final boolean	DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE	Default security mode.
public static final int	DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE	Default buffer size.
public static final int	MIN_PERSISTENCE_BYTE_BUFFER_SIZE	Minimum buffer size.
public static final int	MAX_PERSISTENCE_BYTE_BUFFER_SIZE	Maximum buffer size.
public static final String	DEFAULT_CIPHER_TRANSFORMATION	Default cipher transformation.
public static final int	DEFAULT_STORE_CAPACITY	Default cache capacity.

Modifier and Type	Variable	Description
public static final int	MAXIMUM_STORE_CAPACITY	Maximum cache capacity.
public static final int	DEFAULT_SEARCH_LIMIT	Default for maximum search results retrieved from cache.
public static final int	DEFAULT_LOG_LEVEL	Default log level.
public static final boolean	DEFAULT_SAPPASSPORT_ENABLED	SAP Passport enablement default setting.
public static final boolean	DEFAULT_BUSINESS_TRANSACTION_ENABLED	SAP Business Transaction XML enablement default setting.

DEFAULT_BUSINESS_TRANSACTION_ENABLED variable
SAP Business Transaction XML enablement default setting.

Syntax

```
public static final boolean DEFAULT_BUSINESS_TRANSACTION_ENABLED
```

DEFAULT_CIPHER_TRANSFORMATION variable
Default cipher transformation.

Syntax

```
public static final String DEFAULT_CIPHER_TRANSFORMATION
```

DEFAULT_CONNECTION_TIMEOUT variable
Default connection timeout.

Syntax

```
public static final int DEFAULT_CONNECTION_TIMEOUT
```

DEFAULT_HANDLER_CLASS_NAME variable
Default handler class.

Syntax

```
public static final String DEFAULT_HANDLER_CLASS_NAME
```

DEFAULT_HTTP_PORT variable

Default HTTP port.

Syntax

```
public static final int DEFAULT_HTTP_PORT
```

DEFAULT_HTTPS_PORT variable

Default HTTPS port.

Syntax

```
public static final int DEFAULT_HTTPS_PORT
```

DEFAULT_LOG_LEVEL variable

Default log level.

Syntax

```
public static final int DEFAULT_LOG_LEVEL
```

DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE variable

Default security mode.

Syntax

```
public static final boolean  
DEFAULT_PERSISTENCE_BOOLEAN_SECUREMODE
```

DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE variable

Default buffer size.

Syntax

```
public static final int DEFAULT_PERSISTENCE_BYTE_BUFFER_SIZE
```

DEFAULT_PROXY_HOST variable

Default proxy host.

Syntax

```
public static final String DEFAULT_PROXY_HOST
```

DEFAULT_PROXY_PORT variable

Default proxy port.

Syntax

```
public static final int DEFAULT_PROXY_PORT
```

DEFAULT_SAP_APPLICATIONID_HEADER_VALUE variable

Default application ID.

Syntax

```
public static final String  
DEFAULT_SAP_APPLICATIONID_HEADER_VALUE
```

DEFAULT_SAPPASSPORT_ENABLED variable

SAP Passport enablement default setting.

Syntax

```
public static final boolean DEFAULT_SAPPASSPORT_ENABLED
```

DEFAULT_SEARCH_LIMIT variable

Default for maximum search results retrieved from cache.

Syntax

```
public static final int DEFAULT_SEARCH_LIMIT
```

DEFAULT_SOCKET_CONNECTION_TIMEOUT variable

Default socket connection timeout.

Syntax

```
public static final int DEFAULT_SOCKET_CONNECTION_TIMEOUT
```

DEFAULT_STORE_CAPACITY variable

Default cache capacity.

Syntax

```
public static final int DEFAULT_STORE_CAPACITY
```

MAX_PERSISTENCE_BYTE_BUFFER_SIZE variable

Maximum buffer size.

Syntax

```
public static final int MAX_PERSISTENCE_BYTE_BUFFER_SIZE
```

MAXIMUM_STORE_CAPACITY variable

Maximum cache capacity.

Syntax

```
public static final int MAXIMUM_STORE_CAPACITY
```

***MIN_PERSISTENCE_BYTE_BUFFER_SIZE* variable**

Minimum buffer size.

Syntax

```
public static final int MIN_PERSISTENCE_BYTE_BUFFER_SIZE
```

***SDM_HTTP_HANDLER_CLASS* variable**

Socket Connection handler class.

Syntax

```
public static final String SDM_HTTP_HANDLER_CLASS
```

***SDM_IMO_HANDLER_CLASS* variable**

IMO Connection handler class.

Syntax

```
public static final String SDM_IMO_HANDLER_CLASS
```

***SDM_SHARED_PREFERENCES* variable**

Shared preferences.

Syntax

```
public static final String SDM_SHARED_PREFERENCES
```

***SDMHttpChannelListeners* class**

Deprecated. since 3.0, Use `com.sap.mobile.lib.request.HttpChannelListeners`

Package

```
com.sap.mobile.lib.sdmconnectivity
```

Syntax

```
public class SDMHttpChannelListeners
```

***SDMHttpChannelListeners.Authenticationschema* class**

Deprecated. since 3.0, Use

`com.sap.mobile.lib.request.HttpChannelListeners.Authenticationschema`

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public class Authenticationschema
```

Members

All members of AuthenticationSchema, including inherited members. **Variables**

Modifier and Type	Variable	Description
public String	realm	
public String	schemaName	

Methods

Modifier and Type	Method	Description
public String	<i>getRealm()</i> on page 1166	
public String	<i>getSchemeName()</i> on page 1166	
public void	<i>processChallenge(ICredential, ISDMRequest)</i> on page 1166	

*getRealm() method**Syntax*

```
public String getRealm ()
```

*getSchemeName() method**Syntax*

```
public String getSchemeName ()
```

*processChallenge(ICredential, ISDMRequest) method**Syntax*

```
public void processChallenge (
    ICredential credentials,
    ISDMRequest request
)
```

*realm variable**Syntax*

```
public String realm
```

schemaName variable

Syntax

```
public String schemaName
```

SDMHttpChannelListeners.BasicCredetials class

Deprecated. since 3.0, Use

`com.sap.mobile.lib.request.HttpChannelListeners.BasicCredetials`

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public class BasicCredetials implements ICredential
```

Implemented interfaces

- *ICredential* on page 1170

Members

All members of `BasicCredetials`, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static String	uName	
public static String	passwd	

Constructors

Modifier and Type	Constructor	Description
public	<i>BasicCredetials(String, String)</i> on page 1167	

Methods

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 1168	

BasicCredetials(String, String) constructor

Syntax

```
public BasicCredetials (  
    String username,
```

```
String pwd
)
```

getAuthHeader() method

Syntax

```
public Map< String, Object > getAuthHeader ()
```

passwd variable

Syntax

```
public static String passwd
```

uName variable

Syntax

```
public static String uName
```

SDMHttpChannelListeners.CookieCredetials class

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpChannelListeners.ICredential

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public class CookieCredetials implements ICredential
```

Implemented interfaces

- *ICredential* on page 1170

Members

All members of CookieCredetials, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static Cookie	cookieValue	

Constructors

Modifier and Type	Constructor	Description
public	<i>CookieCredetials(Cookie)</i> on page 1169	

Methods

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 1169	

CookieCredetials(Cookie) constructor

Syntax

```
public CookieCredetials (Cookie cookie)
```

getAuthHeader() method

Syntax

```
public Map< String, Object > getAuthHeader ()
```

cookieValue variable

Syntax

```
protected static Cookie cookieValue
```

SDMHttpChannelListeners.IAuthenticationChallengeListner interface

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.HttpChannelListeners.IAuthenticationChallengeListner

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public interface IAuthenticationChallengeListner
```

Derived classes

- *AuthenticationChallengeListener* on page 1741

Members

All members of IAuthenticationChallengeListner, including inherited members. **Methods**

Modifier and Type	Method	Description
public ICredential	<i>OnAuthenticationFailed(Authenticationschema, HttpResponse)</i> on page 1170	

*OnAuthenticationFailed(Authenticationschema, HttpResponseMessage) method***Syntax**

```
public ICredential OnAuthenticationFailed (
    Authenticationschema authScheme,
    HttpResponseMessage response
)
```

SDMHttpChannelListeners.ICredential interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpChannelListeners.ICredential

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public interface ICredential
```

Derived classes

- *BasicCredetials* on page 1167
- *CookieCredetials* on page 1168

Members

All members of ICredential, including inherited members. **Methods**

Modifier and Type	Method	Description
public Map< String, Object >	<i>getAuthHeader()</i> on page 1170	

*getAuthHeader() method***Syntax**

```
public Map< String, Object > getAuthHeader ()
```

SDMHttpChannelListeners.IMutualSSLChallengeListener interface

Deprecated. since 3.0, Use com.sap.mobile.lib.request.HttpChannelListeners.IMutualSSLChallengeListener

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public interface IMutualSSLChallengeListener
```

Members

All members of IMutualSSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public HttpClientCertInfo	<i>getClientCertificate()</i> on page 1171	

*getClientCertificate() method**Syntax*

```
public HttpClientCertInfo getClientCertificate ()
```

SDMHttpChannelListeners.ISSLChallengeListener interface

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.HttpChannelListeners.ISSLChallengeListener

Package

```
com.sap.mobile.lib.sdmconnectivity.SDMHttpChannelListeners
```

Syntax

```
public interface ISSLChallengeListener
```

Members

All members of ISSLChallengeListener, including inherited members. **Methods**

Modifier and Type	Method	Description
public boolean	<i>isServerTrusted(X509Certificate[])</i> on page 1171	

*isServerTrusted(X509Certificate[]) method**Syntax*

```
public boolean isServerTrusted (X509Certificate[]  
paramArrayOfX509Certificate)
```

SDMLogger class

Deprecated. since 3.0, Use com.sap.mobile.lib.supportability.Logger ISDMLogger implementation.

Package

```
com.sap.mobile.lib.supportability
```

Syntax

```
public class SDMLogger implements ISDMLogger, ISDMPersistable
```

Implemented interfaces

- *ISDMLogger* on page 817
- *ISDMPersistable* on page 1084

Members

All members of SDMLogger, including inherited members. **Variables**

Modifier and Type	Variable	Description
public static int	passportTraceLevel	
public static int	e2eStep	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMLogger()</i> on page 1176	Constructs a new SDMLogger, an ISDMLogger implementation.

Methods

Modifier and Type	Method	Description
public boolean	<i>canLog()</i> on page 1177	Implementer should override this method!
public void	<i>cleanup(final int)</i> on page 1177	Deletes all entries weaker than the threshold priority.
public void	<i>d(final String, final String)</i> on page 1177	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable)</i> on page 1177	Sends a DEBUG log message and logs the exception.
public void	<i>d(final String, final String, final String)</i> on page 1178	Sends a DEBUG log message.
public void	<i>d(final String, final String, final Throwable, final String)</i> on page 1178	Sends a DEBUG log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>e</i> (<i>final String</i> , <i>final String</i>) on page 1179	Sends an ERROR log message.
public void	<i>e</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i>) on page 1179	Sends an ERROR log message and logs the exception.
public void	<i>e</i> (<i>final String</i> , <i>final String</i> , <i>final String</i>) on page 1180	Sends an ERROR log message.
public void	<i>e</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 1180	Sends an ERROR log message and logs the exception.
public Enumeration< LogEntry >	<i>getLogElements</i> () on page 1180	
public Vector< LogEntry >	<i>getLogElements</i> (<i>final int</i>) on page 1181	Get the log elements above (and including) the threshold.
public Vector< LogEntry >	<i>getLogElementsByCorrelationId</i> (<i>final String</i>) on page 1181	
public Vector< LogEntry >	<i>getLogElementsByPID</i> (<i>final long</i>) on page 1181	
public Vector< LogEntry >	<i>getLogElementsByTag</i> (<i>final String</i>) on page 1181	
public Vector< LogEntry >	<i>getLogElementsByTimeStamp</i> (<i>final long</i> , <i>final long</i>) on page 1181	
public final int	<i>getLogLevel</i> () on page 1181	Returns the log level.
public void	<i>i</i> (<i>final String</i> , <i>final String</i>) on page 1182	Sends an INFO log message.
public void	<i>i</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i>) on page 1182	Sends a INFO log message and logs the exception.
public void	<i>i</i> (<i>final String</i> , <i>final String</i> , <i>final String</i>) on page 1183	Sends an INFO log message.
public void	<i>i</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 1183	Sends a INFO log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>log</i> (<i>final int, final String, final String, final Throwable, String</i>) on page 1183	Logs a log message.
public void	<i>logFullLocation</i> (<i>boolean</i>) on page 1184	Setting to control log full location (class-path and method name).
public boolean	<i>logsFullLocation</i> () on page 1184	To get the setting which controls log output should contain full location (class and method name) or not.
public boolean	<i>logsToAndroid</i> () on page 1184	To get the setting which controls log output to Android log.
public void	<i>logToAndroid</i> (<i>final boolean</i>) on page 1185	Setting to control log output to Android log.
public void	<i>p</i> (<i>final String, final String</i>) on page 1185	Sends a PERFORMANCE log message.
public void	<i>p</i> (<i>final String, final String, final String</i>) on page 1185	Sends a PERFORMANCE log message.
public void	<i>read</i> (<i>BufferedReader</i>) on page 1186	
public void	<i>setHeaderData</i> (<i>final String, final String, final String, final String, final String, final String, final String</i>) on page 1186	Sets the log header fields.
public void	<i>setLogLevel</i> (<i>final int</i>) on page 1187	Set the log level.
public void	<i>terminate</i> () on page 1187	Clears collected log data.
public synchronized String	<i>toString</i> () on page 1187	Get log data.
public void	<i>v</i> (<i>final String, final String</i>) on page 1187	Sends a VERBOSE log message.
public void	<i>v</i> (<i>final String, final String, final Throwable</i>) on page 1188	Sends a VERBOSE log message and logs the exception.

Modifier and Type	Method	Description
public void	<i>v(final String, final String, final String)</i> on page 1188	Sends a VERBOSE log message.
public void	<i>v(final String, final String, final Throwable, final String)</i> on page 1189	Sends a VERBOSE log message and logs the exception.
public void	<i>w(final String, final Throwable)</i> on page 1189	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final Throwable)</i> on page 1189	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String)</i> on page 1190	Sends a WARN log message.
public void	<i>w(final String, final Throwable, final String)</i> on page 1190	Sends a WARN log message and logs the exception.
public void	<i>w(final String, final String, final String)</i> on page 1191	Sends a WARN log message.
public void	<i>w(final String, final String, final Throwable, final String)</i> on page 1191	Sends a WARN log message and logs the exception.
public void	<i>write(BufferedWriter)</i> on page 1192	
public void	<i>wtf(final String, final Throwable)</i> on page 1192	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf(final String, final String)</i> on page 1192	Use com.sap.mobile.lib.supportability.ILogger#w(String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf(final String, final String, final Throwable)</i> on page 1193	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable) What a Terrible Failure: Reports an exception that should never happen.

Modifier and Type	Method	Description
public void	<i>wtf</i> (<i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 1193	Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.
public void	<i>wtf</i> (<i>final String</i> , <i>final String</i> , <i>final String</i>) on page 1194	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, String) What a Terrible Failure: Reports a condition that should never happen.
public void	<i>wtf</i> (<i>final String</i> , <i>final String</i> , <i>final Throwable</i> , <i>final String</i>) on page 1194	Use com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String) What a Terrible Failure: Reports an exception that should never happen.

Inherited members from ISDMLogger

Modifier and Type	Member	Description
public static final int	<i>ASSERT</i> on page 836	Log level ASSERT.
public static final int	<i>DEBUG</i> on page 836	Log level DEBUG.
public static final int	<i>ERROR</i> on page 836	Log level ERROR.
public static final int	<i>FATAL</i> on page 836	Log level FATAL.
public static final int	<i>INFO</i> on page 836	Log level INFO.
public static final int	<i>PERFORMANCE</i> on page 836	Log level PERFORMANCE.
public static final int	<i>VERBOSE</i> on page 836	Log level VERBOSE.
public static final int	<i>WARN</i> on page 837	Log level WARN.

SDMLogger() constructor

Constructs a new SDMLogger, an ISDMLogger implementation.

Syntax

```
public SDMLogger ()
```

canLog() method

Implementer should override this method!

Syntax

```
public boolean canLog ()
```

Returns

State of ability to log.

cleanUp(final int) method

Deletes all entries weaker than the threshold priority.

Syntax

```
public void cleanUp (final int threshold)
```

d(final String, final String) method

Sends a DEBUG log message.

Syntax

```
public void d (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,String)`

d(final String, final String, final Throwable) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#d(String,String,Throwable,String)`

d(final String, final String, final String) method

Sends a DEBUG log message.

Syntax

```
public void d (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

d(final String, final String, final Throwable, final String) method

Sends a DEBUG log message and logs the exception.

Syntax

```
public void d (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,String)`

e(final String, final String, final Throwable) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (  
    final String tag,  
    final String msg,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#e(String,String,Throwable,String)`

e(final String, final String, final String) method

Sends an ERROR log message.

Syntax

```
public void e (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

e(final String, final String, final Throwable, final String) method

Sends an ERROR log message and logs the exception.

Syntax

```
public void e (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

getLogElements() method

Syntax

```
public Enumeration< LogEntry > getLogElements ()
```

getLogElements(final int) method

Get the log elements above (and including) the threshold.

Syntax

```
public Vector< LogEntry > getLogElements (final int threshold)
```

Parameters

- **threshold** – the desired level (inclusively)

Returns

log elements as Vector

*getLogElementsByCorrelationId(final String) method**Syntax*

```
public Vector< LogEntry > getLogElementsByCorrelationId (final String correlationId)
```

*getLogElementsByPID(final long) method**Syntax*

```
public Vector< LogEntry > getLogElementsByPID (final long PID)
```

*getLogElementsByTag(final String) method**Syntax*

```
public Vector< LogEntry > getLogElementsByTag (final String aTag)
```

*getLogElementsByTimeStamp(final long, final long) method**Syntax*

```
public Vector< LogEntry > getLogElementsByTimeStamp (
    final long start,
    final long end
)
```

getLogLevel() method

Returns the log level.

Syntax

```
public final int getLogLevel ()
```

Returns

the log level.

i(final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,String)`

i(final String, final String, final Throwable) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (  
    final String tag,  
    final String msg,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#i(String,String,Throwable,String)`

i(final String, final String, final String) method

Sends an INFO log message.

Syntax

```
public void i (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

i(final String, final String, final Throwable, final String) method

Sends a INFO log message and logs the exception.

Syntax

```
public void i (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

log(final int, final String, final String, final Throwable, String) method

Logs a log message.

Syntax

```
public void log (
    final int level,
    final String tag,
    final String msg,
    final Throwable tr,
```

```
String location  
)
```

Parameters

- **level** – the log level
- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

logFullLocation(boolean) method

Setting to control log full location (class-path and method name).

Syntax

```
public void logFullLocation (boolean logFullLocation)
```

Parameters

- **logFullLocation** – log i or do not log it.

logsFullLocation() method

To get the setting which controls log output should contain full location (class and method name) or not.

Syntax

```
public boolean logsFullLocation ()
```

Returns

logging with full location or not.

logsToAndroid() method

To get the setting which controls log output to Android log.

Syntax

```
public boolean logsToAndroid ()
```

Returns

logging to Android log or not logging.

logToAndroid(final boolean) method

Setting to control log output to Android log.

Syntax

```
public void logToAndroid (final boolean dolt)
```

Parameters

- **dolt** – log or do not log.

p(final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#p(String,String,String)`

p(final String, final String, final String) method

Sends a PERFORMANCE log message.

Syntax

```
public void p (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

- **location** – The line-level location of the log source (full class name of the class).

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setHeaderData(final String, final String) method

Sets the log header fields.

Syntax

```
public void setHeaderData (  
    final String osVersion,  
    final String appName,  
    final String appVersion,  
    final String thirdParty,  
    final String hwVersion,  
    final String user,  
    final String timezone,  
    final String language,  
    final String baseUrl  
)
```

Parameters

- **osVersion** – the Operating System version
- **appName** – the Application name
- **appVersion** – the version of the Application
- **thirdParty** – 3rd-party product versions (e.g. SQLite)
- **hwVersion** – the Hardware version
- **user** – the user name used in Connectivity (SDMConnectivity sets it)
- **timezone** – the time zone
- **language** – the language used in connectivity (SDMConnectivity sets it)
- **baseUrl** – the URL used in Connectivity (SDMconnectivity sets it)

Remarks

A header field is set only if it is not null. Also, it is set only once; subsequent calls will not overwrite the first write.

setLogLevel(final int) method

Set the log level.

Syntax

```
public void setLogLevel (final int level)
```

Parameters

- **level** – the log level

terminate() method

Clears collected log data.

Syntax

```
public void terminate ()
```

toString() method

Get log data.

Syntax

```
public synchronized String toString ()
```

Returns

log data as string

v(final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#v(String,String,String)`

v(final String, final String, final Throwable) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (  
    final String tag,  
    final String msg,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#v(String,String,Throwable,String)`

v(final String, final String, final String) method

Sends a VERBOSE log message.

Syntax

```
public void v (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

v(final String, final String, final Throwable, final String) method

Sends a VERBOSE log message and logs the exception.

Syntax

```
public void v (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,Throwable,String)`

w(final String, final String, final Throwable) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final String msg,
```

```
        final Throwable tr
    )
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,String,Throwable,String)`

w(final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (
    final String tag,
    final String msg
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#w(String,String,String)`

w(final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String, final String) method

Sends a WARN log message.

Syntax

```
public void w (
    final String tag,
    final String msg,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

w(final String, final String, final Throwable, final String) method

Sends a WARN log message and logs the exception.

Syntax

```
public void w (
    final String tag,
    final String msg,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

wtf(final String, final Throwable) method

Use com.sap.mobile.lib.supportability.ILogger#w(String, Throwable) What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (  
    final String tag,  
    final Throwable tr  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log

Remarks

Similar to wtf(String, final String), with an exception to log. Logger implementation is able to identify the source of the log message at the price of performance penalty. See SDMLogger#wtf(String,Throwable,String)

wtf(final String, final String) method

Use com.sap.mobile.lib.supportability.ILogger#w(String, String) What a Terrible Failure: Reports a condition that should never happen.

Syntax

```
public void wtf (  
    final String tag,  
    final String msg  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.

Remarks

Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,String,String)`

wtf(final String, final String, final Throwable) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (
    final String tag,
    final String msg,
    final Throwable tr
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **tr** – An exception to log

Remarks

Similar to `wtf(finalString, Throwable)`, also with a message. Logger implementation is able to identify the source of the log message at the price of performance penalty. See `SDMLogger#wtf(String,String,Throwable,String)`

wtf(final String, final Throwable, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, Throwable, String)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (
    final String tag,
    final Throwable tr,
    final String location
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

Remarks

Similar to `wtf(String, final String)`, with an exception to log.

wtf(final String, final String, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, String)` What a Terrible Failure: Reports a condition that should never happen.

Syntax

```
public void wtf (  
    final String tag,  
    final String msg,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.
- **msg** – The message you would like to be logged.
- **location** – The line-level location of the log source (full class name of the class).

wtf(final String, final String, final Throwable, final String) method

Use `com.sap.mobile.lib.supportability.ILogger#w(String, String, Throwable, String)` What a Terrible Failure: Reports an exception that should never happen.

Syntax

```
public void wtf (  
    final String tag,  
    final String msg,  
    final Throwable tr,  
    final String location  
)
```

Parameters

- **tag** – Used to identify the source of a log message. It usually identifies the class or activity where the log call occurs.

- **msg** – The message you would like to be logged.
- **tr** – An exception to log
- **location** – The line-level location of the log source (full class name of the class).

Remarks

Similar to `wtf(finalString, Throwable)`, also with a message.

e2eStep variable

Syntax

```
public static int e2eStep
```

passportTraceLevel variable

Syntax

```
public static int passportTraceLevel
```

SDMODataAssociation class

Deprecated. since 3.0, Use `ODataAssociation`

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataAssociation extends SDMParserDocument
implements ISDMODataAssociation
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataAssociation* on page 838

Derived classes

- *SDMODataAssociationSet* on page 1221

Members

All members of `SDMODataAssociation`, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODDataAssociation()</i> on page 1209	
protected	<i>SDMODDataAssociation(int[], String[])</i> on page 1209	
public	<i>SDMODDataAssociation(SDMParserDocument)</i> on page 1209	
protected	<i>SDMODDataAssociation(String)</i> on page 1210	

Methods

Modifier and Type	Method	Description
public ISDMODDataAssociationEnd	<i>getAssociationEnd(String)</i> on page 1210	Returns the value of the appropriate Association End SDMODData element with the given role.
public List< ISDMODDataAssociationEnd >	<i>getAssociationEnds()</i> on page 1210	Returns list of the appropriate SDMODData elements.
public String	<i>getName()</i> on page 1210	Returns the value of the appropriate SDMODData attribute.

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	

Modifier and Type	Member	Description
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	

Modifier and Type	Member	Description
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List< String >, String...)</i> on page 1700	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataAssociation

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 845	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 845	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 845	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ASSOCIATIONEND</i> on page 846	Name of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataAssociation() constructor

Syntax

```
public SDMODataAssociation ()
```

SDMODataAssociation(int[], String[]) constructor

Syntax

```
protected SDMODataAssociation (
    int[] routes,
    String[] values
)
```

SDMODataAssociation(SDMParserDocument) constructor

Syntax

```
public SDMODataAssociation (SDMParserDocument document)
```

SDMODataAssociation(String) constructor

Syntax

```
protected SDMODataAssociation (String elementAssociationset)
```

getAssociationEnd(String) method

Returns the value of the appropriate Association End SDMOData element with the given role.

Syntax

```
public ISDMODataAssociationEnd getAssociationEnd (String role)
```

Parameters

- **role** – The expected value of the appropriate SDMOData attribute

Returns

the value of the appropriate Association End SDMOData element

getAssociationEnds() method

Returns list of the appropriate SDMOData elements.

Syntax

```
public List< ISDMODataAssociationEnd > getAssociationEnds ()
```

Returns

list of the appropriate SDMOData elements

getName() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public String getName ()
```

Returns

the value of the appropriate SDMOData attribute

SDMODataAssociation.SDMODataAssociationEnd class

Deprecated. since 3.0, Use ODataAssociationEnd

Package

```
com.sap.mobile.lib.sdmparser.SDMODataAssociation
```

Syntax

```
public class SDMODataAssociationEnd extends SDMParserDocument
implements ISDMODataAssociationEnd
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataAssociationEnd* on page 846

Members

All members of *SDMODataAssociationEnd*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataAssociationEnd()</i> on page 1219	
protected	<i>SDMODataAssociationEnd(int[], String[])</i> on page 1220	
public	<i>SDMODataAssociationEnd(SDMParserDocument)</i> on page 1220	

Methods

Modifier and Type	Method	Description
public String	<i>getCollectionId()</i> on page 1220	
public String	<i>getEntitySet()</i> on page 1220	
public String	<i>getMultiplicity()</i> on page 1220	
public String	<i>getRole()</i> on page 1220	
public String	<i>getType()</i> on page 1220	

Inherited members from *SDMParserDocument*

Modifier and Type	Member	Description
public <i>SDMParserDocument</i>	<i>clone()</i> on page 1681	Creates a copy of this object.

Modifier and Type	Member	Description
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParseDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	

Modifier and Type	Member	Description
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	

Modifier and Type	Member	Description
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.

Modifier and Type	Member	Description
public static void	<i>setNameMap(List<String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List<String >, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataAssociationEnd

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 848	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_MULTIPLICITY</i> on page 848	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_ROLE</i> on page 848	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 848	Name of the appropriate SDMODData attribute.

SDMODDataAssociationEnd() constructor

Syntax

```
public SDMODDataAssociationEnd ()
```

SDMODataAssociationEnd(int[], String[]) constructor

Syntax

```
protected SDMODataAssociationEnd (  
    int[] routes,  
    String[] values  
)
```

SDMODataAssociationEnd(SDMParserDocument) constructor

Syntax

```
public SDMODataAssociationEnd (SDMParserDocument document)
```

getCollectionId() method

Syntax

```
public String getCollectionId ()
```

getEntitySet() method

Syntax

```
public String getEntitySet ()
```

getMultiplicity() method

Syntax

```
public String getMultiplicity ()
```

getRole() method

Syntax

```
public String getRole ()
```

getType() method

Syntax

```
public String getType ()
```

***SDMODataAssociationSet* class**

Deprecated. since 3.0, Use ODataAssociationSet

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataAssociationSet extends SDMODataAssociation
implements ISDMODataAssociationSet
```

Base class

- *SDMODataAssociation* on page 1195

Implemented interfaces

- *ISDMODataAssociationSet* on page 849

Members

All members of SDMODataAssociationSet, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataAssociationSet()</i> on page 1240	
protected	<i>SDMODataAssociationSet(int[], String[])</i> on page 1240	
public	<i>SDMODataAssociationSet(SDMParserDocument)</i> on page 1241	

Methods

Modifier and Type	Method	Description
public String	<i>getAssociation()</i> on page 1241	Returns the value of appropriate SDMOData element.

Inherited members from SDMODataAssociation

Modifier and Type	Member	Description
public ISDMODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 1210	Returns the value of the appropriate Association End SDMOData element with the given role.
public List< ISDMODataAssociationEnd >	<i>getAssociationEnds()</i> on page 1210	Returns list of the appropriate SDMOData elements.
public String	<i>getName()</i> on page 1210	Returns the value of the appropriate SDMOData attribute.
public	<i>SDMODataAssociation()</i> on page 1209	
protected	<i>SDMODataAssociation(int[], String[])</i> on page 1209	
public	<i>SDMODataAssociation(SDMParserDocument)</i> on page 1209	
protected	<i>SDMODataAssociation(String)</i> on page 1210	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.

Modifier and Type	Member	Description
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	

Modifier and Type	Member	Description
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	

Modifier and Type	Member	Description
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParseDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String>, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValues(List<String>, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns. Note: Some patterns are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataAssociation

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 845	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 845	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 845	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ASSOCIATION- END</i> on page 846	Name of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataAssociationSet

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_ASSOCIATION-SET</i> on page 855	Name of the appropriate SDMODData element.

Inherited members from ISDMODataAssociation

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ASSOCIATION</i> on page 845	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 845	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_ASSOCIATION</i> on page 845	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ASSOCIATION-END</i> on page 846	Name of the appropriate SDMODData element.
public abstract ISDMODataAssociationEnd	<i>getAssociationEnd(String)</i> on page 844	Returns the value of the appropriate Association End SDMODData element with the given role.
public abstract List< ISDMODataAssociationEnd >	<i>getAssociationEnds()</i> on page 845	Returns list of the appropriate SDMODData elements.
public abstract String	<i>getName()</i> on page 845	Returns the value of the appropriate SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATA_SERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataAssociationSet() constructor

Syntax

```
public SDMODataAssociationSet ()
```

SDMODataAssociationSet(int[], String[]) constructor

Syntax

```
protected SDMODataAssociationSet (  
    int[] routes,
```

```
String[] values
)
```

SDMODataAssociationSet(SDMParserDocument) constructor

Syntax

```
public SDMODataAssociationSet (SDMParserDocument document)
```

getAssociation() method

Returns the value of appropriate SDMOData element.

Syntax

```
public String getAssociation ()
```

Returns

the value of appropriate SDMOData element

SDMODataCollection class

Deprecated. since 3.0, Use ODataCollection

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataCollection extends SDMParserDocument
implements ISDMODataCollection
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataCollection* on page 855

Members

All members of SDMODataCollection, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	
protected String	collectionName	
protected boolean	isJson	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODDataCollection()</i> on page 1257	
protected	<i>SDMODDataCollection(int[], String[])</i> on page 1257	
public	<i>SDMODDataCollection(SDMParserDocument)</i> on page 1257	
public	<i>SDMODDataCollection(String)</i> on page 1257	

Methods

Modifier and Type	Method	Description
public int	<i>getDisplayOrder()</i> on page 1257	Returns the value of the appropriate SDMODData extension attribute.
public String	<i>getHref()</i> on page 1258	Returns the value of the 'href' SDMODData attribute.
public List< ISDMODDataIcon >	<i>getIcons()</i> on page 1258	Returns list of the appropriate SDMODData elements.
public String	<i>getId()</i> on page 1258	Returns the value of the 'href' SDMODData attribute as a relative href (matchable with appropriate entitySet)
public List< ISDMODDataLink >	<i>getLinks()</i> on page 1258	Returns the value of the appropriate SDMODData elements.
public String	<i>getMemberTitle()</i> on page 1259	Returns the value of the appropriate SDMSDMODData element.
public ISDMODDataLink	<i>getSearchLink()</i> on page 1259	Returns SDMSDMODData Link object that should be used for retrieving Open Search Description XML.
public String	<i>getSemantics()</i> on page 1259	Returns the value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public ISDMODDataLink	<i>getSubscriptionLink()</i> on page 1259	Returns SDMSDMODData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getTitle()</i> on page 1260	Returns the value of the appropriate SDMODData element.
public String	<i>getUrl()</i> on page 1260	Returns SDMSDMODData Link object that should be used for self related operations.
public boolean	<i>isCreatable()</i> on page 1260	Returns the value of the appropriate SDMODData attribute.
public boolean	<i>isDeletable()</i> on page 1260	Returns the value of the appropriate SDMODData attribute.
public boolean	<i>isFilterable()</i> on page 1260	Returns the value of the appropriate SDMODData attribute.
public boolean	<i>isSearchable()</i> on page 1261	Returns the value of the appropriate SDMODData attribute.
public boolean	<i>isUpdatable()</i> on page 1261	Returns the value of the appropriate SDMODData attribute.
public void	<i>read(BufferedReader)</i> on page 1261	
protected void	<i>setBaseUrl(String)</i> on page 1261	
public void	<i>setEntitySet(ISDMODDataEntitySet)</i> on page 1262	Sets the data held by the appropriate element of the SDMODData Schema.
public void	<i>write(BufferedWriter)</i> on page 1262	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map<String, String>	<i>extensions</i> on page 1701	

Modifier and Type	Member	Description
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.

Modifier and Type	Member	Description
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	

Modifier and Type	Member	Description
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	

Modifier and Type	Member	Description
public static void	<i>setPrefixMapping</i> (<i>Map</i> < <i>String</i> , <i>String</i> >) on page 1699	
protected void	<i>setString</i> (<i>String</i> , <i>String</i> ...) on page 1699	
protected void	<i>setStrings</i> (<i>List</i> < <i>String</i> >, <i>String</i> ...) on page 1699	
public void	<i>setValue</i> (<i>String</i> , <i>String</i> ...) on page 1699	
public void	<i>setValues</i> (<i>List</i> < <i>String</i> >, <i>String</i> ...) on page 1700	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected <i>String</i> []	<i>strings</i> on page 1701	
public <i>String</i>	<i>toXMLString</i> () on page 1700	Returns the XML string representation of this object.
protected static final <i>String</i>	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public static void	<i>writeNameMap</i> (<i>BufferedWriter</i>) on page 1701	

Inherited members from *ISDMParserDocument*

Modifier and Type	Member	Description
public static final <i>String</i>	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final <i>String</i>	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static <i>Map</i> < <i>String</i> , <i>String</i> >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataCollection

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 866	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 867	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_DISPLAYORDER</i> on page 867	Name of the appropriate SDMODData extension attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 867	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_HREF</i> on page 867	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 867	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 867	Name of the appropriate SDMSDMODData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 867	Name of the appropriate SDMODData attribute.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUE_REL_SEARCH</i> on page 868	Possible value of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_COLLECTION</i> on page 868	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_LINK</i> on page 868	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_MEMBERTITLE</i> on page 868	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_TITLE</i> on page 868	Name of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List<String>, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataCollection() constructor*Syntax*

```
public SDMODataCollection ()
```

SDMODataCollection(int[], String[]) constructor*Syntax*

```
protected SDMODataCollection (
    int[] routes,
    String[] values
)
```

SDMODataCollection(SDMParserDocument) constructor*Syntax*

```
public SDMODataCollection (SDMParserDocument document)
```

SDMODataCollection(String) constructor*Syntax*

```
public SDMODataCollection (String string)
```

getDisplayOrder() method

Returns the value of the appropriate SDMOData extension attribute.

Syntax

```
public int getDisplayOrder ()
```

Returns

The value of the appropriate SDMODData extension attribute

getHref() method

Returns the value of the 'href' SDMODData attribute.

Syntax

```
public String getHref ()
```

Returns

The value of the 'href' SDMODData attribute

getIcons() method

Returns list of the appropriate SDMODData elements.

Syntax

```
public List< ISDMODDataIcon > getIcons ()
```

Returns

list of the appropriate SDMODData elements

getId() method

Returns the value of the 'href' SDMODData attribute as a relative href (matchable with appropriate entitySet)

Syntax

```
public String getId ()
```

Returns

The value of the 'href' SDMODData attribute

getLinks() method

Returns the value of the appropriate SDMODData elements.

Syntax

```
public List< ISDMODDataLink > getLinks ()
```

Returns

The value of the appropriate SDMODData elements

getMemberTitle() method

Returns the value of the appropriate SDMSDMOData element.

Syntax

```
public String getMemberTitle ()
```

Returns

The value of the appropriate SDMSDMOData element

getSearchLink() method

Returns SDMSDMOData Link object that should be used for retrieving Open Search Description XML.

Syntax

```
public ISDMODataLink getSearchLink ()
```

Returns

SDMSDMOData Link for search

getSemantics() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate SDMOData attribute

getSubscriptionLink() method

Returns SDMSDMOData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public ISDMODataLink getSubscriptionLink ()
```

Returns

SDMSDMOData Link for subscribe

getTitle() method

Returns the value of the appropriate SDMODData element.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate SDMODData element

getUrl() method

Returns SDMSDMODData Link object that should be used for self related operations.

Syntax

```
public String getUrl ()
```

Returns

SDMSDMODData Link for self Returns the full URL of the collectionThe full URL of the collection

isCreatable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public boolean isCreatable ()
```

Returns

The value of the appropriate SDMODData attribute

isDeletable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public boolean isDeletable ()
```

Returns

The value of the appropriate SDMODData attribute

isFilterable() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public boolean isFilterable ()
```

Returns

The value of the appropriate SDMOData attribute

isSearchable() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public boolean isSearchable ()
```

Returns

The value of the appropriate SDMOData attribute

isUpdatable() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public boolean isUpdatable ()
```

Returns

The value of the appropriate SDMOData attribute

read(BufferedReader) method**Syntax**

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method**Syntax**

```
protected void setBaseUrl (String baseUrl)
```

setEntitySet(ISDMODataEntitySet) method

Sets the data held by the appropriate element of the SDMOData Schema.

Syntax

```
public void setEntitySet (ISDMODataEntitySet entitySet)
```

Parameters

- **entitySet** – The SDMOData EntitySet to use the data from.

Remarks

If EntitySet is set base attributes of collection will be overwritten with the appropriate values of the EntitySet.

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

collectionName variable

Syntax

```
protected String collectionName
```

isJson variable

Syntax

```
protected boolean isJson
```

SDMODataComplexType class

Deprecated. since 3.0, Use `ODataComplexType`

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataComplexType extends SDMParserDocument
implements ISDMODataComplexType
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataComplexType* on page 868

Members

All members of *SDMODataComplexType*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataComplexType()</i> on page 1276	
protected	<i>SDMODataComplexType(int[], String[])</i> on page 1276	
public	<i>SDMODataComplexType(SDMParserDocument)</i> on page 1277	

Methods

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 1277	Returns the value of the appropriate <i>SDMOData</i> element.
public List< <i>ISDMODataProperty</i> >	<i>getProperties()</i> on page 1277	Returns the list of the appropriate <i>SDMOData</i> elements.

Inherited members from *SDMParserDocument*

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.

Modifier and Type	Member	Description
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate namespace prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	

Modifier and Type	Member	Description
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List<String >, String...)</i> on page 1700	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_NAME</i> on page 875	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_COMPLEXTYPE</i> on page 875	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 875	Name of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataComplexType() constructor

Syntax

```
public SDMODataComplexType ()
```

SDMODataComplexType(int[], String[]) constructor

Syntax

```
protected SDMODataComplexType (  
    int[] routes,
```

```
String[] values
)
```

SDMODataComplexType(SDMParserDocument) constructor

Syntax

```
public SDMODataComplexType (SDMParserDocument document)
```

getName() method

Returns the value of the appropriate SDMOData element.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMOData element

getProperties() method

Returns the list of the appropriate SDMOData elements.

Syntax

```
public List< ISDMODataProperty > getProperties ()
```

Returns

The list of the appropriate SDMOData elements

SDMODataEntitySet class

Deprecated. since 3.0, Use ODataEntitySet

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataEntitySet extends SDMParserDocument
implements ISDMODataEntitySet
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataEntitySet* on page 875

Members

All members of SDMODataEntitySet, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODDataEntity.Set()</i> on page 1291	
protected	<i>SDMODDataEntity.Set(int[], String[])</i> on page 1291	
public	<i>SDMODDataEntity-Set(SDMParserDocument)</i> on page 1292	

Methods

Modifier and Type	Method	Description
public String	<i>getName()</i> on page 1292	
public boolean	<i>isCreatable()</i> on page 1292	
public boolean	<i>isDeletable()</i> on page 1292	
public boolean	<i>isSearchable()</i> on page 1292	
public boolean	<i>isSearchable(String)</i> on page 1293	Returns the value of the given SDMODData attribute.
public boolean	<i>isUpdatable()</i> on page 1293	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.

Modifier and Type	Member	Description
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	

Modifier and Type	Member	Description
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List< String >, String...)</i> on page 1700	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataEntitySet

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 882	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 882	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 883	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 883	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 883	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_ENTITYSET</i> on page 883	Name of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .

public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataEntitySet() constructor

Syntax

```
public SDMODataEntitySet ()
```

SDMODataEntitySet(int[], String[]) constructor

Syntax

```
protected SDMODataEntitySet (
    int[] routes,
```

```
) String[] values
```

SDMODataEntitySet(SDMParserDocument) constructor

Syntax

```
public SDMODataEntitySet (SDMParserDocument document)
```

getName() method

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMOData attribute

isCreatable() method

Syntax

```
public boolean isCreatable ()
```

Returns

The value of the appropriate SDMOData attribute

isDeletable() method

Syntax

```
public boolean isDeletable ()
```

Returns

The value of the appropriate SDMOData attribute

isSearchable() method

Syntax

```
public boolean isSearchable ()
```

Returns

The value of the appropriate SDMOData attribute

isSearchable(String) method

Returns the value of the given SDMOData attribute.

Syntax

```
public boolean isSearchable (String searchAttributeName)
```

Parameters

- **searchAttributeName** – The name of the SDMOData attribute

Returns

The value of the given SDMOData attribute

*isUpdatable() method**Syntax*

```
public boolean isUpdatable ()
```

Returns

The value of the appropriate SDMOData attribute

SDMODataEntityType class

Deprecated. since 3.0, Use ODataEntityType

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataEntityType extends SDMParserDocument  
implements ISDMODataEntityType
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataEntityType* on page 883

Derived classes

- *SDMODataReturnEntityType* on page 1536

Members

All members of SDMODataEntityType, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataEntityType()</i> on page 1308	
protected	<i>SDMODataEntityType(int[], String[])</i> on page 1308	
public	<i>SDMODataEntityType(SDMParserDocument)</i> on page 1309	

Methods

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 1309	Returns The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public List< ISDMODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1309	Returns The list of appropriate SDMOData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public List< ISDMODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 1309	Returns The list of appropriate SDMOData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.
public List< String >	<i>getKeyPropertyNames()</i> on page 1310	Returns the list of the values of the 'PropertyRef' SDMOData element contained by the 'Key' SDMOData element.
public String	<i>getName()</i> on page 1310	Returns The value of the appropriate SDMOData attribute.
public List< ISDMODataNavigationProperty >	<i>getNavigationProperties()</i> on page 1310	Returns The list of appropriate SDMOData elements.
public ISDMODataNavigationProperty	<i>getNavigationProperty(String)</i> on page 1310	Returns The appropriate SDMOData element with the given name.
public List< ISDMODataProperty >	<i>getProperties()</i> on page 1311	Returns The list of appropriate SDMOData elements.

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 1311	Returns The list of appropriate SDMODData elements with given attribute value.
public List< ISDMODataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 1311	Returns The list of appropriate SDMODData elements with given attribute value.
public ISDMODataProperty	<i>getProperty(String)</i> on page 1311	Returns The appropriate SDMODData element with the given name.
public List< ISDMODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 1312	Returns The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value.
protected ISDMODataSchema	<i>getSchema()</i> on page 1312	
public List< ISDMODataProperty >	<i>getSearchablePropertiesData(String)</i> on page 1312	Returns The list of appropriate SDMODData elements with 'true' attribute value of the given attribute.
public boolean	<i>hasStream()</i> on page 1312	Returns The value of the appropriate SDMODData attribute.
protected void	<i>setSchema(ISDMODataSchema)</i> on page 1313	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	

Modifier and Type	Member	Description
public Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.

Modifier and Type	Member	Description
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	

Modifier and Type	Member	Description
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List< String >, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataEntityType

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HASSTREAM</i> on page 894	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 894	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_ENTITYTYPE</i> on page 894	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_KEY</i> on page 894	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PROPERTY</i> on page 894	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PROPERTYREF</i> on page 895	Name of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATA_SERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .

public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataEntityType() constructor

Syntax

```
public SDMODataEntityType ()
```

SDMODataEntityType(int[], String[]) constructor

Syntax

```
protected SDMODataEntityType (  
    int[] routes,
```

```
String[] values
)
```

SDMODataEntityType(SDMParserDocument) constructor

Syntax

```
public SDMODataEntityType (SDMParserDocument document)
```

getGPUseInSearchPropertiesData() method

Returns The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value.

Syntax

```
public List< ISDMODataProperty >
getGPUseInSearchPropertiesData ()
```

Returns

The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value

getGPVisibleInDetailPropertiesData() method

Returns The list of appropriate SDMOData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.

Syntax

```
public List< ISDMODataProperty >
getGPVisibleInDetailPropertiesData ()
```

Returns

The list of appropriate SDMOData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value

getGPVisibleInListPropertiesData() method

Returns The list of appropriate SDMOData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Syntax

```
public List< ISDMODataProperty >
getGPVisibleInListPropertiesData ()
```

Returns

The list of appropriate SDMOData elements with 'true' visible-in-list (Generic Player names-pace) attribute value

getKeyPropertyNames() method

Returns the list of the values of the 'PropertyRef' SDMODData element contained by the 'Key' SDMODData element.

Syntax

```
public List< String > getKeyPropertyNames ()
```

Returns

The list of the values of the 'PropertyRef' SDMODData element

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getNavigationProperties() method

Returns The list of appropriate SDMODData elements.

Syntax

```
public List< ISDMODDataNavigationProperty >  
getNavigationProperties ()
```

Returns

The list of appropriate SDMODData elements

getNavigationProperty(String) method

Returns The appropriate SDMODData element with the given name.

Syntax

```
public ISDMODDataNavigationProperty getNavigationProperty  
(String name)
```

Returns

The appropriate SDMODData element with the given name

getProperties() method

Returns The list of appropriate SDMODData elements.

Syntax

```
public List< ISDMODDataProperty > getProperties ()
```

Returns

The list of appropriate SDMODData elements

getPropertiesWithAttribute(String, String) method

Returns The list of appropriate SDMODData elements with given attribute value.

Syntax

```
public List< ISDMODDataProperty > getPropertiesWithAttribute (
    String attributeName,
    String attributeValue
)
```

Returns

The list of appropriate SDMODData elements with given attribute value

getPropertiesWithAttribute(String, String, boolean) method

Returns The list of appropriate SDMODData elements with given attribute value.

Syntax

```
public List< ISDMODDataProperty > getPropertiesWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Returns

The list of appropriate SDMODData elements with given attribute value

getProperty(String) method

Returns The appropriate SDMODData element with the given name.

Syntax

```
public ISDMODDataProperty getProperty (String propertyName)
```

Returns

The appropriate SDMODData element with the given name

getSAPSearchablePropertiesData() method

Returns The list of appropriate SDMOData elements with 'true' searchable (SAP names-pace) attribute value.

Syntax

```
public List< ISDMODataProperty >  
getSAPSearchablePropertiesData ()
```

Returns

The list of appropriate SDMOData elements with 'true' searchable (SAP names-pace) attribute value

getSchema() method

Syntax

```
protected ISDMODataSchema getSchema ()
```

Returns

the schema

getSearchablePropertiesData(String) method

Returns The list of appropriate SDMOData elements with 'true' attribute value of the given attribute.

Syntax

```
public List< ISDMODataProperty > getSearchablePropertiesData  
(String searchAttributeName)
```

Returns

The list of appropriate SDMOData elements with 'true' attribute value of the given attribute

hasStream() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public boolean hasStream ()
```

Returns

The value of the appropriate SDMOData attribute

*setSchema(ISDMODataSchema) method**Syntax*

```
protected void setSchema (ISDMODataSchema schema)
```

Parameters

- **schema** – the schema to set

SDMODataEntry class

Deprecated. since 3.0, Use ODataEntry

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataEntry extends SDMParserDocument implements  
ISDMODataEntry
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataEntry* on page 895

Derived classes

- *SDMODataReturnTypeEntry* on page 1490
- *SDMODataSubscriptionEntry* on page 1591

Members

All members of SDMODataEntry, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected JsonObject	jsonObject	JSON related variables
protected ISDMODataSchema	schema	
protected String	collectionId	
protected static final String	FILTER	
protected static final String	FILTER_EQ	

Modifier and Type	Variable	Description
protected static final String	FILTER_AND	
protected static final int	TRUE	
protected static final int	FALSE	
protected static final int	NOT_TESTED	
protected static cacheState	Cachestate	
protected static boolean	isLocalEntry	
protected static Long	cache_timestamp	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODDataEntry()</i> on page 1333	
public	<i>SDMODDataEntry(boolean)</i> on page 1333	
protected	<i>SDMODDataEntry(int[], String[])</i> on page 1333	
public	<i>SDMODDataEntry(ISDMODataSchema)</i> on page 1334	
public	<i>SDMODDataEntry(JsonObject)</i> on page 1334	Json Related
public	<i>SDMODDataEntry(SDMParserDocument)</i> on page 1334	
public	<i>SDMODDataEntry(SDMParserDocument, ISDMODataSchema)</i> on page 1334	

Methods

Modifier and Type	Method	Description
protected void	<i>addPropertyValues(ISDMODataProperty, Map<String, String>, String)</i> on page 1334	

Modifier and Type	Method	Description
protected void	<i>fillPropertyData(ISDMODataProperty, String...)</i> on page 1334	
protected void	<i>fillPropertyDataWithAttribute(ISDMODataProperty, String, String, boolean, String...)</i> on page 1335	
public List< ISDMODataLink >	<i>getActionLinks()</i> on page 1335	Returns SDMODData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')
public String	<i>getAuthorName()</i> on page 1335	Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.
public cacheState	<i>getCachestate()</i> on page 1335	
public Long	<i>getCacheTimestamp()</i> on page 1335	
public String	<i>getCollectionId()</i> on page 1336	Returns the Id of the SDMOCata Collection that this Entry belongs to.
public String	<i>getEtag()</i> on page 1336	Returns the Id of the SDMOData Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 1336	Returns the full execution URL that can be used for filtering collection search for this single entry.
public List< ISDMODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 1336	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMODData Entry document with 'true' use-in-search (Generic Player name-space) attribute value.

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1337	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.
public List< ISDMODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 1337	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.
public List< ISDMODataIcon >	<i>getIcons()</i> on page 1337	Returns the list of the appropriate SDMODData elements.
public String	<i>getId()</i> on page 1337	Returns The Id of this SDMO-Data Entry (value of appropriate SDMODData Id element)
public boolean	<i>getIsLocal()</i> on page 1338	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 1338	Returns the values of the properties that are marked as key properties in the SDMODData Schema document.
public Date	<i>getLastUpdated()</i> on page 1338	Returns The parsed value of the 'updated' SDMODData Element.
public List< ISDMODataLink >	<i>getLinks()</i> on page 1338	Returns the list of the appropriate SDMODData elements.
public List< ISDMODataProperty >	<i>getPropertiesData()</i> on page 1338	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-data Entry document.

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 1339	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.
public List< ISDMODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 1339	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.
public ISDMParserDocument	<i>getPropertiesDocument()</i> on page 1340	Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.
public String	<i>getPropertyValue(String...)</i> on page 1340	Returns the value of the appropriate property.
public List< String >	<i>getPropertyValues(List<String[]>)</i> on page 1340	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 1341	Returns the all the values of properties contained by this SDMOData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< ISDMODataLink >	<i>getRelatedDataLinks()</i> on page 1341	Returns SDMOData Link objects that represents links to Related Data.

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 1341	Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' searchable (SAP name-space) attribute value.
public ISDMODataSchema	<i>getSchema()</i> on page 1342	Returns the appropriate SDMOData Schema object.
public ISDMODataLink	<i>getSelfLink()</i> on page 1342	Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public ISDMODataLink	<i>getSubscriptionLink()</i> on page 1342	Returns SDMOData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 1342	Returns The value of the appropriate SDMOData element.
public String	<i>getTitle()</i> on page 1343	Returns The value of the appropriate SDMOData element.
protected void	<i>materialize()</i> on page 1343	
protected void	<i>parseCollectionId()</i> on page 1343	
protected long	<i>parseEdmTime(String)</i> on page 1343	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 1343	Puts the new property element as a sub-element of the 'complex properties' SDMOData element.

Modifier and Type	Method	Description
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1344	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 1344	Sets id of this SDMODData Entry document (value of appropriate SDMODData Id element)
public void	<i>putPropertyValue(String, String)</i> on page 1344	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 1345	Puts the new property element as a sub-element of the 'properties' SDMODData element.
public void	<i>read(BufferedReader)</i> on page 1345	
protected String	<i>resolveTargetCollection(ISDMODDataLink)</i> on page 1345	
public void	<i>setAuthorName(String)</i> on page 1346	Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.
public void	<i>setCachestate(cacheState)</i> on page 1346	
public void	<i>setCacheTimestamp(Long)</i> on page 1346	
public void	<i>setCollectionId(String)</i> on page 1346	Maintains the Id of the SDMO-Cata Collection that this Entry belongs to.
public void	<i>setIsLocal(boolean)</i> on page 1346	
public void	<i>setSchema(ISDMODDataSchema)</i> on page 1346	Maintains the reference to the appropriate SDMODData Schema object.

Modifier and Type	Method	Description
public void	<i>setSummary(String)</i> on page 1347	Sets the value of the appropriate SDMODData element.
public void	<i>setTitle(String)</i> on page 1347	Sets the value of the appropriate SDMODData element.
public void	<i>write(BufferedWriter)</i> on page 1347	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[]>	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	

Modifier and Type	Member	Description
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	

Modifier and Type	Member	Description
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	

Modifier and Type	Member	Description
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List<String >, String...)</i> on page 1700	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataEntry

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 917	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 917	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 918	Value option for appropriate SDMODData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 918	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 918	Name of the appropriate SDMODData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_CONTENT</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_LINK</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_NAME</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_TITLE</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_UPDATED</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 919	
public void	<i>setCacheState(cacheState)</i> on page 916	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIX_MAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataEntry() constructor

Syntax

```
public SDMODataEntry ()
```

SDMODataEntry(boolean) constructor

Syntax

```
public SDMODataEntry (boolean isComplex)
```

SDMODataEntry(int[], String[]) constructor

Syntax

```
protected SDMODataEntry (
    int[] routes,
    String[] values
)
```

SDMODataEntry(ISDMODataSchema) constructor

Syntax

```
public SDMODataEntry (ISDMODataSchema schema)
```

SDMODataEntry(JsonObject) constructor

Json Related

Syntax

```
public SDMODataEntry (JsonObject entry)
```

SDMODataEntry(SDMParserDocument) constructor

Syntax

```
public SDMODataEntry (SDMParserDocument document)
```

SDMODataEntry(SDMParserDocument, ISDMODataSchema) constructor

Syntax

```
public SDMODataEntry (  
    SDMParserDocument document,  
    ISDMODataSchema schema  
)
```

addPropertyValues(ISDMODataProperty, Map< String, String >, String) method

Syntax

```
protected void addPropertyValues (  
    ISDMODataProperty property,  
    Map< String, String > values,  
    String pathString  
)
```

fillPropertyData(ISDMODataProperty, String...) method

Syntax

```
protected void fillPropertyData (  
    ISDMODataProperty property,  
    String... path  
)
```

fillPropertyDataWithAttribute(ISDMODataProperty, String, String, boolean, String...)
method

Syntax

```
protected void fillPropertyDataWithAttribute (
    ISDMODataProperty property,
    String attributeName,
    String attributeValue,
    boolean addByefault,
    String... path
)
```

getActionLinks() method

Returns SDMOData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')

Syntax

```
public List< ISDMODataLink > getActionLinks ()
```

Returns

List of SDMOData Action Link documents

getAuthorName() method

Returns The value of the 'name' SDMOData element of the 'author' SDMOData element.

Syntax

```
public String getAuthorName ()
```

Returns

The value of the 'name' SDMOData element of the 'author' SDMOData element

getCachestate() method

Syntax

```
public cacheState getCachestate ()
```

getCacheTimestamp() method

Syntax

```
public Long getCacheTimestamp ()
```

getCollectionId() method

Returns the Id of the SDMOCata Collection that this Entry belongs to.

Syntax

```
public String getCollectionId ()
```

Returns

The Id of the SDMOCata Collection that this Entry belongs to

getEtag() method

Returns the Id of the SDMOData Collection that this Entry belongs to.

Syntax

```
public String getEtag ()
```

Returns

The Id of the SDMOData Collection that this Entry belongs to

getFilterUrl() method

Returns the full execution URL hat can be used for filtering collection search for this single entry.

Syntax

```
public String getFilterUrl ()
```

Returns

The full filter URL

getGPUseInSearchPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' use-in-search (Generic Player name-space) attribute value.

Syntax

```
public List< ISDMODataProperty >  
getGPUseInSearchPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInDetailPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.

Syntax

```
public List< ISDMODataProperty >
getGPVisibleInDetailPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getGPVisibleInListPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.

Syntax

```
public List< ISDMODataProperty >
getGPVisibleInListPropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getIcons() method

Returns the list of the appropriate SDMOData elements.

Syntax

```
public List< ISDMODataIcon > getIcons ()
```

Returns

The list of the appropriate SDMOData elements

getId() method

Returns The Id of this SDMOData Entry (value of appropriate SDMOData Id element)

Syntax

```
public String getId ()
```

Returns

The Id of this SDMOData Entry

getIsLocal() method

Syntax

```
public boolean getIsLocal ()
```

getKeyPropertyValues() method

Returns the values of the properties that are marked as key properties in the SDMOData Schema document.

Syntax

```
public Map< String, String > getKeyPropertyValues ()
```

Returns

The name-value pairs of the key properties

getLastUpdated() method

Returns The parsed value of the 'updated' SDMOData Element.

Syntax

```
public Date getLastUpdated ()
```

Returns

The parsed value of the value of the 'updated' SDMOData element or null is parsing failed

getLinks() method

Returns the list of the appropriate SDMOData elements.

Syntax

```
public List< ISDMODataLink > getLinks ()
```

Returns

The list of the appropriate SDMOData elements

getPropertiesData() method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document.

Syntax

```
public List< ISDMODataProperty > getPropertiesData ()
```

Returns

The meta-informations and values of the contained properties

getPropertiesDataWithAttribute(String, String) method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.

Syntax

```
public List< ISDMODataProperty >
getPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute

Returns

The meta-informations and values of the appropriate properties

getPropertiesDataWithAttribute(String, String, boolean) method

Returns the value and meta information (retrieved from SDMOData Schema document) of the properties of this SDMOData Entry document with the given attribute value.

Syntax

```
public List< ISDMODataProperty >
getPropertiesDataWithAttribute (
    String attributeName,
    String attributeValue,
    boolean addByDefault
)
```

Parameters

- **attributeName** – The name of the attribute
- **attributeValue** – The expected value of the attribute
- **addByDefault** – true if the Property should be add in case if there is no attribute with the given name

Returns

The meta-informations and values of the appropriate properties

getPropertiesDocument() method

Returns the representer document of SDMOData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

Syntax

```
public ISDMParseDocument getPropertiesDocument ()
```

Returns

The SDMParseDocument representation of SDMOData 'properties' (Metadata name-space) document

getPropertyValue(String...) method

Returns the value of the appropriate property.

Syntax

```
public String getPropertyValue (String... propertyPath)
```

Parameters

- **propertyPath** – The path to the property with or without the name-space prefix including names of the enclosing complex types if any (Without enclosing complex type this argument should be simple the name of the property)

Returns

The value of the property

Exceptions

- **IllegalArgumentException** – if the property name is null or ambiguous.

Remarks

Name of property may or may not contain name-space prefix as long as the property name is not ambiguous

getPropertyValues(List< String[]>) method

Return list of property values for the given property paths.

Syntax

```
public List< String > getPropertyValues (List< String[]>  
propertyPathes)
```

Parameters

- **propertyPaths** – Name of the property or path including the name of the enclosing Complex Types

Returns

The list of the values of the properties

getPropertyValues() method

Returns the all the values of properties contained by this SDMODData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.

Syntax

```
public Map< String, String > getPropertyValues ()
```

Returns

The name/path and value pairs of the contained properties

Remarks

The name of the properties will contain their current name-space prefixes.

getRelatedDataLinks() method

Returns SDMODData Link objects that represents links to Related Data.

Syntax

```
public List< ISDMODDataLink > getRelatedDataLinks ()
```

Returns

List of SDMODData Related Link documents

getSAPSearchablePropertiesData() method

Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMODData Entry document with 'true' searchable (SAP name-space) attribute value.

Syntax

```
public List< ISDMODDataProperty >  
getSAPSearchablePropertiesData ()
```

Returns

The meta-informations and values of the appropriate properties

getSchema() method

Returns the appropriate SDMOData Schema object.

Syntax

```
public ISDMODataSchema getSchema ()
```

Returns

The appropriate SDMOData Schema object.

getSelfLink() method

Returns SDMSDMOData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')

Syntax

```
public ISDMODataLink getSelfLink ()
```

Returns

SDMSDMOData self Link

getSubscriptionLink() method

Returns SDMOData Link object that should be used for subscription or null if there is no subscription link defined.

Syntax

```
public ISDMODataLink getSubscriptionLink ()
```

Returns

SDMOData Link for subscribe

getSummary() method

Returns The value of the appropriate SDMOData element.

Syntax

```
public String getSummary ()
```

Returns

The value of the appropriate SDMOData element

getTitle() method

Returns The value of the appropriate SDMOData element.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate SDMOData element

*materialize() method**Syntax*

```
protected void materialize ()
```

*parseCollectionId() method**Syntax*

```
protected void parseCollectionId ()
```

*parseEdmTime(String) method**Syntax*

```
protected long parseEdmTime (String value)
```

putComplexPropertyValue(String, String...) method

Puts the new property element as a sub-element of the 'complex properties' SDMOData element.

Syntax

```
public void putComplexPropertyValue (
    String propertyValue,
    String... propertyName
)
```

Parameters

- **propertyName** – The route of the property with or without name-space until the complex type.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putDocument(ISDMParserDocument, String...) method

Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.

Syntax

```
public void putDocument (  
    ISDMParserDocument document,  
    String... route  
) throws IllegalArgumentException
```

Parameters

- **document** – The new document
- **route** – The route to the parent element of the new document

Exceptions

- **IllegalArgumentException** – if either of the arguments is null.

putId(String) method

Sets id of this SDMODData Entry document (value of appropriate SDMODData Id element)

Syntax

```
public void putId (String id)
```

Parameters

- **id** – The new id.

putPropertyValue(String, String) method

Puts the new property element as a sub-element of the 'properties' SDMODData element.

Syntax

```
public void putPropertyValue (  
    String propertyName,  
    String propertyValue  
)
```

Parameters

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putPropertyValue(String, String, boolean) method

Puts the new property element as a sub-element of the 'properties' SDMOData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
    String propertyValue,
    boolean useDefaultPrefix
)
```

Parameters

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

*read(BufferedReader) method**Syntax*

```
public void read (BufferedReader reader) throws
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

*resolveTargetCollection(ISDMODataLink) method**Syntax*

```
protected String resolveTargetCollection (ISDMODataLink link)
```

setAuthorName(String) method

Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.

Syntax

```
public void setAuthorName (String authorName)
```

Parameters

- **authorName** – The new value of the element

setCacheState(cacheState) method

Syntax

```
public void setCacheState (cacheState cacheState)
```

setCacheTimestamp(Long) method

Syntax

```
public void setCacheTimestamp (Long timestamp)
```

setCollectionId(String) method

Maintains the Id of the SDMOCata Collection that this Entry belongs to.

Syntax

```
public void setCollectionId (String collectionId)
```

Parameters

- **collectionId** – The Id of the SDMOCata Collection that this Entry belongs to

setIsLocal(boolean) method

Syntax

```
public void setIsLocal (boolean isLocal)
```

setSchema(ISDMODDataSchema) method

Maintains the reference to the appropriate SDMODData Schema object.

Syntax

```
public void setSchema (ISDMODDataSchema schema)
```

Parameters

- **schema** – The appropriate SDMOData Schema object.

setSummary(String) method

Sets the value of the appropriate SDMOData element.

Syntax

```
public void setSummary (String summary)
```

Parameters

- **summary** – The new value of the element

setTitle(String) method

Sets the value of the appropriate SDMOData element.

Syntax

```
public void setTitle (String title)
```

Parameters

- **title** – The new value of the element

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

*cache_timestamp variable**Syntax*

```
protected static Long cache_timestamp
```

CacheState variable

Syntax

```
protected static cacheState CacheState
```

collectionId variable

Syntax

```
protected String collectionId
```

FALSE variable

Syntax

```
protected static final int FALSE
```

FILTER variable

Syntax

```
protected static final String FILTER
```

FILTER_AND variable

Syntax

```
protected static final String FILTER_AND
```

FILTER_EQ variable

Syntax

```
protected static final String FILTER_EQ
```

isLocalEntry variable

Syntax

```
protected static boolean isLocalEntry
```

JsonObject variable

JSON related variables

Syntax

```
protected JsonObject jsonObject
```

NOT_TESTED variable*Syntax*

```
protected static final int NOT_TESTED
```

schema variable*Syntax*

```
protected ISDMODataSchema schema
```

TRUE variable*Syntax*

```
protected static final int TRUE
```

SDMODataError class

Deprecated. since 3.0, Use ODataError

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataError extends SDMParserDocument implements  
ISDMODataError
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataError* on page 919

Members

All members of SDMODataError, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataError()</i> on page 1363	
protected	<i>SDMODataError(int[], String[])</i> on page 1363	

Modifier and Type	Constructor	Description
public	<i>SDMODataError(SDMParserDocument)</i> on page 1363	

Methods

Modifier and Type	Method	Description
public String	<i>getErrorCode()</i> on page 1363	Returns The value of the 'code' SDMOData element.
public String	<i>getLang()</i> on page 1364	Returns The value of the appropriate SDMOData attribute of the 'message' element.
public String	<i>getMessage()</i> on page 1364	Return the localized error message.

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	

Modifier and Type	Member	Description
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	

Modifier and Type	Member	Description
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	

Modifier and Type	Member	Description
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParseDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String>, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValues(List<String>, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns. Note: Some patterns are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataError

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_LANGUAGE</i> on page 926	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_ERROR</i> on page 926	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_ERRORCODE</i> on page 926	Name of the appropriate SDMODData element.
public static final String	<i>ELEMENT_MESSAGE</i> on page 926	Name of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataError() constructor*Syntax*

```
public SDMODataError ()
```

SDMODataError(int[], String[]) constructor*Syntax*

```
protected SDMODataError (
    int[] routes,
    String[] values
)
```

SDMODataError(SDMParserDocument) constructor*Syntax*

```
public SDMODataError (SDMParserDocument document)
```

getErrorCode() method

Returns The value of the 'code' SDMOData element.

Syntax

```
public String getErrorCode ()
```

Returns

The value of the 'code' SDMOData element

getLang() method

Returns The value of the appropriate SDMODData attribute of the 'message' element.

Syntax

```
public String getLang ()
```

Returns

The value of the appropriate SDMODData attribute of the 'message' element

getMessage() method

Return the localized error message.

Syntax

```
public String getMessage ()
```

Returns

The value of the 'message' SDMODData element

SDMODDataFunctionImport class

Deprecated. since 3.0, Use ODataFunctionImport

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODDataFunctionImport extends SDMParserDocument  
implements ISDMODDataFunctionImport
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODDataFunctionImport* on page 926

Members

All members of SDMODDataFunctionImport, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODataFunctionImport()</i> on page 1379	
protected	<i>SDMODataFunctionImport(int[], String[])</i> on page 1379	
public	<i>SDMODataFunctionImport(SDMParserDocument)</i> on page 1379	

Methods

Modifier and Type	Method	Description
public String	<i>getActionFor()</i> on page 1380	Returns The value of the appropriate SDMOData attribute.
public String	<i>getCollectionId()</i> on page 1380	Returns The value of the 'EntitySet' SDMOData attribute.
public String	<i>getEntitySet()</i> on page 1380	Returns The value of the 'EntitySet' SDMOData attribute.
public String	<i>getExecutionUrl(Map< String, String >)</i> on page 1380	Calculate the full execution URL for executing this Function Import according to the passed parameters.
public String	<i>getHTTPMethod()</i> on page 1380	Returns The value of the appropriate SDMOData attribute.
public List< String >	<i>getInputParameterNames()</i> on page 1381	Returns The list of the appropriate SDMOData element with 'In' or 'InOut' attribute value.
public String	<i>getName()</i> on page 1381	Returns The value of the appropriate SDMOData attribute.
public List< String >	<i>getOutputParameterNames()</i> on page 1381	Returns The list of the appropriate SDMOData element with 'Out' or 'InOut' attribute value.
public List< ISDMODataParameter >	<i>getParameters()</i> on page 1381	Returns The list of the appropriate SDMOData element.

Modifier and Type	Method	Description
public String	<i>getReturnType()</i> on page 1382	Returns The value of the appropriate SDMODData attribute.
public RETURN_TYPE_ENUM	<i>getReturnTypeEnum()</i> on page 1382	Returns The return type of this Function Import SDMODData document.
public void	<i>read(BufferedReader)</i> on page 1382	
public void	<i>setBaseUrl(String)</i> on page 1382	
public void	<i>write(BufferedWriter)</i> on page 1382	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	

Modifier and Type	Member	Description
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	

Modifier and Type	Member	Description
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	

Modifier and Type	Member	Description
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	

Modifier and Type	Member	Description
public void	<i>setAttributes(List< String >, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParseDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List< ISDMParseDocument >, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List< String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map< String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValues(List<String>, String...)</i> on page 1700	Sets all the values of the elements with the given route. Values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataFunctionImport

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ACTION_FOR</i> on page 936	Name of the appropriate SDMSDMOData attribute.
public static final String	<i>ATTRIBUTE_ENTITYSET</i> on page 936	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_HTTPMETHOD</i> on page 936	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 936	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_RETURNTYPE</i> on page 936	Name of the appropriate SDMOData attribute.
public static final String	<i>ELEMENT_FUNCTIONAL_IMPORT</i> on page 936	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 937	Name of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIX_MAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataFunctionImport() constructor

Syntax

```
public SDMODataFunctionImport ()
```

SDMODataFunctionImport(int[], String[]) constructor

Syntax

```
protected SDMODataFunctionImport (
    int[] routes,
    String[] values
)
```

SDMODataFunctionImport(SDMParserDocument) constructor

Syntax

```
public SDMODataFunctionImport (SDMParserDocument document)
```

getActionFor() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getActionFor ()
```

Returns

The value of the appropriate SDMODData attribute

getCollectionId() method

Returns The value of the 'EntitySet' SDMODData attribute.

Syntax

```
public String getCollectionId ()
```

Returns

The value of the 'EntitySet' SDMODData attribute

getEntitySet() method

Returns The value of the 'EntitySet' SDMODData attribute.

Syntax

```
public String getEntitySet ()
```

Returns

The value of the 'EntitySet' SDMODData attribute

getExecutionUrl(Map< String, String >) method

Calculate the full execution URL for executing this Function Import according to the passed paramteres.

Syntax

```
public String getExecutionUrl (Map< String, String > parameters)
```

Returns

The full execution URL

getHTTPMethod() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getHTTPMethod ()
```

Returns

The value of the appropriate SDMODData attribute

getInputParameterNames() method

Returns The list of the appropriate SDMODData element with 'In' or 'InOut' attribute value.

Syntax

```
public List< String > getInputParameterNames ()
```

Returns

The list of the appropriate SDMODData element with 'In' or 'InOut' attribute value

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getOutputParameterNames() method

Returns The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value.

Syntax

```
public List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate SDMODData element with 'Out' or 'InOut' attribute value

getParameters() method

Returns The list of the appropriate SDMODData element.

Syntax

```
public List< ISDMODDataParameter > getParameters ()
```

Returns

The list of the appropriate SDMODData element

getReturnType() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getReturnType ()
```

Returns

The value of the appropriate SDMOData attribute

getReturnTypeEnum() method

Returns The return type of this Function Import SDMOData document.

Syntax

```
public RETURN_TYPE_ENUM getReturnTypeEnum ()
```

Returns

The return type of this Function Import SDMOData document

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
public void setBaseUrl (String baseUrl)
```

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

SDMODataIcon class

Deprecated. since 3.0, Use ODataIcon

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataIcon extends SDMParserDocument implements  
ISDMODataIcon
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataIcon* on page 937

Members

All members of SDMODataIcon, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODataIcon()</i> on page 1397	

Modifier and Type	Constructor	Description
protected	<i>SDMODDataIcon(int[], String[])</i> on page 1397	
public	<i>SDMODDataIcon(SDMParser- Document)</i> on page 1397	

Methods

Modifier and Type	Method	Description
public int	<i>getHeight()</i> on page 1397	Returns The value of the appropriate SDMODData attribute.
public String	<i>getUrl()</i> on page 1398	Returns The value of the appropriate SDMODData attribute.
public int	<i>getWidth()</i> on page 1398	Returns The value of the appropriate SDMODData attribute.
public void	<i>read(BufferedReader)</i> on page 1398	
protected void	<i>setBaseUrl(String)</i> on page 1398	
public void	<i>write(BufferedWriter)</i> on page 1398	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttribute- Map(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	

Modifier and Type	Member	Description
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695

public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	

Modifier and Type	Member	Description
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String>, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List< String >, String...)</i> on page 1700	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataIcon

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HEIGHT</i> on page 943	Name of the appropriate SDMSMODData attribute.
public static final String	<i>ATTRIBUTE_WIDTH</i> on page 943	Name of the appropriate SDMSMODData attribute.
public static final String	<i>ELEMENT_ICON</i> on page 944	Name of the appropriate SDMSMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataIcon() constructor

Syntax

```
public SDMODataIcon ()
```

SDMODataIcon(int[], String[]) constructor

Syntax

```
protected SDMODataIcon (
    int[] routes,
    String[] values
)
```

SDMODataIcon(SDMParserDocument) constructor

Syntax

```
public SDMODataIcon (SDMParserDocument document)
```

getHeight() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public int getHeight ()
```

Returns

The value of the appropriate SDMOData attribute

getUrl() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getUrl ()
```

Returns

The value of the appropriate SDMODData attribute

getWidth() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public int getWidth ()
```

Returns

The value of the appropriate SDMODData attribute

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

SDMODataLink class

Deprecated. since 3.0, Use ODataLink

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataLink extends SDMParserDocument implements ISDMODataLink
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataLink* on page 944

Members

All members of SDMODataLink, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected String	targetCollectionId	
protected String	baseUrl	
protected ISDMODataSchema	schema	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODDataLink()</i> on page 1414	
protected	<i>SDMODDataLink(int[], String[])</i> on page 1414	
public	<i>SDMODDataLink(SDMParser-Document)</i> on page 1415	

Methods

Modifier and Type	Method	Description
public String	<i>getHref()</i> on page 1415	Returns the value of the appropriate SDMODData attribute.
public List< ISDMODDataEntry >	<i>getInlineEntries()</i> on page 1415	Returns the list of SDMODData Entries contained by the appropriate SDMODData 'inline' element.
public List< String >	<i>getInputParameterNames()</i> on page 1415	Returns the list of the appropriate SDMODData Parameter elements that should be used as input parameter.
public List< String >	<i>getOutputParameterNames()</i> on page 1416	Returns the list of the appropriate SDMODData Parameter elements that should be used as output parameter.
public List< ISDMODDataParameter >	<i>getParameters()</i> on page 1416	Returns the list of the appropriate SDMODData Parameter elements.
public String	<i>getRel()</i> on page 1416	Returns the value of the appropriate SDMODData attribute.
public ISDMODDataSchema	<i>getSchema()</i> on page 1416	Returns the Schema that is to be used for 'Inline entries'.
public String	<i>getSemantics()</i> on page 1417	Returns The value of the appropriate SDMODData extension (vCard) attribute.
public String	<i>getTargetCollectionId()</i> on page 1417	Returns the Id of the collection that this link points to (if any)

Modifier and Type	Method	Description
public String	<i>getTitle()</i> on page 1417	Returns the value of the appropriate SDMODData attribute.
public String	<i>getUrl()</i> on page 1417	Returns the full URL for this SDMODData Link object without parameters.
public String	<i>getUrlWithParameters(Map<String, String >)</i> on page 1418	Returns the full URL for this SDMODData Link object extended with the given parameter names and values.
public void	<i>read(BufferedReader)</i> on page 1418	
protected void	<i>setBaseUrl(String)</i> on page 1418	
public void	<i>setSchema(ISDMODDataSchema)</i> on page 1418	Sets the Schema that is to be used for 'Inline entries'.
public void	<i>setTargetCollectionId(String)</i> on page 1418	Maintains the Id of the collection that this link points to (if any)
public void	<i>write(BufferedWriter)</i> on page 1419	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map<String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List<String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map<String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple elements use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	

Modifier and Type	Member	Description
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	

Modifier and Type	Member	Description
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List<String>, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List< String >, String...)</i> on page 1700	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataLink

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_HREF</i> on page 954	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_REL</i> on page 955	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_REL_VAL-UE_EDIT</i> on page 955	Value option for the appropriate SDMOData parameter.
public static final String	<i>ATTRIBUTE_REL_VAL-UE_SELF</i> on page 955	Value option for the appropriate SDMOData parameter.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 955	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_TITLE</i> on page 955	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_VALUE-PART_RELATED</i> on page 955	String that should be part of every rel attribute of a Related Data Link.
public static final String	<i>ATTRIBUTE_VALUESUFFIX_SUBSCRIPTION</i> on page 955	String that should be end of every rel attribute of a Subscription Link.
public static final String	<i>ELEMENT_INLINE</i> on page 956	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_LINK</i> on page 956	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PARAMETER</i> on page 956	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PARAMETER-SET</i> on page 956	Name of the appropriate SDMOData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM DateTimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataLink() constructor

Syntax

```
public SDMODataLink ()
```

SDMODataLink(int[], String[]) constructor

Syntax

```
protected SDMODataLink (  
    int[] routes,
```

```
String[] values
)
```

SDMODataLink(SDMParserDocument) constructor

Syntax

```
public SDMODataLink (SDMParserDocument document)
```

getHref() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public String getHref ()
```

Returns

The value of the appropriate SDMOData attribute

getInlineEntries() method

Returns the list of SDMOData Entries contained by the appropriate SDMOData 'inline' element.

Syntax

```
public List< ISDMODataEntry > getInlineEntries ()
```

Returns

The List of 'inline' SDMOData Entries

getInputParameterNames() method

Returns the list of the appropriate SDMOData Parameter elements that should be used as input parameter.

Syntax

```
public List< String > getInputParameterNames ()
```

Returns

The list of the appropriate SDMOData Parameter elements that should be used as input parameter

getOutputParameterNames() method

Returns the list of the appropriate SDMODData Parameter elements that should be used as output parameter.

Syntax

```
public List< String > getOutputParameterNames ()
```

Returns

The list of the appropriate SDMODData Parameter elements that should be used as output parameter

getParameters() method

Returns the list of the appropriate SDMODData Parameter elements.

Syntax

```
public List< ISDMODDataParameter > getParameters ()
```

Returns

The list of the appropriate SDMODData Parameter elements

getRel() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public String getRel ()
```

Returns

The value of the appropriate SDMODData attribute

getSchema() method

Returns the Schema that is to be used for 'Inline entries'.

Syntax

```
public ISDMODDataSchema getSchema ()
```

Returns

The relevant schema

getSemantics() method

Returns The value of the appropriate SDMODData extension (vCard) attribute.

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate SDMODData extension (vCard) attribute

getTargetCollectionId() method

Returns the Id of the collection that this link points to (if any)

Syntax

```
public String getTargetCollectionId ()
```

Returns

The Id of the collection that this link points to

getTitle() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public String getTitle ()
```

Returns

The value of the appropriate SDMODData attribute

getUrl() method

Returns the full URL for this SDMODData Link object without parameters.

Syntax

```
public String getUrl ()
```

Returns

The full URL of this link without parameters

getUrlWithParameters(Map< String, String >) method

Returns the full URL for this SDMOData Link object extended with the given parameter names and values.

Syntax

```
public String getUrlWithParameters (Map< String, String >
parameters)
```

Returns

The full URL of this link with parameters

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

setSchema(ISDMODataSchema) method

Sets the Schema that is to be used for 'Inline entries'.

Syntax

```
public void setSchema (ISDMODataSchema schema)
```

Parameters

- **schema** – The relevant schema

setTargetCollectionId(String) method

Maintains the Id of the collection that this link points to (if any)

Syntax

```
public void setTargetCollectionId (String targetCollectionId)
```

Parameters

- **targetCollectionId** – The Id of the collection that this link points to

*write(BufferedWriter) method**Syntax*

```
public void write (BufferedWriter writer) throws
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

*baseUrl variable**Syntax*

```
protected String baseUrl
```

*schema variable**Syntax*

```
protected ISDMODataSchema schema
```

*targetCollectionId variable**Syntax*

```
protected String targetCollectionId
```

SDMODataNavigationProperty class

Deprecated. since 3.0, Use ODataNavigationProperty

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataNavigationProperty extends
SDMParserDocument implements ISDMODataNavigationProperty
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataNavigationProperty* on page 956

Members

All members of *SDMODataNavigationProperty*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataNavigationProperty()</i> on page 1433	
protected	<i>SDMODataNavigationProperty(int[], String[])</i> on page 1433	
public	<i>SDMODataNavigationProperty(SDMParserDocument)</i> on page 1434	

Methods

Modifier and Type	Method	Description
public String	<i>getFromRole()</i> on page 1434	Returns The value of the appropriate <i>SDMOData</i> attribute.
public String	<i>getName()</i> on page 1434	Returns The value of the appropriate <i>SDMOData</i> attribute.
public String	<i>getRelationship()</i> on page 1434	Returns The value of the appropriate <i>SDMOData</i> attribute.
public String	<i>getToRole()</i> on page 1434	Returns The value of the appropriate <i>SDMOData</i> attribute.

Inherited members from *SDMParserDocument*

Modifier and Type	Member	Description
public <i>SDMParserDocument</i>	<i>clone()</i> on page 1681	Creates a copy of this object.
protected <i>Map<String, String></i>	<i>extensions</i> on page 1701	

Modifier and Type	Member	Description
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	

Modifier and Type	Member	Description
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695

public static final String	<i>ATTRIBUTE_RELATIONSHIP</i> on page 963	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TOROLE</i> on page 963	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_NAVIGATIONPROPERTY</i> on page 964	Name of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParseDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	

Modifier and Type	Member	Description
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODDataNavigationProperty() constructor

Syntax

```
public SDMODDataNavigationProperty ()
```

SDMODDataNavigationProperty(int[], String[]) constructor

Syntax

```
protected SDMODDataNavigationProperty (  
    int[] routes,
```

```
String[] values  
)
```

SDMODataNavigationProperty(SDMParserDocument) constructor

Syntax

```
public SDMODataNavigationProperty (SDMParserDocument document)
```

getFromRole() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getFromRole ()
```

Returns

The value of the appropriate SDMOData attribute

getName() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMOData attribute

getRelationship() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getRelationship ()
```

Returns

The value of the appropriate SDMOData attribute

getToRole() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getToRole ()
```

Returns

The value of the appropriate SDMOData attribute

***SDMODataOpenSearchDescription* class**

Deprecated. since 3.0, Use `ODataOpenSearchDescription`

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataOpenSearchDescription extends
SDMParserDocument implements ISDMODataOpenSearchDescription
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataOpenSearchDescription* on page 964

Members

All members of `SDMODataOpenSearchDescription`, including inherited members.

Variables

Modifier and Type	Variable	Description
protected String	baseUrl	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODataOpenSearchDescription()</i> on page 1449	
protected	<i>SDMODataOpenSearchDescription(int[], String[])</i> on page 1449	
public	<i>SDMODataOpenSearchDescription(SDMParserDocument)</i> on page 1449	

Methods

Modifier and Type	Method	Description
public String	<i>getDescription()</i> on page 1449	Returns The value of the appropriate <code>SDMOData</code> element.

Modifier and Type	Method	Description
public String	<i>getShortName()</i> on page 1450	Returns The value of the appropriate SDMODData element.
public List< ISDMODDataURL >	<i>getUrls()</i> on page 1450	Returns The list of the appropriate SDMODData element.
public void	<i>read(BufferedReader)</i> on page 1450	
protected void	<i>setBaseUrl(String)</i> on page 1450	
public void	<i>write(BufferedWriter)</i> on page 1450	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	

Modifier and Type	Member	Description
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695

public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataOpenSearchDescription() constructor*Syntax*

```
public SDMODataOpenSearchDescription ()
```

SDMODataOpenSearchDescription(int[], String[]) constructor*Syntax*

```
protected SDMODataOpenSearchDescription (
    int[] routes,
    String[] values
)
```

SDMODataOpenSearchDescription(SDMParserDocument) constructor*Syntax*

```
public SDMODataOpenSearchDescription (SDMParserDocument
document)
```

getDescription() method

Returns The value of the appropriate SDMOData element.

Syntax

```
public String getDescription ()
```

Returns

The value of the appropriate SDMOData element

getShortName() method

Returns The value of the appropriate SDMODData element.

Syntax

```
public String getShortName ()
```

Returns

The value of the appropriate SDMODData element

getUrls() method

Returns The list of the appropriate SDMODData element.

Syntax

```
public List< ISDMODDataURL > getUrls ()
```

Returns

The list of the appropriate SDMODData element

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setBaseUrl(String) method

Syntax

```
protected void setBaseUrl (String baseUrl)
```

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

baseUrl variable

Syntax

```
protected String baseUrl
```

SDMODataParameter class

Deprecated. since 3.0, Use ODataParameter

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataParameter extends SDMParserDocument
implements ISDMODataParameter
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataParameter* on page 971

Members

All members of SDMODataParameter, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataParameter()</i> on page 1465	
protected	<i>SDMODataParameter(int[], String[])</i> on page 1465	
public	<i>SDMODataParameter(SDMParserDocument)</i> on page 1465	

Methods

Modifier and Type	Method	Description
public String	<i>getMode()</i> on page 1466	Returns The value of the appropriate SDMODData attribute.
public String	<i>getName()</i> on page 1466	Returns The value of the appropriate SDMODData attribute.
public String	<i>getType()</i> on page 1466	Returns The value of the appropriate SDMODData attribute.

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[]>	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	

Modifier and Type	Member	Description
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	

Modifier and Type	Member	Description
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	

Modifier and Type	Member	Description
public void	<i>setAttributes(List< String >, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParseDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List< ISDMParseDocument >, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List< String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map< String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValues(List<String>, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns. Note: Some patterns are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataParameter

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_MODE</i> on page 978	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NAME</i> on page 978	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 978	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_PARAMETER</i> on page 978	Name of the appropriate SDMODData element.
public static final String	<i>VALUE_MODE_IN</i> on page 978	Value option for the 'Mode' SDMODData attribute.
public static final String	<i>VALUE_MODE_OUT</i> on page 978	Value option for the 'Mode' SDMODData attribute.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.

Modifier and Type	Member	Description
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name under. All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route. For removing multiple element use <code>setDocuments</code> with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route. Values will be paired to attributes in order. Attributes with greater or equals index than size of new values will be untouched. Attributes paired with null values will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given route Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .

public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODataParameter() constructor

Syntax

```
public SDMODataParameter ()
```

SDMODataParameter(int[], String[]) constructor

Syntax

```
protected SDMODataParameter (
    int[] routes,
    String[] values
)
```

SDMODataParameter(SDMParserDocument) constructor

Syntax

```
public SDMODataParameter (SDMParserDocument document)
```

getMode() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getMode ()
```

Returns

The value of the appropriate SDMODData attribute

getName() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMODData attribute

getType() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public String getType ()
```

Returns

The value of the appropriate SDMODData attribute

SDMODDataProperty class

Deprecated. since 3.0, Use ODataProperty

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODDataProperty extends SDMParserDocument  
implements ISDMODDataProperty
```

Base class

- *SDMParserDocument* on page 1672

Implemented interfaces

- *ISDMODataProperty* on page 978

Members

All members of *SDMODataProperty*, including inherited members. **Constructors**

Modifier and Type	Constructor	Description
public	<i>SDMODataProperty()</i> on page 1483	
protected	<i>SDMODataProperty(int[], String[])</i> on page 1483	
public	<i>SDMODataProperty(SDMParserDocument)</i> on page 1484	

Methods

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getChildPropertiesData()</i> on page 1484	Returns all the child properties added to this document with putChildProperty method.
public List< ISDMODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String)</i> on page 1484	Returns list of appropriate contained Property SDMOData elements with the given attribute value.
public List< ISDMODataProperty >	<i>getChildPropertiesDataWithAttribute(String, String, boolean)</i> on page 1484	Returns list of appropriate contained Property SDMOData elements with the given attribute value.
public ISDMODataProperty	<i>getChildPropertyData(String)</i> on page 1485	Return a single child property added with putChildProperty method.
public String	<i>getCollation()</i> on page 1485	Returns the value of the appropriate SDMOData attribute.
public String	<i>getDefault Value()</i> on page 1485	Returns the value of the appropriate SDMOData attribute.

Modifier and Type	Method	Description
public int	<i>getDetailDisplayOrder()</i> on page 1486	In current version it return the same value as <i>getListDisplayOrder</i> .
public String	<i>getLabel()</i> on page 1486	Returns The value of the appropriate SDMODData attribute.
public int	<i>getListDisplayOrder()</i> on page 1486	In current version it returns the same value as <i>getDetailDisplayOrder</i> .
public int	<i>getMaxLength()</i> on page 1486	Returns the value of the appropriate SDMODData attribute with default value = 0;.
public String	<i>getName()</i> on page 1486	Returns The value of the appropriate SDMODData attribute.
public String	<i>getPrecision()</i> on page 1487	Returns the value of the appropriate SDMODData attribute.
public String	<i>getScale()</i> on page 1487	Returns the value of the appropriate SDMODData attribute.
public String	<i>getSemantics()</i> on page 1487	Returns the value of the appropriate SDMODData attribute with default value = 0;.
public String	<i>getType()</i> on page 1487	Returns The value of the appropriate SDMODData attribute.
public String	<i>getValue()</i> on page 1488	Returns the value of the property if there is a single property instance that is represented by this object and value is set with <i>setValue</i> method.
public boolean	<i>hasFixedLength()</i> on page 1488	Returns The value of the appropriate SDMODData attribute.
public boolean	<i>isComplex()</i> on page 1488	Returns if the property has complex type and has child properties.
public boolean	<i>isCreatable()</i> on page 1488	Returns The value of the appropriate SDMODData attribute.

Modifier and Type	Method	Description
public boolean	<i>isDeletable()</i> on page 1489	Returns The value of the appropriate SDMODData attribute.
public boolean	<i>isFilterable()</i> on page 1489	Returns The value of the appropriate SDMODData attribute.
public boolean	<i>isNullable()</i> on page 1489	Returns The value of the appropriate SDMODData attribute.
public boolean	<i>isSearchable()</i> on page 1489	Returns The value of the appropriate SDMODData attribute.
public boolean	<i>isUnicode()</i> on page 1489	Returns the value of the appropriate SDMODData attribute.
public boolean	<i>isUpdatable()</i> on page 1490	Returns The value of the appropriate SDMODData attribute.
public void	<i>putChildPropertyData(ISDMODDataProperty)</i> on page 1490	Put new child property to this property document.
public void	<i>setValue(String)</i> on page 1490	Sets the value of the property, represented by this object.

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route. Inserted document will be placed before already existing documents with the same route name. All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.

Modifier and Type	Member	Description
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	

Modifier and Type	Member	Description
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	
public void	<i>setAttributes(List<String>, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParserDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List<ISDMParserDocument>, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List<String>)</i> on page 1699	
public static void	<i>setPrefixMapping(Map<String, String>)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	
public void	<i>setValues(List< String >, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataProperty

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_COLLATION</i> on page 994	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_CREATABLE</i> on page 994	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DEFAULTVALUE</i> on page 994	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DELETABLE</i> on page 995	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_DETAIL_DISPLAYORDER</i> on page 995	Name of the display-order SDMOData attribute.
public static final String	<i>ATTRIBUTE_FILTERABLE</i> on page 995	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_FIXEDLENGTH</i> on page 995	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_LABEL</i> on page 995	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_LIST_DISPLAYORDER</i> on page 995	Name of the display-order SDMOData attribute.
public static final String	<i>ATTRIBUTE_MAXLENGTH</i> on page 995	Name of the appropriate SDMOData attribute.

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_NAME</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_NULLABLE</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_PRECISION</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SCALE</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SEARCHABLE</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_TYPE</i> on page 996	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_UNICODE</i> on page 997	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_UPDATABLE</i> on page 997	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_USEIN-SEARCH</i> on page 997	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEINDE-TAIL</i> on page 997	Name of the appropriate SDMODData attribute.
public static final String	<i>ATTRIBUTE_VISIBLEIN-LIST</i> on page 997	Name of the appropriate SDMODData attribute.
public static final String	<i>ELEMENT_PROPERTY</i> on page 997	Name of the appropriate SDMODData element.

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMODData element.
public static final String	<i>ATTRIBUTE_VALUEPRE-FIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAP-PING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.

Modifier and Type	Member	Description
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.

Modifier and Type	Member	Description
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .

Modifier and Type	Member	Description
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

SDMODDataProperty() constructor

Syntax

```
public SDMODDataProperty ()
```

SDMODDataProperty(int[], String[]) constructor

Syntax

```
protected SDMODDataProperty (  
    int[] routes,
```

```
String[] values  
)
```

SDMODataProperty(SDMParserDocument) constructor

Syntax

```
public SDMODataProperty (SDMParserDocument document)
```

getChildPropertiesData() method

Returns all the child properties added to this document with putChildProperty method.

Syntax

```
public List< ISDMODataProperty > getChildPropertiesData ()
```

Returns

List of child properties.

getChildPropertiesDataWithAttribute(String, String) method

Returns list of appropriate contained Property SDMOData elements with the given attribute value.

Syntax

```
public List< ISDMODataProperty >  
getChildPropertiesDataWithAttribute (  
    String attributeName,  
    String attributeValue  
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute

Returns

list of appropriate contained Property SDMOData elements with the given attribute value

getChildPropertiesDataWithAttribute(String, String, boolean) method

Returns list of appropriate contained Property SDMOData elements with the given attribute value.

Syntax

```
public List< ISDMODataProperty >  
getChildPropertiesDataWithAttribute (  
    String attributeName,  
    String attributeValue,
```

```
boolean addByDefault
)
```

Parameters

- **attributeName** – the name of the attribute that value should be checked
- **attributeValue** – expected value of the attribute
- **addByDefault** – true if the child Property should be add in case if there is no attribute with the given name

Returns

list of appropriate contained Property SDMODData elements with the given attribute value

getChildPropertyData(String) method

Return a single child property added with putChildProperty method.

Syntax

```
public ISDMODDataProperty getChildPropertyData (String
propertyName)
```

Parameters

- **propertyName** – The name of the child property that should be returned.

Returns

The found child property or null if there is no child property with the given name.

getCollation() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public String getCollation ()
```

Returns

The value of the appropriate SDMODData attribute

getDefaultValue() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public String getDefaultValue ()
```

Returns

The value of the appropriate SDMODData attribute

getDetailDisplayOrder() method

In current version it return the same value as getListDisplayOrder.

Syntax

```
public int getDetailDisplayOrder ()
```

Returns

The value of 'display-order' attribute with defaultValue = 0;

getLabel() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getLabel ()
```

Returns

The value of the appropriate SDMOData attribute

getListDisplayOrder() method

In current version it returns the same value as getDetailDisplayOrder.

Syntax

```
public int getListDisplayOrder ()
```

Returns

The value of 'display-order' attribute with defaultValue = 0;

getMaxLength() method

Returns the value of the appropriate SDMOData attribute with defaultValue = 0;.

Syntax

```
public int getMaxLength ()
```

Returns

The value of the appropriate SDMOData attribute with defaultValue = 0;

getName() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getName ()
```

Returns

The value of the appropriate SDMOData attribute

getPrecision() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public String getPrecision ()
```

Returns

The value of the appropriate SDMOData attribute

getScale() method

Returns the value of the appropriate SDMOData attribute.

Syntax

```
public String getScale ()
```

Returns

The value of the appropriate SDMOData attribute

getSemantics() method

Returns the value of the appropriate SDMOData attribute with default value = 0;.

Syntax

```
public String getSemantics ()
```

Returns

The value of the appropriate SDMOData attribute with default value = 0;

getType() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public String getType ()
```

Returns

The value of the appropriate SDMOData attribute

getValue() method

Returns the value of the property if there is a single property instance that is represented by this object and value is set with setValue method.

Syntax

```
public String getValue ()
```

Returns

the value of the property instance represented by this object.

Remarks

Otherwise it returns null.

Typically this object contains value only if this object was returned by an SDMOData Entry.

hasFixedLength() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public boolean hasFixedLength ()
```

Returns

The value of the appropriate SDMOData attribute

isComplex() method

Returns if the property has complex type and has child properties.

Syntax

```
public boolean isComplex ()
```

Returns

true if the property has complex type and has child properties.

isCreatable() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public boolean isCreatable ()
```

Returns

The value of the appropriate SDMOData attribute

isDeletable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public boolean isDeletable ()
```

Returns

The value of the appropriate SDMODData attribute

isFilterable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public boolean isFilterable ()
```

Returns

The value of the appropriate SDMODData attribute

isNullable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public boolean isNullable ()
```

Returns

The value of the appropriate SDMODData attribute

isSearchable() method

Returns The value of the appropriate SDMODData attribute.

Syntax

```
public boolean isSearchable ()
```

Returns

The value of the appropriate SDMODData attribute

isUnicode() method

Returns the value of the appropriate SDMODData attribute.

Syntax

```
public boolean isUnicode ()
```

Returns

The value of the appropriate SDMOData attribute

isUpdatable() method

Returns The value of the appropriate SDMOData attribute.

Syntax

```
public boolean isUpdatable ()
```

Returns

The value of the appropriate SDMOData attribute

putChildPropertyData(ISDMODataProperty) method

Put new child property to this property document.

Syntax

```
public void putChildPropertyData (ISDMODataProperty property)
```

Parameters

- **property** – The child property

setValue(String) method

Sets the value of the property, represented by this object.

Syntax

```
public void setValue (String value)
```

Parameters

- **value** – The value of the property instance represented by this object.

Remarks

This method should be used only if there a property instance that is represented by this object.

Typically this method is used when property object is returned by an SDMOData Entry object.

SDMODataReturnTypeEntry class

Deprecated. since 3.0, Use ODataReturnTypeEntry

Package

```
com.sap.mobile.lib.sdmparser
```

Syntax

```
public class SDMODataReturnTypeEntry extends SDMODataEntry
implements ISDMODataEntry
```

Base class

- *SDMODataEntry* on page 1313

Implemented interfaces

- *ISDMODataEntry* on page 895

Members

All members of *SDMODataReturnTypeEntry*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected static final String	SDM_RETURNTYPE_COLLECTION	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODataReturnTypeEntry(boolean)</i> on page 1516	
public	<i>SDMODataReturnTypeEntry(SDMParserDocument, ISDMODataFunctionImport, ISDMODataSchema, boolean)</i> on page 1516	

Methods

Modifier and Type	Method	Description
public void	<i>putPropertyValue(String, String)</i> on page 1517	Puts the new property element as a sub-element of the 'properties' <i>SDMOData</i> element.
public void	<i>putPropertyValue(String, String, boolean)</i> on page 1517	Puts the new property element as a sub-element of the 'properties' <i>SDMOData</i> element.
public void	<i>read(BufferedReader)</i> on page 1518	

Modifier and Type	Method	Description
public void	<i>setCollectionId(String)</i> on page 1518	Maintains the Id of the SDMO-Cata Collection that this Entry belongs to.
public void	<i>setSchema(ISDMODataSchema)</i> on page 1518	Maintains the reference to the appropriate SDMOData Schema object.
public void	<i>write(BufferedWriter)</i> on page 1518	

Inherited members from SDMODataEntry

Modifier and Type	Member	Description
protected void	<i>addPropertyValues(ISDMODataProperty, Map< String, String >, String)</i> on page 1334	
protected static Long	<i>cache_timestamp</i> on page 1347	
protected static cacheState	<i>Cachestate</i> on page 1348	
protected String	<i>collectionId</i> on page 1348	
protected static final int	<i>FALSE</i> on page 1348	
protected void	<i>fillPropertyData(ISDMODataProperty, String...)</i> on page 1334	
protected void	<i>fillPropertyDataWithAttribute(ISDMODataProperty, String, String, boolean, String...)</i> on page 1335	
protected static final String	<i>FILTER</i> on page 1348	
protected static final String	<i>FILTER_AND</i> on page 1348	
protected static final String	<i>FILTER_EQ</i> on page 1348	
public List< ISDMODataLink >	<i>getActionLinks()</i> on page 1335	Returns SDMOData Link objects that are set as action links (Has semantics (SAP namespace) attribute with value 'action')

Modifier and Type	Member	Description
public String	<i>getAuthorName()</i> on page 1335	Returns The value of the 'name' SDMODData element of the 'author' SDMODData element.
public cacheState	<i>getCachestate()</i> on page 1335	
public Long	<i>getCacheTimestamp()</i> on page 1335	
public String	<i>getCollectionId()</i> on page 1336	Returns the Id of the SDMOCa-ta Collection that this Entry belongs to.
public String	<i>getEtag()</i> on page 1336	Returns the Id of the SDMODa-ta Collection that this Entry belongs to.
public String	<i>getFilterUrl()</i> on page 1336	Returns the full execution URL hat can be used for filtering collection search for this single entry.
public List< ISDMODDataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 1336	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with 'true' use-in-search (Generic Player name-space) attribute value.
public List< ISDMODDataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1337	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-detail (Generic Player name-space) attribute value.
public List< ISDMODDataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 1337	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with 'true' visible-in-list (Generic Player name-space) attribute value.

Modifier and Type	Member	Description
public List< ISDMODataIcon >	<i>getIcons()</i> on page 1337	Returns the list of the appropriate SDMODData elements.
public String	<i>getId()</i> on page 1337	Returns The Id of this SDMO-Data Entry (value of appropriate SDMODData Id element)
public boolean	<i>getIsLocal()</i> on page 1338	
public Map< String, String >	<i>getKeyPropertyValues()</i> on page 1338	Returns the values of the properties that are marked as key properties in the SDMODData Schema document.
public Date	<i>getLastUpdated()</i> on page 1338	Returns The parsed value of the 'updated' SDMODData Element.
public List< ISDMODataLink >	<i>getLinks()</i> on page 1338	Returns the list of the appropriate SDMODData elements.
public List< ISDMODataProperty >	<i>getPropertiesData()</i> on page 1338	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-data Entry document.
public List< ISDMODataProperty >	<i>getPropertiesDataWithAttribute(String, String)</i> on page 1339	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public List< ISDMODataProperty >	<i>getPropertiesDataWithAttribute(String, String, boolean)</i> on page 1339	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMO-Data Entry document with the given attribute value.
public ISDMParserDocument	<i>getPropertiesDocument()</i> on page 1340	Returns the representer document of SDMODData 'properties' (Metadata name-space) document This method is created for performance reasons mostly to use in search methods.

Modifier and Type	Member	Description
public String	<i>getPropertyValue(String...)</i> on page 1340	Returns the value of the appropriate property.
public List< String >	<i>getPropertyValues(List<String[]>)</i> on page 1340	Return list of property values for the given property paths.
public Map< String, String >	<i>getPropertyValues()</i> on page 1341	Returns the all the values of properties contained by this SDMODData Entry document Key for the properties will be their name of their full path in case they are enclosed by Complex Types.
public List< ISDMODDataLink >	<i>getRelatedDataLinks()</i> on page 1341	Returns SDMODData Link objects that represents links to Related Data.
public List< ISDMODDataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 1341	Returns the value and meta information (retrieved from SDMODData Schema document) of the properties of this SDMODData Entry document with 'true' searchable (SAP name-space) attribute value.
public ISDMODDataSchema	<i>getSchema()</i> on page 1342	Returns the appropriate SDMODData Schema object.
public ISDMODDataLink	<i>getSelfLink()</i> on page 1342	Returns SDMSDMODData Link object that should be used for self related operations (with 'rel' attribute value 'self' or 'edit')
public ISDMODDataLink	<i>getSubscriptionLink()</i> on page 1342	Returns SDMODData Link object that should be used for subscription or null if there is no subscription link defined.
public String	<i>getSummary()</i> on page 1342	Returns The value of the appropriate SDMODData element.
public String	<i>getTitle()</i> on page 1343	Returns The value of the appropriate SDMODData element.
protected static boolean	<i>isLocalEntry</i> on page 1348	

Modifier and Type	Member	Description
protected JsonObject	<i>JsonObject</i> on page 1348	JSON related variables
protected void	<i>materialize()</i> on page 1343	
protected static final int	<i>NOT_TESTED</i> on page 1349	
protected void	<i>parseCollectionId()</i> on page 1343	
protected long	<i>parseEdmTime(String)</i> on page 1343	
public void	<i>putComplexPropertyValue(String, String...)</i> on page 1343	Puts the new property element as a sub-element of the 'complex properties' SDMODData element.
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1344	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putId(String)</i> on page 1344	Sets id of this SDMODData Entry document (value of appropriate SDMODData Id element)
protected String	<i>resolveTargetCollection(ISDMODDataLink)</i> on page 1345	
protected ISDMODDataSchema	<i>schema</i> on page 1349	
public	<i>SDMODDataEntry()</i> on page 1333	
public	<i>SDMODDataEntry(boolean)</i> on page 1333	
protected	<i>SDMODDataEntry(int[], String[])</i> on page 1333	
public	<i>SDMODDataEntry(ISDMODDataSchema)</i> on page 1334	
public	<i>SDMODDataEntry(SDMParseDocument)</i> on page 1334	

Modifier and Type	Member	Description
public	<i>SDMODDataEntry(SDMParserDocument, ISDMODDataSchema)</i> on page 1334	
public	<i>SDMODDataEntry(JsonObject)</i> on page 1334	Json Related
public void	<i>setAuthorName(String)</i> on page 1346	Sets the value of the 'name' SDMODData element of the 'author' SDMODData element.
public void	<i>setCachestate(cache.State)</i> on page 1346	
public void	<i>setCacheTimestamp(Long)</i> on page 1346	
public void	<i>setIsLocal(boolean)</i> on page 1346	
public void	<i>setSummary(String)</i> on page 1347	Sets the value of the appropriate SDMODData element.
public void	<i>setTitle(String)</i> on page 1347	Sets the value of the appropriate SDMODData element.
protected static final int	<i>TRUE</i> on page 1349	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.

Modifier and Type	Member	Description
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[] >	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexProperty Value(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	

Modifier and Type	Member	Description
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route. For removing multiple element use setDocuments with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	

Modifier and Type	Member	Description
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	

Modifier and Type	Member	Description
public void	<i>setAttributes(List< String >, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParseDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List< ISDMParseDocument >, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List< String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map< String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValues(List<String>, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIX_MAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .
public static final String	<i>XMLNS_METADATA_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices/metadata .
public static final String	<i>XMLNS_SAP_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

Inherited members from ISDMODataEntry

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_SEMANTICS</i> on page 917	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_TERM</i> on page 917	Name of the appropriate SDMOData attribute.
public static final String	<i>ATTRIBUTE_VALUE_SEMANTICS_ACTION</i> on page 918	Value option for appropriate SDMOData attribute.
public static final String	<i>ELEMENT_AUTHOR</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_CATEGORY</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_CONTENT</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ENTRY</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_LINK</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_NAME</i> on page 918	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_PROPERTIES</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_SUMMARY</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_TITLE</i> on page 919	Name of the appropriate SDMOData element.

Modifier and Type	Member	Description
public static final String	<i>ELEMENT_UPDATED</i> on page 919	Name of the appropriate SDMOData element.
public static final String	<i>PROPERTY_LEVEL_SEPARATOR</i> on page 919	
public void	<i>setCacheState(cache.State)</i> on page 916	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public abstract ISDMParserDocument	<i>clone()</i> on page 1069	Creates a copy of this object.
public static Map< String, String >	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns Note: Some pattern are not supported by OData specification but still widely used.
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.

Modifier and Type	Member	Description
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttribute-Map(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate name-space prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.
public abstract void	<i>putDocument(ISDMParserDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.

Modifier and Type	Member	Description
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List< String >, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List< ISDMParserDocument >, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.

Modifier and Type	Member	Description
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .

Inherited members from ISDMPersistable

Modifier and Type	Member	Description
public void	<i>read(BufferedReader)</i> on page 1085	
public void	<i>write(BufferedWriter)</i> on page 1085	

*SDMODataReturnTypeEntry(boolean) constructor***Syntax**

```
public SDMODataReturnTypeEntry (boolean isComplex)
```

*SDMODataReturnTypeEntry(SDMParserDocument, ISDMODataFunctionImport, ISDMODataSchema, boolean) constructor***Syntax**

```
public SDMODataReturnTypeEntry (
    SDMParserDocument document,
```

```
ISDMODataFunctionImport functionImport,
ISDMODataSchema schema,
boolean isComplex
)
```

putPropertyValue(String, String) method

Puts the new property element as a sub-element of the 'properties' SDMODData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
    String propertyValue
)
```

Parameters

- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element. Not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML name-space.

putPropertyValue(String, String, boolean) method

Puts the new property element as a sub-element of the 'properties' SDMODData element.

Syntax

```
public void putPropertyValue (
    String propertyName,
    String propertyValue,
    boolean useDefaultPrefix
)
```

Parameters

- **useDefaultPrefix** – If true not-prefixed property name will be automatically prefixed with the current prefix of DataServices XML names-pace.
- **propertyName** – The name of the property with or without name-space.
- **propertyValue** – The value of the property

Remarks

An element with the same name will be overwritten by the new element.

If name of the property is not prefixed and useDefaultPreix is false, name of the property should be prefixed by the caller. (Use getPrefix for get the valid prefix for a name-space URI)

read(BufferedReader) method

Syntax

```
public void read (BufferedReader reader) throws  
SDMPersistenceException
```

Parameters

- **reader** – The buffered reader to read the object from.

Exceptions

- **SDMPersistenceException** – if data can not be loaded from the reader.

setCollectionId(String) method

Maintains the Id of the SDMOCata Collection that this Entry belongs to.

Syntax

```
public void setCollectionId (String collectionId)
```

Parameters

- **collectionId** – The Id of the SDMOCata Collection that this Entry belongs to

setSchema(ISDMODataSchema) method

Maintains the reference to the appropriate SDMOData Schema object.

Syntax

```
public void setSchema (ISDMODataSchema schema)
```

Parameters

- **schema** – The appropriate SDMOData Schema object.

write(BufferedWriter) method

Syntax

```
public void write (BufferedWriter writer) throws  
SDMPersistenceException
```

Parameters

- **writer** – The buffered writer that object data needs to be written into.

Exceptions

- **SDMPersistenceException** – if data can not be written into the writer

SDM_RETURNTYPE_COLLECTION variable

Syntax

```
protected static final String SDM_RETURNTYPE_COLLECTION
```

SDMODataReturnEntry.SDMODataReturnSchema class

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.ODataReturnEntry.ODataReturnSchema

Package

```
com.sap.mobile.lib.sdmparser.SDMODataReturnEntry
```

Syntax

```
protected class SDMODataReturnSchema extends SDMODataSchema
implements ISDMLocalSchema
```

Base class

- *SDMODataSchema* on page 1552

Implemented interfaces

- *ISDMLocalSchema* on page 817

Members

All members of *SDMODataReturnSchema*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected List< ISDMODataProperty >	referenceProperties	
protected SDMODataComplexType	complexType	

Constructors

Inherited members from SDMODataSchema

Modifier and Type	Member	Description
public SDMODataAssociation	<i>getAssociation(String)</i> on page 1568	Returns the appropriate SDMOData Association element with the given relationship attribute.
public List< ISDMODataAssociation >	<i>getAssociations()</i> on page 1568	Returns the list of the appropriate SDMOData elements.
public SDMODataAssociationSet	<i>getAssociationSet(String)</i> on page 1569	Returns the appropriate AssociationSet with for given association.
public List< ISDMODataAssociationSet >	<i>getAssociationSets()</i> on page 1569	Returns the list of the appropriate SDMOData elements.

Modifier and Type	Member	Description
public List< ISDMODataComplexType >	<i>getComplexTypes()</i> on page 1570	Returns The list of the appropriate SDMODData element.
public SDMODDataEntitySet	<i>getEntitySet(String)</i> on page 1570	Returns The appropriate SDMODData EntitySet.
public SDMODDataEntityType	<i>getEntityType(String)</i> on page 1570	Returns The 'EntityType' SDMODData element associated with the reference argument.
public List< ISDMODataFunctionImport >	<i>getFunctionImports()</i> on page 1571	Returns The list of the 'FunctionImport' SDMODData element.
public List< ISDMODataFunctionImport >	<i>getFunctionImportsForCollection(String)</i> on page 1571	Returns List of FunctionImports valid for the appropriate collection.
public ISDMODataServiceDocument	<i>getServiceDocument()</i> on page 1571	Returns the appropriate SDMODData Service Document.
public String	<i>getTargetCollectionIdForNavigationProperty(String, String)</i> on page 1571	Resolves the target collection Id of the given SDMODData Navigation Property element.
public	<i>SDMODDataSchema()</i> on page 1568	
protected	<i>SDMODDataSchema(int[], String[])</i> on page 1568	
public	<i>SDMODDataSchema(SDMParseDocument)</i> on page 1568	
protected ISDMODataServiceDocument	<i>serviceDocument</i> on page 1572	
public void	<i>setServiceDocument(ISDMODataServiceDocument)</i> on page 1572	Maintains reference to the appropriate SDMODData Service Document.

Inherited members from SDMParseDocument

Modifier and Type	Member	Description
public SDMParseDocument	<i>clone()</i> on page 1681	Creates a copy of this object.

public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.

Modifier and Type	Member	Description
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
public abstract String	<i>getAttribute(String...)</i> on page 1069	Returns the value of the first attribute with the given route.
public abstract List< String >	<i>getAttributes(String...)</i> on page 1070	Returns all the values of attributes with the given route.
public abstract Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1070	Returns all the name-value pairs of attributes contained by the element with the given route.
public abstract List< String >	<i>getChildAttributes(String...)</i> on page 1070	Returns all the values of attributes contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocuments(String...)</i> on page 1071	Returns the elements contained by the element with the given route.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1071	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract List< ISDMParseDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1072	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocument(String...)</i> on page 1072	Returns the first element with the given route.
public abstract List< ISDMParseDocument >	<i>getDocuments(String...)</i> on page 1073	Returns all the elements with the given route.
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1073	Returns the elements with the given route that contains the given attribute with the given value.

Modifier and Type	Member	Description
public abstract List< ISDMParseDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1074	Returns the elements with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1074	Returns the first element with the given route that contains the given attribute with the given value.
public abstract ISDMParseDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1075	Returns the first element with the given route that contains the given attribute with the given value.
public abstract String	<i>getElementName()</i> on page 1075	Returns The name of the root element of this document.
public abstract String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1076	
public abstract String	<i>getPrefixForUri(String)</i> on page 1076	Returns the appropriate namespace prefix for the given XML name-space URI.
public abstract String[]	<i>getStrings()</i> on page 1076	Returns all the string values contained by this document.
public abstract String	<i>getValue(String...)</i> on page 1076	Returns the value of the first element with the given route.
public abstract List< String >	<i>getValues(String...)</i> on page 1077	Returns all the values of elements with the given route.
public abstract void	<i>putAttribute(String, String...)</i> on page 1077	Sets the value of the attribute with the given route If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public abstract void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1078	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public abstract void	<i>putValue(String, String...)</i> on page 1078	Sets the value of the first element with the given route.
public abstract boolean	<i>removeAttribute(String...)</i> on page 1079	Removes first element with the given route.
public abstract boolean	<i>removeAttributes(String...)</i> on page 1079	Removes all the attribute with the given route.
public abstract boolean	<i>removeDocument(String...)</i> on page 1079	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public static final String	<i>ROOT_DOCUMENT_NAME</i> on page 1083	The default root element name for a new document.
public abstract void	<i>setAttributes(List<String>, String...)</i> on page 1080	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public abstract void	<i>setDocuments(List<ISDMParseDocument>, String...)</i> on page 1080	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.

Modifier and Type	Member	Description
public abstract void	<i>setElementName(String, String...)</i> on page 1081	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public abstract void	<i>setValues(List< String >, String...)</i> on page 1081	Sets all the values of the elements with the given rout Values will be paired to elements in order Elements with greater or equals index than size of new values will be untouched Null values will be treated as empty strings.
public abstract String	<i>toXMLString()</i> on page 1081	Returns the XML string representation of this object.
public static final String	<i>XMLNS_APPLICATION_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_ATOM_URI</i> on page 1083	Constant for XMLNS URI: http://www.w3.org/2005/Atom .
public static final String	<i>XMLNS_DATASERVICES_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/08/dataservices .
public static final String	<i>XMLNS_EDM_URI</i> on page 1083	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/05/edm .
public static final String	<i>XMLNS_EDMX_URI</i> on page 1084	Constant for XMLNS URI: http://schemas.microsoft.com/ado/2007/06/edmx .
public static final String	<i>XMLNS_GENERICPLAYER_URI</i> on page 1084	Constant for XMLNS URI: http://www.sap.com/Protocols/SAPData/GenericPlayer .

protected List< ISDMODataProperty > referenceProperties
```

SDMODataReturnTypeInfo.SDMODataReturnSchema.SDMODataReturnEntityType class

Deprecated. since 3.0, Use

com.sap.mobile.lib.request.ODataReturnTypeInfo.ODataReturnSchema.ODataReturnEntityType

Package

```
com.sap.mobile.lib.sdmparser.SDMODataReturnTypeInfo.SDMODataReturnSchema
```

Syntax

```
protected class SDMODataReturnEntityType extends  
SDMODataEntityType
```

Base class

- *SDMODataEntityType* on page 1293

Members

All members of *SDMODataReturnEntityType*, including inherited members. **Variables**

Modifier and Type	Variable	Description
protected List< ISDMODataProperty >	referenceProperties	

Constructors

Modifier and Type	Constructor	Description
public	<i>SDMODataReturnEntityType(List< ISDMODataProperty >)</i> on page 1552	

Methods

Modifier and Type	Method	Description
public List< ISDMODataProperty >	<i>getProperties()</i> on page 1552	

Inherited members from *SDMODataEntityType*

Modifier and Type	Member	Description
public List< ISDMODataProperty >	<i>getGPUseInSearchPropertiesData()</i> on page 1309	Returns The list of appropriate SDMOData elements with 'true' use-in-search (Generic Player names-pace) attribute value.
public List< ISDMODataProperty >	<i>getGPVisibleInDetailPropertiesData()</i> on page 1309	Returns The list of appropriate SDMOData elements with 'true' visible-in-detail (Generic Player names-pace) attribute value.
public List< ISDMODataProperty >	<i>getGPVisibleInListPropertiesData()</i> on page 1309	Returns The list of appropriate SDMOData elements with 'true' visible-in-list (Generic Player names-pace) attribute value.

Modifier and Type	Member	Description
public List< String >	<i>getKeyPropertyNames()</i> on page 1310	Returns the list of the values of the 'PropertyRef' SDMODData element contained by the 'Key' SDMODData element.
public String	<i>getName()</i> on page 1310	Returns The value of the appropriate SDMODData attribute.
public List< ISDMODDataNavigationProperty >	<i>getNavigationProperties()</i> on page 1310	Returns The list of appropriate SDMODData elements.
public ISDMODDataNavigationProperty	<i>getNavigationProperty(String)</i> on page 1310	Returns The appropriate SDMODData element with the given name.
public List< ISDMODDataProperty >	<i>getPropertiesWithAttribute(String, String)</i> on page 1311	Returns The list of appropriate SDMODData elements with given attribute value.
public List< ISDMODDataProperty >	<i>getPropertiesWithAttribute(String, String, boolean)</i> on page 1311	Returns The list of appropriate SDMODData elements with given attribute value.
public ISDMODDataProperty	<i>getProperty(String)</i> on page 1311	Returns The appropriate SDMODData element with the given name.
public List< ISDMODDataProperty >	<i>getSAPSearchablePropertiesData()</i> on page 1312	Returns The list of appropriate SDMODData elements with 'true' searchable (SAP names-pace) attribute value.
protected ISDMODDataSchema	<i>getSchema()</i> on page 1312	
public List< ISDMODDataProperty >	<i>getSearchablePropertiesData(String)</i> on page 1312	Returns The list of appropriate SDMODData elements with 'true' attribute value of the given attribute.
public boolean	<i>hasStream()</i> on page 1312	Returns The value of the appropriate SDMODData attribute.
public	<i>SDMODDataEntityType()</i> on page 1308	
protected	<i>SDMODDataEntityType(int[], String[])</i> on page 1308	

Modifier and Type	Member	Description
public	<i>SDMODataEntityType(SDMParserDocument)</i> on page 1309	
protected void	<i>setSchema(ISDMODataSchema)</i> on page 1313	

Inherited members from SDMParserDocument

Modifier and Type	Member	Description
public SDMParserDocument	<i>clone()</i> on page 1681	Creates a copy of this object.
protected Map< String, String >	<i>extensions</i> on page 1701	
public String	<i>getAttribute(String...)</i> on page 1682	Returns the value of the first attribute with the given route.
public List< String >	<i>getAttributes(String...)</i> on page 1682	Returns all the values of attributes with the given route.
protected int	<i>getAttributesEndPosition(int[], int, int)</i> on page 1682	
public Map< String, String >	<i>getChildAttributeMap(String...)</i> on page 1683	Returns all the name-value pairs of attributes contained by the element with the given route.
public List< String >	<i>getChildAttributes(String...)</i> on page 1683	Returns all the values of attributes contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocuments(String...)</i> on page 1683	Returns the elements contained by the element with the given route.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.
public List< ISDMParserDocument >	<i>getChildDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1684	Returns the elements contained by the element with the given route and having the given attribute with the given value.

Modifier and Type	Member	Description
public SDMParserDocument	<i>getDocument(String...)</i> on page 1685	Returns the first element with the given route.
protected List< int[]>	<i>getDocumentPositions(String[], int, boolean, boolean)</i> on page 1685	
public List< ISDMParserDocument >	<i>getDocuments(String...)</i> on page 1686	Returns all the elements with the given route.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, String...)</i> on page 1686	Returns the elements with the given route that contains the given attribute with the given value.
public List< ISDMParserDocument >	<i>getDocumentsWithAttribute(String, String, boolean, String...)</i> on page 1687	Returns the elements with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, String...)</i> on page 1687	Returns the first element with the given route that contains the given attribute with the given value.
public ISDMParserDocument	<i>getDocumentWithAttribute(String, String, boolean, String...)</i> on page 1688	Returns the first element with the given route that contains the given attribute with the given value.
public String	<i>getElementName()</i> on page 1688	Returns The name of the root element of this document.
public String	<i>getExtension(String)</i> on page 1689	
public String	<i>getFunctionImportComplexPropertyValue(String...)</i> on page 1689	
public static List< String >	<i>getNameMap()</i> on page 1689	
public static String	<i>getPrefix(String)</i> on page 1689	

Modifier and Type	Member	Description
public String	<i>getPrefixForUri(String)</i> on page 1689	Returns the appropriate name-space prefix for the given XML name-space URI.
public static Map< String, String >	<i>getPrefixMapping()</i> on page 1689	
protected List< Integer >	<i>getStringPositions(String[], int, boolean, boolean)</i> on page 1690	
public String[]	<i>getStrings()</i> on page 1690	Returns all the string values contained by this document.
public String	<i>getValue(String...)</i> on page 1690	Returns the value of the first element with the given route.
public List< String >	<i>getValues(String...)</i> on page 1690	Returns all the values of elements with the given route.
protected int[]	<i>insertRoutePositions(int[], int, int[])</i> on page 1691	
protected void	<i>insertRoutesPositions(int, int[])</i> on page 1691	
protected void	<i>insertStringsPositions(int, String[])</i> on page 1691	
protected String[]	<i>insertStringsPositions(String[], int, String[])</i> on page 1691	
protected boolean	<i>isMatched(String, String)</i> on page 1692	
public void	<i>putAttribute(String, String...)</i> on page 1692	Sets the value of the attribute with the given route. If attribute does not exist it will be created as well as all other non existing elements in the route.

Modifier and Type	Member	Description
public void	<i>putDocument(ISDMParseDocument, String...)</i> on page 1692	Insert the document under the element with the given route inserted document will be placed before already existing documents with the same route name under All missing elements from the route will be created.
public void	<i>putExtension(String, String)</i> on page 1693	
protected void	<i>putString(int, String, int, String...)</i> on page 1693	
public void	<i>putValue(String, String...)</i> on page 1693	Sets the value of the first element with the given route.
public void	<i>read(BufferedReader)</i> on page 1693	
public static void	<i>readNameMap(BufferedReader)</i> on page 1694	
public boolean	<i>removeAttribute(String...)</i> on page 1694	Removes first element with the given route.
public boolean	<i>removeAttributes(String...)</i> on page 1694	Removes all the attribute with the given route.
public boolean	<i>removeDocument(String...)</i> on page 1695	Removes first element with the given route For removing multiple element use setDocuemtns with null arguments.
public void	<i>removeExtension(String)</i> on page 1695	
protected void	<i>removeRoutesPositions(int, int)</i> on page 1695	
protected int[]	<i>removeRoutesPositions(int[], int, int)</i> on page 1695	
protected boolean	<i>removeString(String...)</i> on page 1695	

Modifier and Type	Member	Description
protected boolean	<i>removeStrings(String...)</i> on page 1696	
protected void	<i>removeStringsPositions(int, int)</i> on page 1696	
protected String[]	<i>removeStringsPositions(String[], int, int)</i> on page 1696	
protected int	<i>replaceRoutesPositions(int, int, int[])</i> on page 1696	
protected int[]	<i>replaceRoutesPositions(int[], int, int, int[])</i> on page 1696	
protected int	<i>replaceStringsPositions(int, int, String[])</i> on page 1697	
protected String[]	<i>replaceStringsPositions(String[], int, int, String[])</i> on page 1697	
public static String	<i>resolveUrl(String, String)</i> on page 1697	
protected int[]	<i>routes</i> on page 1701	
public	<i>SDMParserDocument(String)</i> on page 1681	
public	<i>SDMParserDocument(SDMParserDocument)</i> on page 1681	
protected	<i>SDMParserDocument(int[], String[])</i> on page 1681	
protected	<i>SDMParserDocument(String, boolean)</i> on page 1681	
public void	<i>setAttribute(String, String...)</i> on page 1697	

Modifier and Type	Member	Description
public void	<i>setAttributes(List< String >, String...)</i> on page 1697	Sets all the values of the attributes with the given route Values will be paired to attributes in order Attributes with greater or equals index than size of new values will be untouched Attributes paired with null values will be removed.
public boolean	<i>setDocument(ISDMParseDocument, String...)</i> on page 1698	
public void	<i>setDocuments(List< ISDMParseDocument >, String...)</i> on page 1698	Replaces all the elements with the given route Documents will be paired to elements in order Elements with greater or equals index than size of new elements will be untouched Element paired with null will be removed.
public void	<i>setElementName(String, String...)</i> on page 1698	Sets the name of the root element with the given route Use empty route for setting root name of this document.
public static void	<i>setNameMap(List< String >)</i> on page 1699	
public static void	<i>setPrefixMapping(Map< String, String >)</i> on page 1699	
protected void	<i>setString(String, String...)</i> on page 1699	
protected void	<i>setStrings(List< String >, String...)</i> on page 1699	
public void	<i>setValue(String, String...)</i> on page 1699	

Modifier and Type	Member	Description
public void	<i>setValues(List<String>, String...)</i> on page 1700	Sets all the values of the elements with the given route values will be paired to elements in order. Elements with greater or equals index than size of new values will be untouched. Null values will be treated as empty strings.
protected String[]	<i>strings</i> on page 1701	
public String	<i>toXMLString()</i> on page 1700	Returns the XML string representation of this object.
protected static final String	<i>URL_PROTOCOL_PREFIX</i> on page 1701	
public void	<i>write(BufferedWriter)</i> on page 1700	
public static void	<i>writeNameMap(BufferedWriter)</i> on page 1701	

Inherited members from ISDMParserDocument

Modifier and Type	Member	Description
public static final String	<i>ATTRIBUTE_ETAG</i> on page 1082	Name of the appropriate SDMOData element.
public static final String	<i>ATTRIBUTE_VALUEPREFIX_EDMTYPE</i> on page 1082	Value prefix for EDM Type type values.
public static Map<String, String>	<i>DEFAULT_PREFIXMAPPING</i> on page 1082	The default XML Namespace-to-Prefix mapping used for building XMLS.
public static final String[]	<i>EDMDATETIME_PATTERNS</i> on page 1082	Possible EDM DateTime patterns. Note: Some patterns are not supported by OData specification but still widely used.
public static final String[]	<i>EDMDATETIMEOFFSET_PATTERNS</i> on page 1082	Possible EDM TimeOffset patterns. Note: Some patterns are not supported by OData specification but still widely used.

Modifier and Type	Member	Description
public static final String	<i>EDMTIME_PATTERN</i> on page 1082	EDM Time pattern.
public static String	<i>ELEMENT_FEED</i> on page 1083	Name of the appropriate SDMOData element.
public static final String	<i>ELEMENT_ID</i> on page 1083	Name of the appropriate SDMOData element.
